
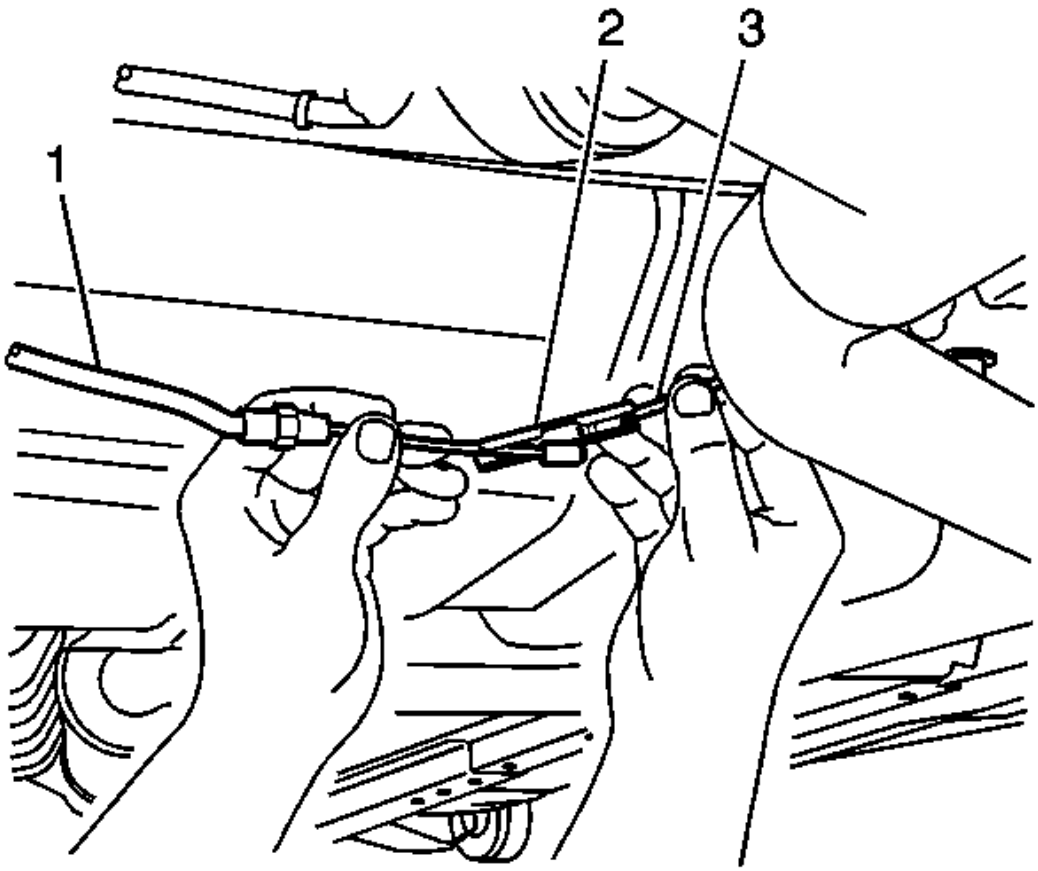

Fig. 8: View Of Front Brake Cable Connected To Right Rear Cable
Courtesy of GENERAL MOTORS COMPANY

11. Connect the front park brake cable (1) to the rear cable (3) at the connector clip (2).

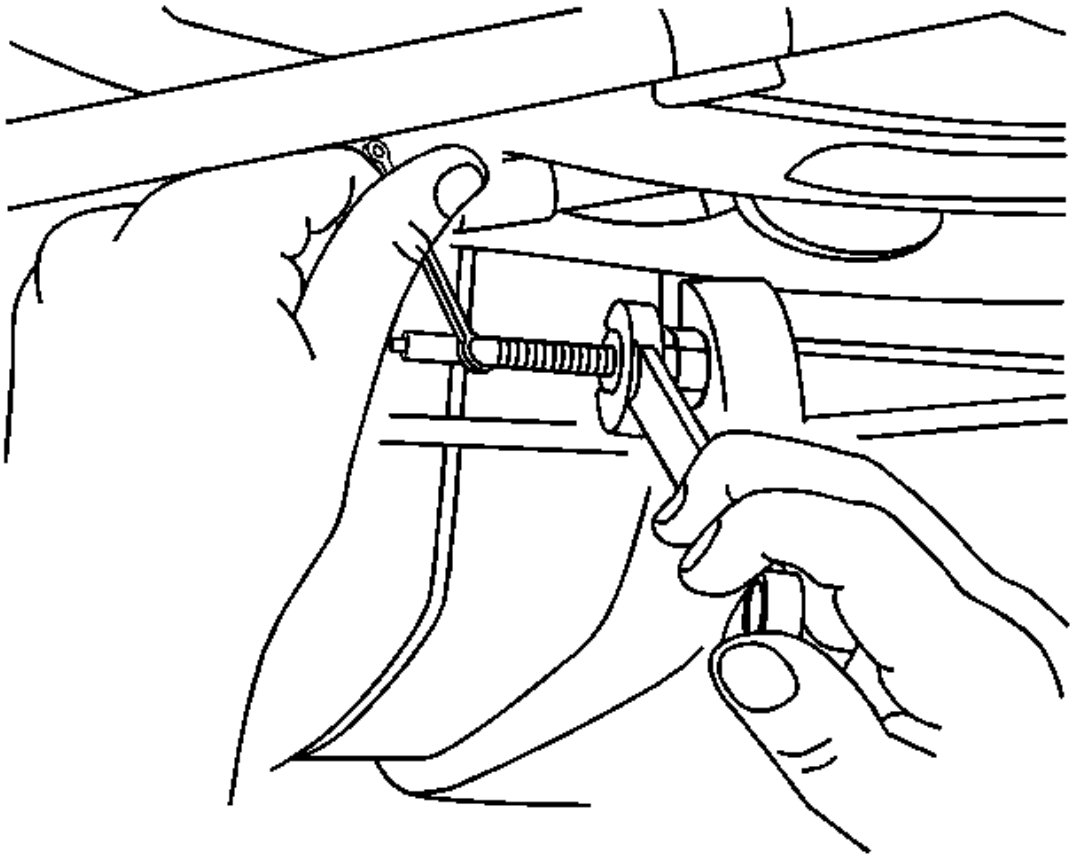

Fig. 9: Adjusting Park Brake Tension At Equalizer Assembly
Courtesy of GENERAL MOTORS COMPANY

12. Tighten the nut on the equalizer in order to remove slack in the cable.
13. Lower the vehicle.

PARKING BRAKE INDICATOR SWITCH REPLACEMENT

Removal Procedure

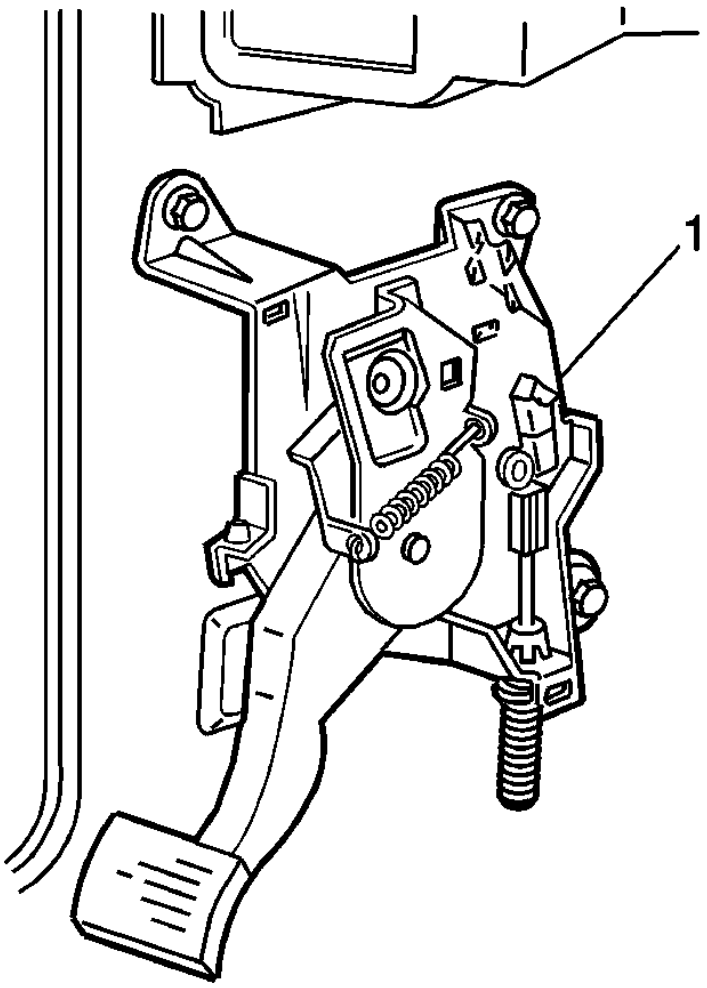

Fig. 10: Parking Brake Indicator Switch
Courtesy of GENERAL MOTORS COMPANY

1. Remove the left side instrument panel insulator.
2. Remove the left carpet retainers. Refer to **Front Side Door Opening Floor Carpet Retainer Replacement (Impala)** .
3. Disconnect the electrical connector from the switch.
4. Remove the mounting screw.
5. Remove the parking brake indicator switch (1).

Installation Procedure

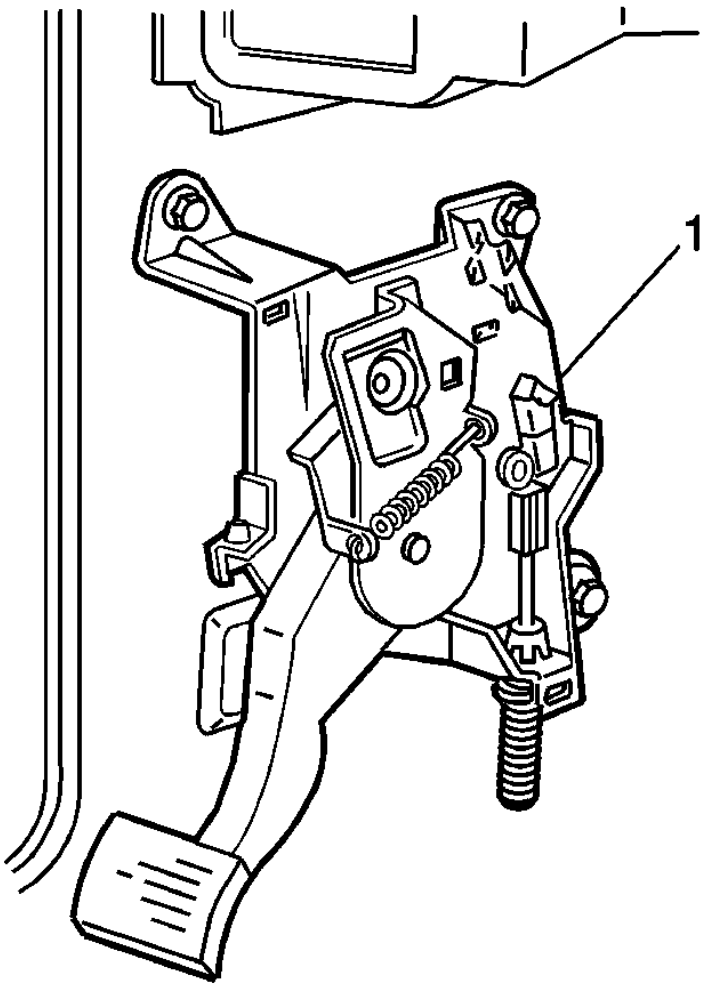

Fig. 11: Parking Brake Indicator Switch
Courtesy of GENERAL MOTORS COMPANY

1. Install the parking brake indicator switch (1).

   CAUTION: Refer to Fastener Caution .

2. Install the mounting screw.

   Tighten

   Tighten the mounting screw to 3 N.m (26 lb in).

3. Connect the electrical connector to the switch.

   Check the operation of the switch.

4. Install the left carpet retainers. Refer to **Front Side Door Opening Floor Carpet Retainer Replacement (Impala)** .
5. Install the left side instrument panel insulator.

PARKING BRAKE FRONT CABLE REPLACEMENT

Tools Required

J 37043 Parking Brake Cable Release Tool

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

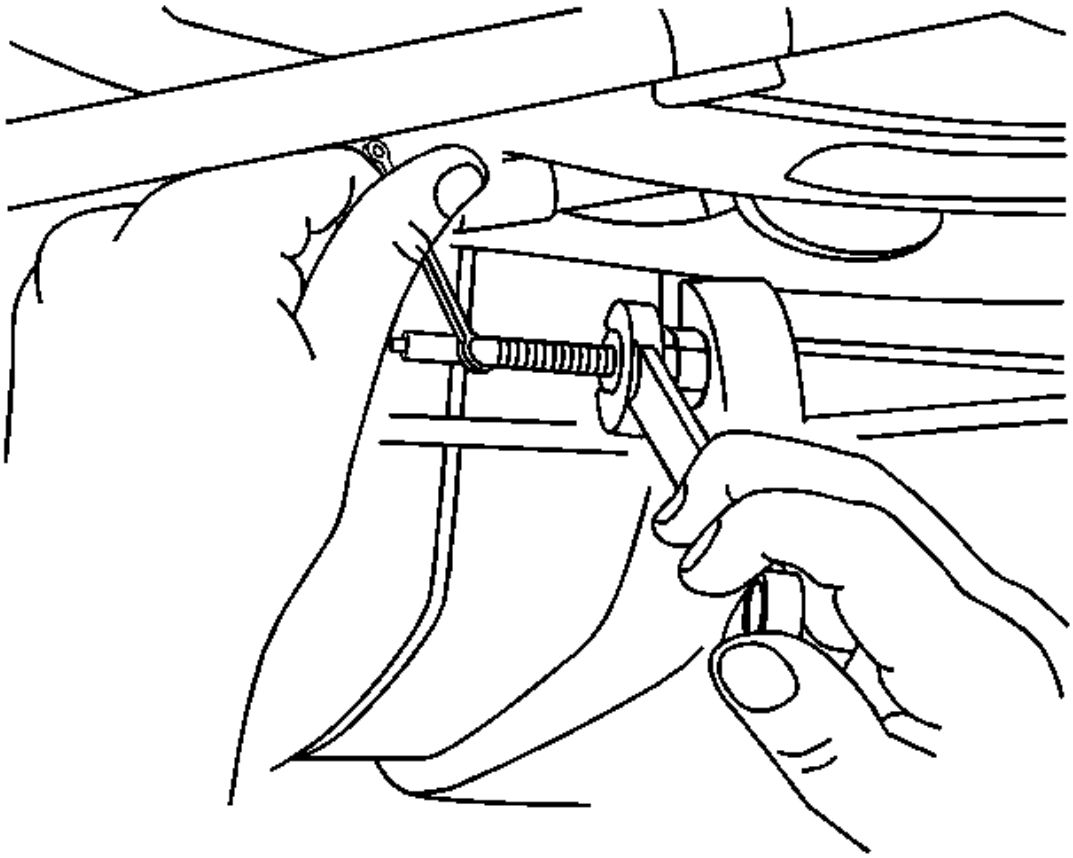

Fig. 12: Adjusting Park Brake Tension At Equalizer Assembly
Courtesy of GENERAL MOTORS COMPANY

2. Relieve the cable tension at the park brake equalizer.

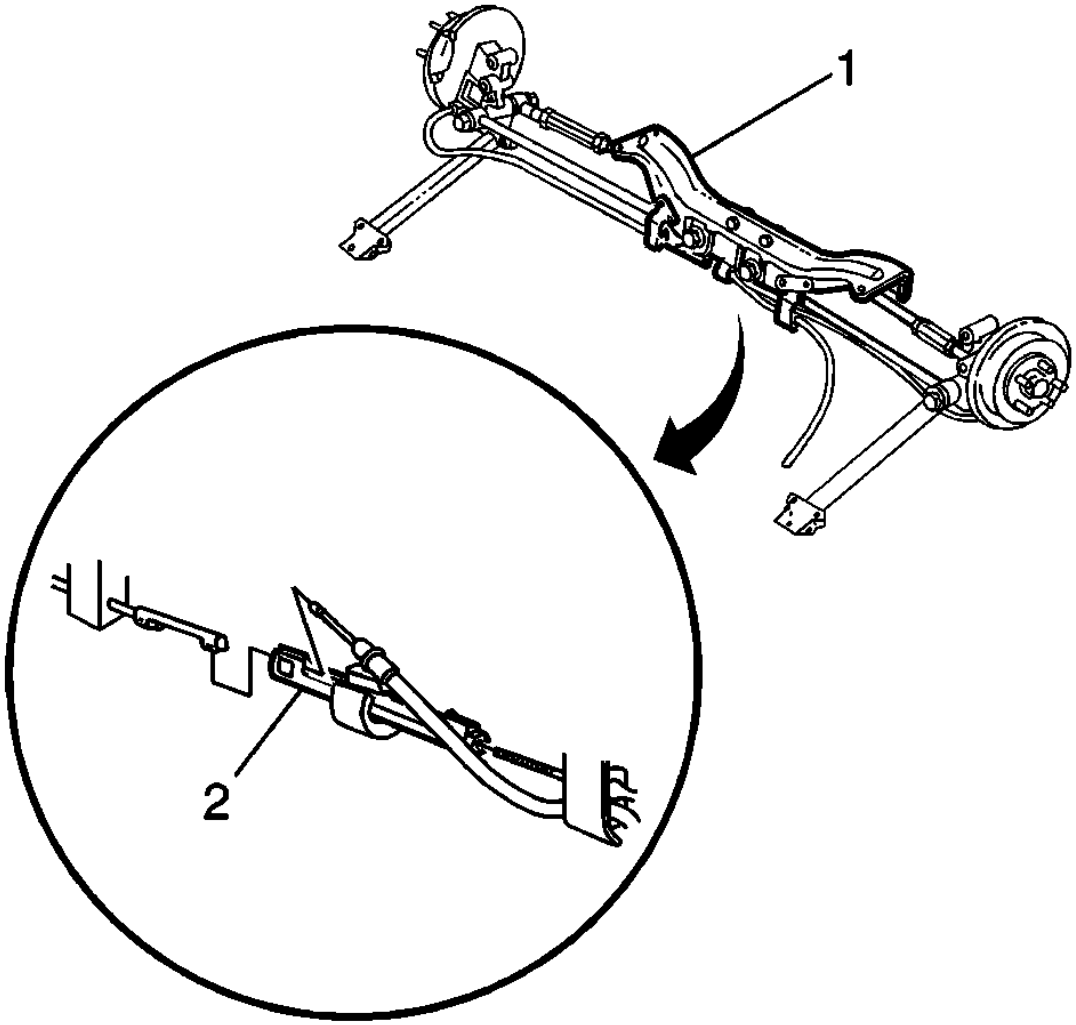

Fig. 13: View Of Parking Brake Adjustment
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the front cable from the connector (2).

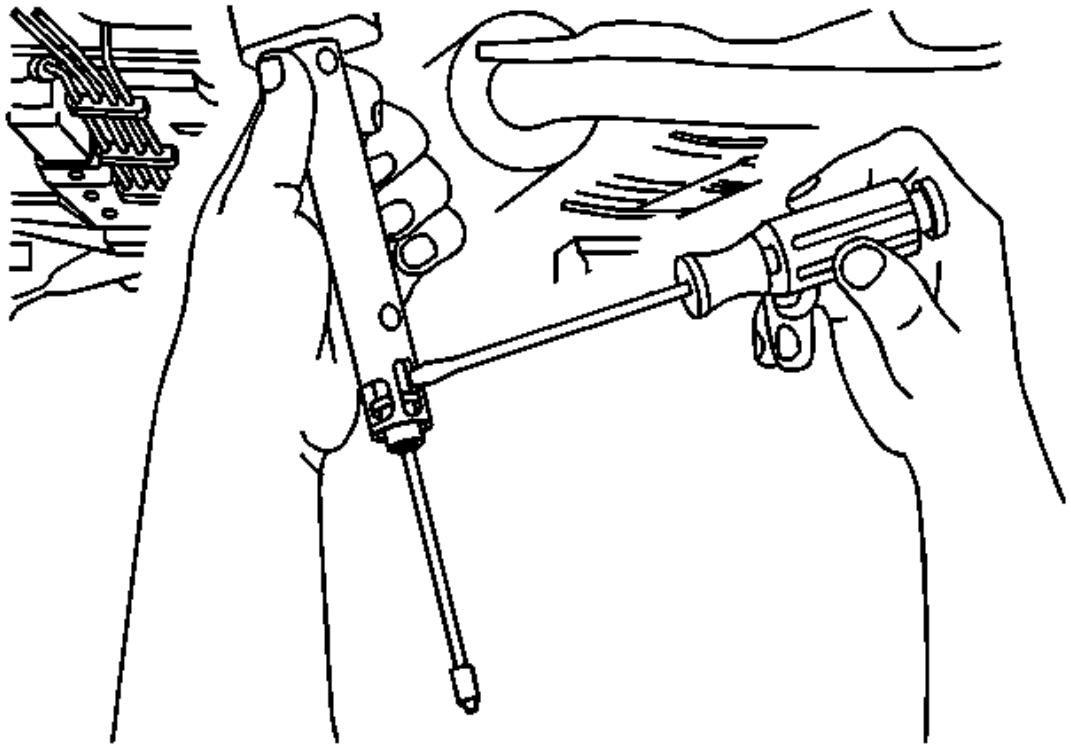

Fig. 14: Equalizer Assembly And Front Park Brake Cable
Courtesy of GENERAL MOTORS COMPANY

4. Remove the front cable from the equalizer.
5. Remove the front cable from the cable guides.
6. Lower the vehicle.
7. Remove the left side closeout/insulator panel. Refer to **Instrument Panel Insulator Panel Replacement - Left Side** .
8. Remove the lower center pillar panel on the left side and the left side carpet retainers. Refer to **Center Pillar Lower Trim Panel Replacement** .
9. Fold back the carpeting in order to gain access to the front park brake cable.

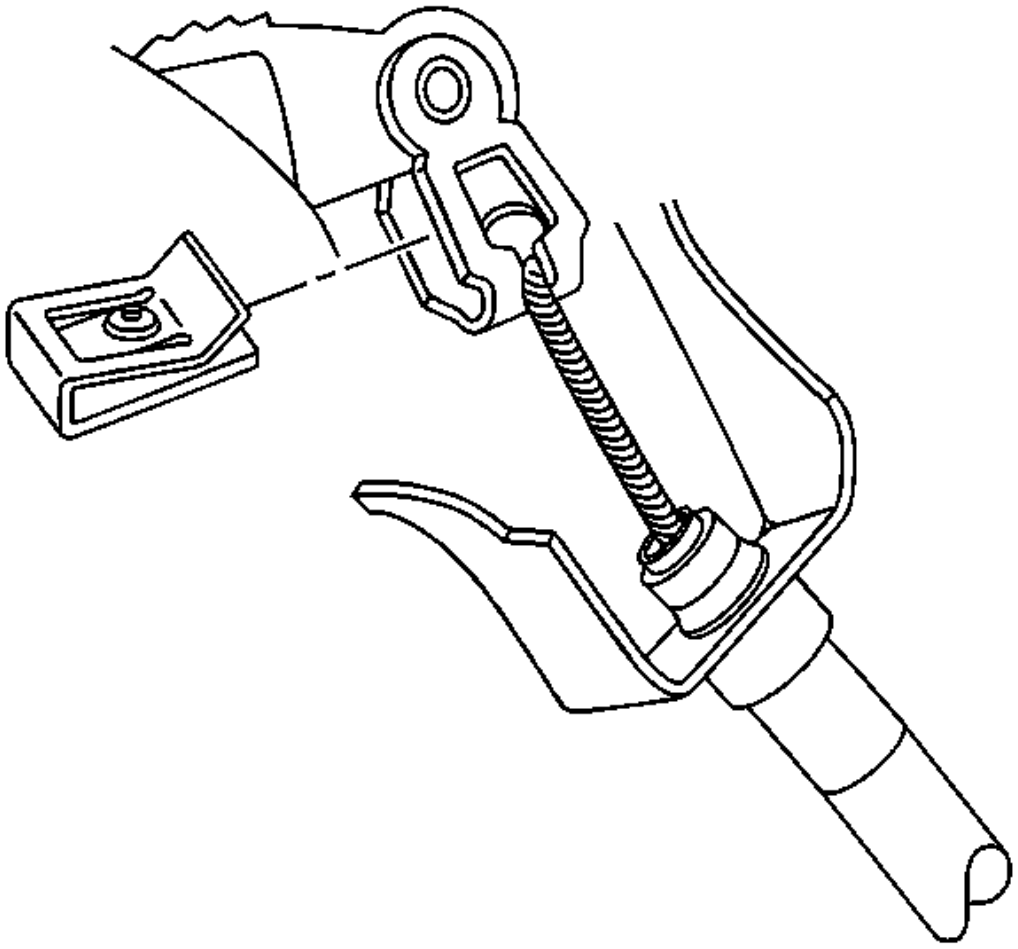

Fig. 15: View Of Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

10. Remove the retaining clip and disconnect the cable from the clevis.
11. Use the **J 37043** parking brake cable release tool to release the retainer holding cable to the bracket on the pedal assembly.
12. Remove the front cable from the vehicle.

Note routing of the cable for installation.

Installation Procedure

1. Install the front cable into the vehicle as noted in the removal procedure.
2. Install the front park brake cable into the bracket on the park brake pedal assembly.

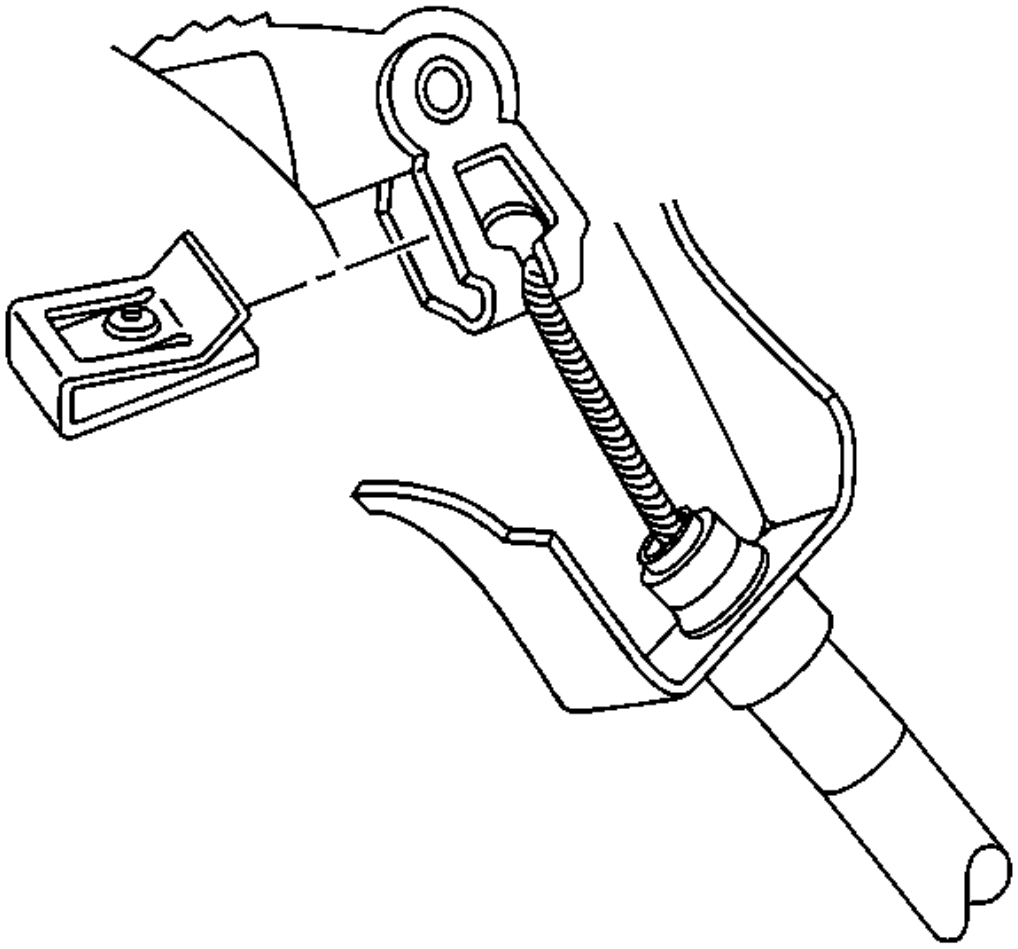

Fig. 16: View Of Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

3. Insert the cable button end into the clevis and install the retaining clip.
4. Reposition the carpeting properly.
5. Install the left side carpet retainers and the lower center pillar trim panel on the left side . Refer to **Center Pillar Lower Trim Panel Replacement** .
6. Install the left side closeout/insulator panel. Refer to **Instrument Panel Insulator Panel Replacement - Left Side** .
7. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
8. Install the front park brake cable through the park brake cable guides.
9. Install the front park brake cable into the equalizer.

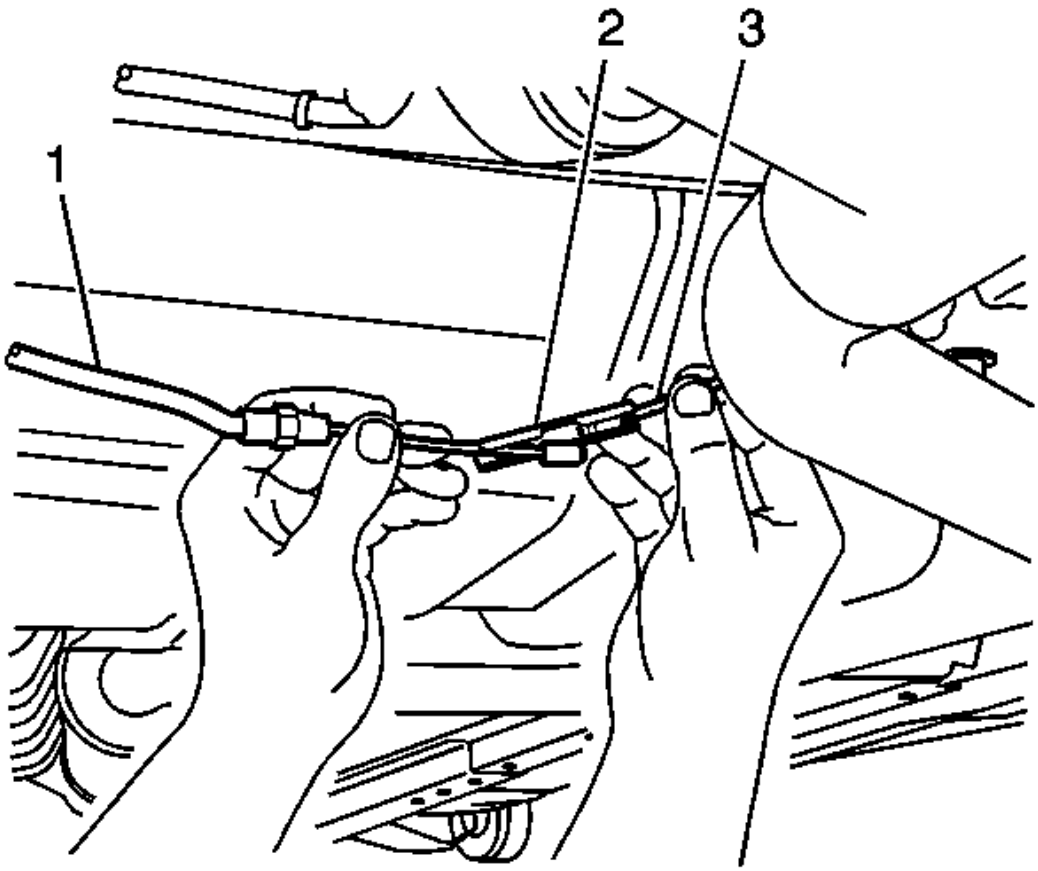

Fig. 17: View Of Front Brake Cable Connected To Right Rear Cable
Courtesy of GENERAL MOTORS COMPANY

10. Connect the front park brake cable (1) to the rear cable (3) at the connector clip (2).

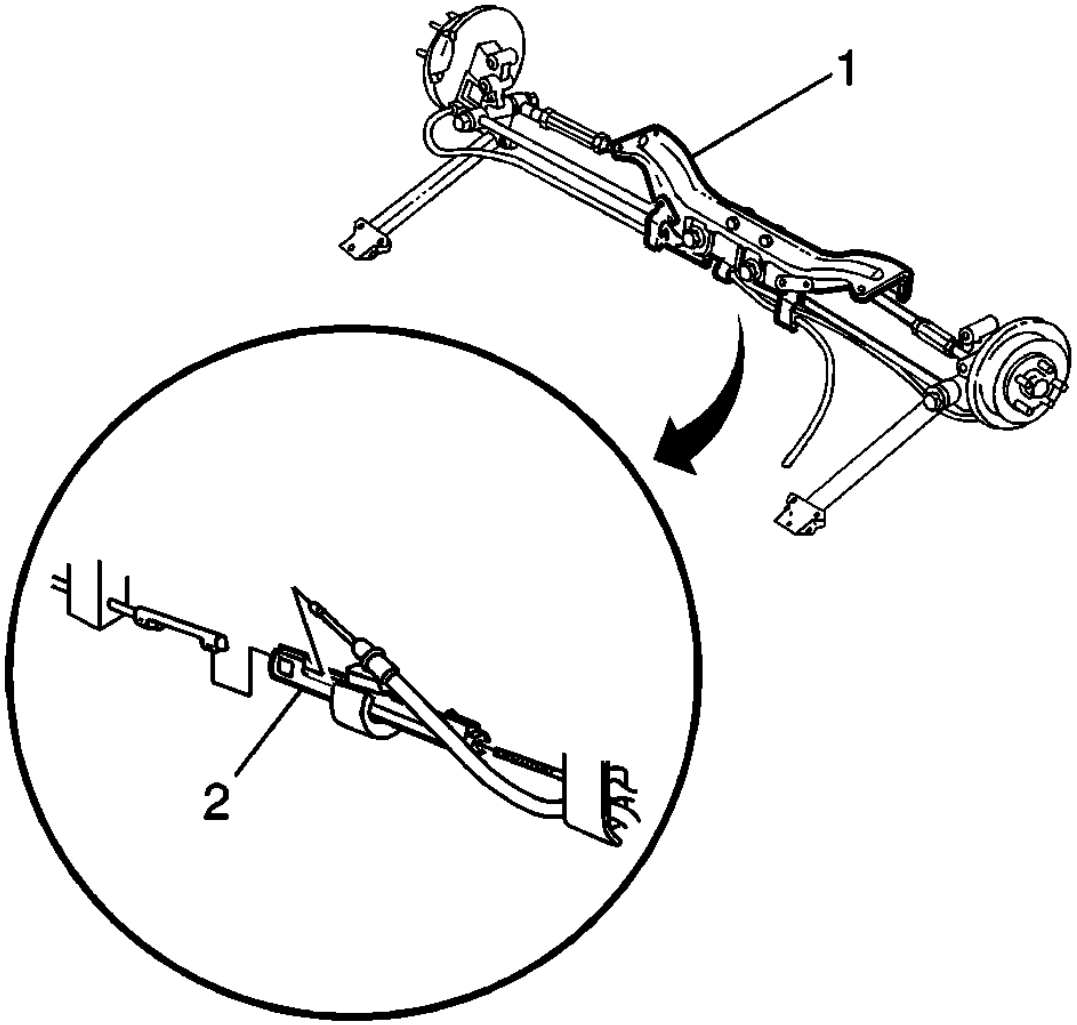

Fig. 18: View Of Parking Brake Adjustment
Courtesy of GENERAL MOTORS COMPANY

11. Tighten the nut on the equalizer (2) in order to remove slack in the cable.
12. Lower the vehicle.

PARKING BRAKE REAR CABLE REPLACEMENT (Z7U)

Special Tools

J 37043 Parking Brake Cable Release Tool

Removal Procedure

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Raise and suitably support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

2. Relieve the park brake cable tension at the equalizer.
3. Disconnect the front cable from the rear cable that is to be replaced.

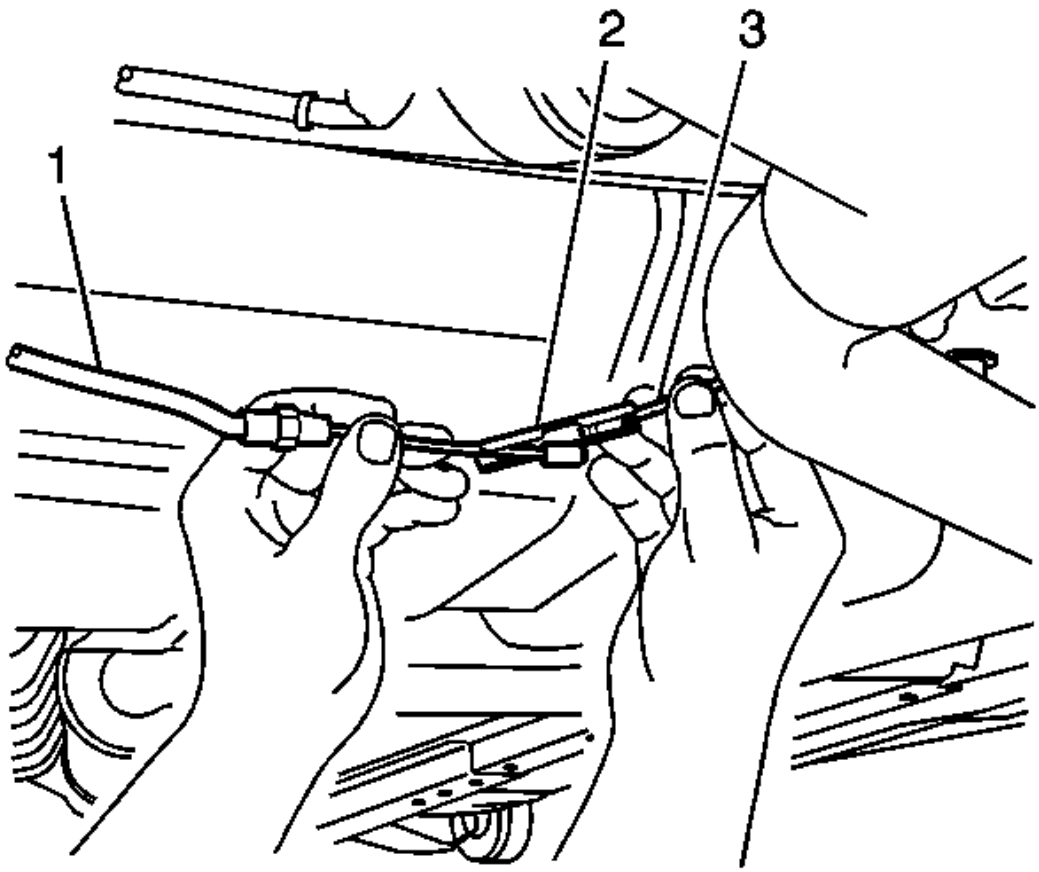

Fig. 19: View Of Front Brake Cable Connected To Right Rear Cable
Courtesy of GENERAL MOTORS COMPANY

- For the right rear cable, disconnect the cable (3) from the clip (2).
- For the left rear cable, fully remove the equalizer nut from the equalizer stud, which is part of the left rear cable.

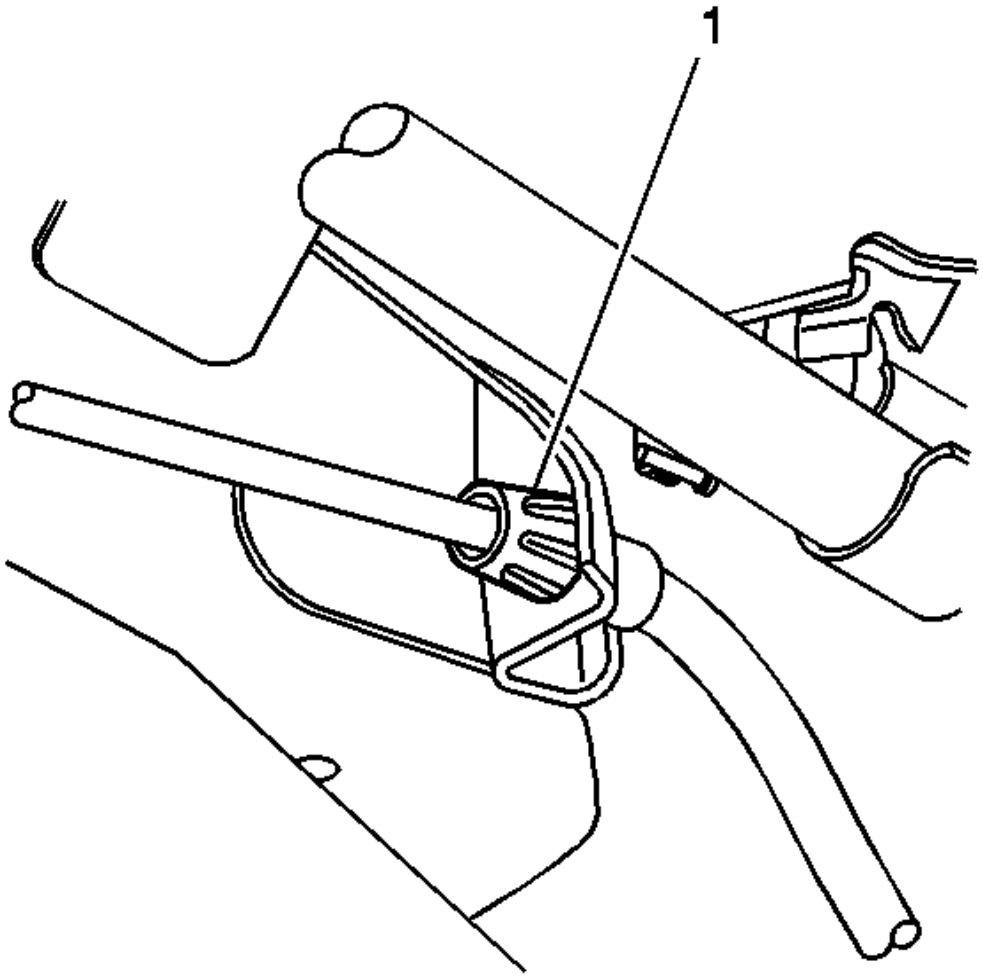

Fig. 20: Rear Park Brake Cable To Support Bracket Retainer (Z7U)
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the retainer (1) that holds the cable to the support bracket. Use the **J 37043** parking brake cable release tool to release the retainer.

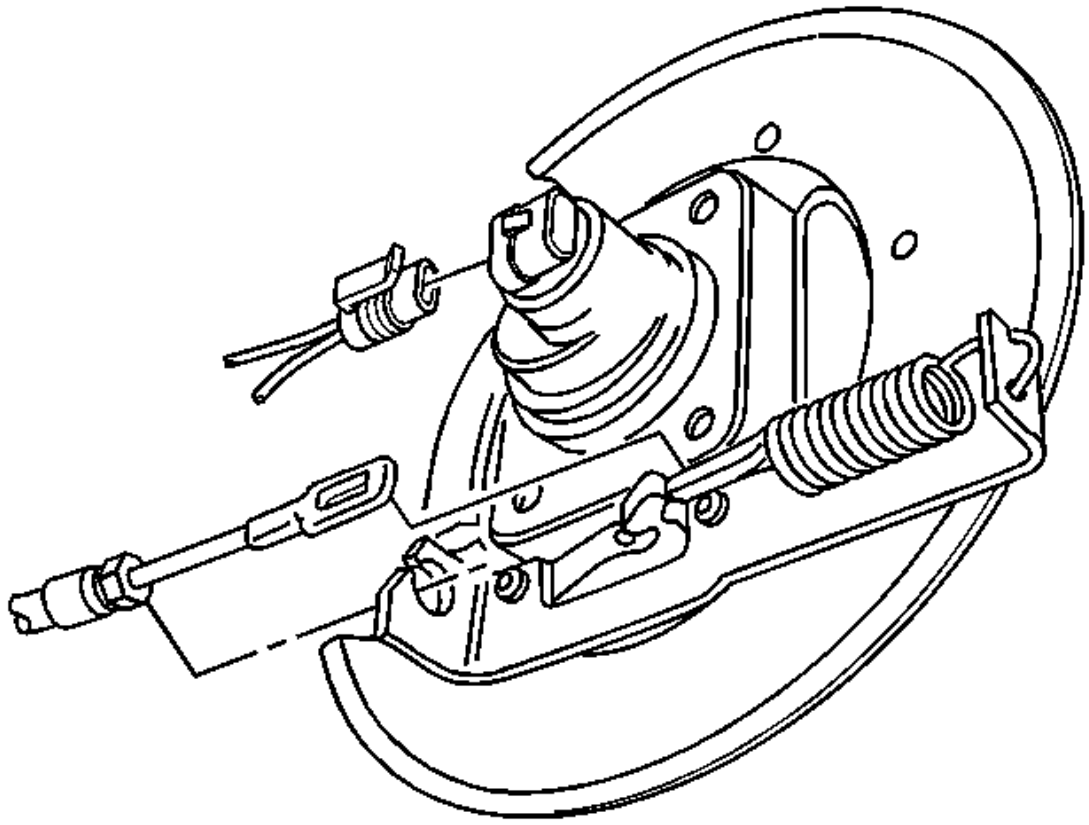

Fig. 21: View Of Rear Park Brake Cable & Wheel Speed Sensor Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect the park brake cable from the actuator lever.
6. Remove cable retaining pin from the support bracket and remove the park brake cable.

Installation Procedure

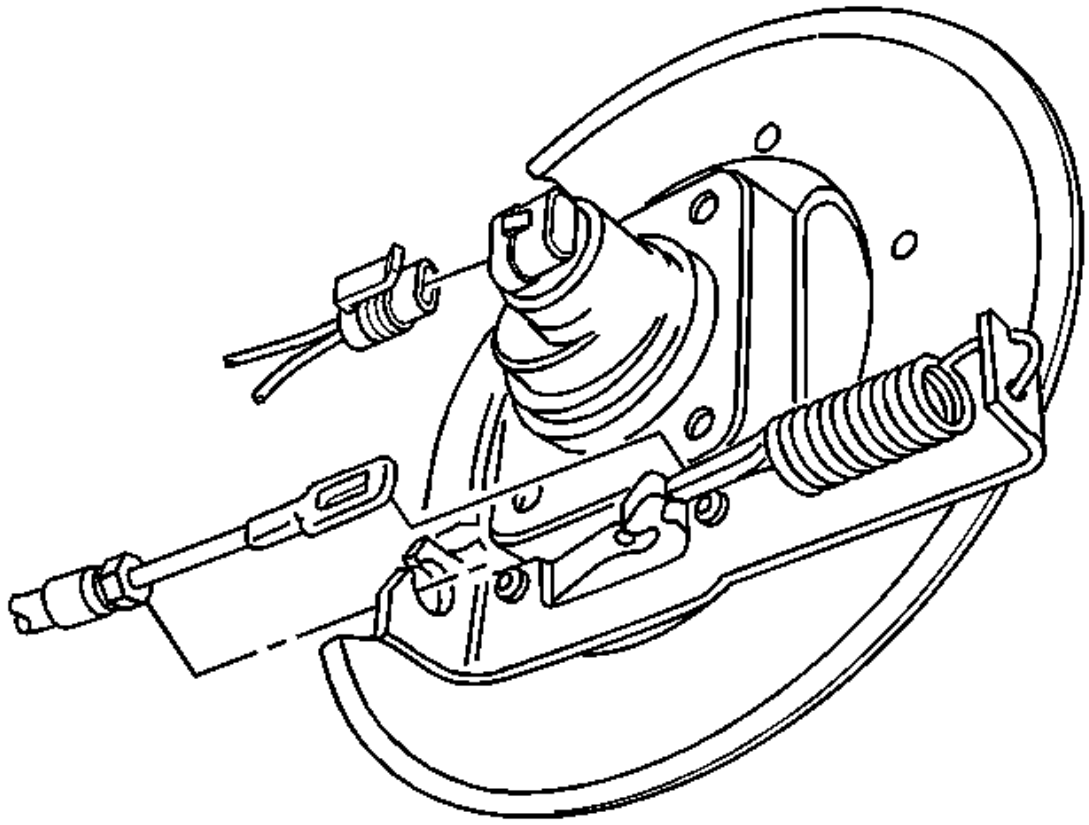

Fig. 22: View Of Rear Park Brake Cable & Wheel Speed Sensor Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

1. Position the park brake cable into the support bracket and install the cable retaining pin.
2. Install the park brake cable to the actuator lever.

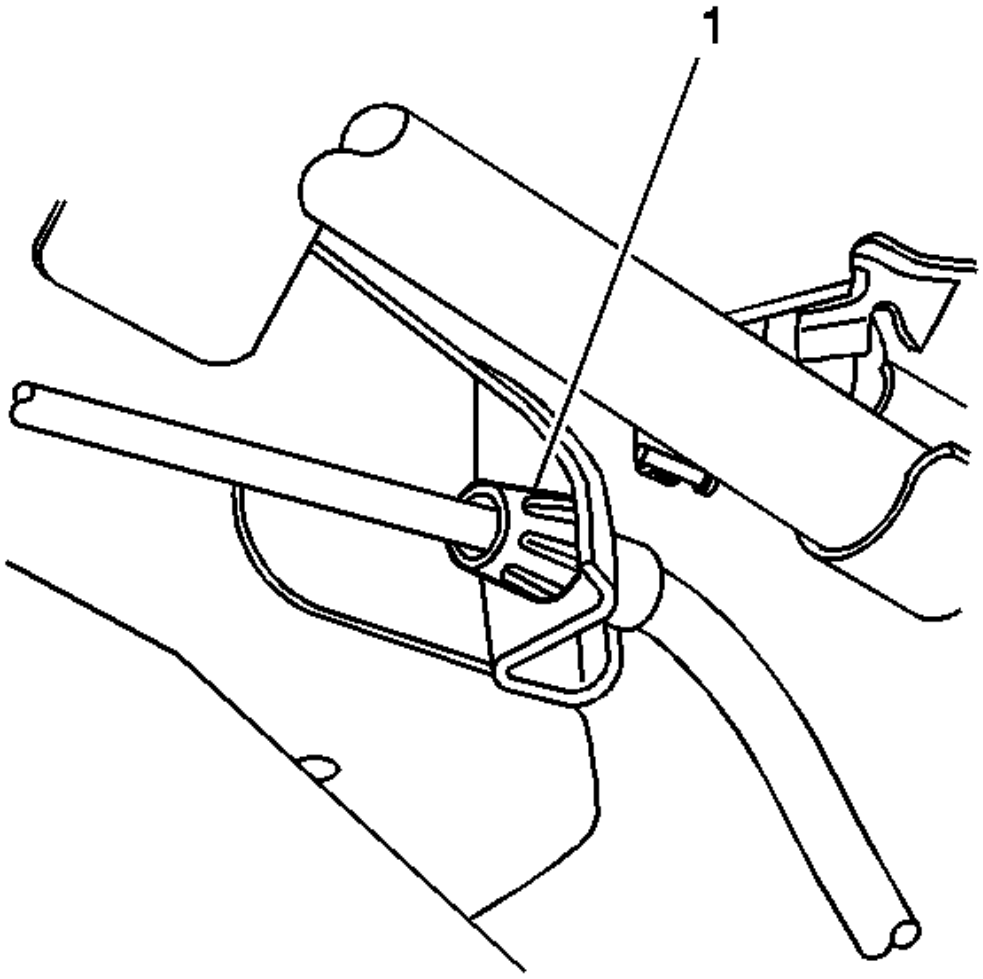

Fig. 23: Rear Park Brake Cable To Support Bracket Retainer (Z7U)
Courtesy of GENERAL MOTORS COMPANY

3. Connect the retainer (1) that holds the cable to the support bracket.
4. Connect the rear cable to the front cable.

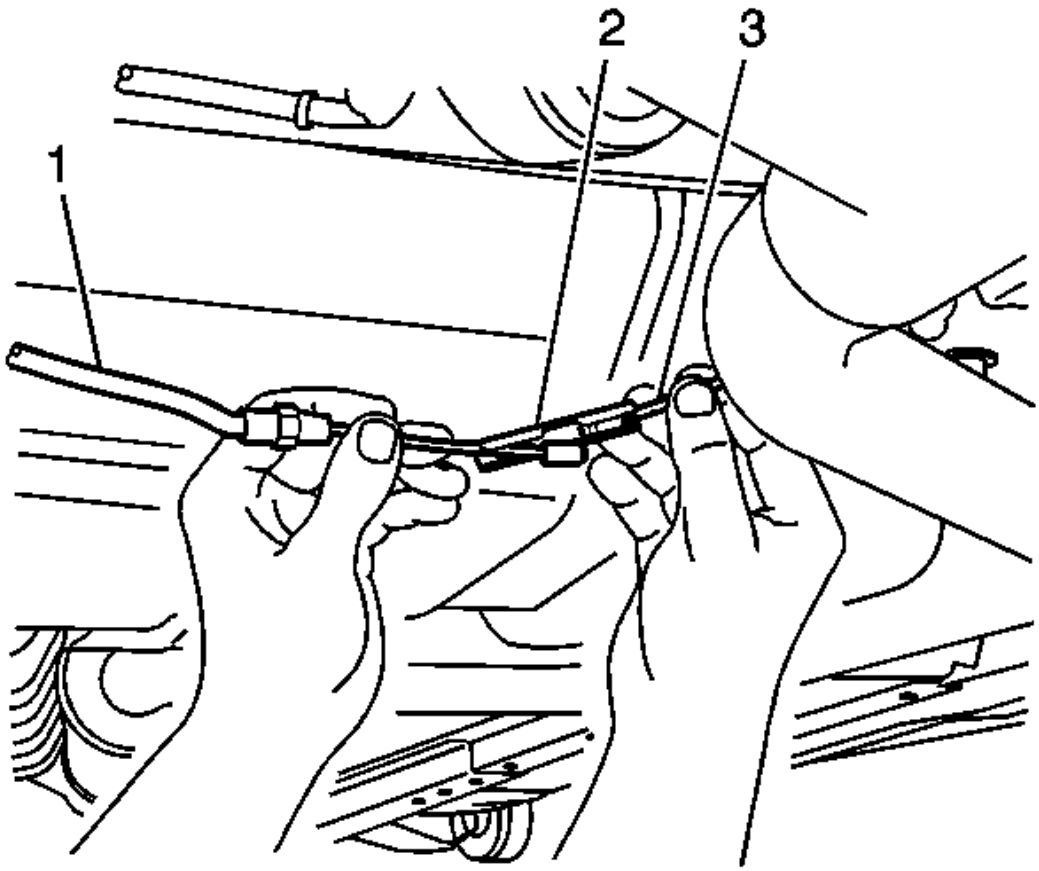

Fig. 24: View Of Front Brake Cable Connected To Right Rear Cable
Courtesy of GENERAL MOTORS COMPANY

- For the right rear cable, connect the cable (3) to the clip (2).
- For the left rear cable, install the equalizer stud to the equalizer nut, which is part of the equalizer assembly.

5. Adjust the park brake. Refer to **Parking Brake Adjustment**.
6. Lower the vehicle.

PARKING BRAKE CABLE EQUALIZER REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

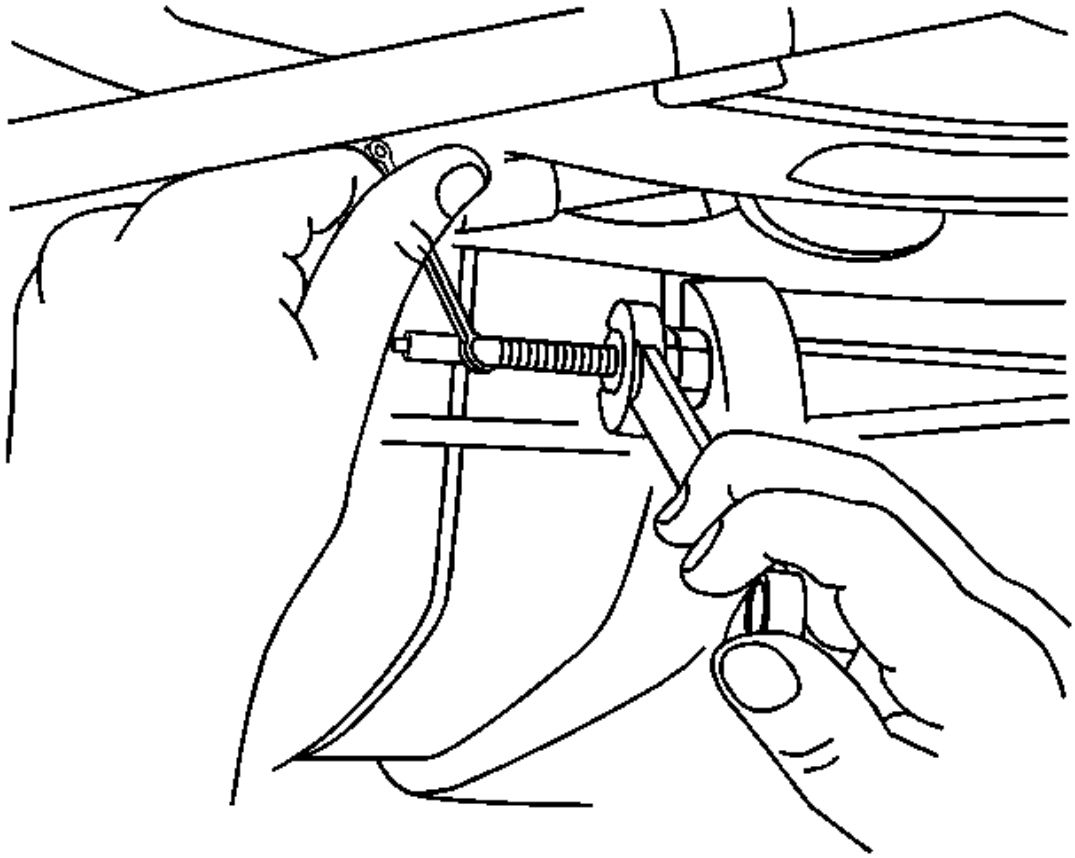

Fig. 25: Adjusting Park Brake Tension At Equalizer Assembly
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the left rear park brake cable and adjustment stud assembly from the equalizer assembly by removing the equalizer nut from the adjustment stud.

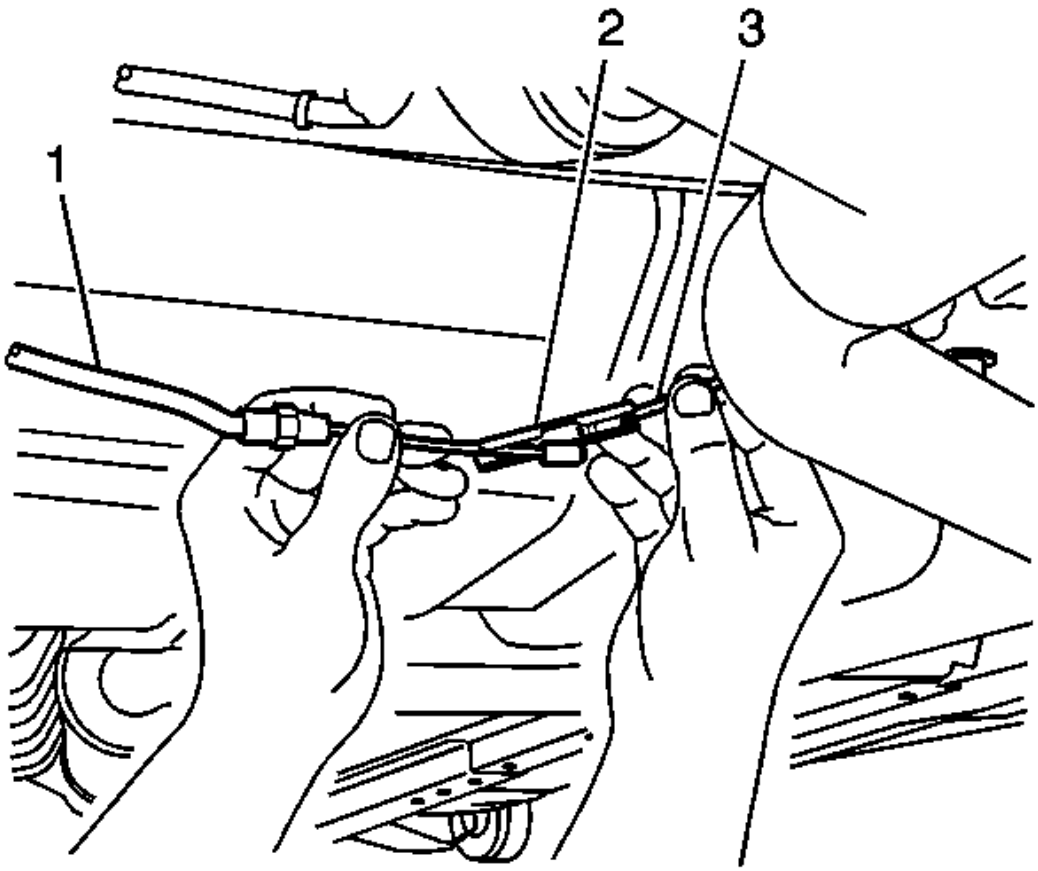

Fig. 26: View Of Front Brake Cable Connected To Right Rear Cable
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the front park brake cable (1) from the right rear cable (3) at the connector clip (2).

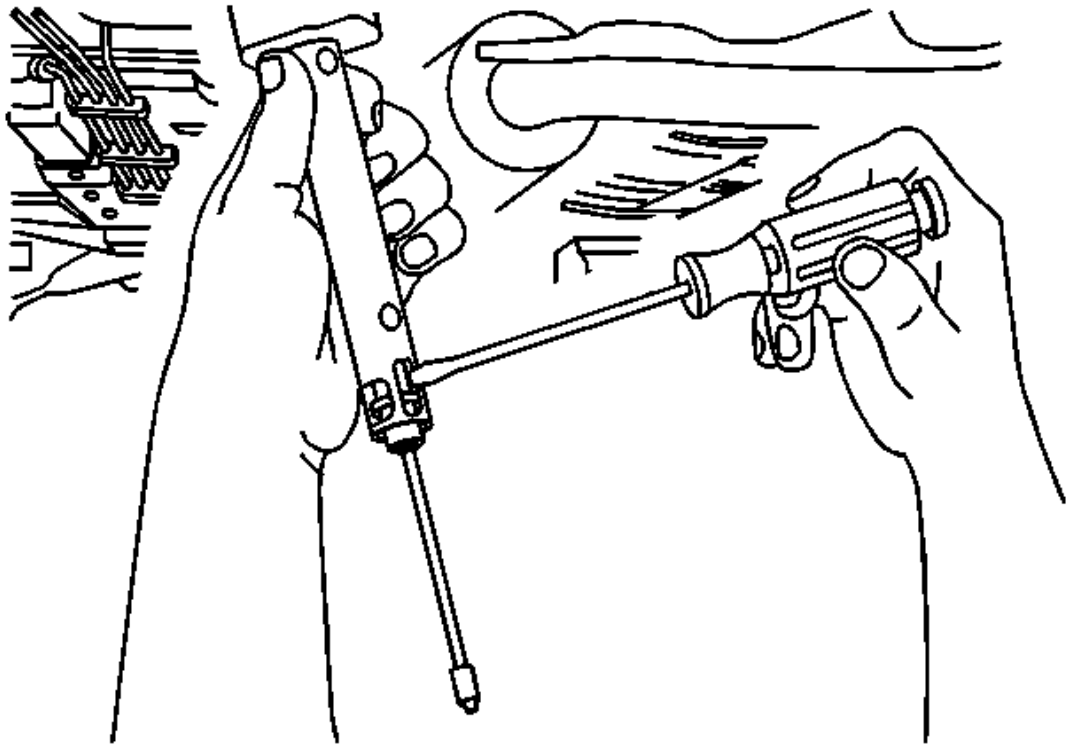

Fig. 27: Equalizer Assembly And Front Park Brake Cable
Courtesy of GENERAL MOTORS COMPANY

4. Remove the equalizer assembly from the front park brake cable. Insert a flat-bladed tool into the equalizer and lightly twist to reposition the equalizer retaining tab. This will release the assembly from the cable.

Installation Procedure

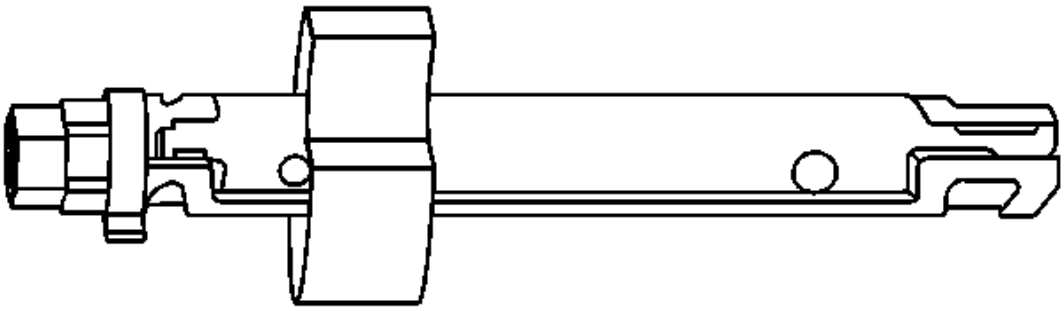

Fig. 28: View Of Equalizer Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the equalizer assembly to the front park brake cable.

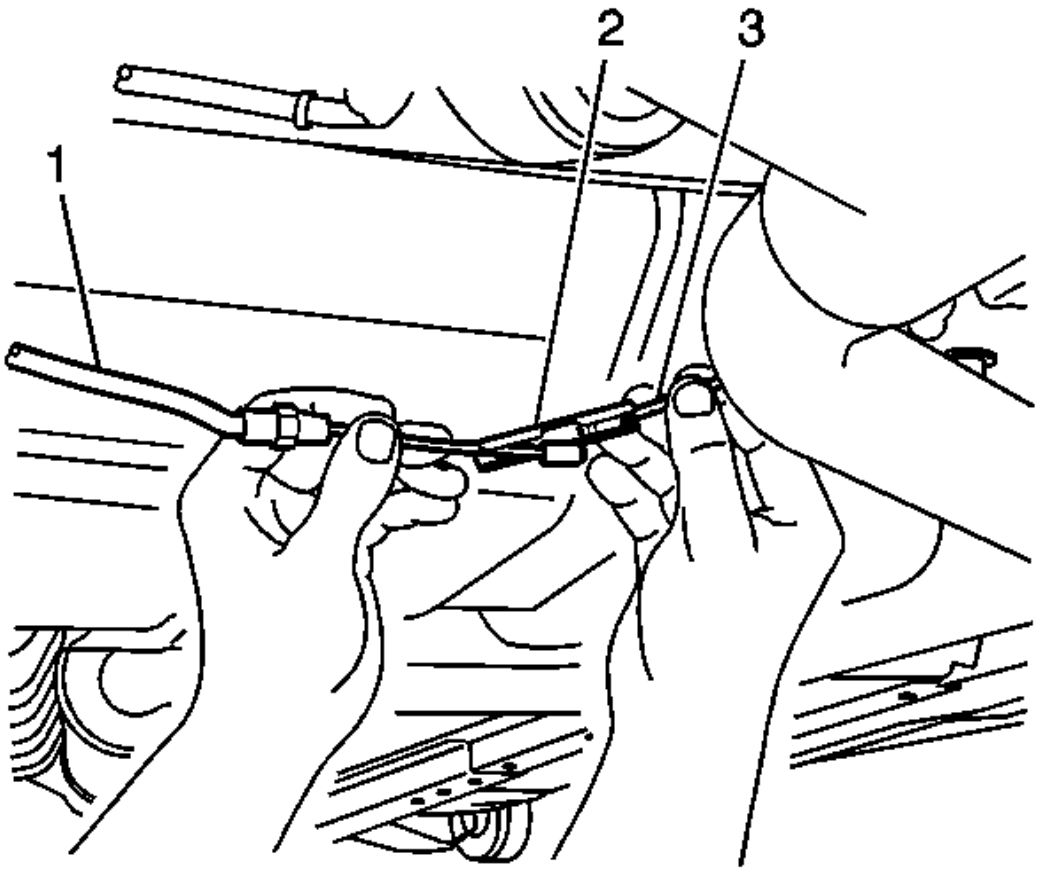

Fig. 29: View Of Front Brake Cable Connected To Right Rear Cable
Courtesy of GENERAL MOTORS COMPANY

2. Connect the front brake cable (1) to the right rear cable (3) at the connector clip (2).
3. Connect the left rear brake cable and adjustment stud assembly to the equalizer assembly by installing the adjustment stud to the equalizer nut.
4. Adjust the Park Brake System. Refer to **Parking Brake Adjustment**.
5. Lower the vehicle.

PARKING BRAKE ADJUSTMENT

WARNING: Refer to Brake Dust Warning .

Adjustment of manual adjustment park brake cable system is necessary whenever the rear brake cables have been disconnected. A need for park brake cable adjustment is indicated if the hydraulic brake system operates with good reserve, but a firm park brake pedal feel cannot be achieved with less than one full stroke of the park brake pedal.

1. Apply and release the park brake 4 times.

2. Park brake light should be illuminated after park brake has been depressed slightly.
3. Check park brake pedal assembly for full release by turning the ignition on and inspecting PARK BRAKE warning light. Light should be off. If PARK BRAKE warning light is on and park brake appears to be fully released, pull the pedal back by hand and continue with the adjustment procedure.
4. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
5. Check park brake levers on rear calipers. Levers should be against the stops on the caliper housing. If levers are not against stops, check for binding in rear brake cables and position levers against stops.
6. Tighten park brake cable at equalizer until either the left or right lever begins to move off stop.
7. Loosen adjustment at equalizer until the lever which has moved off the stop, as in step 5, is again resting fully against stops. Loosen tension at equalizer until the cables feel slightly loose to the touch. Cables should not sag under their own weight.
8. Operate park brake several times to check adjustment. A firm pedal feel should be obtained by depressing the pedal less than one full stroke.
9. Inspect left and right caliper levers. Both levers must be resting on stops after adjustment of parking brake.
10. Check the operation of the park brake. Refer to **Park Brake System Description and Operation**.
11. To achieve optimal performance ensure cables are not over-tensioned at the equalizer.

DESCRIPTION AND OPERATION

PARK BRAKE SYSTEM DESCRIPTION AND OPERATION

System Component Description

The park brake system consists of the following:

Park Brake Pedal Assembly

Receives and transfers park brake system apply input force from driver to park brake cable system. Releases applied park brake system when depressed again.

Park Brake Cables

Transfers input force received from park brake pedal, through park brake cable equalizer, to park brake apply lever.

Park Brake Cable Equalizer

Evenly distributes input force to both the left and right park brake units.
Threaded park brake cable equalizers are also used to remove slack in park brake cables.

Park Brake Apply Lever

Multiplies and transfers input force to park brake actuator.

Park Brake Actuator/Adjuster

Uses multiplied input force from apply lever to expand park brake shoe toward the friction surface of the

drum-in-hat portion of the rear brake rotor.
Threaded park brake actuators are also used to control clearance between the park brake shoe and the friction surface of the drum-in-hat portion of the rear brake rotor.

Park Brake Shoe

Applies mechanical output force from park brake actuator to friction surface of the drum-in-hat portion of the rear brake rotor.

System Operation

Park brake apply input force is received by the park brake pedal assembly being depressed, transferred and evenly distributed, through the park brake cables and the park brake cable equalizer, to the left and right park brake apply levers. The park brake apply levers multiply and transfer the apply input force to the park brake actuators which expand the park brake shoe toward the friction surface of the drum-in-hat portion of the rear brake rotor in order to prevent the rotation of the rear tire and wheel assemblies. The park brake pedal assembly releases an applied park brake system when it is depressed again.

DTC B393B	Air Conditioning Compressor Valve
DTC P0532 or P0533	Air Conditioning A/C Refrigerant Pressure Sensor
DTC P0645, P0646, or P0647	Air Conditioning (A/C) Compressor Clutch Relay

HYDRAULIC BRAKE SYSTEM - DIAGNOSTIC TROUBLE CODES

HYDRAULIC BRAKE SYSTEM - DIAGNOSTIC TROUBLE CODES

DTC	Description
DTC C0267	Low Brake Fluid
DTC C027B	Auxiliary Brake Booster Pump Malfunction
DTC C1100	Brake Booster Vacuum Sensor
DTC P258A-P258D	Vacuum Pump/Vacuum Pump Relay

IMMOBILIZER SYSTEM - DIAGNOSTIC TROUBLE CODES

IMMOBILIZER SYSTEM - DIAGNOSTIC TROUBLE CODES

DTC	Description
DTC B302A	Telematic Requested Immobilization
DTC B3031	Security System Controller In Learn Mode
DTC B3055	No Transponder Modulation or No Transponder
DTC B3060	Unprogrammed Transponder Identification Code
DTC B3935	Transponder Authentication
DTC B3976	Unconfigured Transponder/Vehicle Configuration
DTC P0513	Theft Deterrent Key
DTC P0633	Theft Deterrent Key Not Programmed
DTC P1629	Theft Deterrent Fuel Enable Signal
DTC P162B	Remote Vehicle Speed Limiting Signal Message Counter
DTC P1631	Theft Deterrent Fuel Enable Signal
DTC P1632	Theft Deterrent Fuel Disable Signal

INSTRUMENT PANEL SYSTEM DISPLAYS AND GAUGES - DIAGNOSTIC TROUBLE CODES

INSTRUMENT PANEL SYSTEM DISPLAYS AND GAUGES - DIAGNOSTIC TROUBLE CODES

DTC	Description

DTC	Description
DTC B3567	Driver Information Center Select Switch
DTC P0461	Fuel Level Sensor
DTC P0462	Fuel Level Sensor
DTC P0463	Fuel Level Sensor
DTC P0464	Fuel Level Sensor 1
DTC P0520	ECM Requesting EOP Indicator Turned ON

KEYLESS ENTRY SYSTEM AND REMOTE FUNCTIONS - DIAGNOSTIC TROUBLE CODES

KEYLESS ENTRY SYSTEM AND REMOTE FUNCTIONS - DIAGNOSTIC TROUBLE CODES

DTC	Description
DTC B2976	Driver Door Ajar
DTC B3125, B3130, or B3135	Front/Driver Door Only Unlock/All Door Lock/Unlock
DTC B3265	Trunk Release

LIGHTING SYSTEM - DIAGNOSTIC TROUBLE CODES

LIGHTING SYSTEM - DIAGNOSTIC TROUBLE CODES

DTC	Description
DTC B1395	Device Voltage Output 1
DTC B2530	Front Fog Lamp
DTC B2545	Backup Lamps
DTC B2575	Headlamp Control
DTC B257A	Headlamp Switch Input Signal Mismatch
DTC B2580	Headlamp High Beam Control
DTC B2585	Park Lamp Control
DTC B2600	Daytime Running Lam
DTC B261A	Passenger Compartment Dimming 4 Circuit
DTC B2610	Passenger Compartment Dimming 1
DTC B2615	Passenger Compartment Dimming 2
DTC B2625	Display Dimming Pulse Width Modulation (PWM)
DTC B2645	Ambient Light Sensor
DTC B2652	Passenger Compartment Dimming 3
DTC B3445 or B3884	Stop Lamp/Center High Mounted Stop Lamp (CHMSL)
DTC B3600	Passenger Compartment Dimming Request
DTC C0277 or C0890	Brake Pedal Position Sensor
DTC C0297	Brake Applied Output Circuit

POWER DOOR LOCK SYSTEM AND RELEASE SYSTEMS - DIAGNOSTIC

TROUBLE CODES

POWER DOOR LOCK SYSTEM AND RELEASE SYSTEMS - DIAGNOSTIC TROUBLE CODES

DTC	Description
DTC B1008	Calibration Data Not Programmed
DTC B3105	Keyless Entry System Key Fobs Not Programmed
DTC B3109, B3110, B3111, or B3112	Keyless Entry Transmitter Battery 1-4

SEAT HEATING SYSTEM AND SEAT COOLING SYSTEM - DIAGNOSTIC TROUBLE CODES

SEAT HEATING SYSTEM AND SEAT COOLING SYSTEM - DIAGNOSTIC TROUBLE CODES

DTC	Description
DTC B1395	Device Voltage Reference
DTC B1925 or B2170	Seat Heater Sensor
DTC B2345	Seat Heater Disable
DTC B2425 or B2430	Seat Heater Cushion Circuit
DTC B2508 or B2509	Seat Heater Relay

SECONDARY AND CONFIGURABLE CUSTOMER CONTROL SYSTEM - DIAGNOSTIC TROUBLE CODES

SECONDARY AND CONFIGURABLE CUSTOMER CONTROL SYSTEM - DIAGNOSTIC TROUBLE CODES

DTC	Description
DTC B1529	Device Voltage Reference
DTC B3622	Steering Wheel Controls

SHIFT LOCK CONTROL SYSTEM - DIAGNOSTIC TROUBLE CODES

SHIFT LOCK CONTROL SYSTEM - DIAGNOSTIC TROUBLE CODES

DTC	Description
DTC B2705	Gearshift Unlock Circuit

SUPPLEMENTAL INFLATABLE RESTRAINT SYSTEM - DIAGNOSTIC TROUBLE CODES

SUPPLEMENTAL INFLATABLE RESTRAINT SYSTEM - DIAGNOSTIC TROUBLE CODES

DTC	Description
DTC B0012 or B0013	Steering Wheel Air Bag Deployment Loop
DTC B0014, B0021, B0031, or B0038	Seat Side Air Bag Deployment Loop
DTC B0015, B001A, B001B, or B0022	Seat Belt Anchor Pretensioner Deployment
DTC B0016, B0018, B0023, or B0025	Roof Rail Air Bag Deployment Loop
DTC B0019 or B0020	Instrument Panel Air Bag Deployment Loop

DTC	Description
DTC B0052	Deployment Commanded
DTC B0055	Side Air Bag Deployment Commanded
DTC B0056-B0058	Air Bag/Pretensioner Suppressed
DTC B0074	Passenger Presence Sensor
DTC B0081	Passenger Presence Module
DTC B0083-B0088	Front/Front Side Impact Sensor
DTC B1001	SDM Option Configuration Error (SDM)
DTC B1001	Option Configuration Error (PPS)
DTC B1019	SDM System Configuration Error
DTC B101D, B101E, or B1089	Air Bag Deployment Loop Invalid
DTC B1370	Device Ignition 1 Circuit

TIRE PRESSURE MONITORING SYSTEM - DIAGNOSTIC TROUBLE CODES

TIRE PRESSURE MONITORING SYSTEM - DIAGNOSTIC TROUBLE CODES

DTC	Description
DTC C0569	System Configuration Error
DTC C0750, C0755, C0760, or C0765	Low Tire Pressure Sensor Signal
DTC C0775	Low Tire Pressure System Sensors Not Learned

WIPER SYSTEM AND WASHER SYSTEM - DIAGNOSTIC TROUBLE CODES

WIPER SYSTEM AND WASHER SYSTEM - DIAGNOSTIC TROUBLE CODES

DTC	Description
DTC B3715	Front Wiper Relay Control Circuit
DTC B3873	Front Washer Relay Control Circuit
DTC B3875	Wiper High Speed Control Relay
DTC B3922	Windshield Wiper Low Speed Signal Circuit

WIRING SYSTEMS AND POWER MANAGEMENT - DIAGNOSTIC TROUBLE CODES

WIRING SYSTEMS AND POWER MANAGEMENT - DIAGNOSTIC TROUBLE CODES

DTC	Description
DTC B0005	In Park Signal Circuit
DTC B1370-B1379, B1380-B1389, or B1440-B1443	Ignition Device
DTC B1428	Ignition Switched Power Relay 1
DTC B1475	Retained Accessory Power
DTC P2534 or P2535	Ignition On/Start Switch
DTC P2537	Ignition Accessory Switch

DOOR COMPONENT VIEWS

DRIVER DOOR COMPONENTS

FUSE BLOCK - UNDERHOOD LABEL

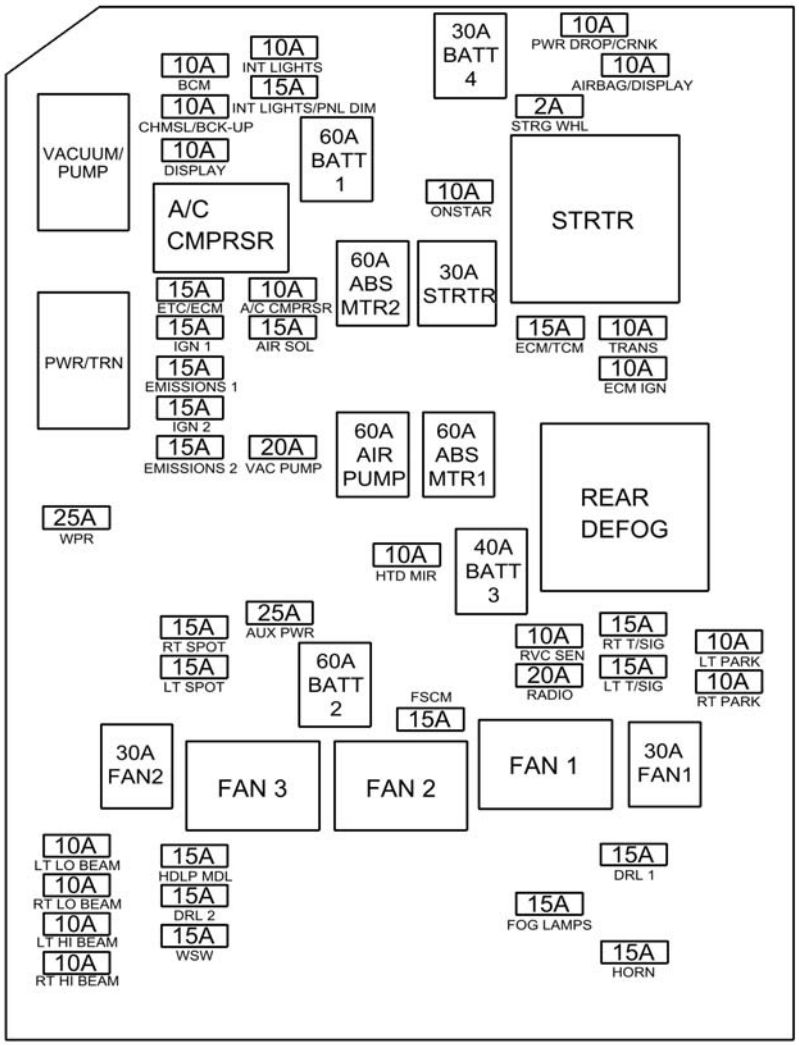

Fig. 1: Fuse Block -- Underhood Label
Courtesy of GENERAL MOTORS COMPANY

Fuse Block - Underhood Label Usage

Fuse And Relay Description	Rating	Circuits
A/C CMPRSR Fuse	10A	A/C Compressor Clutch
ABS MTR1 Fuse	60A	Electronic Brake Control Module (EBCM)
ABS MTR2 Fuse	60A	Electronic Brake Control Module (EBCM)

Fuse And Relay Description	Rating	Circuits
AIRBAG/DISPLAY Fuse	10A	Instrument Panel Cluster (IPC), HVAC Control Module, Inflatable Restraint Passenger Air Bag On/Off Indicator, and Inflatable Restraint Sensing and Diagnostic Module (SDM)
AUX PWR Fuse	25A	Accessory Power Outlet - I/P 1 and Accessory Power Outlet - I/P 2
BATT 1 Fuse	60A	CNSTR, XM, AMP, AUX Fuses, and Trunk Relay
BATT 2 Fuse	60A	HTD/SEAT, AIRBAG, PWR/MIR, S/ROOF, DR/LCK Fuses, PWR/SEAT Circuit Breaker, and RAP Relay
BATT 3 Fuse	40A	Rear Window Defogger Grid
BATT 4 Fuse	30A	Blower Motor Control Module
BCM Fuse	10A	Body Control Module (BCM), Ignition Switch, and Theft Deterrent Module (TDM)
CHMSL/BCK-UP Fuse	10A	Body Control Module (BCM)
DISPLAY Fuse	10A	Data Link Connector (DLC), Remote Control Door Lock Receiver (RCDLR), Instrument Panel Cluster (IPC), and HVAC Control Module
DRL 1 Fuse	15A	DRL 2 Fuse
DRL 2 Fuse	15A	LT LO BEAM Fuse, RT LO BEAM Fuse
ECM IGN Fuse	10A	Engine Control Module (ECM)
ECM/TCM Fuse	15A	Engine Control Module (ECM) and Transmission Control Module (TCM)
EMISSIONS 1 Fuse	15A	Heated Oxygen Sensor (HO2S) 1, Heated Oxygen Sensor (HO2S) 2, and Evaporative Emission (EVAP) Canister Purge Solenoid Valve
EMISSIONS 2 Fuse	15	Mass Air Flow (MAF)/Intake Air Temperature (IAT) Sensor, Valve Lifter Oil Manifold (VLOM) Assembly (LZG), Secondary Air Injection (AIR) Pump Relay (NU3), Secondary Air Injection (AIR) Solenoid Relay (NU3), A/C CMPRSR Relay, FAN 1 Relay, FAN 2 Relay, and FAN 3 Relay
ETC/ECM Fuse	15A	Engine Control Module (ECM)
FAN1 Fuse	30A	FAN 1 Relay
FAN2 Fuse	30A	FAN 3 Relay
FOG LAMPS Fuse	15A	Fog Lamp - Left Front and Fog Lamp - Right Front
FSCM Fuse	15A	Fuel Pump Flow Control Module
HDLP MDL Fuse	15A	C122 or Emergency Vehicle Headlamp Flasher (6J7)
HORN Fuse	15A	Horn Assembly
HTD MIR Fuse	10A	Outside Rearview Mirror - Driver and Outside Rearview Mirror - Passenger
INJ 1 Fuse	20A	Fuel Injectors 1-6
INJ 2 Fuse	20A	Ignition Control Module
INT LIGHTS Fuse	10A	Body Control Module (BCM)
INT LTS/PNL DIM Fuse	15A	Body Control Module (BCM)

Fuse And Relay Description	Rating	Circuits
LT HI BEAM FUSE	10A	Headlamp - High Beam - Left or Emergency Vehicle Headlamp Flasher (6J7)
LT LO BEAM Fuse	10A	Headlamp - Low Beam - Left
LT PARK Fuse	10A	Marker lamp - LF, Park/Turn Signal Lamp - Left Front, Tail Lamp - Left, and Tail/Stop and Turn Signal - Left
LT SPOT Fuse (9C1, 9C3)	15A	Spot Lamp - Left (7x6, 7X7)
LT T/SIG Fuse	15A	Body Control Module (BCM)
PWR DROP/CRNK Fuse	10A	Blunt Cut Wire (9C1, 9C3)
RADIO Fuse	20A	Radio
RT HI BEAM Fuse	10A	Headlamp - High Beam - Right or Emergency Vehicle Headlamp Flasher (6J7)
RT LO BEAM Fuse	10A	Headlamp - Low Beam - Right
RT PARK Fuse	10A	Marker Lamp - RF, Park/Turn Signal Lamp - RF, Tail Lamp - Right, and Tail/Stop and Turn Signal - Right
RT SPOT Fuse (9C1, 9C3)	15A	Spot Lamp - Right (7X7)
RT T/SIG Fuse	15A	Body Control Module (BCM)
RVC SEN Fuse	10A	Body Control Module (BCM)
Spare Fuse	2A	Not Used
Spare Fuse	10A	Not Used
Spare Fuse	15A	Not Used
Spare Fuse	20A	Not Used
Spare Fuse	25A	Not Used
STRG WHL Fuse	2A	Steering Wheel Controls - Left and Steering Wheel Controls - Right
STRTR Fuse	40A	Starter
TRANS Fuse	10A	1-2 Shift Solenoid (1-2 SS) Valve, 2-3 Shift Solenoid (2-3 SS) Valve, Torque Converter Clutch (TCC) Solenoid Valve, and Transmission Control Module (TCM)
VAC PUMP Fuse	20A	Brake Booster Pump - Auxiliary
WPR Fuse	25A	WIPER PCB Relay
WSW Fuse	15A	Windshield Washer Fluid Pump
A/C CMPRSR Relay	-	A/C CMPRSR Fuse
FAN 1 Relay	-	Engine Cooling Fan - Left
FAN 2 Relay	-	Engine Cooling Fan - Right
FAN 3 Relay	-	Engine Cooling Fan - Right
PWR/TRN Relay	-	ETC/ECM, INJ 1, INJ 2, EMISSIONS 1, and EMISSIONS 2 Fuses
REAR DEFOG Relay	-	BATT 3 and HTD MIR Fuses
STRTR Relay	-	STRTR Fuse
Vacuum Pump Relay	-	VAC Pump Fuse
Relays listed below are non-serviceable Printed Circuit Board (PCB) relays and are internal to the block.		
DRL PCB Relay	-	DRL 1 Fuse

Fuse And Relay Description	Rating	Circuits
FOG LP PCB Relay	-	FOG LAMPS Fuse
HIGH BEAM PCB Relay	-	LT HI BEAM and RT HI BEAM Fuses
HORN PCB Relay	-	HORN Fuse
IGN MAIN PCB Relay	-	AIRBAG/DISPLAY, ECM IGN, PWR DROP/CRNK, and TRANS Fuses
LOW BEAM PCB Relay	-	DRL 2, LT LO BEAM, and RT LO BEAM Fuses
PARK LP PCB Relay	-	LT PARK and RT PARK Fuses
WIPER PCB Relay	-	WIPER HIGH PCB Relay
WIPER HIGH PCB Relay	-	Windshield Wiper Motor
WS WASH PCB Relay	-	WSW Fuse

Connector Part Information

- Harness Type: Engine
- OEM Connector: 15477822
- Service Connector: 19115189
- Description: 56-Way F GT 150 280 Metri-Pack 800 Series (BK)

Terminal Part Information

- Pins: A1, A5, A6, A8, C1, C2, C7, H1, H7
- Terminated Lead: 13575735
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 12191812/19
- Core/Insulation Crimp: E/C

- Pins: B1, D1, D2, J1, J3
- Terminated Lead: 13575753
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 15304711/8
- Core/Insulation Crimp: E/A

- Pins: B2, B4
- Terminated Lead: 13575753
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 15304711/8
- Core/Insulation Crimp: 2/A

- Pins: B3, B5, G2
- Terminated Lead: 13575753
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 15304711/8
- Core/Insulation Crimp: E/A

- Pins: E1, E2, F1, F2
- Terminated Lead: 13575718
- Release Tool: J-38125-558
- Diagnostic Test Probe: J-35616-44 (YE)
- Terminal/Tray: 12110127/19
- Core/Insulation Crimp: F/G

- Pin: J2
- Terminated Lead: 13575753
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 15304711/8
- Core/Insulation Crimp: E/A

Fuse Block - I/P - Label Usage

Fuse And Relay Description	Rating	Circuits
AIRBAG Fuse	10A	Inflatable Restraint Sensing and Diagnostic Module (SDM), Inflatable Restraint Front Passenger Presence System (PPS) Module
AMP Fuse	25A	Audio Amplifier
AUX Fuse	20A	Accessory Power Outlet - Center Seat, Accessory Power Outlet - Center Console 1, Accessory Power Outlet - Center Console 2, Accessory Power Outlet - Center Console Compartment
CNSTR Fuse	10A	Evaporative Emission (EVAP) Canister Vent Solenoid
DR/LCK Fuse	25A	DOOR UNLOCK PCB Relay - Driver, DOOR UNLOCK PCB Relay, and DOOR LOCK PCB Relay

Fuse And Relay Description	Rating	Circuits
HTD/SEAT Fuse	20A	Heated Seat Control Module (KA1), Emergency Vehicle Rear Compartment Lid Lamps Relay (T53)
PWR/MIR Fuse	2A	Outside Rearview Mirror Switch
RAP Fuse	10A	Automatic Transmission Shift Lock Control Solenoid (with Floor Shifter), Inside Rearview Mirror (DD6), Sunroof Motor (CF5)
S/ROOF Fuse	20A	Sunroof Motor (CF5)
TRUNK Fuse	10A	Rear Compartment Lid Release Actuator
PWR/SEAT Circuit Breaker	25A	Seat Adjuster Switch - Driver, Seat Adjuster Switch - Passenger
PWR/WNDW Circuit Breaker	25A	Window Switch - Driver, and Window Switch - Passenger
Trunk Relay	-	Trunk Fuse
XM Fuse	10A	Digital Radio Receiver (U2K)
Relays listed below are non-serviceable Printed Circuit Board (PCB) relays and are internal to the block.		
DOOR LOCK PCB Relay	-	Door Locks
DOOR UNLOCK PCB Relay	-	Door Lock - Passenger, Door Lock - Left Rear, Door Lock - Right Rear
DOOR UNLOCK PCB Relay - Driver	-	Door Lock - Driver
RAP Relay	-	RAP Fuse

Air Temperature Actuator - Left	In the passenger compartment, to the right of the accelerator pedal, behind the center of the instrument panel, on the HVAC case	Interior HVAC Components	Air Temperature Actuator - Left
Air Temperature Actuator - Right	In the passenger compartment, behind the center of the instrument panel, to the left of the instrument panel compartment, on the HVAC case	Interior HVAC Components	Air Temperature Actuator - Right
Ambient Air Temperature Sensor	In the engine compartment, in front of the radiator, just right of the center of the vehicle	Under the Hood Latch Trim Panel Components	Ambient Air Temperature Sensor
Ambient Light Sensor	In the passenger compartment, top center of the instrument panel	Instrument Panel Components	Ambient Light Sensor
Audio Amplifier (UQ3)	In the center of the rear compartment, mounted below the rear shelf panel	Radio and Speaker Components	• Audio Amplifier X1 (UQ3) • Audio Amplifier X2 (UQ3) • Audio Amplifier X3 (UQ3)
Automatic Transmission	In the engine compartment, left middle lower	Automatic Transmission Electronic Components	-
Automatic Transmission Fluid Temperature (TFT) Sensor	At the left front of the engine compartment, in the automatic	Automatic Transmission Electronic	-

Name	Location	Locator View	Connector End View
	transmission, part of the control solenoid valve assembly	Components	
Automatic Transmission Input Shaft Speed (ISS) Sensor	In the engine compartment, left middle lower, in the automatic transmission	Automatic Transmission Electronic Components	Automatic Transmission Input Shaft Speed (ISS) Sensor
Automatic Transmission Internal Mode Switch (IMS)	In the engine compartment, left middle lower, in the automatic transmission, part of the control solenoid valve assembly	Automatic Transmission Electronic Components	-
Automatic Transmission Shift Lock Control Solenoid (D55)	In the passenger compartment, under the center console, attached to the shifter lever	Center Console Components (D55)	Automatic Transmission Shift Lock Control Solenoid (D55)
Automatic Transmission Shift Lock Control Solenoid (without D55)	In the passenger compartment, attached to the right side of the steering column	Steering Column Components (without D55)	Automatic Transmission Shift Lock Control Solenoid (without D55)
Backup Lamp - Left	At the rear of the vehicle, in the bottom of the left rear tail lamp assembly	Rear of the Vehicle Components	Backup Lamp - Left
Backup Lamp - Right	At the rear of the vehicle, in the bottom of the right rear tail lamp assembly	Rear of the Vehicle Components	Backup Lamp - Right
Battery	At the right front of the engine compartment	Right Front of the Engine Compartment Components (2 of 2)	Battery Current Sensor
Battery Current Sensor	At the right front side of the engine compartment, on the positive battery cable	Right Front of the Engine Compartment Components (2 of 2)	Battery Current Sensor
Blower Motor	In the passenger compartment, behind the right side of the instrument panel, lower right side of the HVAC assembly, above foot area of the passenger floor	Interior HVAC Components	Blower Motor
Blower Motor Control Module	In the passenger compartment, behind the right side of the	Interior HVAC Components	Blower Motor Control Module

Name	Location	Locator View	Connector End View
	instrument panel, lower right side of the HVAC assembly, next to the blower motor		
Body Control Module (BCM)	In the passenger compartment, below the left side of the instrument panel, left of the steering column	Near the Steering Column Components	• Body Control Module (BCM) X1 • Body Control Module (BCM) X2 • Body Control Module (BCM) X3 • Body Control Module (BCM) X4 • Body Control Module (BCM) X5 • Body Control Module (BCM) X6 • Body Control Module (BCM) X7
Brake Fluid Level Switch	In the engine compartment, mounted under the center of the brake fluid reservoir	Left Rear of the Engine Compartment Components	Brake Fluid Level Switch
Brake Pedal Position (BPP) Sensor	In the passenger compartment, below the left side of the instrument panel, in the right side of the brake pedal bracket	Below the Instrument Panel Components- Pedal Assemblies	Brake Pedal Position (BPP) Sensor
Camshaft Position (CMP) Actuator Solenoid Valve - Bank 1 Exhaust	In the engine compartment, rear of the engine, at the right side	Right Rear of Engine Components	Camshaft Position (CMP) Actuator Solenoid Valve - Bank 1 Exhaust
Camshaft Position (CMP) Actuator Solenoid Valve - Bank 1 Intake	In the engine compartment, rear of the engine, at the right side	Right Rear of Engine Components	Camshaft Position (CMP) Actuator Solenoid Valve - Bank 1 Intake
Camshaft Position (CMP) Actuator Solenoid Valve - Bank 2 Exhaust	In the engine compartment, right side of the engine, near the front	Right Rear of Engine Components	Camshaft Position (CMP) Actuator Solenoid Valve - Bank 2 Exhaust
Camshaft Position (CMP) Actuator Solenoid Valve - Bank 2 Intake	In the engine compartment, right side of the engine, near the front	Right Rear of Engine Components	Camshaft Position (CMP) Actuator Solenoid Valve - Bank 2 Intake

Name	Location	Locator View	Connector End View
Camshaft Position (CMP) Sensor - Bank 1 Exhaust	In the engine compartment, right side of the engine, near the rear	Right Rear of Engine Components	Camshaft Position (CMP) Sensor - Bank 1 Exhaust
Camshaft Position (CMP) Sensor - Bank 1 Intake	In the engine compartment, right side of the engine, near the rear	Right Rear of Engine Components	Camshaft Position (CMP) Sensor - Bank 1 Intake
Camshaft Position (CMP) Sensor - Bank 2 Exhaust	In the engine compartment, right side of the engine, near the front	Right Rear of Engine Components	Camshaft Position (CMP) Sensor - Bank 2 Exhaust
Camshaft Position (CMP) Sensor - Bank 2 Intake	In the engine compartment, right side of the engine, near the front	Right Rear of Engine Components	Camshaft Position (CMP) Sensor - Bank 2 Intake
Cellular and Digital Radio Antenna (UE1 and/or U2K)	On the vehicle exterior, top rear center of the roof	Headliner Components- Top View	-
Cellular Telephone Microphone (UE1)	In the passenger compartment, on the headliner, near the left sunshade	-	Cellular Telephone Microphone (UE1)
Center High Mounted Stop Lamp (CHMSL)	In the rear compartment, on the upper center of the deck lid	Rear of the Vehicle Components	Center High Mounted Stop Lamp (CHMSL)
Control Solenoid Valve Assembly	In the left front of the engine compartment, in the automatic transmission	Automatic Transmission Electronic Components	• Control Solenoid Valve Assembly X1 • Control Solenoid Valve Assembly X2 • Control Solenoid Valve Assembly X3 • Control Solenoid Valve Assembly X4
Crankshaft Position (CKP) Sensor	In the engine compartment, rear of the engine, left side of the engine block	Right Rear of Engine Components	Crankshaft Position (CKP) Sensor
Data Link Connector (DLC)	In the passenger compartment, on the bottom of the instrument panel, left of the steering column	Below the Instrument Panel Components- Left Front Footwell	Data Link Connector (DLC)

Name	Location	Locator View	Connector End View
Data Link Resistor (without UE1)	In the right side luggage compartment, taped to the body harness, approximately 26 cm (10.25 in) from the fuel pump flow control module	-	-
Data Link Resistor (UE1)	In the left side luggage compartment, taped to the body harness, between the vehicle communication interface module and the vehicle communication interface module battery	-	-
Digital Radio Receiver (U2K)	In the luggage compartment, left side, above the Vehicle Communication Interface Module (VCIM)	**Radio and Speaker Components**	**Digital Radio Receiver (U2K)**
Dome/Reading Lamps	In the passenger compartment, inside center of the roof	**Headliner Components**	**Dome/Reading Lamps**
Door Lock - Driver	In the passenger compartment, in the rear of the driver door	**Driver Door Components**	• **Door Lock - Driver (UA6)** • **Door Lock - Driver (without UA6)**
Door Lock - Left Rear	In the passenger compartment, in the rear of the left rear door	**Left Rear Door Components**	**Door Lock - Left Rear**
Door Lock - Passenger	In the passenger compartment, in the rear of the passenger door	**Passenger Door Components**	**Door Lock - Passenger**
Door Lock - Right Rear	In the passenger compartment, in the rear of the right rear door	**Right Rear Door Components**	**Door Lock - Right Rear**
Door Lock Switch - Driver	In the passenger compartment, in the center of the driver door panel, near the door handle	**Driver Door Components**	**Door Lock Switch - Driver**
Door Lock Switch - Passenger	In the passenger compartment, in the center of the front	**Passenger Door Components**	**Door Lock Switch - Passenger**

Name	Location	Locator View	Connector End View
	passenger door panel, near the door handle		
Driver Information Center (DIC) Switch	In the passenger compartment, on the instrument panel, to the right of the instrument panel cluster	Instrument Panel Components	Driver Information Center (DIC) Switch
Electronic Brake Control Module (EBCM)	At the left side of the engine compartment, part of the brake pressure modulator valve, mounted to the back side of the strut tower	Left Front of the Engine Compartment Components	Electronic Brake Control Module (EBCM)
Emergency Vehicle Front Lamp Flasher (6J3)	Under the vehicle, in the right front footwell, mounted to the closeout panel	-	Emergency Vehicle Front Lamp Flasher (6J3)
Emergency Vehicle Headlamp Flasher (6J7)	At the front of the vehicle, at the left side of the right headlamp assembly	Right Headlamp Assembly Components (9C1 or 9C3)	-
Emergency Vehicle Rear Compartment Lid Lamp - Left (T53)	In the rear compartment, on the inside of the rear compartment lid	Rear Compartment Lid Components (9C1 or 9C3)	-
Emergency Vehicle Rear Compartment Lid Lamp - Right (T53)	In the rear compartment, on the inside of the rear compartment lid	Rear Compartment Lid Components (9C1 or 9C3)	-
Emergency Vehicle Rear Compartment Lid Lamp Relay (T53)	In the luggage compartment, at the upper right hand corner of the trunk opening	Luggage Compartment Components (T53)	-
Emergency Vehicle Rear Window Panel Lamp - Left (6J6)	In the rear compartment, on the left side of the package shelf	Package Shelf Components (9C1 or 9C3)	Emergency Vehicle Rear Window Panel Lamp - Left (6J6)
Emergency Vehicle Rear Window Panel Lamp - Right (6J6)	In the rear compartment, on the right side of the package shelf	Package Shelf Components (9C1 or 9C3)	Emergency Vehicle Rear Window Panel Lamp - Right (6J6)
Engine Control Module (ECM)	At the left side of the engine compartment, inside the air cleaner assembly	Left Front of the Engine Compartment Components	• Engine Control Module (ECM) X1 (LFX) • Engine Control Module (ECM) X2 (LFX) • Engine Control Module (ECM) X3 (LFX)

Name	Location	Locator View	Connector End View
Engine Coolant Temperature (ECT) Sensor	In the engine compartment, on the right front side of the cylinder head between exhaust ports 4 and 6	Left Front of Engine Components	Engine Coolant Temperature (ECT) Sensor
Engine Cooling Fan - Left	At the front of the engine compartment, mounted to the left side of the radiator	Engine Compartment Cooling Components	Engine Cooling Fan - Left
Engine Cooling Fan - Right	At the front of the engine compartment, mounted to the right side of the radiator	Engine Compartment Cooling Components	Engine Cooling Fan - Right
Engine Cooling Fan Diode - Left	In the engine compartment, near the Fuse Block - Underhood	-	-
Engine Cooling Fan Diode - Right	In the engine compartment, near the Fuse Block - Underhood	-	-
Engine Oil Pressure (EOP) Sensor	In the engine compartment, right front lower area of the engine, below the generator, above the A/C compressor	Left Front of Engine Components	Engine Oil Pressure (EOP) Switch
Evaporative Emission (EVAP) Canister Purge Solenoid Valve	In the engine compartment, right rear edge of the intake manifold	Right Rear of Engine Components	Evaporative Emission (EVAP) Canister Purge Solenoid Valve
Evaporative Emission (EVAP) Canister Vent Solenoid Valve	Under the vehicle, behind the left rear wheelhouse	Fuel Tank Components	Evaporative Emission (EVAP) Canister Vent Solenoid Valve
Evaporator Temperature Sensor	In the passenger compartment, front left of center, on left side of HVAC assembly	-	Evaporator Temperature Sensor
Fog Lamp - Left Front (T96)	At the front of the vehicle, on left front lower bumper fascia	Front of the Vehicle Components	Fog Lamp - Left Front (T96)
Fog Lamp - Right Front (T96)	At the front of the vehicle, on right front lower bumper fascia	Front of the Vehicle Components	Fog Lamp - Right Front (T96)
Fuel Injector 1	In the engine compartment, top of the engine, at number 1	Top Engine Components	Fuel Injector 1

Name	Location	Locator View	Connector End View
	cylinder intake port, below intake manifold		
Fuel Injector 2	In the engine compartment, top of the engine, at number 2 cylinder intake port, below intake manifold	**Top Engine Components**	**Fuel Injector 2**
Fuel Injector 3	In the engine compartment, top of the engine, at number 3 cylinder intake port, below intake manifold	**Top Engine Components**	**Fuel Injector 3**
Fuel Injector 4	In the engine compartment, top of the engine, at number 4 cylinder intake port, below intake manifold	**Top Engine Components**	**Fuel Injector 4**
Fuel Injector 5	In the engine compartment, top of the engine, at number 5 cylinder intake port, below intake manifold	**Top Engine Components**	**Fuel Injector 5**
Fuel Injector 6	In the engine compartment, top of the engine, at number 6 cylinder intake port, below intake manifold	**Top Engine Components**	**Fuel Injector 6**
Fuel Level Sensor	Under the vehicle, in the fuel tank, part of the Fuel Pump and Sender Assembly	**Fuel Tank Components**	-
Fuel Pressure Sensor	Under the vehicle, on the left hand side, rear of the engine compartment	-	**Fuel Pressure Sensor**
Fuel Pump and Sender Assembly	Under the vehicle, in the fuel tank	**Fuel Tank Components**	**Fuel Pump and Sender Assembly**
Fuel Pump Flow Control Module (Chassis Control Module)	In the luggage compartment, mounted to the rear of the right rear wheelhouse	**Right Side of the Luggage Compartment Components**	**Fuel Pump Flow Control Module**
Fuel Rail Pressure (FRP) Sensor	In the engine compartment, top of the engine, at the fuel rail near fuel injector 1	**Top Engine Components**	**Fuel Rail Pressure (FRP) Sensor**

Name	Location	Locator View	Connector End View
Fuel Tank Pressure (FTP) Sensor	Under the vehicle, at the top of the fuel tank, part of the fuel pump and sender assembly	**Fuel Tank Components**	**Fuel Tank Pressure (FTP) Sensor**
Fuse Block - Auxiliary (9C1 or 9C3)	In the passenger compartment, behind the instrument panel, right of the steering column, above the accelerator pedal	**Instrument Panel Harness Routing- Rear of the Instrument Panel Carrier**	-
Fuse Block - I/P	In the passenger compartment, behind the right front kick panel	**Right Front of the Passenger Compartment Components**	**Electrical Center Identification Views**
Fuse Block - Underhood	At the right side of the engine compartment, mounted to the strut tower	**Right Front of the Engine Compartment Components (1 of 2)**	**Electrical Center Identification Views**
Fusible Link (9C1 or 9C3)	In the passenger compartment, at the fuse block - underhood battery stud	**Instrument Panel Harness Routing- Engine Compartment**	-
Fusible Link (without 6J1)	In the engine compartment, near the starter, between starter and generator	-	-
Garage Door Opener (GDO) (UG1)	In the passenger compartment, front center of the headliner, above the inside rearview mirror, in the headliner console	**Headliner Components**	**Garage Door Opener (UG1)**
Generator	In the engine compartment, top right rear of the engine	**Right Front of the Engine Compartment Components (1 of 2)**	**Generator X1**
Headlamp - Left High Beam	In the left headlamp assembly	**Front of the Vehicle Components**	**Headlamp - Left High Beam**
Headlamp - Left Low Beam	At the front of the vehicle, in the left headlamp assembly	**Front of the Vehicle Components**	**Headlamp - Left Low Beam**
Headlamp - Right High Beam	At the front of the vehicle, in the right headlamp assembly	**Front of the Vehicle Components**	**Headlamp - Right High Beam**

Name	Location	Locator View	Connector End View
Headlamp - Right Low Beam	At the front of the vehicle, in the right headlamp assembly	Front of the Vehicle Components	Headlamp - Right Low Beam
Headlamp Switch	In the passenger compartment, left side of the instrument panel, left of the steering column	Instrument Panel Components	Headlamp Switch
Heated Oxygen Sensor (HO2S) - Bank 1 Sensor 1	In the rear of the engine compartment, in the exhaust pipe near the cylinder head	Oxygen Sensors	Heated Oxygen Sensor (HO2S) - Bank 1 Sensor 1
Heated Oxygen Sensor (HO2S) - Bank 1 Sensor 2	In the rear of the engine compartment, after the catalytic converter	Oxygen Sensors	Heated Oxygen Sensor (HO2S) - Bank 1 Sensor 2
Heated Oxygen Sensor (HO2S) - Bank 2 Sensor 1	In the front of the engine compartment, in the exhaust pipe near the cylinder head	Oxygen Sensors	Heated Oxygen Sensor (HO2S) - Bank 2 Sensor 1
Heated Oxygen Sensor (HO2S) - Bank 2 Sensor 2	In the lower front of the engine compartment, after the catalytic converter	Oxygen Sensors	Heated Oxygen Sensor (HO2S) - Bank 2 Sensor 2
Heated Seat Control Module (KA1)	In the passenger compartment, under the driver seat	Driver Seat Components	• Heated Seat Control Module (KA1) X1 • Heated Seat Control Module (KA1) X2 • Heated Seat Control Module (KA1) X3 • Heated Seat Control Module (KA1) X4
Heated Seat Element - Driver Back (KA1)	In the passenger compartment, under the upholstery of the driver seat back	Driver Seat Components	Heated Seat Element - Driver Back (KA1)
Heated Seat Element - Driver Cushion (KA1)	In the passenger compartment, under the upholstery of the driver seat cushion	Driver Seat Components	Heated Seat Element - Driver Cushion (KA1)
Heated Seat Element - Passenger Back (KA1)	In the passenger compartment, under the upholstery of the passenger seat back	Passenger Seat Components	Heated Seat Element - Passenger Back (KA1)

Name	Location	Locator View	Connector End View
Heated Seat Element - Passenger Cushion (KA1)	In the passenger compartment, under the upholstery of the passenger seat cushion	Passenger Seat Components	Heated Seat Element - Passenger Cushion (KA1)
High Pressure Fuel Pump (LFX)	In the engine compartment, near center middle, at the left rear of the bank 2 cylinder head	Left Front of Engine Components	G18 High Pressure Fuel Pump (LFX)
Hood Ajar Switch (AP3)	In the luggage compartment, part of the hood latch	Under the Hood Latch Trim Panel Components	Hood Ajar Switch (AP3)
Horn Assembly	At the front of the vehicle, behind the front fascia, mounted to the frame rail extension, below the right headlamp	Right Front of the Engine Compartment Components (1 of 2)	Horn Assembly
Horn Switch	In the passenger compartment, in the steering wheel, behind the inflatable restraint steering wheel module	Steering Wheel Components	Horn Switch
HVAC Control Module	In the passenger compartment, center of the instrument panel	Instrument Panel Components	• HVAC Control Module X1 • HVAC Control Module X2
I/P Courtesy Lamp - Left	In the passenger compartment, below the instrument panel, above the left footwell	Below the Instrument Panel Components- Left Front Footwell	I/P Courtesy Lamp - Left
I/P Courtesy Lamp - Right	In the passenger compartment, below the instrument panel, above the right footwell	Below the Instrument Panel Components- Right Front Footwell	I/P Courtesy Lamp - Right
Ignition Coil 1	In the engine compartment, on top of the engine, at cylinder 1	Right Rear of Engine Components	Ignition Coil 1
Ignition Coil 2	In the engine compartment, on top of the engine, at cylinder 2	Left Front of Engine Components	Ignition Coil 2
Ignition Coil 3	In the engine compartment, on top of the engine, at cylinder 3	Right Rear of Engine Components	Ignition Coil 3

Name	Location	Locator View	Connector End View
Ignition Coil 4	In the engine compartment, on top of the engine, at cylinder 4	**Left Front of Engine Components**	**Ignition Coil 4**
Ignition Coil 5	In the engine compartment, on top of the engine, at cylinder 5	**Right Rear of Engine Components**	**Ignition Coil 5**
Ignition Coil 6	In the engine compartment, on top of the engine, at cylinder 6	**Left Front of Engine Components**	**Ignition Coil 6**
Ignition Lock Cylinder Control Actuator (without D55)	In the passenger compartment, right side of the steering column	**In the Steering Column Components**	-
Ignition Switch	In the passenger compartment, right side of the steering column	**In the Steering Column Components**	**Ignition Switch**
Inflatable Restraint Front End Sensor - Left	At the left front of the vehicle, behind the front fascia, left of the hood latch	**Left Front of the Engine Compartment Components**	**Inflatable Restraint Front End Sensor - Left**
Inflatable Restraint Front End Sensor - Right	At the right front of the vehicle, behind the front fascia, right of the hood latch	**Right Front of the Engine Compartment Components (1 of 2)**	**Inflatable Restraint Front End Sensor - Right**
Inflatable Restraint Front Passenger Presence System (PPS) Module	In the passenger compartment, under the front passenger seat	**Passenger Seat Components**	**Inflatable Restraint Front Passenger Presence System (PPS) Module**
Inflatable Restraint Front Passenger Presence System (PPS) Sensor	In the passenger compartment, under the front passenger seat	**Passenger Seat Components**	-
Inflatable Restraint I/P Module	In the passenger compartment, right side of the instrument panel, above the instrument panel compartment	**Instrument Panel Components**	• **Inflatable Restraint I/P Module X1** • **Inflatable Restraint I/P Module X2**
Inflatable Restraint I/P Module Indicator	In the passenger compartment, on the instrument panel, to the right of the instrument panel cluster, above the radio	**Instrument Panel Components**	**Inflatable Restraint I/P Module Indicator**
Inflatable Restraint Roof Rail Module - Left	In the passenger compartment, mounted on	**Roof Rail Components**	**Inflatable Restraint Roof Rail Module - Left**

Name	Location	Locator View	Connector End View
	the left C-pillar, behind the trim		
Inflatable Restraint Roof Rail Module - Right	In the passenger compartment, mounted on the right C-pillar, behind the trim	Roof Rail Components	Inflatable Restraint Roof Rail Module - Right
Inflatable Restraint Sensing and Diagnostic Module (SDM)	In the passenger compartment, under the front passenger seat, under the carpet	Under the Passenger Seat Components	• Inflatable Restraint Sensing and Diagnostic Module (SDM) X1 • Inflatable Restraint Sensing and Diagnostic Module (SDM) X2
Inflatable Restraint Side Impact Module - Left	In the passenger compartment, on the left side of the driver seat back	Front Seat Airbag Components	Inflatable Restraint Side Impact Module - Left
Inflatable Restraint Side Impact Module - Right	In the passenger compartment, on the right side of the front passenger seat back	Front Seat Airbag Components	Inflatable Restraint Side Impact Module - Right
Inflatable Restraint Side Impact Sensor (SIS) - Left	In the passenger compartment, in the driver door	Driver Door Components	Inflatable Restraint Side Impact Sensor (SIS) - Left
Inflatable Restraint Side Impact Sensor (SIS) - Right	In the passenger compartment, in the front passenger door	Passenger Door Components	Inflatable Restraint Side Impact Sensor (SIS) - Right
Inflatable Restraint Steering Wheel Module	In the passenger compartment, in the center of the steering wheel	Near the Steering Column Components	• Inflatable Restraint Steering Wheel Module X1 • Inflatable Restraint Steering Wheel Module X2
Inflatable Restraint Steering Wheel Module Coil	In the passenger compartment, in the steering column, behind the steering wheel	Instrument Panel Components	• Inflatable Restraint Steering Wheel Module X1 • Inflatable Restraint Steering Wheel Module X2
Inline Fuse - Engine Cooling Fan - Left	In the engine compartment, near the Fuse Block - Underhood	-	-

Name	Location	Locator View	Connector End View
Inline Fuse - Engine Cooling Fan - Right	In the engine compartment, near the Fuse Block - Underhood	-	-
Inline Fuse - Generator (6J1)	In the engine compartment, near the starter, between the starter and the generator	-	-
Inside Rearview Mirror (ISRVM)	In the passenger compartment, top center of the windshield	**Above the Windshield Components**	• **Inside Rearview Mirror (DD6 or UE1)** • **Inside Rearview Mirror (without DD6 or UE1)**
Instrument Panel Cluster (IPC)	In the passenger compartment, left side of the instrument panel, above the steering column	**Instrument Panel Components**	**Instrument Panel Cluster (IPC)**
Junction Block - Rear (6J1)	In the rear compartment, behind the right rear wheelhouse	**Right Side of the Luggage Compartment Components**	-
Keyless Entry Antenna	In the passenger compartment, left side of the windshield, along the A-pillar	**Left Side of the Windshield Components**	-
Knock Sensor (KS) 1	In the engine compartment, rear of the engine, below the exhaust manifold, above the transmission	**Right Rear of Engine Components**	**Knock Sensor (KS) 1**
Knock Sensor (KS) 2	In the engine compartment, front of the engine, above the starter	**Left Front of Engine Components**	**Knock Sensor (KS) 2**
License Lamp	At the rear of the vehicle, center of the rear fascia, above the license plate opening	**Rear of the Vehicle Components**	**License Lamp**
Manifold Absolute Pressure (MAP) Sensor	In the engine compartment, rear near center, top left side of the intake manifold, left of the throttle body	**Right Rear of Engine Components**	**Manifold Absolute Pressure (MAP) Sensor**
Mode Actuator	In the passenger compartment, center of the instrument panel, to	**Interior HVAC Components**	**Mode Actuator**

Name	Location	Locator View	Connector End View
	the right of the radio, on the HVAC assembly		
Multifunction Intake Air Sensor	At the left front of the engine compartment, in the air cleaner duct	**Left Front of the Engine Compartment Components**	**Multifunction Intake Air Sensor**
Outside Rearview Mirror - Driver	On the vehicle exterior, upper front of the driver door	**Driver Door Components**	**Outside Rearview Mirror - Driver**
Outside Rearview Mirror - Passenger	On the vehicle exterior, upper front of the front passenger door	**Passenger Door Components**	**Outside Rearview Mirror - Passenger**
Outside Rearview Mirror Switch	In the passenger compartment, on the left front door trim panel	**Driver Door Components**	**Outside Rearview Mirror Switch**
Park Brake Switch	In the passenger compartment, below the left side of the instrument panel, part of the park brake pedal assembly	**Below the Instrument Panel Components- Pedal Assemblies**	**Park Brake Switch**
Park/Turn Signal Lamp - Left	At the front of the vehicle, in the left front headlamp assembly	**Front of the Vehicle Components**	**Park/Turn Signal Lamp - Left**
Park/Turn Signal Lamp - Right	At the front of the vehicle, in the right front headlamp assembly	**Front of the Vehicle Components**	**Park/Turn Signal Lamp - Right**
Pressure Control (PC) Solenoid Valve 1	At the left front of the engine compartment, in the automatic transmission, part of the control solenoid valve assembly	**Automatic Transmission Electronic Components**	-
Pressure Control (PC) Solenoid Valve 2	At the left front of the engine compartment, in the automatic transmission, part of the control solenoid valve assembly	**Automatic Transmission Electronic Components**	-
Pressure Control (PC) Solenoid Valve 3	At the left front of the engine compartment, in the automatic transmission, part of the control solenoid valve assembly	**Automatic Transmission Electronic Components**	-

Name	Location	Locator View	Connector End View
Pressure Control (PC) Solenoid Valve 4	At the left front of the engine compartment, in the automatic transmission, part of the control solenoid valve assembly	Automatic Transmission Electronic Components	-
Pressure Control (PC) Solenoid Valve 5	At the left front of the engine compartment, in the automatic transmission, part of the control solenoid valve assembly	Automatic Transmission Electronic Components	-
Radio	In the passenger compartment, center of the instrument panel	Instrument Panel Components	• Radio X1 • Radio X2
Radio Antenna Module	In the passenger compartment, left of the back window	Above the Rear Seat Components	Radio Antenna Module
Radio Rear Window Antenna	At the rear of the vehicle, attached to the top of the rear window, above the rear window defogger grid	Rear of the Vehicle Components	-
Reading Lamp - Auxiliary (6C7)	In the passenger compartment, center of the roof, forward of the dome lamp	Headliner Components (9C1 or 9C3)	Reading Lamp - Auxiliary (6C7)
Rear Compartment Courtesy Lamp	In the rear compartment, in the rear deck, below the center of the rear window panel	Under the Rear Package Shelf Components	Rear Compartment Courtesy Lamp
Rear Compartment Lid Latch Release Actuator	In the rear compartment, mounted to the rear center of the deck lid, on the lid latch	Rear Center Deck Lid Components	-
Rear Window Defogger Grid	At the rear of the vehicle, on the inside rear window glass	Rear of the Vehicle Components	• Rear Window Defogger Grid X1 • Rear Window Defogger Grid X2
Recirculation Actuator	In the passenger compartment, back of the instrument panel compartment, on the	Interior HVAC Components	Recirculation Actuator

Name	Location	Locator View	Connector End View
	upper HVAC case, near the right A-pillar		
Remote Control Door Lock Receiver (RCDLR)	In the passenger compartment, on the upper center of the instrument panel, under the defroster grille panel	**Behind the Instrument Panel Components**	**Remote Control Door Lock Receiver (RCDLR)**
Seat Adjuster Motor Assembly - Driver (AG1 or AH5)	In the passenger compartment, below the driver seat	**Driver Seat Components**	**Seat Adjuster Motor Assembly - Driver (AG1, AH5)**
Seat Adjuster Motor Assembly - Passenger (AG2)	In the passenger compartment, below the front passenger seat	**Passenger Seat Components**	**Seat Adjuster Motor Assembly - Passenger (AG2)**
Seat Adjuster Switch - Driver (AG1 or AH5)	In the passenger compartment, left side of the driver seat cushion	**Driver Seat Components**	• **Seat Adjuster Switch - Driver (AG1)** • **Seat Adjuster Switch - Driver (AH5)**
Seat Adjuster Switch - Passenger (AG2)	In the passenger compartment, right side of the front passenger seat cushion	**Passenger Seat Components**	**Seat Adjuster Switch - Passenger (AG2)**
Seat Belt Pretensioner - Driver	In the passenger compartment, mounted to the left side of the driver seat, under the seat cushion	-	**Seat Belt Pretensioner - Driver**
Seat Belt Pretensioner - Passenger	In the passenger compartment, mounted to the right side of the passenger seat, under the seat cushion	-	**Seat Belt Pretensioner - Passenger**
Seat Belt Retractor Pretensioner - Driver	In the passenger compartment, mounted to the left front retractor, at the base of the B-pillar	**Left B-Pillar Components**	**Seat Belt Retractor Pretensioner - Driver**
Seat Belt Retractor Pretensioner - Passenger	In the passenger compartment, mounted to the right front retractor, at the base of the B-pillar	**Right B-Pillar Components**	**Seat Belt Retractor Pretensioner - Passenger**
Seat Belt Switch - Driver	In the passenger compartment, inside the driver seat belt buckle	-	**Seat Belt Switch - Driver**

Name	Location	Locator View	Connector End View
Seat Belt Switch - Passenger	In the passenger compartment, inside the front passenger seat belt buckle	**Passenger Seat Components**	**Seat Belt Switch - Passenger**
Seat Recline Motor - Driver (AH5)	In the passenger compartment, attached to the right side of the driver seat back	**Driver Seat Components**	**Seat Recline Motor - Driver (AH5)**
Secondary Air Injection (AIR) Pump (NU5 or NU6)	At the left front of the engine compartment, above the starter, near G111	**Left Front of the Engine Compartment Components (NU5 or NU6)**	**Secondary Air Injection (AIR) Pump (NU5/NU6)**
Secondary Air Injection (AIR) Pump Relay (NU5 or NU6)	In the engine compartment, near the mass air flow/intake air temperature sensor	**Left Front of the Engine Compartment Components (NU5 or NU6)**	**Secondary Air Injection (AIR) Pump Relay (NU5/NU6)**
Secondary Air Injection (AIR) Pump Solenoid (NU5 or NU6)	In the engine compartment, near the ignition control module	**Left Front of the Engine Compartment Components (NU5 or NU6)**	**Secondary Air Injection (AIR) Pump Solenoid Bank 1 (NU5/NU6)**
Secondary Air Injection (AIR) Pump Solenoid Relay (NU5 or NU6)	In the engine compartment, near the mass air flow/intake air temperature sensor	**Left Front of the Engine Compartment Components (NU5 or NU6)**	**Secondary Air Injection (AIR) Pump Solenoid Relay (NU5/NU6)**
Shift Solenoid (SS) Valve 1	At the left front of the engine compartment, in the automatic transmission, part of the control solenoid valve assembly	**Automatic Transmission Electronic Components**	-
Shift Solenoid (SS) Valve 2	At the left front of the engine compartment, in the automatic transmission, part of the control solenoid valve assembly	**Automatic Transmission Electronic Components**	-
Side Marker Lamp - Left Front	At the front of the vehicle, in the left front headlamp assembly	**Front of the Vehicle Components**	**Side Marker Lamp - Left Front**

Name	Location	Locator View	Connector End View
Side Marker Lamp - Right Front	At the front of the vehicle, in the right front headlamp assembly	Front of the Vehicle Components	Side Marker Lamp - Right Front
Speaker - Left Front	In the passenger compartment, lower front of the driver door trim panel	Radio and Speaker Components	Speaker - Left Front
Speaker - Left Front Tweeter (UQ3)	In the passenger compartment, on the left front A-pillar	Left A-Pillar Components	Speaker - Left Front Tweeter
Speaker - Left Rear	In the rear compartment, mounted in the left side of the rear package shelf	Radio and Speaker Components	• Speaker - Left Rear (UW6) • Speaker - Left Rear (UQ3)
Speaker - Right Front	In the passenger compartment, lower front of the front passenger door trim panel	Radio and Speaker Components	Speaker - Right Front
Speaker - Right Front Tweeter (UQ3)	In the passenger compartment, on the right front A-pillar	Right A-Pillar Components	Speaker - Right Front Tweeter
Speaker - Right Rear	In the rear compartment, mounted in the right side of the rear package shelf	Radio and Speaker Components	• Speaker - Right Rear (UW6) • Speaker - Right Rear (UQ3)
Spot Lamp - Left (7X6 or 7X7)	In the passenger compartment, on the left A-pillar	A-Pillar Components (9C1 or 9C3)	-
Spot Lamp - Right (7X7)	In the passenger compartment, on the right A-pillar	A-Pillar Components (9C1 or 9C3)	Spot Lamp - Right (7X7)
Starter Motor	In the engine compartment, lower front of the engine, facing the radiator, at the transmission	Left Front of Engine Components	Starter X2
Steering Angle Sensor	In the passenger compartment, at the base of the steering column	-	Steering Angle Sensor
Steering Wheel Control Switch - Left (UK3)	In the passenger compartment, on the left side of the steering wheel	Steering Wheel Components	Steering Wheel Control Switch - Left

Name	Location	Locator View	Connector End View
Steering Wheel Control Switch - Right	In the passenger compartment, on the right side of the steering wheel	**Steering Wheel Components**	**Steering Wheel Control Switch - Right (UK3)**
Sunroof Control Module (CF5)	In the passenger compartment, front center of the sunroof module, above the windshield header panel, under the headliner	**Headliner Components- Top View**	**Sunroof Control Module (CF5)**
Sunroof Switch (CF5)	In the passenger compartment, front center of the headliner, above the inside rearview mirror	**Headliner Components**	**Sunroof Switch (CF5)**
Sunshade - Left (DH6)	In the passenger compartment, mounted in the sunshade, on the left side of the windshield header	**Above the Windshield Components**	**Sunshade - Left (DH6)**
Sunshade - Right (DH6)	In the passenger compartment, mounted in the sunshade, on the right side of the windshield header	**Above the Windshield Components**	**Sunshade - Right (DH6)**
Tail Lamp - Left	At the rear of the vehicle, in the left tail lamp assembly	**Rear of the Vehicle Components**	**Tail Lamp - Left**
Tail Lamp - Right	At the rear of the vehicle, in the right tail lamp assembly	**Rear of the Vehicle Components**	**Tail Lamp - Right**
Tail/Stop and Turn Signal Lamp - Left	At the rear of the vehicle, in the left tail lamp assembly	**Rear of the Vehicle Components**	**Tail/Stop and Turn Signal Lamp - Left**
Tail/Stop and Turn Signal Lamp - Right	At the rear of the vehicle, in the right tail lamp assembly	**Rear of the Vehicle Components**	**Tail/Stop and Turn Signal Lamp - Right**
Theft Deterrent Module (TDM)	In the passenger compartment, around the ignition key cylinder housing	**In the Steering Column Components**	**Theft Deterrent Module (TDM)**
Throttle Body	In the engine compartment, top of the engine, at the intake manifold inlet	**Right Rear of Engine Components**	**Q38 Throttle Body (LFR/LFX)**

Name	Location	Locator View	Connector End View
Torque Converter Clutch (TCC) Pressure Control (PC) Solenoid Valve	In the engine compartment, left front lower, in the automatic transmission, part of the control solenoid valve assembly	**Automatic Transmission Electronic Components**	-
Transmission Control Module (TCM)	In the engine compartment, left front lower, inside the front of the automatic transmission, part of the control solenoid valve assembly	**Left Front of the Engine Compartment Components**	-
Turn Signal/Multifunction Switch	In the passenger compartment, inside the steering column, below the inflatable restraint steering wheel module coil, on the left side	**Instrument Panel Components**	• **Turn Signal/Multifunction Switch X1** • **Turn Signal/Multifunction Switch X2** • **Turn Signal/Multifunction Switch X3**
Vehicle Communication Interface Module (VCIM) (UE1)	In the rear compartment, mounted to the rear of the left rear wheelhouse	**Left Side of the Luggage Compartment Components**	• **Vehicle Communication Interface Module (VCIM) (UE1) X1** • **Vehicle Communication Interface Module (VCIM) (UE1) X2**
Vehicle Communication Interface Module (VCIM) Battery (UE1)	At the left side of the rear compartment, attached to the side of the vehicle communication interface module	**Left Side of the Luggage Compartment Components**	**Vehicle Communication Interface Module (VCIM) Battery (UE1)**
Wheel Speed Sensor (WSS) - Left Front	Under the vehicle, inside the left front wheel hub	**Front Wheel Components**	**Wheel Speed Sensor (WSS) - Left Front**
Wheel Speed Sensor (WSS) - Left Rear	Under the vehicle, inside the left rear wheel hub	**Rear Wheel Components**	**Wheel Speed Sensor (WSS) - Left Rear**
Wheel Speed Sensor (WSS) - Right Front	Under the vehicle, inside the right front wheel hub	**Front Wheel Components**	**Wheel Speed Sensor (WSS) - Right Front**
Wheel Speed Sensor (WSS) - Right Rear	Under the vehicle, inside the right rear wheel hub	**Rear Wheel Components**	**Wheel Speed Sensor (WSS) - Right Rear**

Name	Location	Locator View	Connector End View
Window Motor - Driver	In the passenger compartment, center of the driver door, behind the door panel	Driver Door Components	Window Motor - Driver
Window Motor - Left Rear	In the passenger compartment, center of the left rear door, behind the door panel	Left Rear Door Harness Routing	Window Motor - Left Rear
Window Motor - Passenger	In the passenger compartment, center of the front passenger door, behind the door panel	Passenger Door Components	Window Motor - Passenger
Window Motor - Right Rear	In the passenger compartment, center of the right rear door, behind the door panel	Right Rear Door Harness Routing	Window Motor - Right Rear
Window Switch - Driver	In the passenger compartment, center of the driver door trim panel	Driver Door Components	• Window Switch - Driver X1 • Window Switch - Driver X2
Window Switch - Left Rear	In the passenger compartment, in the left rear inside door handle trim bezel	Left Rear Door Components	Window Switch - Left Rear
Window Switch - Passenger	In the passenger compartment, center of the front passenger door trim panel	Passenger Door Components	Window Switch - Passenger
Window Switch - Right Rear	In the passenger compartment, in the right rear inside door handle trim bezel	Right Rear Door Components	Window Switch - Right Rear
Windshield Washer Fluid Level Switch	At the right side of the engine compartment, in the lower portion of washer fluid container	Right Front of the Engine Compartment Components (1 of 2)	Windshield Washer Fluid Level Switch
Windshield Washer Fluid Pump	At the right side of the engine compartment, in the lower portion of washer fluid container	Right Front of the Engine Compartment Components (1 of 2)	Windshield Washer Fluid Pump
Windshield Wiper Motor	In the engine compartment, in the left side cowl panel, below	Left Front of the Engine Compartment	Windshield Wiper Motor

Name	Location	Locator View	Connector End View
	the air inlet screen	Components	
Yaw and Lateral Accelerometer Sensor	In the passenger compartment, mounted on the floor under the center console	-	Yaw and Lateral Accelerometer Sensor
X101 (10 cavities)	Instrument panel harness to engine harness, left rear of the engine compartment, near the brake booster, bolted to the left strut tower, next to X111	Engine Harness Routing - Left Rear	X101 I/P Harness to Engine Harness
X105 (2 cavities)	Instrument panel harness to battery cable harness, forward of the right front strut tower	Battery Cable Harness Routing (Typical)	X105 Battery Harness to I/P Harness
X111 (14 cavities)	Instrument panel harness to engine harness, left rear of the engine compartment, near the brake booster, bolted to the left strut tower, next to X101	Engine Harness Routing - Left Rear	X111 I/P Harness to Engine Harness
X115 (14 cavities)	Engine harness to instrument panel harness, left rear of the engine compartment, on the left strut tower	Engine Harness Routing - Left Rear	X115 Engine Harness to Instrument Panel Harness
X120 (10 cavities)	Instrument panel harness to forward lamp harness, left side of the engine compartment, behind the left headlamp assembly, on the frame	Forward Lamp Harness Routing	X120 I/P Harness to Forward Lamp Harness
X122 (6 cavities) (9C1 or 9C3 without 6J7)	Forward lamp harness to forward lamp harness, at the left side of the right headlamp assembly	Forward Lamp Harness Routing	X122 Forward Lamp Harness to Forward Lamp Harness (9C1/9C3 without 6J7)
X123 (4 cavities) (9C1 or 9C3)	Instrument panel harness to grille lamp jumper harness, forward of the right front strut tower	Instrument Panel Harness Routing- Engine Compartment	X123 I/P Harness to the Grille Lamp Jumper Harness (6J3)
X141 (5 cavities)	Forward lamp harness to left headlamp harness, behind the left headlamp	Forward Lamp Harness Routing	X141 Forward Lamp Harness to Left Front Headlamp Assembly Harness

Name	Location	Locator View	Connector End View
	assembly		
X142 (5 cavities)	Forward lamp harness to right headlamp harness, behind the right headlamp assembly	**Forward Lamp Harness Routing**	**X142 Forward Lamp Harness to Right Front Headlamp Assembly Harness**
X160 (12 cavities)	Engine harness to even fuel injector harness, top right left of the engine	**Engine Harness Routing - Left Rear**	**X160 Engine Harness to Even Fuel Injector Harness**
X161 (6 cavities)	Engine harness to odd fuel injector harness, top left side of engine, next to X160	**Engine Harness Routing - Left Rear**	**X161 Engine Harness to Odd Fuel Injector Harness**
X200 (40 cavities)	Body harness to instrument panel harness, behind the right front kick panel, below the instrument panel fuse panel	**Instrument Panel Harness Routing**	**X200 Body Harness to I/P Harness**
X201 (10 cavities)	Steering column harness to instrument panel harness, behind the knee bolster, to the right of the steering column	**Instrument Panel Harness Routing**	**X201 Steering Column Harness to I/P Harness**
X203 (22 cavities)	Body harness to instrument panel harness, behind the knee bolster, to the left of the steering column, behind the left instrument panel access panel, near X250	**Instrument Panel Harness Routing**	**X203 I/P Harness to Body Harness**
X208 (9C1 or 9C3)	SEO auxiliary harness to body harness, in the right front footwell	-	**X208 SEO Auxiliary Harness to Body Harness (9C1, 9C3)**
X210 (2 cavities)	Instrument panel harness to HVAC harness, on the right side of the HVAC module assembly	**HVAC Module Harness Routing**	**X210 I/P Harness to HVAC Harness**
X223 (2 cavities) (9C1 or 9C3)	Instrument panel harness to instrument panel harness, under the right side of the instrument panel, in the rear stop/turn signal supply circuits, near G301	**Left Front of the Passenger Compartment Components**	**X223 I/P Harness to I/P Harness (6J6)**

Name	Location	Locator View	Connector End View
X250 (4 cavities)	Inflatable restraint steering wheel module coil wiring harness to the body wiring harness, near X203, behind the left instrument panel access panel	**Instrument Panel Harness Routing- Lower Left**	**X250 SIR Coil to the Body Harness**
X266 (1 cavity) (6J4)	Instrument panel harness to instrument panel harness, above the right front footwell, in the horn control circuit	**Instrument Panel Harness Routing**	**X266 I/P Harness to I/P Harness (6J4)**
X268 (8 cavities) (9C1 or 9C3)	Instrument panel harness to C267B, above the right front footwell	-	**X268 I/P Harness to I/P Harness (9C1, 9C3 with WX7)**
X268 (8 cavities) (WX7)	Instrument panel harness to WX7 speaker jumper harness, above the right front footwell	-	-
X269 (8 cavities) (9C1 or 9C3)	Instrument panel harness to C267A, above the right front footwell	-	**X269 I/P Harness to I/P Harness (9C1, 9C3 with WX7)**
X269 (8 cavities) (WX7)	Instrument panel harness to WX7 speaker jumper harness, above the right front footwell	-	-
X275 (8 cavities)	Inflatable restraint steering wheel module coil harness to steering column harness, on the steering column, near the knee bolster, taped to the steering column harness	-	• **X275 SIR Coil to Steering Column Harness** • **X277 SIR Coil to Steering Column Harness**
X277 (8 cavities)	Inflatable restraint steering wheel module coil harness to steering wheel harness, behind the inflatable restraint steering wheel module	**Instrument Panel Harness Routing- Lower Left**	-
X278 (4 cavities)	Inflatable restraint instrument panel module jumper harness to body harness, behind the right instrument panel access panel	**Right Front of the Passenger Compartment Components**	**X278 Inflatable Restraint I/P Module Jumper Harness to the Body Harness**

Name	Location	Locator View	Connector End View
X297 (6 cavities) (9C1 or 9C3)	Instrument panel harness to emergency vehicle front lamps flasher harness, above the right front footwell	Instrument Panel Harness Routing	X297 I/P Harness to Grille Lamp Jumper Harness (9C1, 9C3, 6J3)
X303 (1 cavity)	Instrument panel harness to body harness, COAX connector at the right front door sill, next to G302, under the carpet	Right Front of the Passenger Compartment Components	-
X311 (12 cavities)	Body harness to driver seat harness, below the driver seat	Body Harness Routing- Left Front Passenger Compartment	X311 Body Harness to Left Front Seat Harness
X313 (12 cavities)	Body harness to front passenger seat harness, below the front passenger seat	Body Harness Routing- Right Front Passenger Compartment	X313 Body Harness to Right Front Seat Harness
X315 (4 cavities)	Driver seat harness to body harness, below the driver seat	Seat Harness Routing- Airbags and Inlines	X315 Left Front Seat Harness to Body Harness
X316 (4 cavities)	Passenger seat harness to body harness, below the passenger seat	Seat Harness Routing- Airbags and Inlines	X316 Right Front Seat Harness to Body Harness
X322 (2 cavities) (9C1 or 9C3)	Body harness to roof provision harness, in the rear compartment, near the right C-pillar	Body Harness Routing- Rear Passenger Compartment	X322 Body Harness to Roof Provision Harness (9C1, 9C3)
X340 (2 cavities) (D55)	Console harness to body harness, below the center floor console, on the left side of the floor shifter	Body Harness Routing- Left Front Passenger Compartment	X340 Console Harness to Body Harness (D55)
X340 (2 cavities) (without D55)	Body harness to auxiliary power outlet seat jumper harness, under the center of the front seat	-	X340 Body Harness to Console Harness (without D55)
X360 (1 cavity) (9C1 or 9C3)	Body harness to instrument panel harness, right side of the instrument panel, near X200	Body Harness Routing- Right Front Passenger Compartment	X360 Body Harness to I/P Harness (9C1, 9C3)
X362 (1 cavity) (9C1 or 9C3)	Body harness to instrument panel harness, right side of the instrument panel, near	G200, G201, G202, and G204	X362 Body Harness to I/P Harness (9C1, 9C3)

Name	Location	Locator View	Connector End View
	X200		
X398 (6 cavities) (CF5)	Roof harness to sunroof harness, near the right front corner of the sunroof, under the headliner, above the sunshade	Sunroof and Headliner Harness Routing	X398 Roof Harness to Sunroof Harness (CF5)
X401 (4 cavities)	Rear body harness to left tail lamp harness, below the left tail lamp assembly	Rear Fascia Harness Routing	X401 Rear Body Harness to Left Tail Lamp Harness
X402 (4 cavities)	Rear body harness to right tail lamp harness, below the right tail lamp assembly	Body Harness Routing- Rear Passenger Compartment	X402 Rear Body Harness to Right Tail Lamp Harness
X405 (16 cavities)	Rear chassis harness to body harness, forward and to the right of the spare tire well	Body Harness Routing- Rear Passenger Compartment	X405 Rear Chassis Harness to Body Harness
X406 (8 cavities)	Body harness to rear body harness, in the rear compartment, below the right tail lamp assembly, clipped on the bumper fascia	Body Harness Routing- Rear Passenger Compartment	X406 Body Harness to Rear Body Harness
X409 (2 cavities) (T53)	Emergency vehicle rear compartment lid lamps harness to body harness, between the center high mounted stop lamp and the junction block - rear	Body Harness Routing- Rear Passenger Compartment	X409 Emergency Vehicle Rear Compartment Lid Lamps Harness to Body Harness (9C1, 9C3)
X490 (18 cavities)	Headliner harness to body harness, under the left side of the rear package shelf trim panel	Sunroof and Headliner Harness Routing	X490 Headliner Harness to Body Harness
X500 (40 cavities)	Body harness to left front door harness, below the A-pillar, between the door hinges	Body Harness Routing- Left Front Passenger Compartment	X500 Body Harness to Left Front Door Harness
X503 (40 cavities)	Driver door harness to driver door trim harness, in the driver door, near the speaker - left front door	Driver Door Harness Routing	X503 Left Front Door Harness to Left Front Door Trim Harness

Name	Location	Locator View	Connector End View
X600 (40 cavities)	Body harness to right front door harness, below the A-pillar, between the door hinges	**Body Harness Routing- Right Front Passenger Compartment**	**X600 Body Harness to Right Front Door Harness**
X604 (10 cavities)	Front passenger door trim harness to front passenger door harness, near the speaker - right front	**Passenger Door Harness Routing**	**X604 Right Front Door Trim Harness to Right Front Door Harness**
X700 (9 cavities)	Body harness to left rear door harness, center of the left B-pillar	**Body Harness Routing- Left Front Passenger Compartment**	**X700 Body Harness to Left Rear Door Harness**
X800 (9 cavities)	Body harness to right rear door harness, center of the right B-pillar	**Body Harness Routing- Right Front Passenger Compartment**	**X800 Body Harness to Right Rear Door Harness**
G100	(CKTs 250, 1250) On the forward lamp harness, in back of the right headlamp assembly, on the frame	**Right Front of the Engine Compartment Components (1 of 2)**	-
G101	(CKT 1350) On the forward lamp harness, in back of the left headlamp assembly, on the frame	**G101**	-
G102	(CKT 50) Near the battery, in back of the right headlamp assembly, on the frame	**G102**	-
G111	(CKTs 51, 451) In the engine compartment, near front middle, below starter motor	**G111, G113 and G115**	-
G113	(CKT 51,1050) In the engine compartment, near front right, on the engine block, below oil filter	**G111, G113 and G115**	-
G115	(CKT 251, 350) On the transmission case, below the brake booster	**G111, G113 and G115**	-
G200	(CKT 150) Front of the instrument panel carrier, above the instrument panel compartment, to the left of the inflatable	**G200, G201, G202, and G204**	-

Name	Location	Locator View	Connector End View
	restraint instrument panel module		
G201	(CKT 1450) Front of the instrument panel carrier, behind the knee bolster, on the right side of the steering column, above G202	**G200, G201, G202, and G204**	-
G202	(CKTs 351, 1551) Front of the instrument panel carrier, behind the knee bolster, on the right side of the steering column, below G201	**G200, G201, G202, and G204**	-
G204 (9C1 or 9C3)	(CKT 2350) Right side of the instrument panel carrier, to the left of the inflatable restraint instrument panel module, next to G200	**G200, G201, G202, and G204**	-
G301	(CKT 550) Below the driver door opening, rear of the left A-pillar	**G301**	-
G302	(CKTs 750, 1751) Below the passenger front door opening, rear of the right A-pillar	**G302**	-
G303	COAX capacitance ground for the remote control door lock receiver windshield antenna, near the top of the left A-pillar, behind the trim panel	-	-
G403	(CKTs 1150, 1351) On the left side of the package shelf, near the C-pillar	**G403 and G404**	-
G404	(CKT 851) On the right side of the package shelf, near the C-pillar	**G403 and G404**	-
J100	In the engine harness, in the engine compartment, on branch to front of engine	**Engine Harness Routing - Right Front**	-

Name	Location	Locator View	Connector End View
J101	(CKT 451) Engine harness, in the engine compartment, front near middle, in main bundle between branch to ECM and branch to ECT	**Engine Harness Routing - Right Front**	-
J102	(CKT 17) Engine harness, in the engine compartment, front left on branch to ECM	**Engine Harness Routing - Right Front**	-
J103	Engine harness, in the engine compartment, front right, in branch on front of engine, near generator	**Engine Harness Routing - Right Front**	-
J109	Engine Harness, In the engine compartment, in the main bundle on left side of engine above transmission	**Engine Harness Routing - Left Rear**	-
J110	(CKT 51) In Engine Harness, In the engine compartment, in the main bundle on left side of engine above transmission	**Engine Harness Routing - Left Rear**	-
J124	(CKT 1250) On the forward lamp harness, behind the right headlamp, approximately 8 cm (3.2 in) from the breakout to G100, toward the inflatable restraint front end sensor - right	**Forward Lamp Harness Routing**	-
J126	(CKT 1250) On the right head lamp assembly harness	-	-
J127	(CKT 1350) On the left head lamp assembly harness	-	-

System Voltage High Voltage

Circuit/System Description

The vehicle control modules or sensors monitor the system voltage to verify the system voltage is within the normal operating range.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The control module or sensor detects a system voltage of less than approximately 9 V for approximately 5 seconds.

Action Taken When the DTC Sets

- A driver information center message and/or warning indicator may be displayed.
- The control module may be temporarily disabled.

Conditions for Clearing the DTC

The system voltage returns to normal operating range.

Diagnostic Aids

- A high or low voltage DTC set or voltage value in multiple modules/sensors indicates a concern in the charging system.
- A possible cause of this DTC could be overcharging with a battery charger or jump starting.

Circuit/System Verification

1. Ignition OFF, measure and record the battery voltage at the battery terminals.
2. Verify the battery voltage stabilizes between 12.4 and 12.8 V within a few minutes of turning the ignition OFF.
   - **If battery voltage is less than 12.4 V or more than 12.8 V**

     Refer to **Battery Inspection/Test**.

   - **If battery voltage is between 12.4 and 12.8 V**
3. Engine running, headlights ON, measure and record the battery voltage at the battery terminals.
4. Verify the voltage is at least 1 V greater than the voltage measured in step 1, but less than 15 V.
   - **If the voltage is not at least 1 V greater than the voltage measured in step 1 or is greater than 15 V.**

     Refer to **Charging System Test**.

   - **If the voltage is at least 1 V greater than the voltage measured in step 1, but less than 15 V.**
5. Verify the appropriate control module scan tool B+ and ignition voltage parameters are within 1 V of the battery voltage.
   - **If not within 1 V of the battery voltage**

     Refer to Circuit/System Testing.

   - **If within 1 V of the battery voltage**
6. All OK.

Circuit/System Testing

NOTE: **Use the schematic to identify the following:**

- **Control modules the vehicle is equipped with**
- **The control module's ground, B+, and Ignition circuit terminal IDs and connectors**

NOTE: **Some control module ground circuits may require up to 20 min after the ignition is turned off before achieving a resistance reading of less than 5 Ω. In most cases the readings will drop below 20 Ω within 1 min indicating the control module is going to sleep.**

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connectors at the appropriate control module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the appropriate control module.

- **If the test lamp illuminates**

4. Ignition ON.
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the appropriate control module.
   - **If the test lamp illuminates**
6. Replace the control module.

Repair Instructions

DTC Descriptor

DTC B1405

Device Voltage Reference Output 2 Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Battery Current Sensor Supply Voltage	B1516	B1516	-	B1516
Battery Current Sensor Signal	B1405	B1405	-	B1405
Battery Current Sensor Low Reference	-	B1516	-	B1516

Circuit/System Description

The battery current sensor is a 3-wire hall effect current sensor. The battery current sensor monitors the battery current. It directly inputs to the body control module (BCM). It creates a 5-volt pulse width modulation (PWM) signal of 128 Hz with a duty cycle of 0-100 percent. Normal duty cycle is between 5-95 percent. Between 0-5 percent and 95-100 percent are for diagnostic purposes.

Conditions for Running the DTC

- The ignition is ON.
- The engine is running.

Conditions for Setting the DTC

The BCM detects a duty cycle of PWM input signal is less than 4 percent or more than 96 percent for more 33 seconds.

Action Taken When the DTC Sets

The DTC sets as current , no driver indication or message is displayed.

Conditions for Clearing the DTC

The DTC clears as current status when the battery sensed current returns to normal range for more than 5 seconds.

Circuit/System Testing

B1405

1. Ignition OFF, disconnect the harness connector at the battery current sensor.
2. Ignition OFF, test for less than 5.0 ohms between the low reference circuit terminal B and ground.
   - If greater than specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the BCM.
3. Ignition ON, test for 4.8-5.2 volts between the battery current sensor supply voltage circuit terminal A and ground.
   - If less than the specified range , test the battery current sensor supply voltage circuit for a short to ground or an open/high resistance. If the circuit test normal, replace the BCM.
   - If greater than the specified range , test the battery current sensor supply voltage circuit for a short to voltage. If the circuit tests normal, replace the BCM.
4. Ignition ON, test for 4.8-5.2 volts between the battery current sensor signal circuit terminal C and ground.
   - If less than the specified range, test the battery current sensor signal circuit for a short to ground or an open/high resistance. If the circuit test normal, replace the BCM.
   - If greater than the specified range, test the battery current sensor signal circuit for a short to voltage. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, replace the battery current sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Battery Current Sensor Replacement**
- **Control Module References** for BCM replacement, setup, and programming

DTC B1424: DEVICE 1 VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1424 00

Device 1 Voltage Low

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	B1424 00	B1424 00	-	-
Ground	-	B1424 00	-	-

Circuit/System Description

The theft deterrent module (TDM) monitors the battery positive (B+) voltage available to it. If the voltage at the TDM is between 6-9 V, and the voltage being reported by a serial data message is greater than 9 V, then DTC B1424 00 sets.

Conditions for Running the DTC

- The Ignition is in Accessory or Run
- The diagnostic runs every 100 milliseconds.

Conditions for Setting the DTC

- Voltage at the B+ circuit is between 6 and 9 V.
- Reported battery voltage received via serial data is valid and is greater than 9 V.
- The above conditions have been met for 2 seconds.

Action Taken When the DTC Sets

- Security Indicator turns ON.
- The driver information center (DIC) displays the SERVICE THEFT DETERRENT SYSTEM message.

Conditions for Clearing the DTC

- This DTC passes when the battery voltage at the TDM is greater than 9 V, or if the voltage reported by serial data is less than 9 V.
- A history DTC clears after 100 consecutive ignition cycles, if no failures are reported by this diagnostic.

Diagnostic Aids

A low voltage DTC in multiple modules indicates a concern in the charging system.

Circuit/System Testing

1. Engine running, accessories OFF, measure and record the battery voltage at the battery terminals.The voltage should be between 12.6 and 15.0 V.
   - If the battery voltage is not within the specified range, refer to **Charging System Test**
2. Ignition OFF, disconnect the harness connector at the theft deterrent module (TDM).
3. Ignition OFF and scan tool disconnected, open and close the driver door, and wait 1 minute. Test for less than 5 Ω between the ground circuit terminal 3 and ground.
   - If greater than the specified range, test the ground circuit for an open/high resistance.
4. Ignition ON , verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
   - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
5. If the circuits test normal, replace the TDM.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

DTC B1516: BATTERY CURRENT SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B1516 08

Battery Current Sensor Signal Invalid

DTC B1516 66

Battery Current Sensor Wrong Mounting Position

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Battery Current Sensor Supply Voltage	B1516 08	B1516 08	-	B1516 08
Battery Current Sensor Signal	B1405	B1405	-	B1405
Battery Current Sensor Low Reference	-	B1516 08	-	B1516 08

Circuit/System Description

The battery current sensor is a 3-wire hall effect current sensor. The battery current sensor monitors the battery current. It directly inputs to the body control module (BCM). It creates a 5-volt pulse width modulation (PWM) signal of 128 Hz with a duty cycle of 0-100 percent. Normal duty cycle is between 5-95 percent. Between 0-5 percent and 95-100 percent are for diagnostic purposes.

Conditions for Running the DTC

- The ignition is ON.
- The engine is running.

Conditions for Setting the DTC

B1516 08

The BCM detects a duty cycle of PWM input signal is less than 4 percent or more than 96 percent for more 33 seconds.

B1516 66

The BCM detects the battery current sensor is improperly installed.

Action Taken When the DTC Sets

The DTC sets as current , no driver indication or message is displayed.

Conditions for Clearing the DTC

The DTC clears as current status when the battery sensed current returns to normal range for more than 5 seconds.

Circuit/System Testing

B1516 08

1. Ignition OFF, disconnect the harness connector at the battery current sensor.
2. Ignition OFF, test for less than 5.0 ohms between the low reference circuit terminal B and ground.
   - If greater than specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the BCM.
3. Ignition ON, test for 4.8-5.2 volts between the battery current sensor supply voltage circuit terminal A and ground.
   - If less than the specified range , test the battery current sensor supply voltage circuit for a short to ground or an open/high resistance. If the circuit test normal, replace the BCM.
   - If greater than the specified range , test the battery current sensor supply voltage circuit for a short to voltage. If the circuit tests normal, replace the BCM.
4. Ignition ON, test for 4.8-5.2 volts between the battery current sensor signal circuit terminal C and ground.
   - If less than the specified range, test the battery current sensor signal circuit for a short to ground or an open/high resistance. If the circuit test normal, replace the BCM.
   - If greater than the specified range, test the battery current sensor signal circuit for a short to voltage. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, replace the battery current sensor.

B1516 66

When diagnosing B1516 66 verify that the battery current sensor is installed securely and positioned in the correct current flow direction.

- If the battery current sensor is not, remove and reinstall the sensor properly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Battery Current Sensor Replacement**
- **Control Module References** for BCM replacement, setup, and programming

DTC B151A: LOW BATTERY CAPACITY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B151A 58

Low Battery Capacity Detected

Circuit/System Description

The body control module (BCM) monitors the battery voltage level during an engine crank event to detect a low battery voltage condition.

Conditions for Running the DTC

The vehicle is ON

Conditions for Setting the DTC

A minimum crank battery voltage is less than the minimum crank battery voltage threshold for 16 consecutive crank events.

Action Taken When the DTC Sets

A driver information center message is displayed.

Conditions for Clearing the DTC

The DTC will clear if the minimum crank voltage is greater than the minimum crank voltage threshold during a crank event.

DTC B1527: PARASITIC LOAD

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1527 00

Parasitic Load

Circuit/System Description

The body control module (BCM) monitors the state of charge of the electrical system.

Conditions for Running the DTC

The ignition is in Accessory or Run mode.

Conditions for Setting the DTC

The state of charge at ignition ON is 30% lower than when the engine was running and battery drain is more than 2 A.

Action Taken When the DTC Sets

There is no battery telltale illuminated or DIC message displayed.

Conditions for Clearing the DTC

- The DTC will clear if the fault does not return after 50 consecutive ignition cycles.
- The DTC will clear when run state of charge is greater than or equal to 80%.

DTC P0615, P0616, OR P0617: STARTER RELAY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0615

Starter Relay Control Circuit

DTC P0616

Starter Relay Control Circuit Low Voltage

DTC P0617

Starter Relay Control Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	P0616	P0615	P0617	-
Ground	-	P0615	-	-

Circuit/System Description

When the ignition switch is placed in the CRANK position, a discrete signal is supplied to the body control module (BCM) notifying it that the ignition is in the CRANK position. The BCM then sends a message to the engine control module (ECM) that crank has been requested. The ECM then verifies that the clutch pedal is depressed or the transmission is in Park/Neutral. If it is, the ECM then supplies 12 V to the control circuit of the starter relay. When this occurs, battery voltage is supplied through the switch of the starter relay to the starter motor.

Conditions for Running the DTC

- The ignition is in the CRANK position.
- The system voltage is between 9.5-18 V.

Conditions for Setting the DTC

The ECM detects improper voltage on the control circuit of the starter relay.

Action Taken When the DTC Sets

DTC P0615, P0616, and P0617 are C type DTCs.

Conditions for Clearing the DTC

DTC P0615, P0616, and P0617 are C type DTCs.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the KR27 Starter Relay. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 85 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON.
4. Verify a test lamp illuminates between the B+ circuit terminal 87 and ground.
   - **If the test lamp does not illuminate**
   1. Ignition OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify cable connection to Battery
   - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85.
6. Verify the test lamp turns ON and OFF when commanding the KR27 Starter Relay ON and OFF with a scan tool.
   - **If the test lamp is always OFF**
   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K20 Engine Control Module.
   - **If the test lamp is always ON**
   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K20 Engine Control Module.
   - **If the test lamp turns ON and OFF**
7. Ignition ON, connect a 30 A fused jumper wire between the B+ circuit terminal 87 and the control circuit terminal 30.
8. Verify the M64 Starter Motor is activated.
   - **If the M64 starter motor does not activate and the circuit fuse is good**
   1. Ignition OFF, disconnect the harness connector at the M64 starter motor.
   2. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the M64 Starter Motor.
   - **If the M64 starter motor does not activate and the circuit fuse is open**

1. Ignition OFF, disconnect the harness connector at the M64 starter motor.
2. Test for infinite resistance between the control circuit terminal X2 A and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the M64 Starter Motor.

- **If the M64 starter motor activates**

9. Test or replace the KR27 Starter Relay.

Component Testing

Relay Test

1. Ignition OFF, disconnect the KR27 Starter Relay.
2. Test for 60-180 Ω between terminals 85 and 86.
    - **If less than 60 or greater than 180 Ω**

      Replace the relay.

    - **If between 60-180 Ω**
3. Test for infinite resistance between the terminals listed below:
    - 30 and 86
    - 30 and 87
    - 30 and 85
    - 85 and 87
    - **If less than infinite resistance**

      Replace the relay.

    - **If infinite resistance**
4. Install a 20 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground.
5. Test for less than 2 Ω between terminals 30 and 87.
    - **If 2 Ω or greater**

      Replace the relay.

    - **If less than 2 Ω**
6. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P0621: GENERATOR L-TERMINAL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0621

Generator L-Terminal Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	-	P0621	-	-
Control - L Terminal	P0621	P0621	P0621	-
Signal - F Terminal	P0622	P0622	P0622	P0622

Circuit/System Description

The engine control module (ECM) uses the generator turn on control circuit to control the load of the generator on the engine. A high side driver in the ECM applies a duty cycled voltage to the voltage regulator. The duty cycle controls the voltage regulator to turn the field circuit on and off. The ECM monitors the state of the generator turn on control circuit. The ECM should detect low voltage on the generator turn on control circuit when the ignition is ON and the engine is off, or when the charging system malfunctions. With the engine running, the ECM should detect on the generator turn on control circuit, a high voltage when the duty cycle voltage is commanded high, and a low voltage when the duty cycle voltage is commanded low.

Conditions for Running the DTC

- Ignition ON, engine OFF (Prior to Ignition ON, the ignition must have been OFF for at least 5 s).
- The engine is running for the run test.

Conditions for Setting the DTC

- Ignition ON, engine OFF - The ECM detects greater than 3.5 V on the generator control circuit for 5 s.
- Engine running - The ECM detects a low voltage for 15 s on the generator control circuit when the duty cycle voltage is commanded high.
- Engine running - The ECM detects a high voltage for 15 s on the generator control circuit when the duty cycle voltage is commanded low.

Action Taken When the DTC Sets

DTC P0621 is a type C DTC.

Conditions for Clearing the DTC

- Ignition ON, engine OFF- Low voltage.
- Engine running - A control signal duty cycle is detected.

Circuit/System Verification

1. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
2. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
3. All OK.

Circuit/System Testing

1. Verify a test lamp illuminates between the G13 Generator B+ circuit terminal A X2, B X2 or 1 X2, and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Remove the test lamp and disconnect the B+ cable at the G13 Generator.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Remove the test lamp, disconnect the battery negative cable, and disconnect the G13 Generator B+ cable.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
   - **If the test lamp illuminates**
2. Disconnect the X1 harness connector at the G13 Generator, engine running.
3. Test for 1 V or greater between the control circuit terminal 1 X1 and ground.
   - **If less than 1 V**
   1. Ignition OFF, disconnect the harness connectors at the K20 Engine Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If greater than 2 Ω, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K20 Engine Control Module.
   - **If 1V or greater**
4. Ignition OFF, disconnect the harness connectors at the K20 Engine Control Module, Ignition ON
5. Test for less than 1 V between the G13 Generator control circuit terminal 1 X1 and ground.
   - **If greater than 1 V**

     Repair the short to voltage on the circuit.

   - **If 1V or less**
6. Test or replace the G13 Generator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P0622: GENERATOR F-TERMINAL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0622

Generator F-Terminal Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	-	P0621	-	-
Control - L Terminal	P0621	P0621	P0621	-
Signal - F Terminal	P0622	P0622	P0622	P0622

Circuit/System Description

The engine control module (ECM) uses the generator field duty cycle signal circuit, or F-terminal circuit, to monitor the duty cycle of the generator. The generator field duty cycle signal circuit connects to high side of the field windings in the generator. A pulse width modulated (PWM) high side driver in the voltage regulator turns the field windings on and off. The ECM uses the PWM signal input to determine the generator load on the engine. This allows the ECM to adjust the idle speed to compensate for high electrical loads. The ECM monitors the status of the generator field duty cycle signal circuit. When the ignition is ON and the engine is off, the ECM should detect a duty cycle near 0%. When the engine is running, the duty cycle should be between 5-99%.

Conditions for Running the DTC

- Ignition ON, engine OFF (Prior to Ignition ON, the ignition must have been OFF for at least 5 s)
- Engine running at less than 3,000 RPM

Conditions for Setting the DTC

- DTC P0621 is not set
- Ignition ON, engine OFF (Prior to Ignition ON, the ignition must have been OFF for at least 5 s), the ECM detects a PWM signal that is greater than 65% for 5 s
- Engine running at less than 3,000 RPM-The ECM detects a PWM signal that is less than 5% for 30 s

Action Taken When the DTC Sets

DTC P0622 is a type C DTC

Conditions for Clearing the DTC

- Ignition ON, Engine OFF- Low / no PWM signal detected
- Engine running - A 5-90% duty cycle is detected

Circuit/System Verification

NOTE: **Do not have a battery charger connected during the generator testing.**

1. Engine running.
2. Verify the scan tool Engine Control Module Generator F-Terminal Signal parameter is between 5-90%.
   - **If not between 5-90%**

     Refer to Circuit/System Testing.

   - **If between 5-90%**
3. Verify the scan tool Generator F-Terminal Signal parameter changes when commanding the headlamps ON and OFF.
   - **If the parameter does not change**

     Refer to Circuit/System Testing.

   - **If the parameter changes**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
6. All OK.

Circuit/System Testing

1. Verify a test lamp illuminates between the G13 Generator B+ circuit terminal A X2, B X2 or 1 X2, and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Remove the test lamp and disconnect the B+ cable at the G13 Generator.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Remove the test lamp, disconnect the battery negative cable, and disconnect the G13 Generator B+ cable.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, test or replace the G13 Generator.
   - **If the test lamp illuminates**
2. Disconnect the X1 harness connector at the G13 Generator, engine running.
3. Verify the scan tool Engine Control Module Generator F-Terminal Signal parameter is less than 5%.
   - **If 5% or greater**
   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
   2. Test for less than 1 V between the signal circuit terminal 2 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K20 Engine Control Module.
   - **If less than 5%**
4. Install a 3 A fused jumper wire between the signal circuit terminal 2 and B+, engine running.
5. Verify the scan tool Engine Control Module Generator F-Terminal Signal parameter is greater than 95%.
   - **If 95% or less**
   1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit
      - If less than 2 Ω, replace the K20 Engine Control Module.
   - **If greater than 95%**
6. Test or replace the G13 Generator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Generator Replacement**
- **Control Module References** for engine control module replacement, programming, and setup

DTC P1668: GENERATOR L-TERMINAL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1668

Generator L-Terminal Control Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Generator L- Terminal	P1668	P1668	P1668	-

Circuit/System Description

The engine control module (ECM) uses the generator turn ON signal circuit to control the load of the generator on the engine. A high side driver in the ECM applies a voltage to the voltage regulator. This signals the voltage regulator to turn the field circuit ON and OFF. The ECM monitors the state of the generator turn ON signal circuit. The ECM should detect low voltage on generator turn ON signal circuit when the ignition is ON and the engine is OFF, or when the charging system malfunctions. With the engine running, the ECM should detect high voltage on the generator turn ON signal circuit. The ECM performs tests to determine the status of the generator turn ON signal circuit.

Conditions for Running the DTC

- No generator, crankshaft position (CKP) sensors, or camshaft position (CMP) sensor DTCs are set.
- The ignition ON, engine OFF for the ignition on test.
- The engine running for the run test.

Conditions for Setting the DTC

- During the ignition ON test, the ECM detects high voltage on the generator turn on signal circuit for at least 5 seconds.
- During the RUN test, the ECM detects low voltage on the generator turn on signal circuit for at least 15 seconds.

Action Taken When the DTC Sets

DTC P1668 is a C type DTC.

Conditions for Clearing the DTC

DTC P1668 is a C type DTC.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the generator.
2. Ignition ON, test for less than 1 volt between the generator turn on signal circuit and ground.
   - If greater than the specified value, test the generator turn on signal circuit for a short to voltage. If the circuit tests normal, replace the ECM.
3. Engine Running, test for greater than 3.5 volts between the generator turn on signal and ground.
   - If less than the specified value, test the generator turn on signal circuit for a short to ground, an open/ high resistance. If the circuit tests normal, replace the ECM.
4. If the circuit tests normal, test or replace the generator.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Control Module References for ECM replacement, setup, and programming
- Generator Replacement

SYMPTOMS - ENGINE ELECTRICAL

NOTE: **The following steps must be completed before using the symptom tables.**

- Perform Diagnostic System Check - Vehicle before using the Symptom Tables in order to verify that all of the following are true:
  - There are no DTCs set.
  - The control modules can communicate via the serial data link.
- Review the system descriptions and operations in order to familiarize yourself with the system functions. Refer to one of the following system operations:
  - Battery Description and Operation
  - Charging System Description and Operation
  - Electrical Power Management Description and Operation
  - Starting System Description and Operation

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the starting and charging systems. Refer to Checking Aftermarket Accessories .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Battery Inspection/Test
- Battery Electrical Drain/Parasitic Load Test
- Charging System Test
- Generator Noise Diagnosis
- Starter Solenoid Does Not Click
- Starter Solenoid Clicks, Engine Does Not Crank
- Engine Cranks Slowly
- Starter Noise Diagnosis

BATTERY INSPECTION/TEST

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Aids

NOTE: **For Warranty repairs -**

You must use regionally required battery test equipment for warranty repairs.

For accurate test results the battery must be disconnected from the vehicle and the equipment connected directly to the battery posts. When setting up the equipment, select "Out of Vehicle" and then the correct battery type (Flooded, AGM or Stop/Start AGM) and rated CCA (both from the battery label) must be entered.

- **Failure to obtain the correct connections during the test may result in a failed test on a good battery.**
- **Use the Out of Vehicle test (battery disconnected with test equipment connected directly to the posts) for each battery when testing a vehicle with dual batteries.**

Special Tools

EL 50313 Battery Tester

Circuit/System Testing

WARNING: Unless directed otherwise, the ignition must be OFF with the key removed, and all electrical loads must be OFF before servicing any electrical component. Disconnect the negative battery cable to prevent an electrical spark should a tool or equipment come in contact with an exposed electrical terminal. Failure to follow these precautions may result in personal injury and/or damage to the vehicle or its components.

For Vehicles equipped with OnStarÂ® (UE1) with Back Up Battery:

The Back Up Battery is a redundant power supply to allow limited OnStarÂ® functionality in the event of a main vehicle battery power disruption to the VCIM (OnStarÂ®module). Do not disconnect the main vehicle battery or remove the OnStarÂ® fuse with the ignition key in any position other than OFF. Retained accessory power should be allowed to time out or be disabled (simply opening the driver door should disable retained accessory power) before disconnecting power. Disconnecting power to the OnStarÂ® module in any way while the ignition is On or with retained accessory power activated may cause activation of the OnStarÂ® Back-Up Battery system and will discharge and permanently damage the back-up battery. Once the Back-Up Battery is activated it will stay on until it has completely discharged. The back-up battery is not rechargeable and once activated the back-up battery must be replaced.

1. Verify the C1 Battery or C1B Battery - Auxiliary (if equipped) case is not cracked, broken, or damaged, which may be indicated by battery acid leakage.
   - **If there is any apparent damage**

     Replace the C1 Battery or C1B Battery - Auxiliary.

   - **If there is no damage**
2. Verify that the battery cables are clean and tight. The battery terminal bolts should be torqued as specified in **Fastener Specifications**.
   - **If the battery cables need to be cleaned or tightened**

     Clean as required and tighten as specified.

   - **If the battery cables are clean and tight**
3. Disconnect battery from the vehicle. There is no need to remove the battery from the vehicle.
4. Connect the EL-50313 directly to the battery terminal posts.
5. Select "Charging," "Diagnostic" and "Out of Vehicle" when setting up the test.
6. Select the proper battery type, Flooded, AGM or Stop/Start AGM.
7. Enter the CCA as shown on the battery label.
8. Verify the test result is not REPLACE BATTERY or BAD CELL-REPLACE

   NOTE: Always write the test code displayed by the tester on the repair order for any warranty purposes. The number is a unique code that describes the test data for a particular battery at a particular time. The test code may occasionally repeat when you retest the same battery. More often, each test will result in a different code. Use the test code from the Out of Vehicle test.

   - **If the test result is REPLACE BATTERY or BAD CELL-REPLACE**

     Replace the C1 Battery or C1B Battery - Auxiliary.

   - **If the test result is not REPLACE BATTERY or BAD CELL-REPLACE**
9. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Battery Replacement

BATTERY CHARGING

Special Tools

EL 50313 Battery Tester

For equivalent regional tools, refer to **Special Tools**.

Diagnostic Aids

- The charging area should be well ventilated.
- Do not charge a battery that appears to be frozen. Allow the battery to warm to room temperature and test it using the **EL 50313** Battery Tester before charging.
- An AGM battery may be damaged if charged to more than 14.5 V.
- A Flooded Cell battery may be damaged if charged to more than 16.5 V.
- Vehicles with dual batteries must be charged individually which will result in two printouts.

Battery State of Charge

NOTE: **Using voltage to determine the batteries state of charge is only accurate after the battery has been at rest for 24 hours. This is enough time for the acid in each cell to equalize. If the battery has been charged or discharged in the past 24 hours, the battery state of charge will only be an estimate.**

The maintenance-free batteries state of charge is estimated by reading the voltage of the battery across the battery terminals. Because the voltage is affected by current flow into or out of the battery, the engine must be stopped and all electrical loads turned OFF, including parasitic loads, when checking the voltage. The voltage can also be affected if the battery has just been charged or discharged, so it is important to consider what has happened to the battery in the time just before testing. Use the following procedure to determine the batteries state of charge:

1. Be sure all electrical loads are turned OFF.
2. Determine whether the battery has been used in a vehicle or charged within the past 12 hours.
   - If the answer is no, the terminal voltage will be stabilized and no action is necessary before reading the voltage. Skip to step 3.
   - If the answer is yes, terminal voltage will not be stabilized and you should wait 12 hours since the last time the battery was used.
3. Estimate the battery temperature by determining the average temperature to which the battery has been exposed for the past 12 hours.

   NOTE: **The table is accurate to 10 percent only after the battery has been at rest for 12 hours.**

4. Measure the battery voltage at the battery terminals. Refer to the following table to determine the state of charge according to the estimated battery temperature:

Battery Voltage	% Charge at 0Â°C (32Â°F)	% Charge at 25Â°C (75Â°F)
12.75 V	100%	100%
12.7 V	100%	90%
12.6 V	90%	75%
12.45 V	75%	65%
12.2 V	65%	45%
12.0 V	40%	20%

Use the state of charge information as follows:

- A battery with a state of charge that is below 65 percent must always be recharged before returning it to service or continuing storage.
- A battery with a state of charge that is 65 percent or greater is generally considered to be charged enough in order to be returned to normal service or in order to continue storage. However, if the battery is being used in slow traffic or with short drive times, or if the temperature is very hot or very cold, the battery should be fully charged, to at least 90 percent, before returning it to service or continuing storage.

Charging Time Required

The time required to charge a battery will vary depending upon the following factors:

- The battery charger capacity-The higher the charger amperage, the less time it will take to charge the battery.
- The state of charge of the battery-A completely discharged battery requires more than twice as much charging time as a half charged battery. In a discharged battery with a voltage below 11 V, the battery has a very high internal resistance and may only accept a very low current at first. Later, as the charging current causes the acid content to increase in the electrolyte, the charging current will increase. Extremely discharged batteries may not activate the reversed voltage protection in some chargers. Refer to the manufacturer's instructions for operating this circuitry.
- The temperature of the battery-The colder the battery is, the more time it takes to recharge the battery. The charging current accepted by a cold battery is very low at first. As the battery warms, the charging current will increase.

Charging Procedure

CAUTION: **Turn OFF the ignition when connecting or disconnecting the battery cables, the battery charger or the jumper cables. Failure to do so may damage the ECM/PCM or other electronic components.**

CAUTION: **Refer to Fastener Caution .**

When charging side-terminal batteries with the battery cables connected, connect the charger to the positive cable bolt and to a ground located away from the battery. When charging side-terminal batteries with the battery cables disconnected, install the battery side terminal adapters and connect the charger to the adapters.

1. Ensure that all of the battery terminal connections are clean and tight.
2. Connect the charger positive lead to the battery positive terminal on the battery or the remote jumper stud underhood.

   CAUTION: **Do not connect the negative charger lead to the housings of other vehicle electrical accessories or equipment. The action of the battery charger may damage such equipment.**

3. Connect the negative charger lead to a solid engine ground or to a ground stud in the engine compartment that is connected directly to the battery negative terminal, but away from the battery. If the negative battery cable is disconnected and a terminal adapter is being used, connect directly to the adapter.
4. Select "Charging," "PDI" and "In Vehicle" when setting up the charger.
5. Select the proper battery type, Flooded, AGM, Spiral AGM or Stop/Start AGM.
6. Enter the CCA as shown on the battery label.

BATTERY ELECTRICAL DRAIN/PARASITIC LOAD TEST

12 V Battery

The following procedure is for the 12 V battery only.

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

Components most likely to cause a parasitic draw on the vehicles battery are switches, relays, and control modules. After the ignition is turned OFF the control modules will begin to go to sleep shut OFF. All control modules do not go to sleep at the same time, some may take up to 30 min or longer after turning the ignition off before going to sleep. Other modules may periodically wake up then go back to sleep. These are all normal conditions.

Diagnostic Aids

- Rule out any possible aftermarket equipment causing an unacceptable parasitic current drain. Aftermarket accessories installed into the courtesy lamp circuit can cause the inadvertent power timer in the body control module (BCM) to keep resetting. This may cause the BCM to remain awake and cause a current drain on the battery.
- Rule out customer driving habits such as regular short trips that do not allow enough time to properly charge the battery. Refer to **Battery Description and Operation**.
- Verify that the battery and charging system are in proper working order. Refer to **Battery Charging**, and **Charging System Test**.
- A battery discharging for no apparent reason while the vehicle is parked can be caused by an intermittent draw, such as a module waking up, or a continuous draw, such as a dome light or stuck relay.
- Some systems and modules such as OnStarÂ®, and regulated voltage control, if equipped, are designed to wake up, perform a task, and go back asleep at regular intervals. Refer to **Body Control System Description and Operation** for the system or modules description and operation.
- An engine off natural vacuum evaporative test can occur if the engine control module (ECM) determines the drive cycle has met the appropriate criteria immediately after key off. The ECM will stay awake and the vent solenoid will stay energized for as long as 45 min. The typical current draw for this is about 1 A.
- Digital OnStar generation 6 and later vehicle communication interface module do not "wake up" every 10 min for the first 48 h as the generation 5 and prior. generation 6 and later vehicle communication interface module current draw is very low, less than 40 mA, so the OnStar system is left in that state for up to the first 48 h. Parasitic draw of up to 40 mA with an occasional spike as high as 80 mA through the vehicle communication interface module for the first 48 h is normal.
- Some automatic climate control systems can remain in a semi awake state for up to three hours, actual draw amounts vary by vehicle platform but are typically not greater than 50 mA.
- An extremely low mA current level is consumed by the remote keyless entry receiver for monitoring purposes, actual system wake up only occurs when the fobs for the vehicle are used. When other devices on the same remote keyless entry operating frequency are activated, such as the 4 tire pressure monitoring sensors and other vehicle FOBs in the vicinity, the remote keyless entry receiver will have a 100 mA spike. These spikes are normal and occur too briefly to have a significant effect on battery drain. Competing signals may cause remote keyless entry performance issues such as jamming but should not cause excessive battery draw.
- If an excessive current draw is not present during initial testing, continue periodic testing over a 1-2 hour period to see if the current draw increases and stays above an unacceptable level.

NOTE: **The battery specification listed below is a generic specification. Refer to the label on the original battery when testing the battery.**

- The battery run down time will vary depending on the batteries reserve capacity. If the reserve capacity is higher, then the battery run down time may be longer. If the reserve capacity is lower, then the battery run down time may be shorter. The graph below indicates roughly how many days a 690 cold cranking amperage battery with a 110 min reserve capacity starting at 80% state of charge will last with a constant current draw until it reaches 50% state of charge. Differences in battery reserve capacity and temperature will affect the results.

Current Drain	Days
25 mA	33
50 mA	16.5
75 mA	11
100 mA	8.25
250 mA	3.3
500 mA	1.65
750 mA	1
1 A	0.8
2 A	0.4

Special Tools

EL 38758 Parasitic Draw Test Switch

For equivalent regional tools, refer to **Special Tools**.

Circuit/System Verification

NOTE:

- **Most vehicle systems will go to sleep within 30 min but it can take up to 2 h before all systems power down allowing the parasitic draw test to pass. An occasional increase in the parasitic draw is normal as long as it returns within 1 s.**
- **Closing the door latches/ajar switch while leaving the doors open is recommended, this allows the vehicle systems to perform in a "doors closed" mode while allowing vehicle interior access that may be needed to complete the diagnostic steps.**
- **Locking doors will arm the vehicle content theft deterrent system if equipped. Failure to arm the system may cause a theft system fault to not be present during testing.**
- **There are many things that can prevent the vehicle from completely going to sleep and passing the parasitic draw test. Make sure all the conditions listed below are met before performing the parasitic current draw test.**
  - **Ignition OFF**
  - **Key out of the ignition switch - when not equipped with keyless access and start**
  - **Retained Accessory Power OFF - open and close the driver door after ignition OFF**
  - **Scan tool not communicating with a vehicle control module - in some cases it may need to be disconnected from the DLC**
  - **All access doors closed**
  - **Headlamps OFF - auto headlamps disabled**
  - **Any delay lighting OFF**
  - **If equipped with an under hood lamp disable it**

- **HVAC after blow OFF**
- **Any accessory that can work with ignition OFF inactive or OFF**
- **Wait up to 2 min or longer, after all other listed conditions are met**

Using an Inductive Pickup Probe

1. Connect an inductive pickup probe to the negative battery cable that can read down to 1 mA.
2. Ignition OFF, as the vehicle systems shut down test for less than 30 mA of parasitic current drain.
   - If greater than the specified range, refer to Circuit/System Testing.

Using the EL 38758 Parasitic Draw Test Switch

WARNING: **Refer to Battery Disconnect Warning .**

CAUTION: **When a fused jumper wire or digital multimeter is connected to the test switch terminals, always turn the test switch ON before opening any access door, turning the ignition on, or turning any accessory on. This is to prevent damaging the jumper wire or digital multimeter fuse.**

NOTE: **The switch knob on the EL 38758 switch is marked ON and OFF. When the switch knob is in the ON position, the circuit is closed and electrical current will pass through the switch. When the switch knob is in the OFF position, the circuit is open and electrical current will not pass through the switch.**

1. Ignition OFF, disconnect the battery negative cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.
2. Turn the **EL 38758** switch knob to the OFF position.
3. Install the male end of the **EL 38758** switch to the battery ground terminal.
4. Install the battery negative cable to the female end of the **EL 38758** switch.
5. Turn the **EL 38758** switch knob to the ON position.
6. Road test the vehicle and activate all of the accessories such as the radio and air conditioning.
7. Ignition OFF, connect a 10 A fused jumper wire to the test switch tool terminals.
8. Turn the **EL 38758** switch knob to the OFF position. The current now flows through the jumper wire.
9. Check the fuse in the jumper wire. The fuse should be OK.
   - Failed: If the jumper wire fuse is blown, refer to Circuit/System Testing.
   - Passed
10. Turn the **EL 38758** switch knob to the ON position. Remove the fused jumper wire.
11. Connect a DMM set to the 10 A DC scale between the test switch tool terminals.
12. Turn the **EL 38758** switch knob to the OFF position. The current now flows through the DMM.
13. As the vehicle systems shut down test for less than 30 mA of parasitic current drain.
    - If greater than the specified range, refer to Circuit/System Testing.

Circuit/System Testing

NOTE:

- **Removing or installing a fuse, relay, or connector, to determine the area causing high parasitic draw may wake up control modules. You must wait for the control modules to go back to sleep before retesting. It is best to install any removed or disconnected components after the diagnosis is completed.**
- **Fuses for power mode master components such as the BCM should be removed last to avoid misdiagnosis.**
- **If a scan tool is connected to the DLC, either disconnect it or subtract the scan tool current draw from the DMM reading to get the actual vehicle parasitic current draw.**

If the vehicle has an unacceptable amount of parasitic current draw, remove each fuse one at a time until the current draw falls to an acceptable level. A drop of more than 10-20 mA, when disabling a single system or circuit, is an indication of an overly high current draw that could be causing the battery drain. Refer to Power Distribution Schematics to diagnose exactly which circuit of the suspect system is causing the high parasitic drain. The following is a list of common components that could cause a high current draw:

- Stuck switch
- Stuck relay
- Control module

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Control Module References for control module replacement, programming and setup

CHARGING SYSTEM TEST

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Reference Information

Description and Operation

Charging System Description and Operation

Electrical Information Reference

Testing for Intermittent Conditions and Poor Connections

Circuit/System Verification

Engine ON, observe the charge indicator on the instrument panel cluster (IPC) or message in the driver information center (DIC). The charge indicator on the IPC should be turned OFF and the DIC should not display charging system message

- If the charge indicator is not on the IPC and a charging system message is not displayed on the DIC, refer to Testing for Intermittent Conditions and Poor Connections .
- If the charge indicator is on the IPC or a charging system message is displayed on the DIC, refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition ON, verify that no generator or battery current sensor DTCs are set that would cause a charging system concern.
   - If DTCs are set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
2. Ignition OFF, measure the voltage across the battery terminals. The voltage should read 12.0 volts or greater at room temperature.
   - If not within specified value, refer to **Battery Inspection/Test**.
3. Connect a carbon pile tester to the battery.
4. Start the engine and increase the engine speed to 2,500 RPM. Observe the voltage reading on the tester. The voltage should read between 12.6 - 15.0 volts.
   - If not within specified range, replace the generator.
5. Adjust the carbon pile tester to the specified load test output value according to the C1 battery designation..
   - If not within specified value, replace the generator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Generator Replacement

GENERATOR NOISE DIAGNOSIS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Aids

Noise from a generator may be due to electrical or mechanical noise. Electrical noise or magnetic whine usually varies with the electrical load placed on the generator and is a normal operating characteristic of all generators. When diagnosing a noisy generator, it is important to remember that loose or misaligned components around the generator may transmit the noise into the passenger compartment and that replacing the generator may not solve the problem.

Circuit/System Testing

1. Start the engine, verify the noise can be heard. Compare the concern to a similar vehicle.
2. Inspect the generator, generator mounting, wiring harness, heater hoses, A/C lines or other accessory equipment that may misrouted or may be the cause of the noise to be transmitted into the passenger compartment.
3. Ignition OFF, remove the engine drive belt. Verify the generator, idler pulley and tensioner pulley spin freely.
   - If any of the pulleys do not spin freely, replace the affected component.
4. Loosen all generator mounting bolts and ensure the generator is properly aligned. Tighten mounting bolts to specification, refer to **Generator Replacement**.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Drive Belt Replacement**
- **Drive Belt Tensioner Replacement**
- **Drive Belt Idler Pulley Replacement**
- **Generator Replacement**

STARTER SOLENOID DOES NOT CLICK

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+ terminal 87	1	1	-	-
ECM Park/ Neutral Signal	2	1	-	-
Coil Control terminal 86	-	1	3	-
Control Output terminal 30	1	1	3	-
Coil Ground terminal 85	-	1	-	-
1. No crank 2. Cranks in any gear 3. Cranks all the time				

Circuit/System Description

When the ignition switch is placed in the START position, a discrete signal is supplied to the body control module (BCM) notifying it that the ignition is in the START position. The BCM then sends a message to the engine control module (ECM) that crank has been requested. The ECM then verifies that the transmission is in Park or Neutral. If it is, the ECM then supplies 12 volts to the control circuit of the starter relay. When this occurs, battery voltage is supplied through the switch of the starter relay to the starter solenoid.

Circuit/System Verification

1. Ignition ON, verify that no starter relay, theft deterrent, engine, or automatic transmission DTCs are set that would cause the ECM not to enable engine starting.
   - If DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle .
2. Ignition ON, observe the scan tool BCM Current Power Mode parameter. Place ignition switch in the crank position, the parameter should display Crank Request.
   - If not the specified value, refer to Power Mode Mismatch
3. Transmission range selector in park , verify the scan tool ECM PNP Switch and TCM IMS parameters display Park/Neutral.
   - If the TCM IMS parameter does not indicate Park/Neutral. Refer to Transmission Internal Mode Switch Logic
   - If the ECM Park/Neutral parameter does not indicate Park/Neutral. Refer to ECM Park Switch Circuit Malfunction.
4. Transmission range selector in park or neutral, attempt to start the vehicle. The starter relay should click and the engine should begin cranking.
   - If the STRTR relay does not click or the engine does not crank, refer to Starter Relay Circuit Malfunction.
5. Ignition ON, observe the scan tool ECM Crankshaft Position Sensor Active Counter is not incrementing.
   - If the Crankshaft Position Sensor Active Counter is incrementing, replace the Crankshaft Position Sensor.

Circuit/System Testing

ECM Park Switch Circuit Malfunction

1. Ignition OFF, disconnect the harness connector at the AT X1 20-Way Connector.
2. Ignition ON, install a 3A fused jumper wire between the signal circuit terminal 20 X1 and ground. Verify the scan tool ECM PNP switch parameter displays Park/Neutral.
   - If not the specified value, test the signal circuit terminal 20 X1 for an open/high resistance. If the circuit tests normal, replace the ECM.
3. If all circuits test normal, test or replace the internal mode switch (IMS).

Starter Relay Circuit Malfunction

1. Ignition OFF, disconnect the starter relay.
2. Ignition OFF, test for less than 3.0 ohms between the relay ground circuit terminal 85 and ground.
   - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, verify a test lamp illuminates between the relay switch B+ circuit terminal 87 and ground.
   - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
4. Ensure the parking brake is applied and the transmission is in PARK. Momentarily install a 40A fused jumper wire between the relay switch B+ circuit terminal 87 and the relay controlled output circuit terminal 30. The starter solenoid should engage and the engine should begin cranking.
   - If the solenoid does not engage, test the relay controlled output circuit for a short to ground or an open/high resistance. If the circuit tests normal, test or replace the starter motor.
5. Connect a test lamp between the relay coil control circuit terminal 86 and the relay coil ground circuit terminal 85.
6. With transmission range selector in park or neutral, cycle the ignition between the OFF and CRANK position. The test lamp should turn ON and OFF when changing between the commanded states.
   - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the ECM.
   - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.
7. If all circuits test normal, test or replace the starter relay.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

4. Transmission range selector in park or neutral, attempt to start the vehicle. The starter relay should click and the engine should begin cranking.
   - If the STRTR relay does not click or the engine does not crank, refer to Starter Relay Circuit Malfunction.

Circuit/System Testing

ECM Park Switch Circuit Malfunction (4T65-E)

1. Ignition OFF, disconnect the harness connector at the AT Inline 20-Way Connector.
2. Ignition ON, install a 3A fused jumper wire between the signal circuit terminal W and ground. Verify the scan tool ECM PNP switch parameter displays Park/Neutral.
   - If not the specified value, test the signal circuit terminal W for an open/high resistance. If the circuit tests normal, replace the ECM.
3. If all circuits test normal, test or replace the internal mode switch (IMS).

Starter Relay Circuit Malfunction

1. Ignition OFF, disconnect the starter relay.
2. Ignition OFF, test for less than 3.0 ohms between the relay ground circuit terminal 85 and ground.
   - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, verify a test lamp illuminates between the relay switch B+ circuit terminal 87 and ground.
   - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
4. Ensure the parking brake is applied and the transmission is in PARK. Momentarily install a 40A fused jumper wire between the relay switch B+ circuit terminal 87 and the relay controlled output circuit terminal 30. The starter solenoid should engage and the engine should begin cranking.
   - If the solenoid does not engage, test the relay controlled output circuit for a short to ground or an open/high resistance. If the circuit tests normal, test or replace the starter motor.
5. Connect a test lamp between the relay coil control circuit terminal 86 and the relay coil ground circuit terminal 85.
6. With transmission range selector in park or neutral, cycle the ignition between the OFF and CRANK position. The test lamp should turn ON and OFF when changing between the commanded states.
   - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the ECM.
   - If the test lamp is always OFF, test the control circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.
7. If all circuits test normal, test or replace the starter relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Relay Replacement (Attached to Wire Harness)** **Relay Replacement (Within an Electrical Center)**
- **Starter Replacement**
- **Control Module References** for ECM replacement, setup, and programming.

ENGINE CRANKS SLOWLY

Inspect the following items:

- Battery-Perform the Battery Inspection/Test. Refer to **Battery Inspection/Test**.
- Wiring-Inspect the wiring for damage. Inspect all connections to the starter motor, the solenoid, the battery, and all ground connections. Refer to:
  - **Circuit Testing**
  - **Wiring Repairs**
  - **Testing for Intermittent Conditions and Poor Connections**
  - **Connector Repairs**
- Engine-Verify that the engine is not seized.

If the battery, the wiring, and the engine are functioning properly, and the engine continues to crank slowly, replace the starter motor. Refer to **Starter Replacement**.

STARTER NOISE DIAGNOSIS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The PG starter motors are non-repairable. They have pole pieces that are arranged around the armature. Both solenoid windings are energized. The pull-in winding circuit is completed to the ground through the

starter motor. The windings work together magnetically to pull and hold in the plunger. The plunger moves the shift lever. This action causes the starter drive assembly to rotate on the armature shaft spline as it engages with the flywheel ring gear on the engine. Moving at the same time, the plunger also closes the solenoid switch contacts in the starter solenoid. Full battery voltage is applied directly to the starter motor and it cranks the engine.

Reference Information

Description and Operation

Charging System Description and Operation

Circuit/System Verification

Start the engine. Listen to the starter noise while the engine is cranking. Compare the concern to a similar vehicle.

Circuit/System Testing

1. Remove the flywheel inspection cover.
2. Inspect the flywheel for the following:
   - Loose flywheel bolts
   - Chipped gear teeth
   - Missing gear teeth
   - Bent flywheel
   - Debris in the bell housing
   - If not within specifications, remove the debris, tighten the flywheel bolts, or repair or replace the flywheel.
3. If all inspections were within specification, replace the starter motor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Engine Flywheel Replacement**
- **Starter Replacement**

REPAIR INSTRUCTIONS

BATTERY NEGATIVE CABLE DISCONNECTION AND CONNECTION

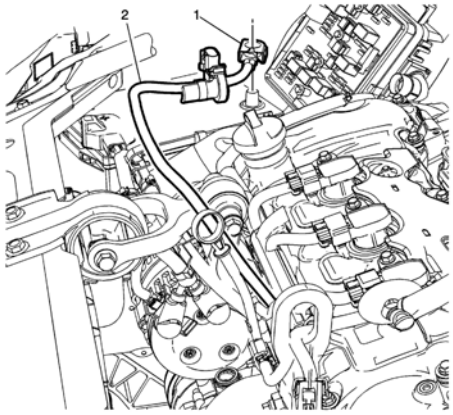

Fig. 3: Battery Negative Cable

11. Install the battery positive terminal (2) to the starter and tighten the fastener (1) to 10 N.m (89 lb in).

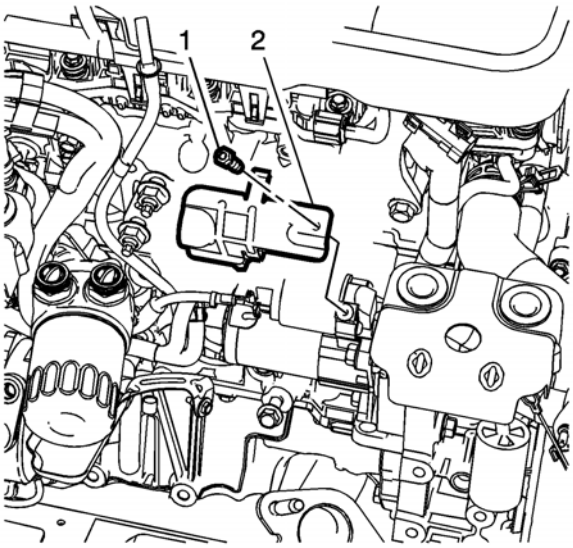

Fig. 20: Starter Heat Shield And Fastener
Courtesy of GENERAL MOTORS COMPANY

12. Install the starter heat shield (2) and tighten the fastener (1) to 5 N.m (44 lb in).
13. Connect the engine coolant temperature (ECT) sensor.
14. Install the air conditioning compressor. Refer to **Air Conditioning Compressor Replacement** .
15. Install the radiator air lower baffle and deflector. Refer to **Radiator Air Lower Baffle and Deflector Replacement** .
16. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection**.

BATTERY REPLACEMENT

Removal Procedure

1. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection**.
2. Remove the accessory wiring junction block. Refer to **Accessory Wiring Junction Block Replacement** .
3. Remove the right front diagonal brace. Refer to **Front Fender Upper Diagonal Brace Replacement** .

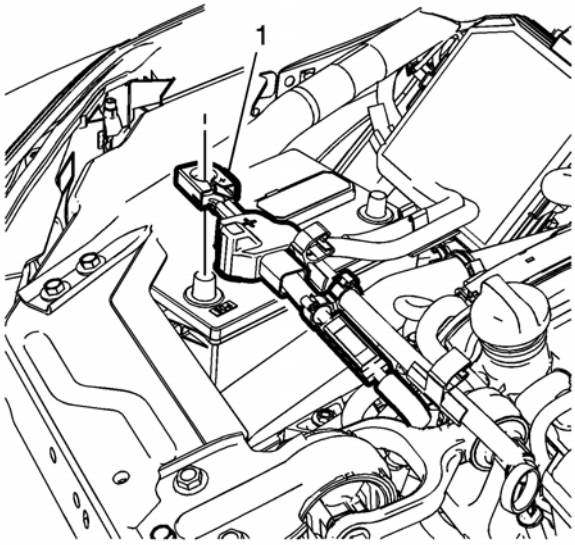

Fig. 21: Battery Positive Clamp
Courtesy of GENERAL MOTORS COMPANY

4. Open the positive battery cable terminal cover and release the positive cable clamp (1).
5. Remove the positive battery cable from the battery.

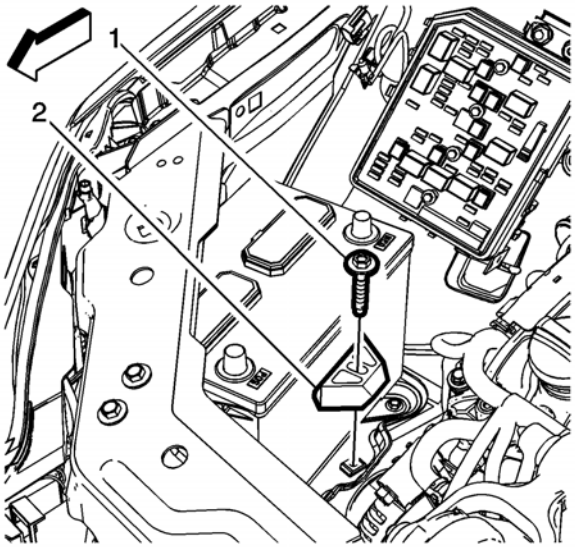

Fig. 22: Retainer And Fastener
Courtesy of GENERAL MOTORS COMPANY

6. Remove the battery hold down fastener (1) and hold down retainer (2).

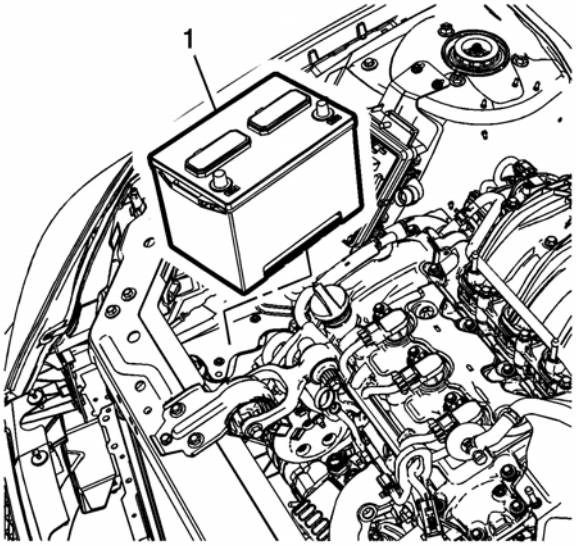

Fig. 23: Battery
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not tip the battery more than 40 degrees during removal.**

7. Remove the battery (1).

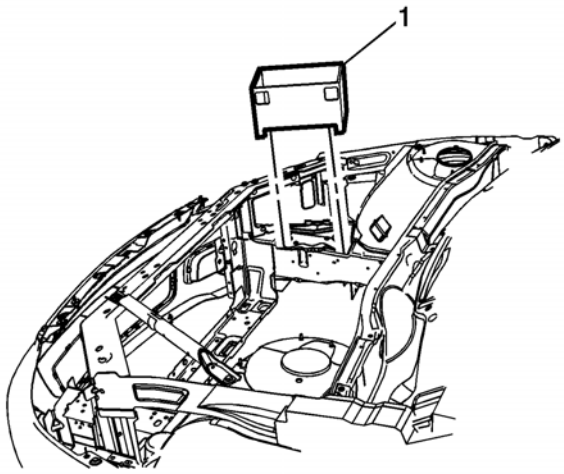

Fig. 24: Battery Insulator

Courtesy of GENERAL MOTORS COMPANY

1. Install the battery insulator.

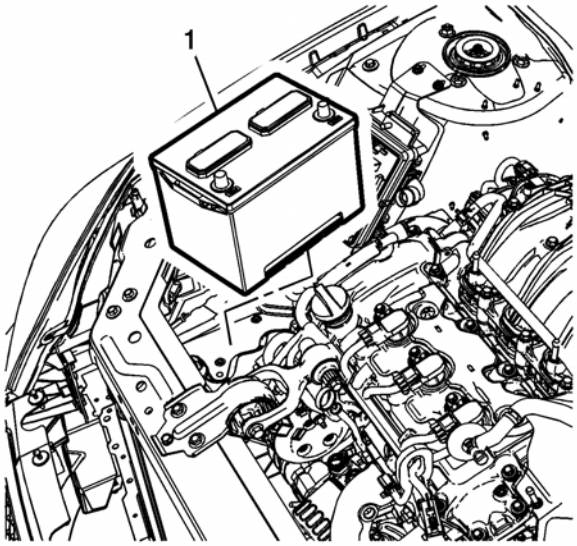

Fig. 26: Battery
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not tip the battery more than 40 degrees during installation.**

2. Install the battery (1).

CAUTION: **Refer to Fastener Caution .**

3. Install the battery hold down retainer and tighten the fastener to 18 N.m (13 lb ft).

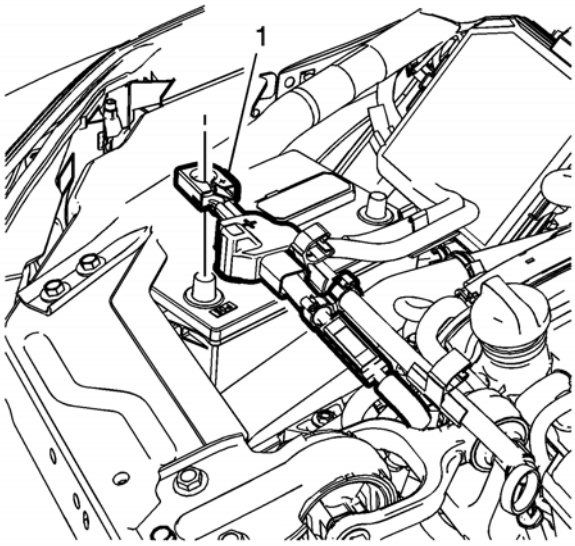

Fig. 27: Battery Positive Clamp
Courtesy of GENERAL MOTORS COMPANY

4. Install the positive battery cable clamp (1) to the battery positive post and tighten to 10 N.m (89 lb in).
5. Install the battery positive cover.
6. Install the accessory wiring junction block. Refer to **Accessory Wiring Junction Block Replacement** .
7. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection**.
8. Install the right front diagonal brace. Refer to **Front Fender Upper Diagonal Brace Replacement** .

BATTERY TRAY REPLACEMENT

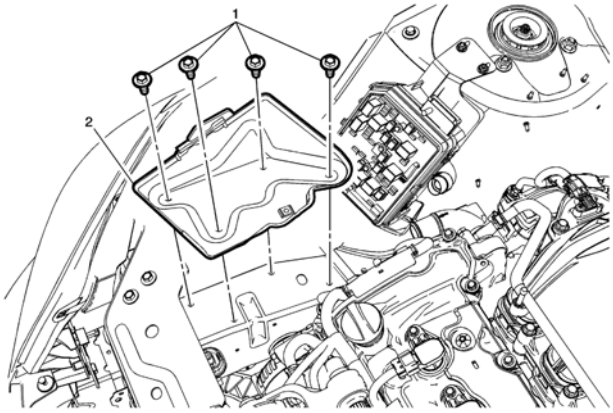

Fig. 28: Battery Tray & Mounting Bolts
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the battery.Refer to Battery Replacement	
1	Bolt (Qty: 4) **CAUTION:** **Refer to** **Fastener Caution .** **Tighten** 5 N.m (44 lb in).
2	Battery Tray **TIP:** Unclip the harness retainers from the battery tray.

STARTER REPLACEMENT

Removal Procedure

1. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection**.
2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
3. Remove the radiator air lower baffle and deflector. Refer to **Radiator Air Lower Baffle and Deflector Replacement** .
4. Lower the vehicle.

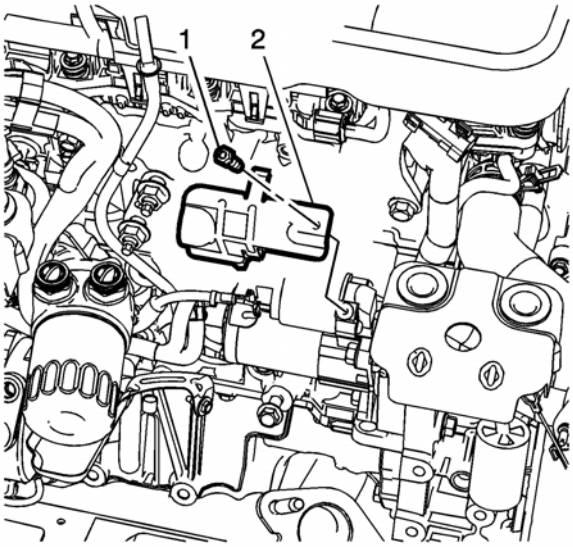

Fig. 29: Starter Heat Shield And Fastener

3. Connect the engine harness connector (1) to the generator and install the battery positive terminal (3) to the generator stud. Tighten the fastener (2) to 20 N.m (15 lb ft).
4. Install the right engine mount strut. Refer to **Engine Mount Strut Replacement - Right Side** .
5. Install the drive belt idler pulley. Refer to **Drive Belt Idler Pulley Replacement** .
6. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection**.

DESCRIPTION AND OPERATION

BATTERY DESCRIPTION AND OPERATION

WARNING: Batteries produce explosive gases, contain corrosive acid, and supply levels of electrical current high enough to cause burns. Therefore, to reduce the risk of personal injury when working near a battery:

- **Always shield your eyes and avoid leaning over the battery whenever possible.**
- **Do not expose the battery to open flames or sparks.**
- **Do not allow the battery electrolyte to contact the eyes or the skin. Flush immediately and thoroughly any contacted areas with water and get medical help.**
- **Follow each step of the jump starting procedure in order.**
- **Treat both the booster and the discharged batteries carefully when using the jumper cables.**

Batteries that are no longer wanted must be disposed of by an approved battery recycler and must never be thrown in the trash or sent to a landfill.

Batteries that are not part of the vehicle itself, not the battery under the hood, must only be transported on public streets for business purposes via approved hazardous material transportation procedures.

Battery storage, charging and testing facilities in repair shops must meet various requirements for ventilation, safety equipment, material segregation, etc.

The maintenance free battery is standard. There are no vent plugs in the cover. The battery is completely sealed except for 2 small vent holes in the side. These vent holes allow the small amount of gas that is produced in the battery to escape.

The battery has 3 functions as a major source of energy:

- Engine cranking
- Voltage stabilizer
- Alternate source of energy with generator overload

Battery Low Start Vehicle Message

The body control module (BCM) monitors battery positive voltage to determine battery state of charge. If one or more of the BCM battery positive voltage terminals measure less than approximately 11.6V compared to the BCM ground circuits, this message will display and four chimes may sound. Start the vehicle immediately. If the vehicle is not started and the battery continues to discharge, the climate controls, heated seats, and audio systems will shut off and the vehicle may require a jump start. These systems will function again after the vehicle is started.

Battery Ratings

A battery has 2 ratings:

- Cold cranking amperage
- Amperage hours

When a battery is replaced use a battery with similar ratings. See battery specification label on the original battery.

Amperage Hours

The amperage hour rating tells you how much amperage is available when discharged evenly over a 20 hour period. The amperage hour rating is cumulative, so in order to know how many constant amperage the battery will output for 20 h, you have to divide the amperage hour rating by 20. Example: If a battery has an amperage hour rating of 74, dividing by 20 = 3.75. Such a battery can carry a 3.75 A load for 20 hours before dropping to 10.5 V. (10.5 V is the fully discharged level, at which point the battery needs to be recharged.) A battery with an amperage hour rating of 55 will carry a 2.75 A load for 20 hours before dropping to 10.5 V.

Cold Cranking Amperage

The cold cranking amperage is an indication of the ability of the battery to crank the engine at cold temperatures. The cold cranking amperage rating is the minimum amperage the battery must maintain for 30 seconds at -18Â°C (0Â°F) while maintaining at least 7.2 V. See battery label for the cold cranking amperage rating of this battery.

CHARGING SYSTEM DESCRIPTION AND OPERATION

Electrical Power Management Overview

The electrical power management system is designed to monitor and control the charging system and send diagnostic messages to alert the driver of possible problems with the battery and generator. This electrical power management system primarily utilizes existing on-board computer capability to maximize the effectiveness of the generator, to manage the load, improve battery state-of-charge and life, and minimize the system's impact on fuel economy. The electrical power management system performs 3 functions:

- It monitors the battery voltage and estimates the battery condition.
- It takes corrective actions by boosting idle speeds, and adjusting the regulated voltage.
- It performs diagnostics and driver notification.

The battery condition is estimated during ignition-off and during ignition-on. During ignition-off the state-of-charge of the battery is determined by measuring the open-circuit voltage. The state-of-charge is a function of the acid concentration and the internal resistance of the battery, and is estimated by reading the battery open circuit voltage when the battery has been at rest for several hours.

The state-of-charge can be used as a diagnostic tool to tell the customer or the dealer the condition of the battery. Throughout ignition-on, the algorithm continuously estimates state-of-charge based on adjusted net amp hours, battery capacity, initial state-of-charge, and temperature.

While running, the battery degree of discharge is primarily determined by a battery current sensor, which is integrated to obtain net amp hours.

In addition, the electrical power management function is designed to perform regulated voltage control to improve battery state-of-charge, battery life, and fuel economy. This is accomplished by using knowledge of the battery state-of-charge and temperature to set the charging voltage to an optimum battery voltage level for recharging without detriment to battery life.

The Charging System Description and Operation is divided into 3 sections. The first section describes the charging system components and their integration into the electrical power management. The second section describes charging system operation. The third section describes the instrument panel cluster operation of the charge indicator, driver information center messages, and voltmeter operation.

Charging System Components

Generator

The generator is a serviceable component. If there is a diagnosed failure of the generator it must be replaced as an assembly. The engine drive belt drives the generator. When the rotor is spun it induces an alternating current (AC) into the stator windings. The AC voltage is then sent through a series of diodes for rectification. The rectified voltage has been converted into a direct current (DC) for use by the vehicles electrical system to maintain electrical loads and the battery charge. The voltage regulator integral to the generator controls the output of the generator. It is not serviceable. The voltage regulator controls the amount of current provided to the rotor. If the generator has field control circuit failure, the generator defaults to an output voltage of 13.8 V.

Body Control Module (BCM)

The body control module (BCM) is a GMLAN device. It communicates with the engine control module (ECM) and the instrument panel cluster for electrical power management (electrical power management) operation. The BCM determines the output of the generator and sends the information to the ECM for control of the generator turn on signal circuit. It monitors the generator field duty cycle signal circuit information sent from the ECM for control of the generator. It monitors a battery current sensor, the battery positive voltage circuit, and estimated battery temperature to determine battery state of charge. The BCM performs idle boost.

Battery Current Sensor

The battery current sensor is a serviceable component that is connected to either the negative or positive battery cable at the battery. The battery current sensor is a 3-wire hall effect current sensor. The battery current sensor monitors the battery current. It directly inputs to the BCM. It creates a 5-volt pulse width modulation (PWM) signal of 128 Hz with a duty cycle of 0-100 percent. Normal duty cycle is between 5-95 percent. Between 0-5 percent and 95-100 percent are for diagnostic purposes.

Engine Control Module (ECM)

When the engine is running, the generator turn-on signal is sent to the generator from the ECM, turning on the regulator. The generator's voltage regulator controls current to the rotor, thereby controlling the output voltage. The rotor current is proportional to the electrical pulse width supplied by the regulator. When the engine is started, the regulator senses generator rotation by detecting AC voltage at the stator through an internal wire. Once the engine is running, the regulator varies the field current by controlling the pulse width. This regulates the generator output voltage for proper battery charging and electrical system operation. The generator field duty terminal is connected internally to the voltage regulator and externally to the ECM. When the voltage regulator detects a charging system problem, it grounds this circuit to signal the ECM that a problem exists. The ECM monitors the generator field duty cycle signal circuit, and receives control decisions based on information from the BCM.

Instrument Panel Cluster

The instrument panel cluster provides the customer notification in case a concern with the charging system. There are 2 means of notification, a charge indicator and a driver information center message of SERVICE BATTERY CHARGING SYSTEM if equipped.

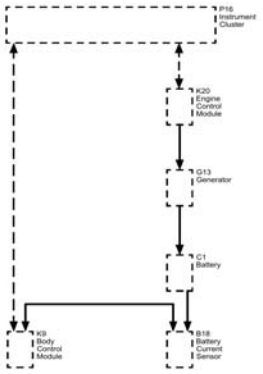

Fig. 42: Charging System Block Diagram
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
DB	Serial Data - GMLAN Low Speed
DB	Serial Data - GMLAN Low Speed
P16	P16 Instrument Cluster
K20	K20 Engine Control Module
G13	G13 Generator
C1	C1 Battery
B18	B18 Battery Current Sensor
K9	K9 Body Control Module

Charging System Operation

The purpose of the charging system is to maintain the battery charge and vehicle loads. There are 6 modes of operation and they include:

- Battery Sulfation Mode
- Charge Mode
- Fuel Economy Mode
- Headlamp Mode
- Start Up Mode
- Voltage Reduction Mode

The engine control module (ECM) controls the generator through the generator turn ON signal circuit. The ECM monitors the generator performance though the generator field duty cycle signal circuit. The signal is a pulse width modulation (PWM) signal of 128 Hz with a duty cycle of 0-100 percent. Normal duty cycle is between 5-95 percent. Between 0-5 percent and 95-100 percent are for diagnostic purposes. The following table shows the commanded duty cycle and output voltage of the generator:

Commanded Duty Cycle	Generator Output Voltage
10%	11 V
20%	11.56 V
30%	12.12 V
40%	12.68 V
50%	13.25 V
60%	13.81 V
70%	14.37 V
80%	14.94 V
90%	15.5 V

The generator provides a feedback signal of the generator voltage output through the generator field duty cycle signal circuit to the ECM. This information is sent to the body control module (BCM). The signal is PWM signal of 128 Hz with a duty cycle of 0-100 percent. Normal duty cycle is between 5-99 percent. Between 0-5 percent and 100 percent are for diagnostic purposes.

Battery Sulfation Mode

The BCM will enter this mode when the interpreted generator output voltage is less than 13.2 V for 45 minutes. When this condition exists the BCM will enter Charge Mode for 2-3 minutes. The BCM will then determine which mode to enter depending on voltage requirements.

Charge Mode

The BCM will enter Charge Mode when ever one of the following conditions are met.

- The wipers are ON for more than 3 seconds.
- GMLAN (Climate Control Voltage Boost Mode Request) is true, as sensed by the HVAC control head. High speed cooling fan, rear defogger and HVAC high speed blower operation can cause the BCM to enter the Charge Mode.
- The estimated battery temperature is less than 0Â°C (32Â°F).
- Battery State of Charge is less than 80 percent.
- Vehicle speed is greater than 145 km/h (90 mph)
- Current sensor fault exists.
- System voltage was determined to be below 12.56 V

When any one of these conditions is met, the system will set targeted generator output voltage to a charging voltage between 13.9-15.5 V, depending on the battery state of charge and estimated battery temperature.

Fuel Economy Mode

The BCM will enter Fuel Economy Mode when the estimated battery temperature is at least 0Â°C (32Â°F) but less than or equal to 80Â°C (176Â°F), the calculated battery current is less than 15 amperes and greater than -8 amperes, and the battery state-of-charge is greater than or equal to 80 percent. Its targeted generator output voltage is the open circuit voltage of the battery and can be between 12.5-13.1 V. The

BCM will exit this mode and enter Charge Mode when any of the conditions described above are present.

Headlamp Mode

The BCM will enter Headlamp Mode when ever the headlamps are ON (high or low beams). Voltage will be regulated between 13.9-14.5 V.

Start Up Mode

When the engine is started the BCM sets a targeted generator output voltage of 14.5 V for 30 seconds.

Voltage Reduction Mode

The BCM will enter Voltage Reduction Mode when the calculated ambient air temperature is above 0Â°C (32Â°F). The calculated battery current is less than 1 ampere and greater than -7 amperes, and the generator field duty cycle is less than 99 percent. Its targeted generator output voltage is 12.9 V. The BCM will exit this mode once the criteria are met for Charge Mode.

Instrument Panel Cluster Operation

Charge Indicator Operation

The instrument panel cluster illuminates the charge indicator and displays a warning message in the driver information center if equipped, when the one or more of the following occurs:

- The engine control module (ECM) detects that the generator output is less than 11 V or greater than 16 V. The instrument panel cluster receives a GMLAN message from the ECM requesting illumination.
- The instrument panel cluster determines that the system voltage is less than 11 V or greater than 16 V for more than 30 seconds. The instrument panel cluster receives a GMLAN message from the body control module (BCM) indicating there is a system voltage range concern.
- The instrument panel cluster performs the displays test at the start of each ignition cycle. The indicator illuminates for approximately 3 seconds.

Display Message: BATTERY NOT CHARGING SERVICE CHARGING SYSTEM or SERVICE BATTERY CHARGING SYSTEM

The BCM and the ECM will send a serial data message to the driver information center for the BATTERY NOT CHARGING SERVICE CHARGING SYSTEM or SERVICE BATTERY CHARGING SYSTEM message to be displayed. It is commanded ON when a charging system DTC is a current DTC. The message is turned OFF when the conditions for clearing the DTC have been met.

ELECTRICAL POWER MANAGEMENT DESCRIPTION AND OPERATION

Electrical Power Management

The electrical power management is used to monitor and control the charging system and alert the driver of possible problems within the charging system. The electrical power management system makes the most efficient use of the generator output, improves the battery state-of-charge, extends battery life, and manages system electrical loads.

The load shed operation is a means of reducing electrical loads during a low voltage or low battery state-of-charge condition.

The idle boost operation is a means of improving generator performance during a low voltage or low battery state-of-charge condition.

Each electrical power management function, either idle boost or load shed, is activated in incremental steps. For example, idle boost 1 must be active before idle boost 2 can be active. The criteria used by the body control module (BCM) to regulate electrical power management are outlined below:

Load Shed 3 End	-	Greater Than 12.0 V	Clear Load Shed 3

STARTING SYSTEM DESCRIPTION AND OPERATION

The starter motors are non-repairable starter motors. They have pole pieces that are arranged around the armature. Both solenoid windings are energized. The pull-in winding circuit is completed to the ground through the starter motor. The windings work together magnetically to pull and hold in the plunger. The plunger moves the shift lever. This action causes the starter drive assembly to rotate on the armature shaft spline as it engages with the flywheel ring gear on the engine. Moving at the same time, the plunger also closes the solenoid switch contacts in the starter solenoid. Full battery voltage is applied directly to the starter motor and it cranks the engine.

As soon as the solenoid switch contacts close, current stops flowing thorough the pull-in winding because battery voltage is applied to both ends of the windings. The hold-in winding remains energized. Its magnetic field is strong enough to hold the plunger, shift lever, starter drive assembly, and solenoid switch contacts in place to continue cranking the engine. When the engine starts, pinion overrun protects the armature from excessive speed until the switch is opened.

When the ignition switch is released from the START position, the START relay opens and battery voltage is removed from the starter solenoid S terminal. Current flows from the motor contacts through both windings to the ground at the end of the hold-in winding. However, the direction of the current flow through the pull-in winding is now opposite the direction of the current flow when the winding was first energized.

The magnetic fields of the pull-in and hold-in windings now oppose one another. This action of the windings, along with the help of the return spring, causes the starter drive assembly to disengage and the solenoid switch contacts to open simultaneously. As soon as the contacts open, the starter circuit is turned off.

Circuit Description (Key Start)

When the ignition switch is placed in the Start position, a discrete signal is supplied to the body control module (BCM) notifying it that the ignition is in the Start position. The BCM then sends a message to the engine control module (ECM) notifying it that CRANK has been requested. The ECM verifies that the transmission is in Park or Neutral. If it is, the ECM then supplies 12 V to the control circuit of the crank relay. When this occurs, battery positive voltage is supplied through the switch side of the crank relay to the S terminal of the starter solenoid.

SYMPTOMS - POWER OUTLETS

Visual/Physical Inspection

- Inspect for aftermarket devices which can affect the operation of the power outlets. Refer to **Checking Aftermarket Accessories**
- Inspect the accessible system components or the visible system components for obvious damage or for obvious conditions which can cause the symptom.

Intermittent

Electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent**

Conditions and Poor Connections

Symptom List

Refer to **Power Outlet Receptacle Malfunction** in order to diagnose the system.

POWER OUTLET RECEPTACLE MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	1	1	-	-
Ground	-	1	-	-
1. Accessory Power Receptacle Malfunction				

Circuit/System Description

The accessory power receptacles are supplied B+ all the time.

Description and Operation

Power Outlets Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate X80 accessory power receptacle.

2. Test for less than 5 Ω between the ground circuit terminal C and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Ignition ON, verify that a test lamp illuminate between the B+ circuit terminal A and ground.
    - If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance.
4. If all circuits test normal, test or replace the X80 accessory power receptacle.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Cigar Lighter Receptacle or 12-Volt Accessory Power Receptacle Replacement

REPAIR INSTRUCTIONS

CIGAR LIGHTER RECEPTACLE OR 12-VOLT ACCESSORY POWER RECEPTACLE REPLACEMENT

Special Tools

J 42059 Cigar Lighter Socket Remover

Removal Procedure

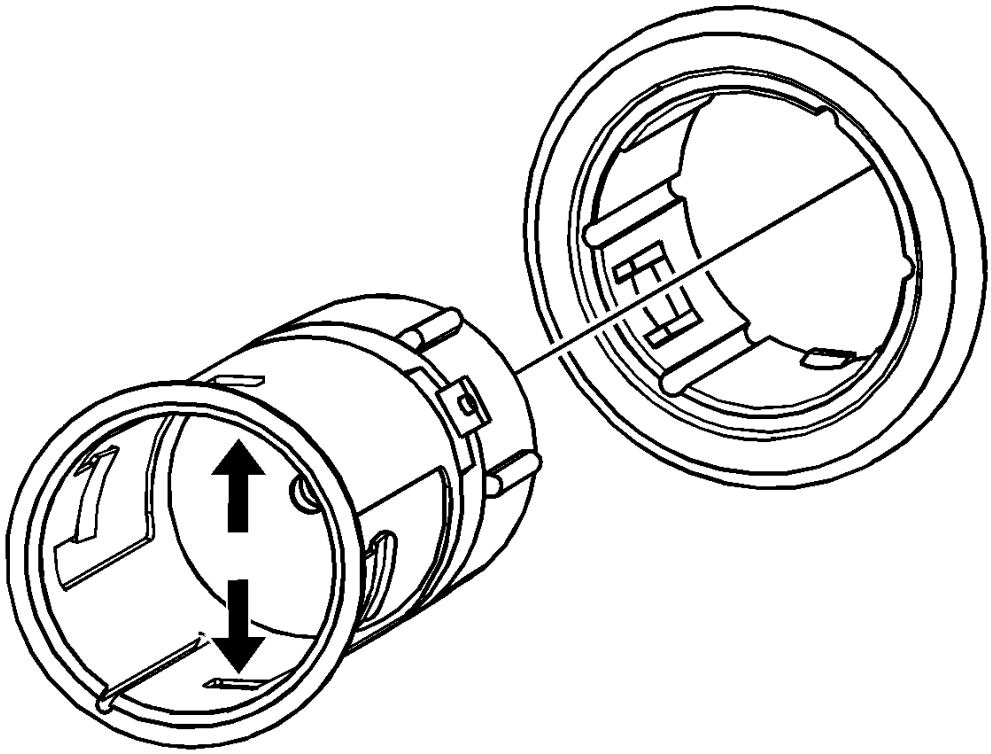

Fig. 2: View Of Cigar Lighter Socket/Accessory Power Outlet
Courtesy of GENERAL MOTORS COMPANY

1. Remove the auxiliary power outlet fuse from the fuse block.
2. Remove the receptacle:
    1. Look into the receptacle. There are two 3 mm (0.11 in) tab windows 12 mm (0.47 in) from the front of the receptacle. The **J 42059** Cigar Lighter Socket Remover pushes the plastic latches from these tab windows and the receptacle can be pulled straight out.
    2. Place one side of the "T" portion of the **J 42059** Cigar Lighter Socket Remover into the tab window. The **J 42059** Cigar Lighter Socket Remover will not fit straight into the receptacle. Angle the **J 42059** Cigar Lighter Socket Remover slightly for insertion into the receptacle.
    3. Insert the other side of the "T" into the opposite tab window.

       You must move the **J 42059** Cigar Lighter Socket Remover handle toward horizontal to engage the other tab window.

    4. Use the **J 42059** Cigar Lighter Socket Remover to pull the receptacle straight out.

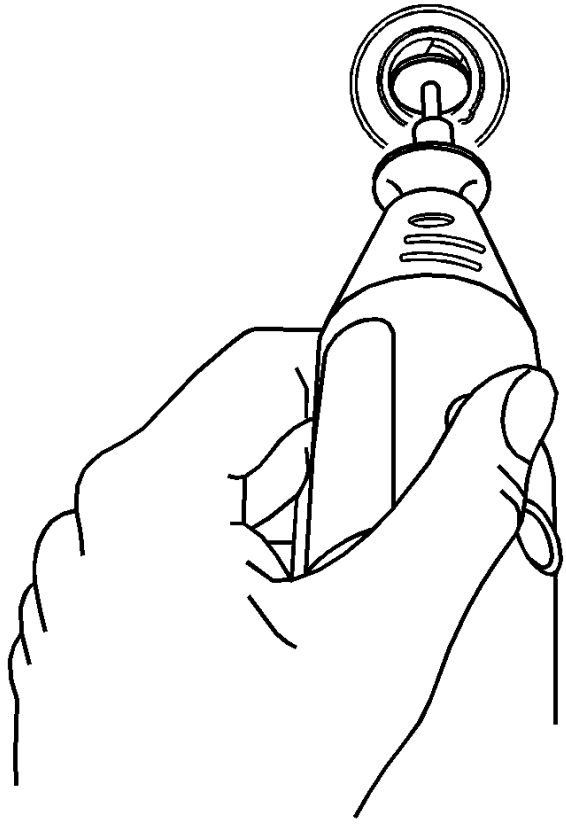

Fig. 3: Removing Cigar Housing Using Grinding Tool
Courtesy of GENERAL MOTORS COMPANY

3. If **J 42059** Cigar Lighter Socket Remover tool fails to release the lighter socket from the retainer, perform the following alternate method:
    1. Insert a small grinding tool with a cutoff wheel into the socket.
    2. Remove the plastic latches in the 3 mm (0.11 in) square windows.
    3. Use the **J 42059** Cigar Lighter Socket Remover as directed above to remove the socket.

Installation Procedure

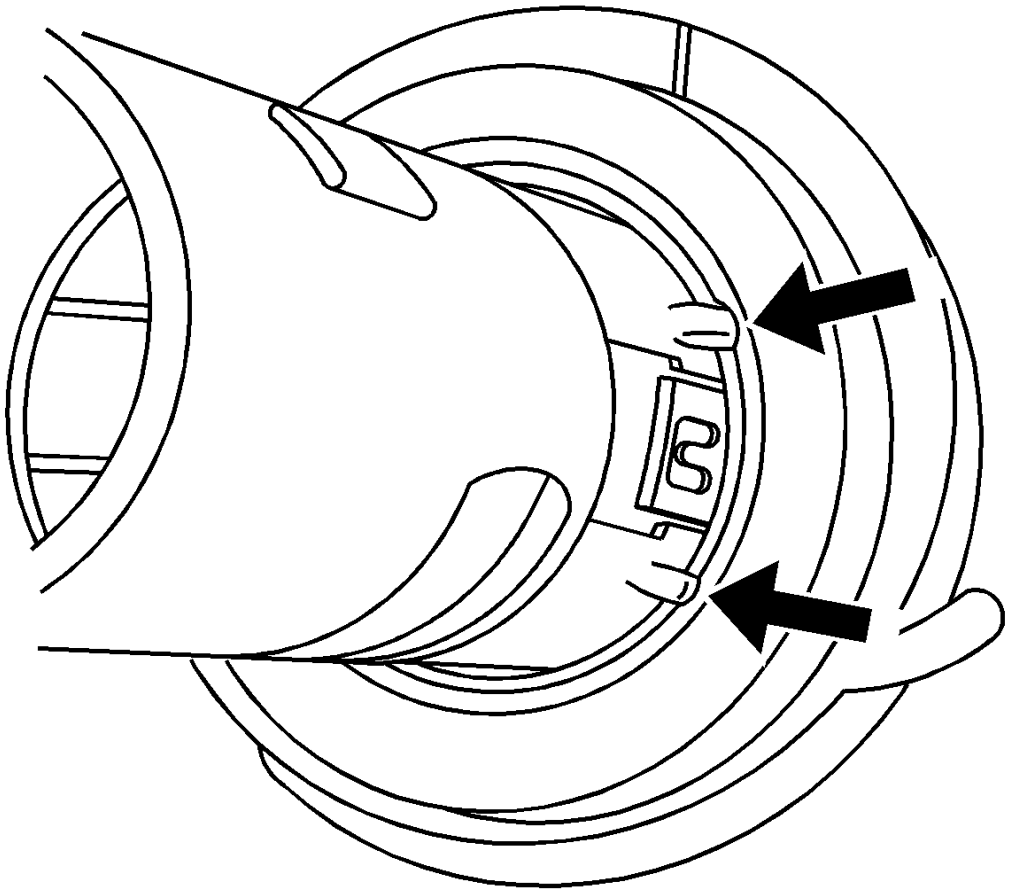

Fig. 4: View Of Receptacle Tabs & Retainer Slots
Courtesy of GENERAL MOTORS COMPANY

1. Route the connector through the retainer. Align the accessory power receptacle retainer to the slot in the opening.
2. Install the retainer by pressing into place fully seated.
3. Connect the electrical connector to the receptacle.
4. Align the tabs on the receptacle to the slots in the retainer. Install the accessory power receptacle by pressing into place until fully seated.
5. Install the accessory power receptacle fuse.

DESCRIPTION AND OPERATION

POWER OUTLETS DESCRIPTION AND OPERATION

12 Volt Power Outlet Receptacle Description and Operation

The accessory power receptacles are supplied battery voltage at all times.

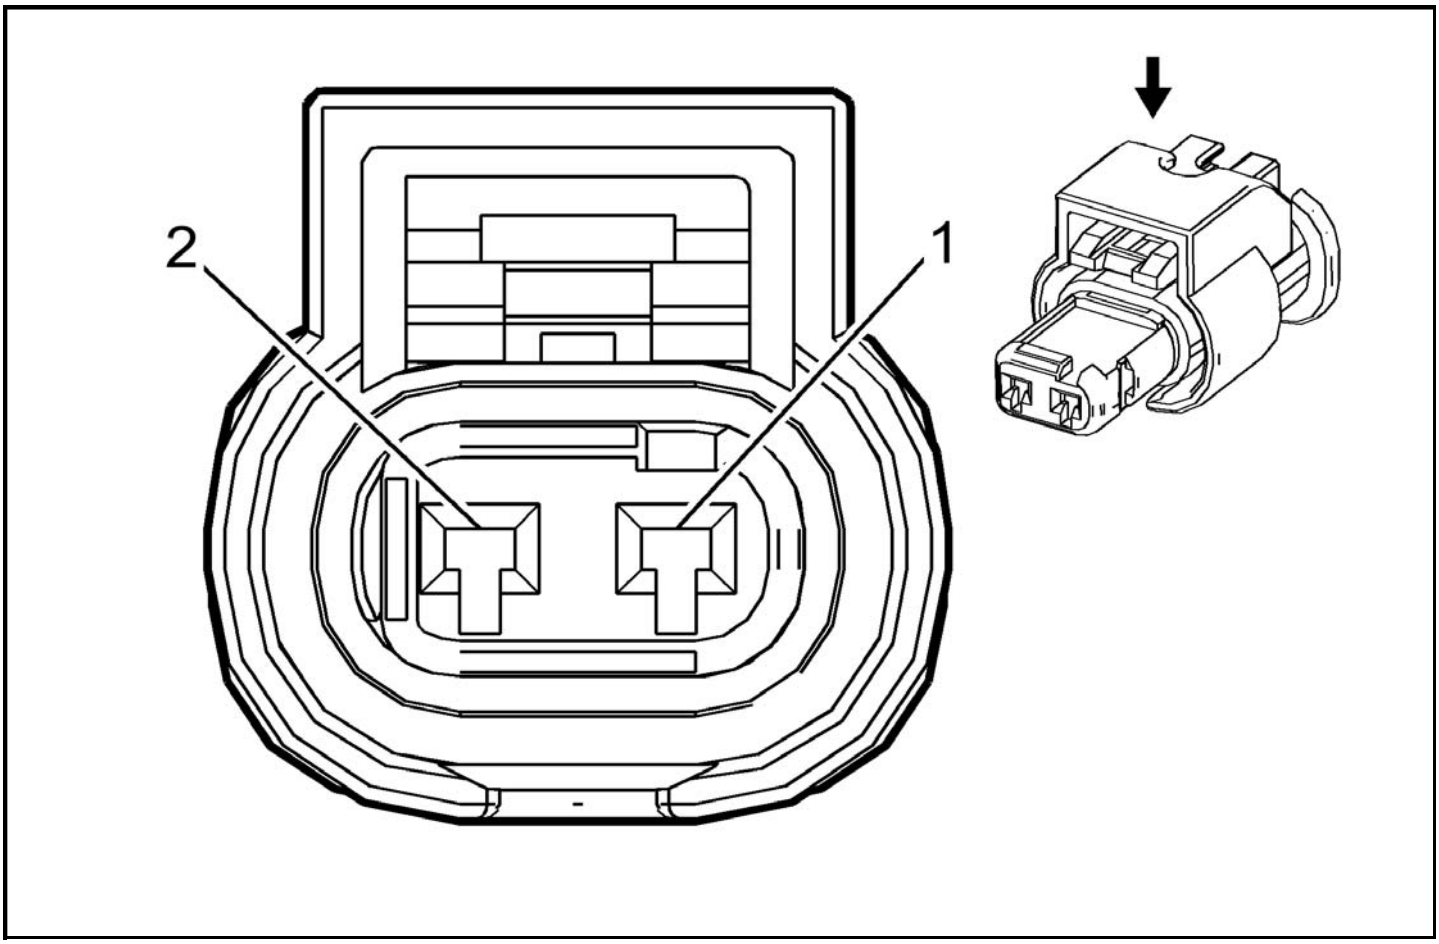
A/C COMPRESSOR CLUTCH



Connector Part Information

- Harness Type: Engine
- OEM Connector: 13761652
- Service Connector: 13577519
- Description: 2-Way F 1.2 MCP Series, Sealed (BK)

Terminal Part Information

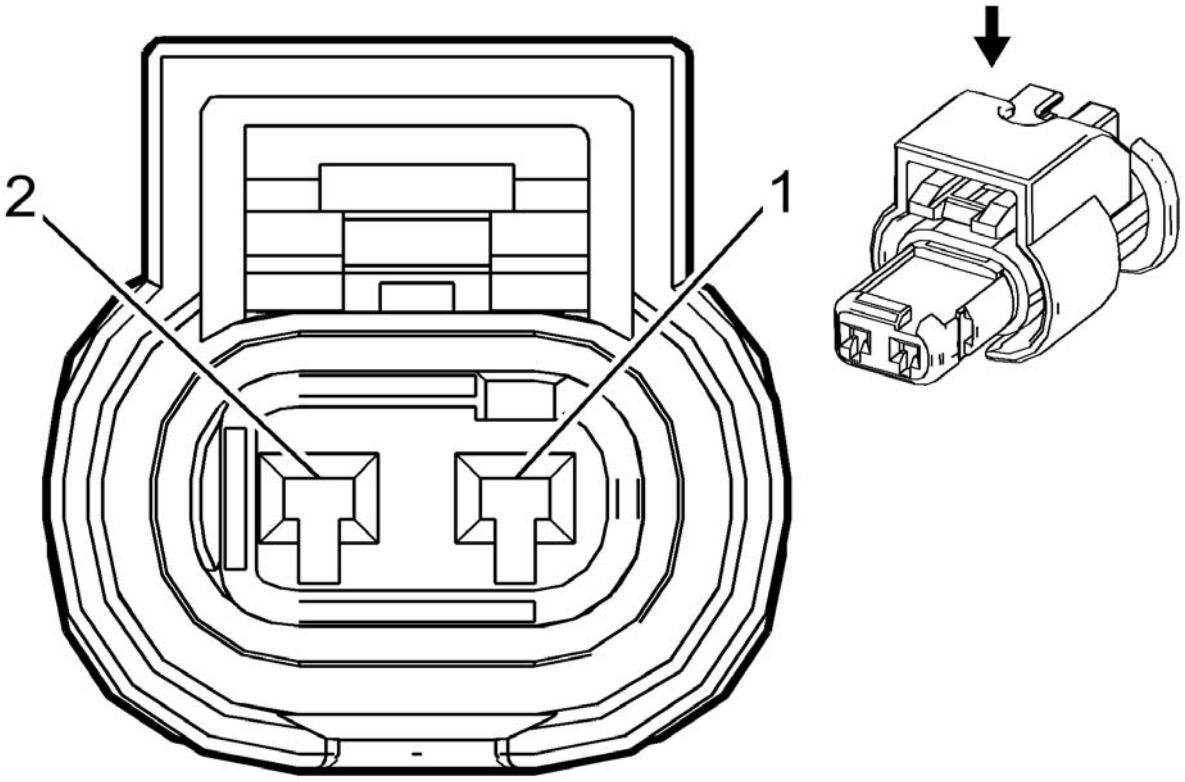
- Terminated Lead: Service by Harness - See Part Catalog
- Release Tool: J-38125-12A

- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

A/C Compressor Clutch

Pin	Wire	Circuit	Function
1	0.8 BK	1050	Ground
2	0.5 D-GN	59	A/C Compressor Clutch Supply Voltage

A/C COMPRESSOR SOLENOID VALVE



Connector Part Information

- Harness Type: Engine
- OEM Connector: 13927762
- Service Connector: Not Available
- Description: 2-Way F 1.2 MCP Series, Sealed (BK)

Terminal Part Information

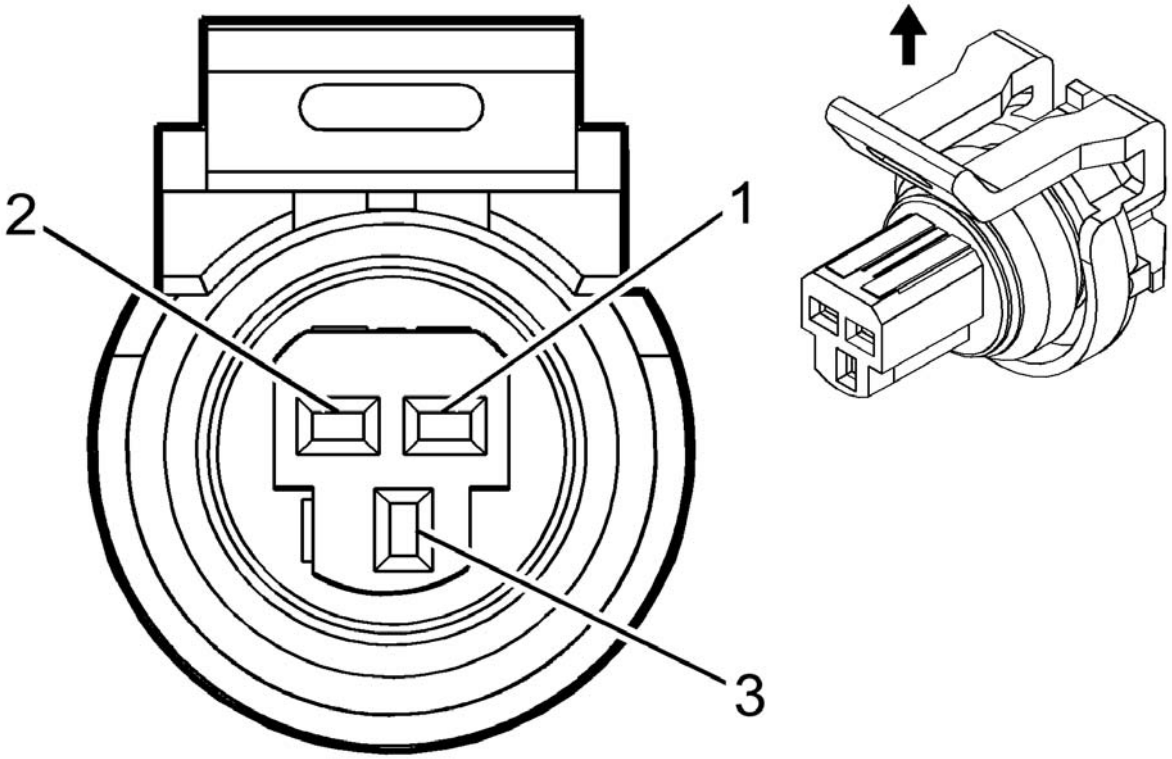
- Terminated Lead: Service by Harness- See Part Catalog

- Release Tool: Not Available
- Diagnostic Test Probe: J-35616-16 (L-GN)
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

A/C Compressor Solenoid Valve

Pin	Wire	Circuit	Function
1	0.5 PK	7574	Electric Variable Displacement Control
2	0.5 TN	7573	Electric Variable Displacement Compressor Supply

A/C REFRIGERANT PRESSURE SENSOR



Connector Part Information

- Harness Type: Engine
- OEM Connector: 13602480
- Service Connector:88988301
- Description: 3-Way F GT 150 Series, Sealed (BK)

Terminal Part Information

- Terminated Lead: 13576360
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 15326267/19
- Core/Insulation Crimp: E/4

Pin	Wire	Circuit	Function
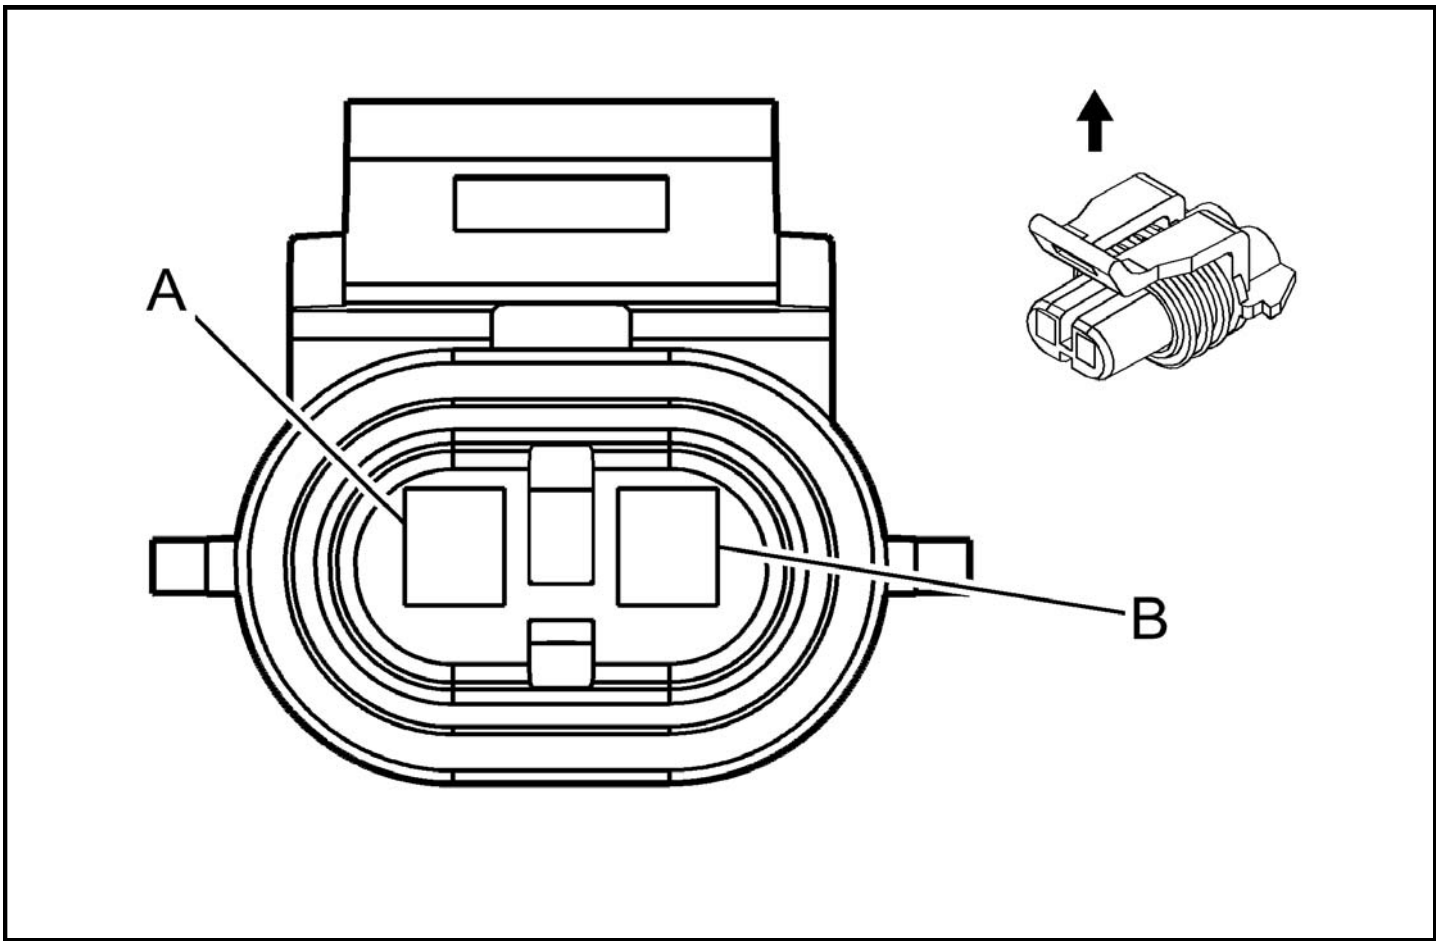
A	0.35 WH/BK	1236	Air Temperature Door Control B
B	0.35 D-BU	1646	Air Temperature Door Control A

AMBIENT AIR TEMPERATURE SENSOR



Connector Part Information

- Harness Type: Forward Lamp
- OEM Connector: 12052642
- Service Connector: 12101856
- Description: 2-Way F Metri-Pack 150 Series, Sealed (L-GN)

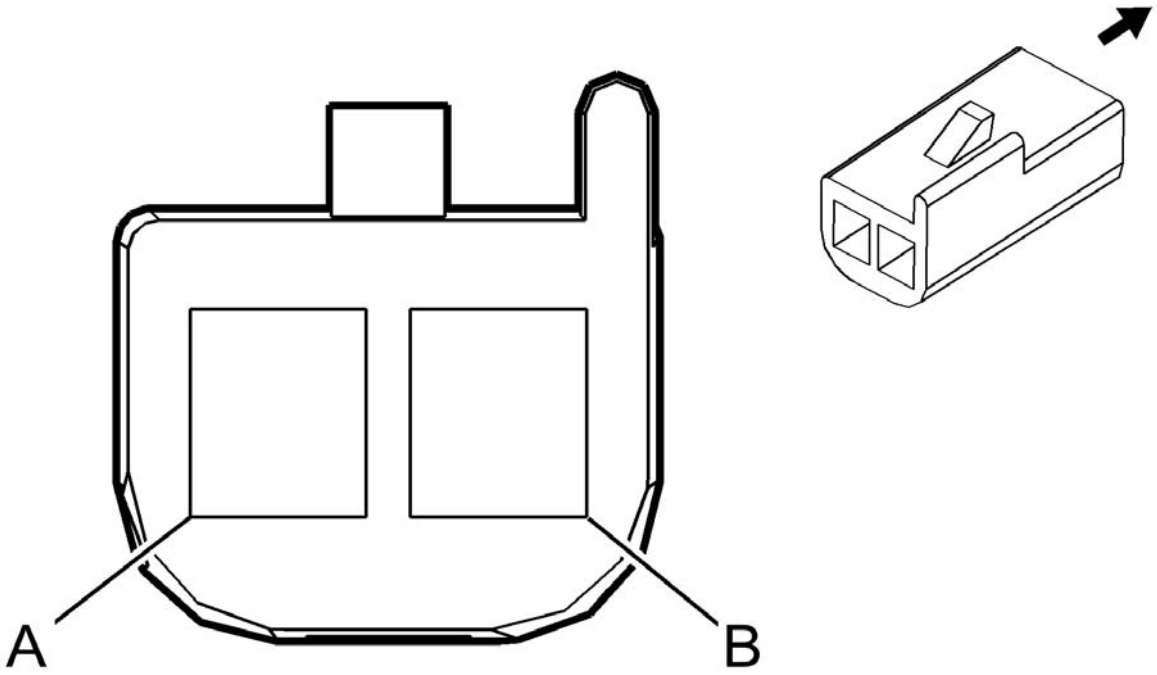
Terminal Part Information

- Terminated Lead: 13575419
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 12048074/2
- Core/Insulation Crimp: E/1

Ambient Air Temperature Sensor

Pin	Wire	Circuit	Function
A	0.35 L-GN/BK	735	Ambient Air Temperature Sensor Signal
B	0.35 YE	61	Low Reference

AMBIENT LIGHT SENSOR



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 12047662
- Service Connector: 12085535
- Description: 2-Way F Metri-Pack 150 Series (BK)

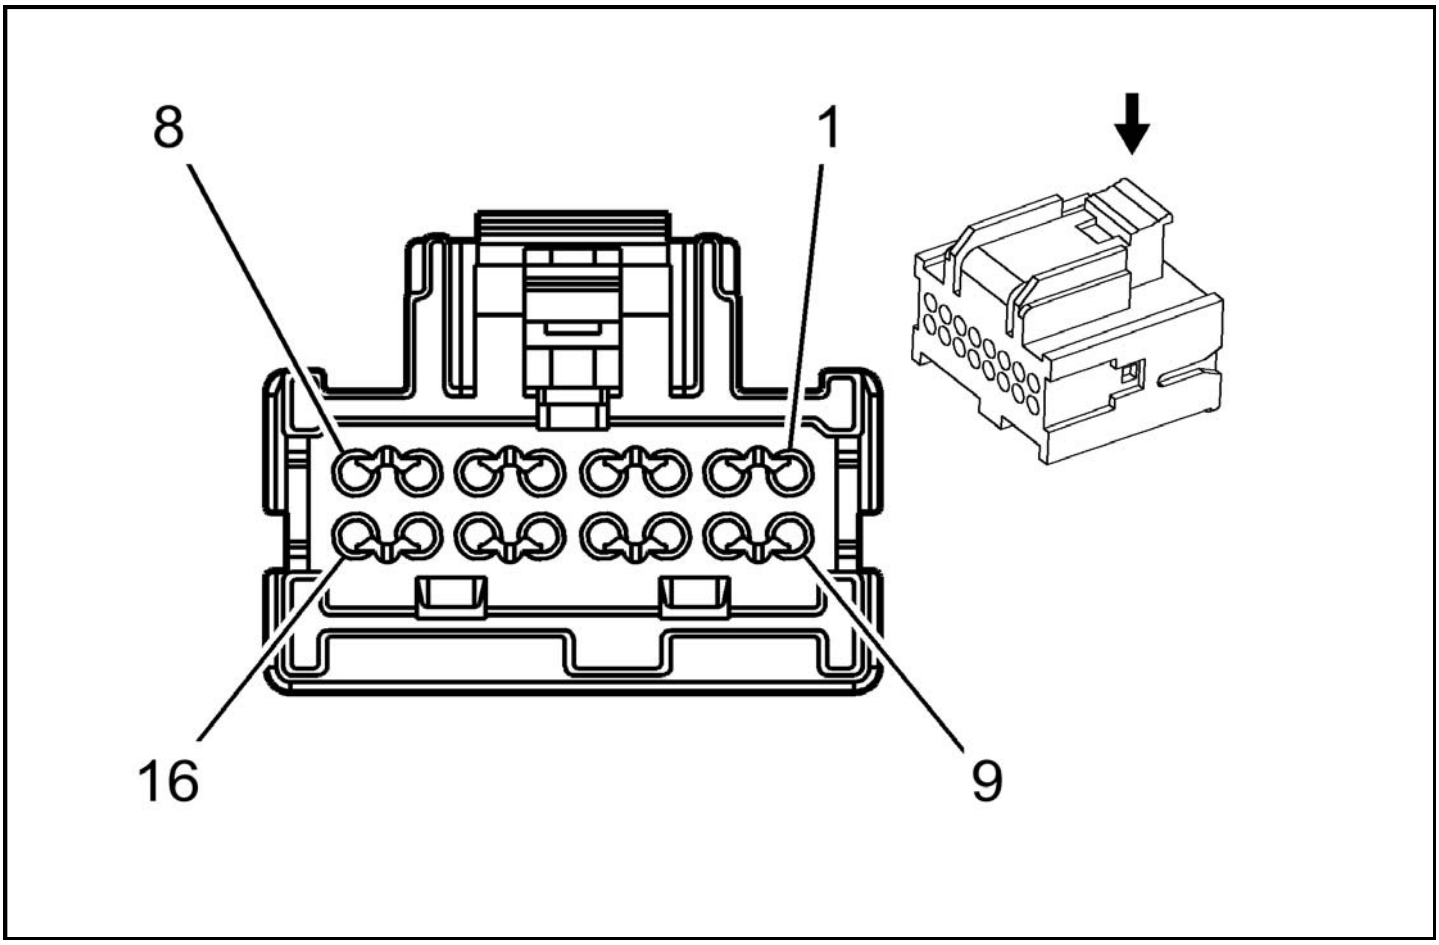
Terminal Part Information

- Terminated Lead: 13575464
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/5
- Core/Insulation Crimp: E/C

Ambient Light Sensor

Pin	Wire	Circuit	Function
A	0.35 L-GN/BK	1137	DRL Ambient Light Sensor Signal
B	0.5 BK/WH	1551	Ground

AUDIO AMPLIFIER X1 (UQ3)



Connector Part Information

- Harness Type: Body
- OEM Connector: 15416970
- Service Connector: 13504130
- Description: 16-Way F Micro-Pack 64 Series (BK)

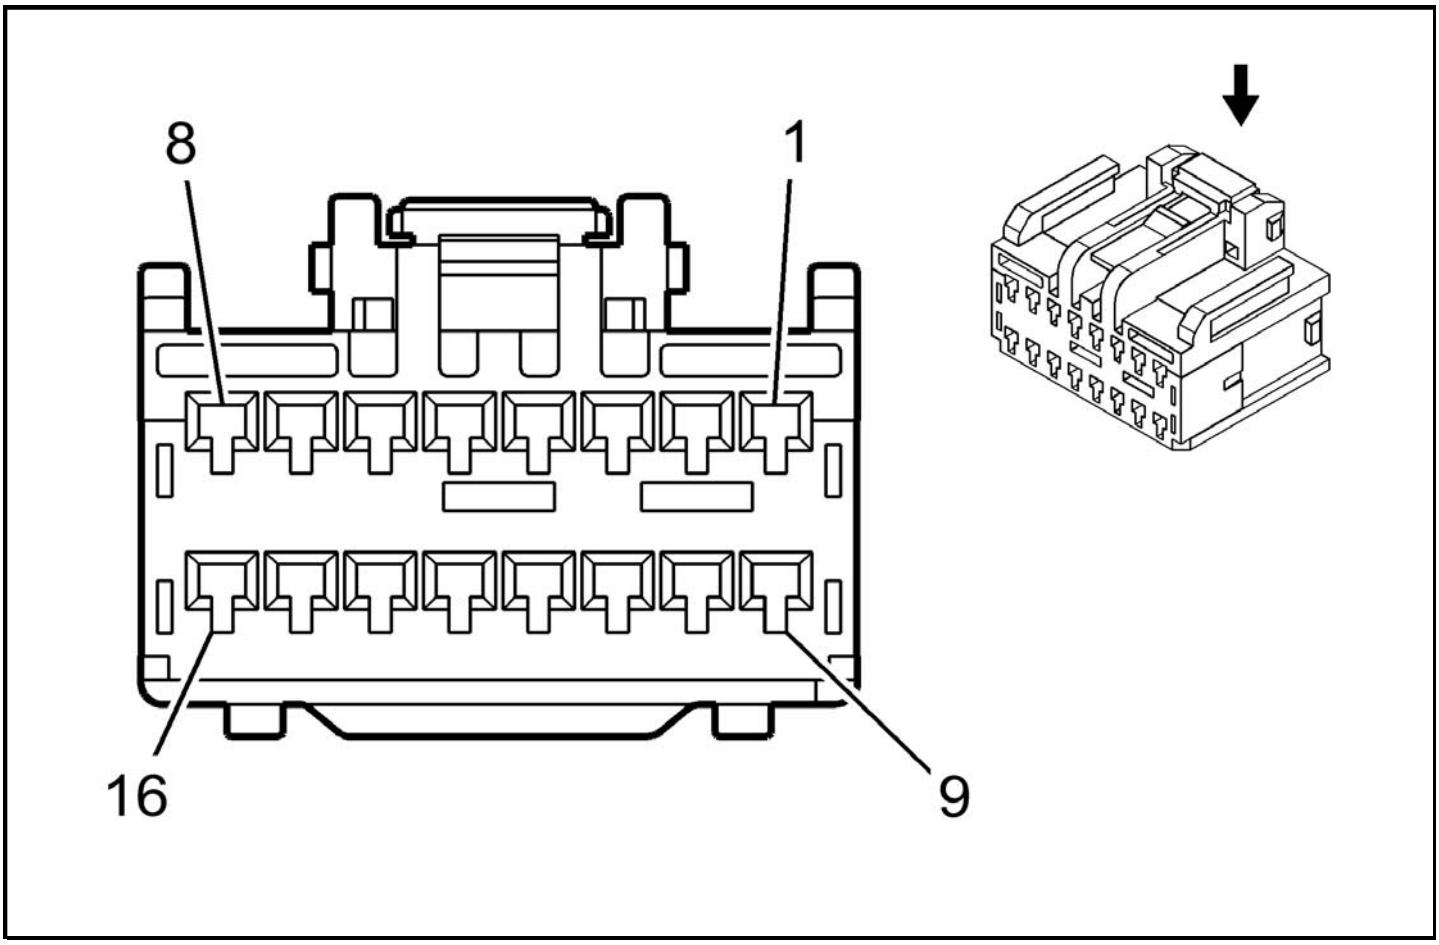
Terminal Part Information

- Terminated Lead: Service by Harness - See Part Catalog
- Release Tool: J-38125-21
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: 15359541/4
- Core/Insulation Crimp: M/M

Audio Amplifier X1 (UQ3)

Pin	Wire	Circuit	Function
1-3	-	-	Not Used
4	0.5 TN	1946	Right Rear Low Level Audio Signal (-)
5	0.5 BN	1999	Left Rear Low Level Audio Signal (-)
6	0.5 L-GN/BK	1948	Right Front Low Level Audio Signal (-)
7	0.5 D-GN	1947	Left Front Low Level Audio Signal (-)
8	0.5 PK	5165	Antenna 14V Switched Supply Voltage
9-10	-	-	Not Used
11	0.35 OG	5748	Radio Audio Mute Signal
12	0.5 D-BU	546	Right Rear Low Level Audio Signal (+)
13	0.5 BN/WH	599	Left Rear Low Level Audio Signal (+)
14	0.5 L-GN	512	Right Front Low Level Audio Signal (+)
15	0.5 TN	511	Left Front Low Level Audio Signal (+)
16	-	-	Not Used

AUDIO AMPLIFIER X2 (UQ3)



Connector Part Information

- Harness Type: Body
- OEM Connector: 15489823

- Service Connector: 15134091
- Description: 16-Way F 1.5 Series (BK)

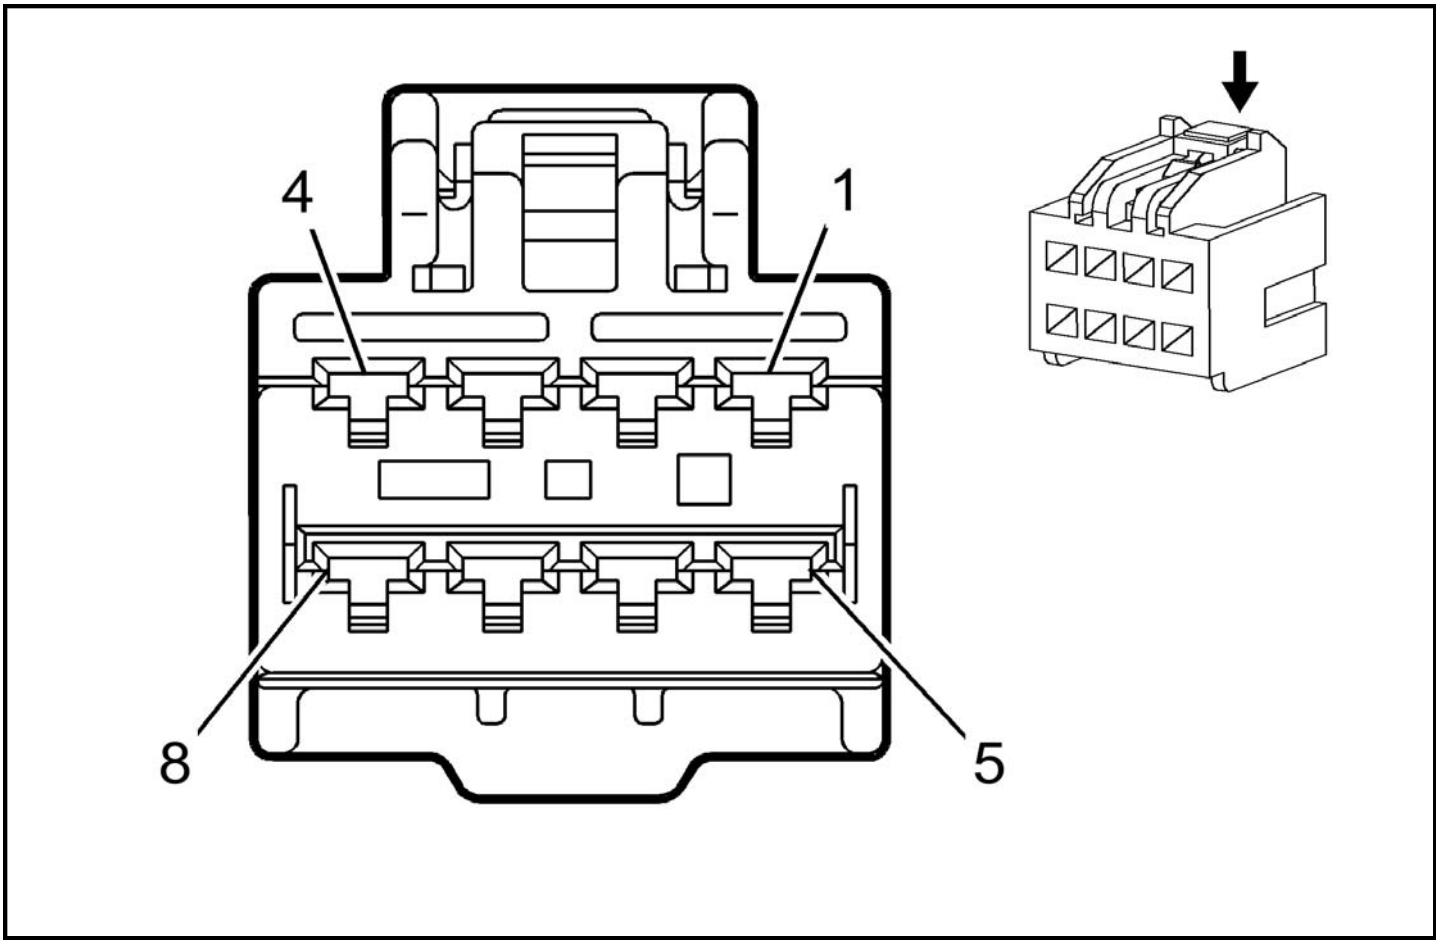
Terminal Part Information

- Terminated Lead: 13575790
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 8240-0128/22
- Core/Insulation Crimp: C/A

Audio Amplifier X2 (UQ3)

Pin	Wire	Circuit	Function
1	0.8 D-GN	117	Right Front Speaker Output (-)
2	0.8 L-GN	200	Right Front Speaker Output (+)
3	0.8 GY	118	Left Front Speaker Output (-)
4	0.8 TN	201	Left Front Speaker Output (+)
5	0.8 L-BU	115	Right Rear Speaker Output (-)
6	0.8 D-BU	46	Right Rear Speaker Output (+)
7	0.8 YE	116	Left Rear Speaker Output (-)
8	0.8 BN	199	Left Rear Speaker Output (+)
9-16	-	-	Not Used

AUDIO AMPLIFIER X3 (UQ3)



Connector Part Information

- Harness Type: Body
- OEM Connector: 15491286
- Service Connector: 13580111
- Description: 8-Way F 2.8 Series (BK)

Terminal Part Information

- Pins:2, 3, 6, 7
- Terminated Lead: 13582326
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-35 (VT)
- Terminal/Tray: 8100-4444/22
- Core/Insulation Crimp: 2/A

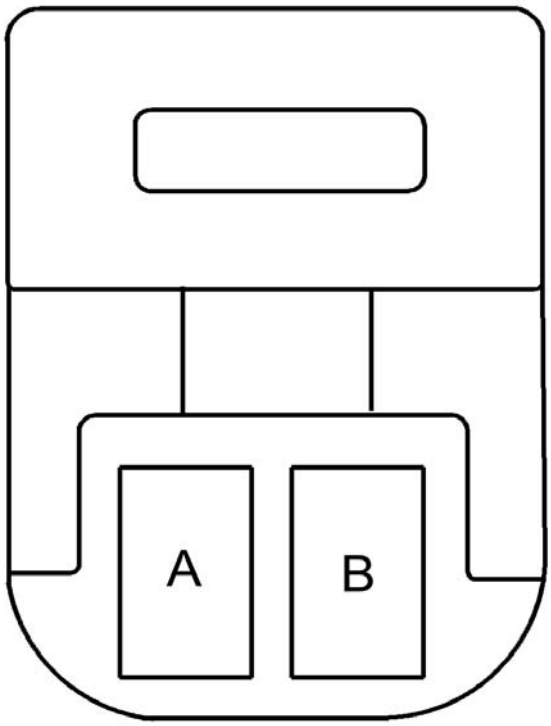
- Pins: 4, 8
- Terminated Lead: 13575578
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-35 (VT)
- Terminal/Tray: 8100-4445/22

- Core/Insulation Crimp: 4/4

Audio Amplifier X3 (UQ3)

Pin	Wire	Circuit	Function
1	-	-	Not Used
2	0.8 L-BU/BK	315	Right Subwoofer Speaker Output (-)
3	0.8 L-GN/BK	1794	Left Subwoofer Speaker Output (-)
4	2 RD/WH	640	Battery Positive Voltage
5	-	-	Not Used
6	0.8 D-GN	1795	Right Subwoofer Speaker Output (+)
7	0.8 D-BU/WH	346	Left Subwoofer Speaker Output (+)
8	2 BK/WH	851	Ground

AUTOMATIC TRANSMISSION INPUT SHAFT SPEED (ISS) SENSOR



Connector Part Information

- Harness Type: Transmission
- OEM Connector: 15473843
- Service Connector: Service by Harness- See Part Catalog
- Description: 2-Way F Metri-Pack 150.2 Series (CR)

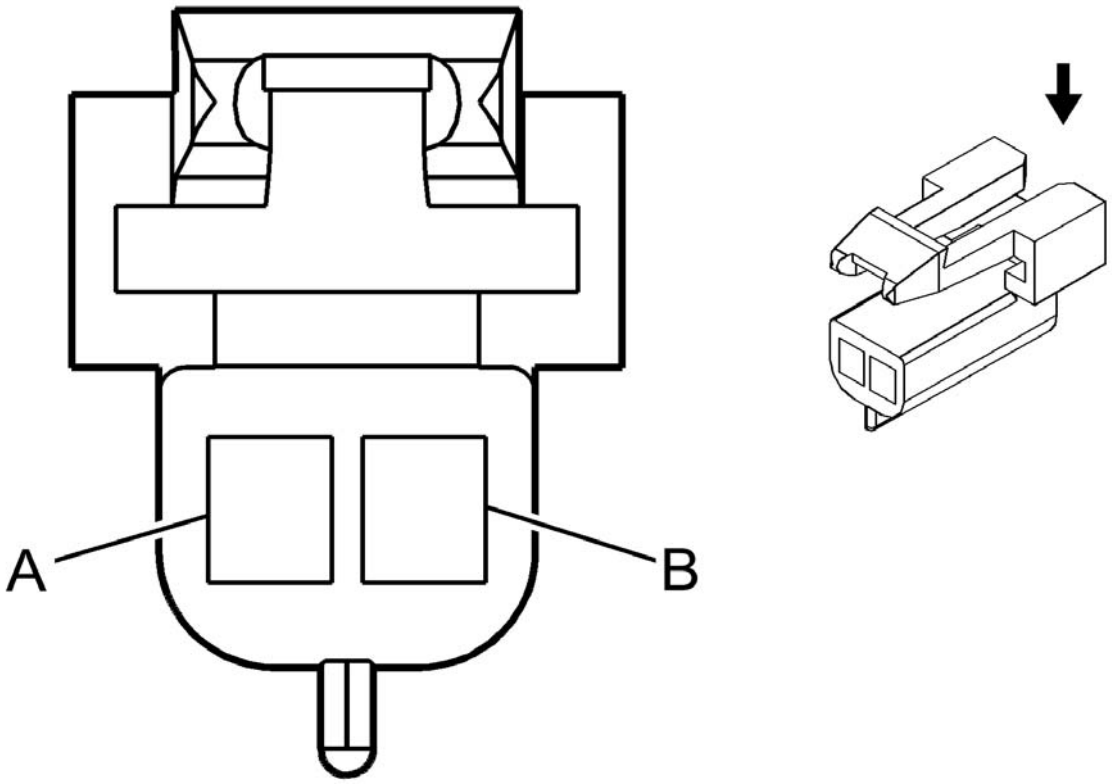
Terminal Part Information

- Terminal/Tray: 12124075/5
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 12180559-1/J-35616-14 (GN)

Automatic Transmission Input Shaft Speed (ISS) Sensor

Pin	Wire	Circuit	Function
A	0.5 D-GN	1231	AT ISS Low Signal
B	0.5 BK	1230	AT ISS High Signal

AUTOMATIC TRANSMISSION SHIFT LOCK CONTROL SOLENOID (WITHOUT D55)



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 12052832
- Service Connector: 13583033
- Description: 2-Way F Metri-Pack 150 Series (BK)

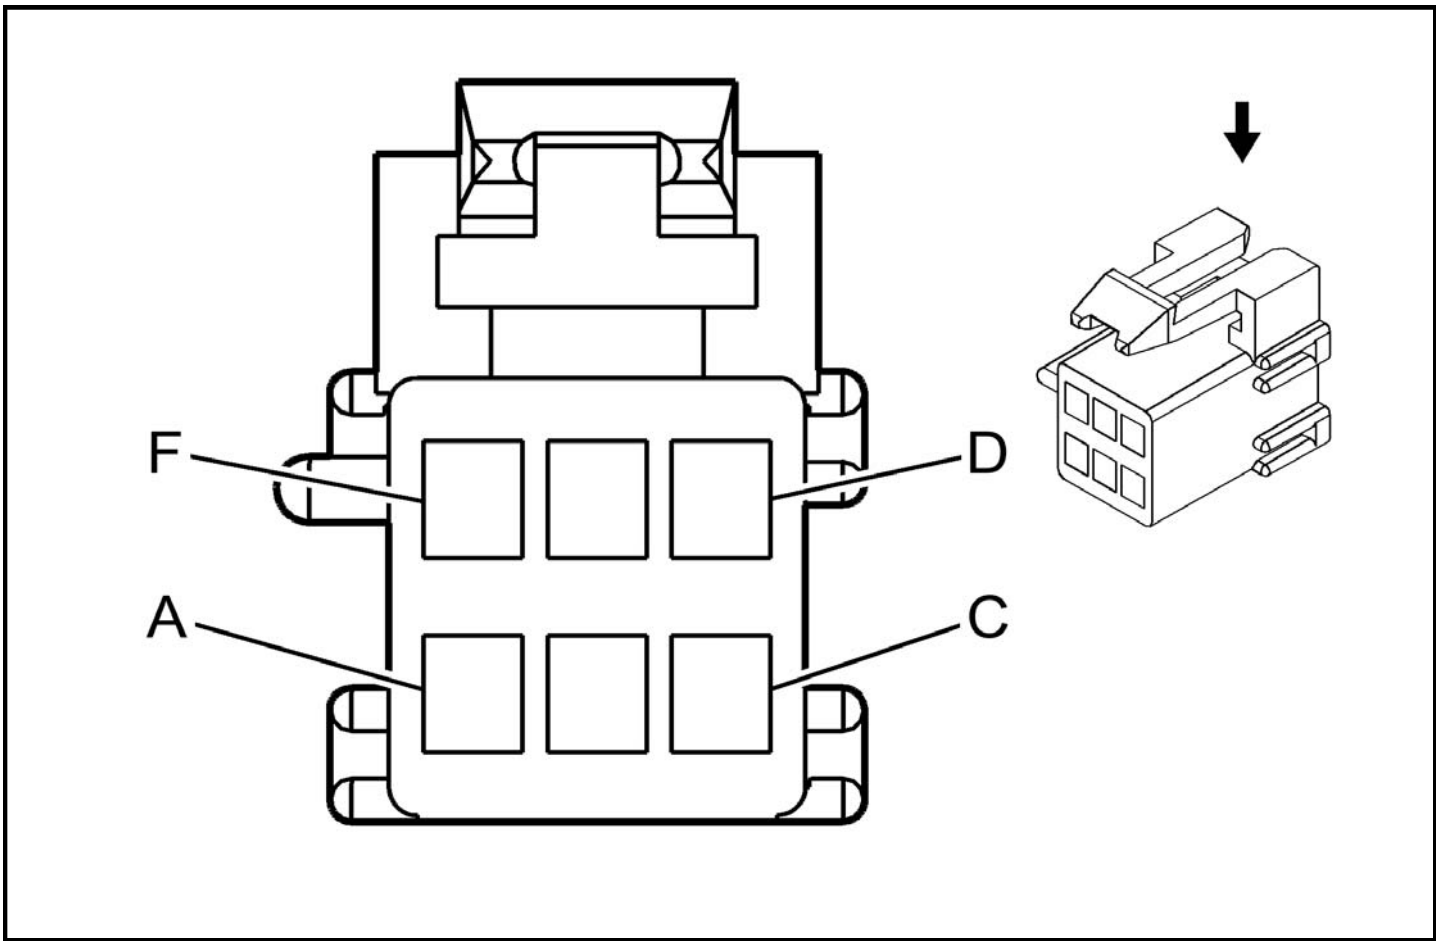
Terminal Part Information

- Terminated Lead: Service by Harness - See Part Catalog
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/2
- Core/Insulation Crimp: E/A

Automatic Transmission Shift Lock Control Solenoid (without D55)

Pin	Wire	Circuit	Function
A	0.8 D-GN/WH	1135	A/T Shift Lock Control Solenoid Supply Voltage
B	BK	1450	Ground

AUTOMATIC TRANSMISSION SHIFT LOCK CONTROL SOLENOID (D55)



Connector Part Information

- Harness Type: Body
- OEM Connector: 12064762
- Service Connector: 13583923
- Description: 6-Way F Metri-Pack 150 Series (GY)

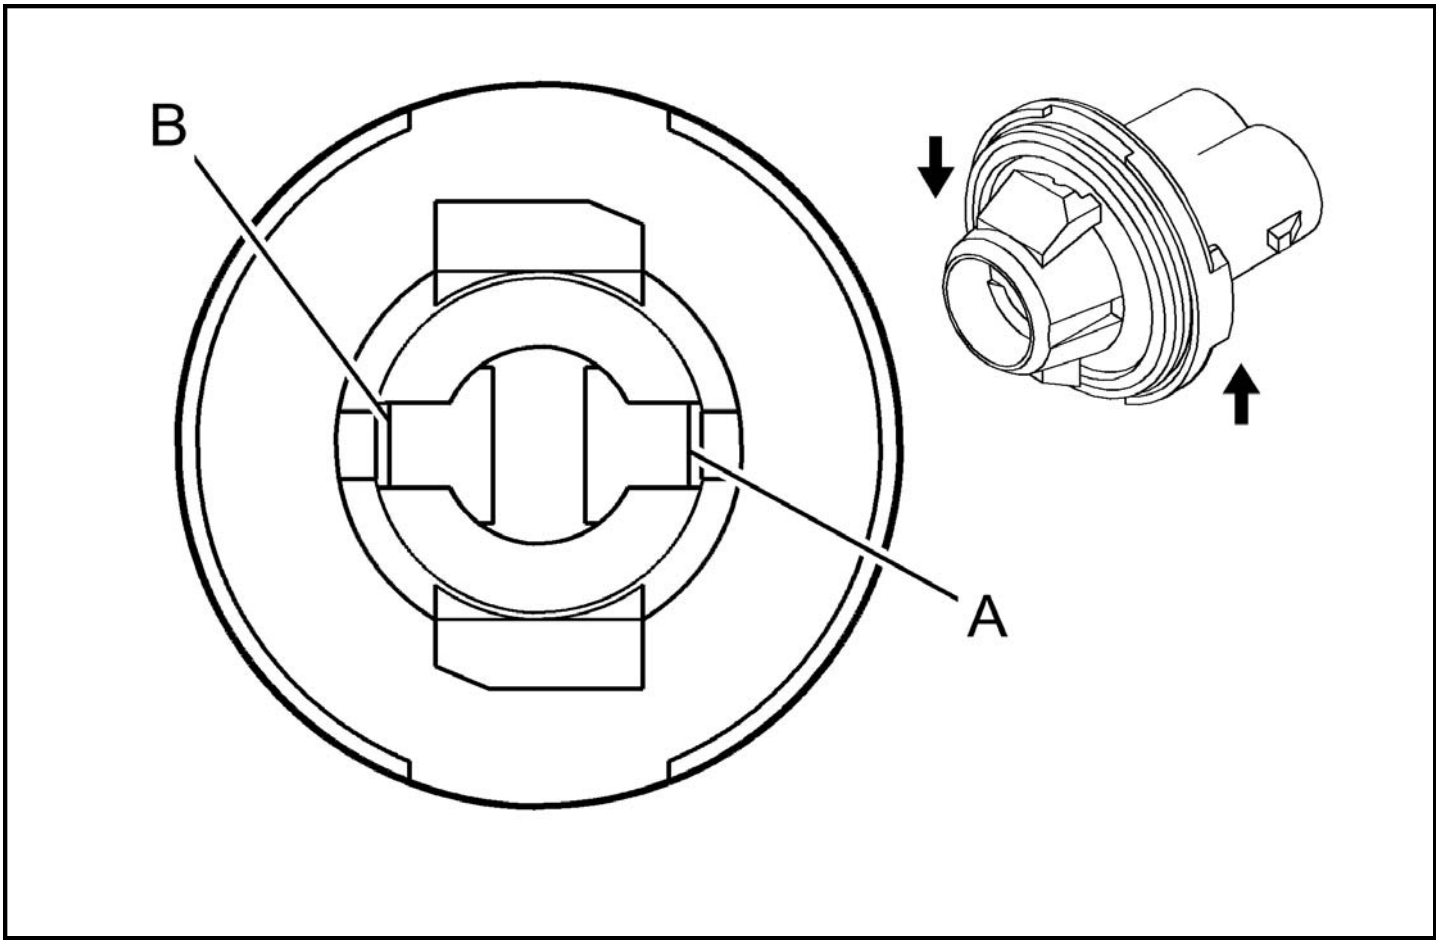
Terminal Part Information

- Terminated Lead: 13575464
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/5
- Core/Insulation Crimp: E/C

Automatic Transmission Shift Lock Control Solenoid (D55)

Pin	Wire	Circuit	Function
A	0.8 BK	750	Ground
B	0.35 D-GN/WH	1135	A/T Shift Lock Control Solenoid Supply Voltage
C	0.35 PU/WH	1630	Steering Column Key Cylinder Lock Solenoid Control
D-E	-	-	Not Used
F	0.35 YE	643	Accessory Voltage

BACKUP LAMP - LEFT



Connector Part Information

- Harness Type: Left Tail Lamp
- OEM Connector: 15324946
- Service Connector: 88986416
- Description: 2-Way F Lamp Socket Wedge Base W2 (D-GY)

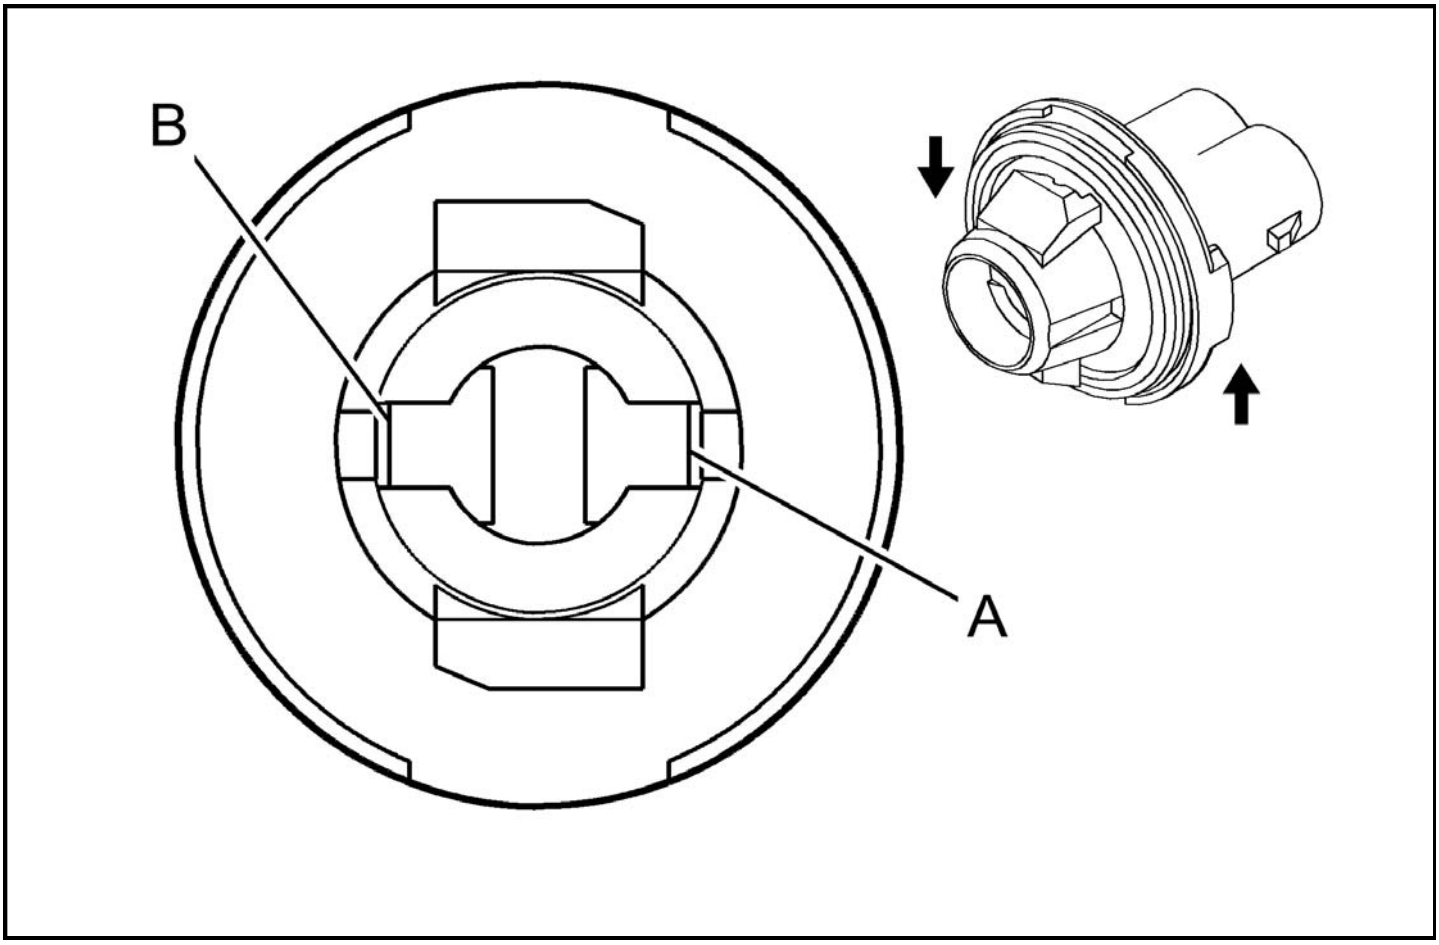
Terminal Part Information

- Terminal/Tray: 12124471/5
- Core/Insulation Crimp: 2/3
- Release Tool/Test Probe: 12094430/ Not Available

Backup Lamp - Left

Pin	Wire	Circuit	Function
A	0.5 BN	24	Backup Lamp Supply Voltage
B	0.5 BK	750	Ground
	0.5 BK	750	Ground

BACKUP LAMP - RIGHT



Connector Part Information

- Harness Type: Right Tail Lamp
- OEM Connector: 15324946
- Service Connector: 88986416
- Description: 2-Way F Lamp Socket Wedge Base W2 (D-GY)

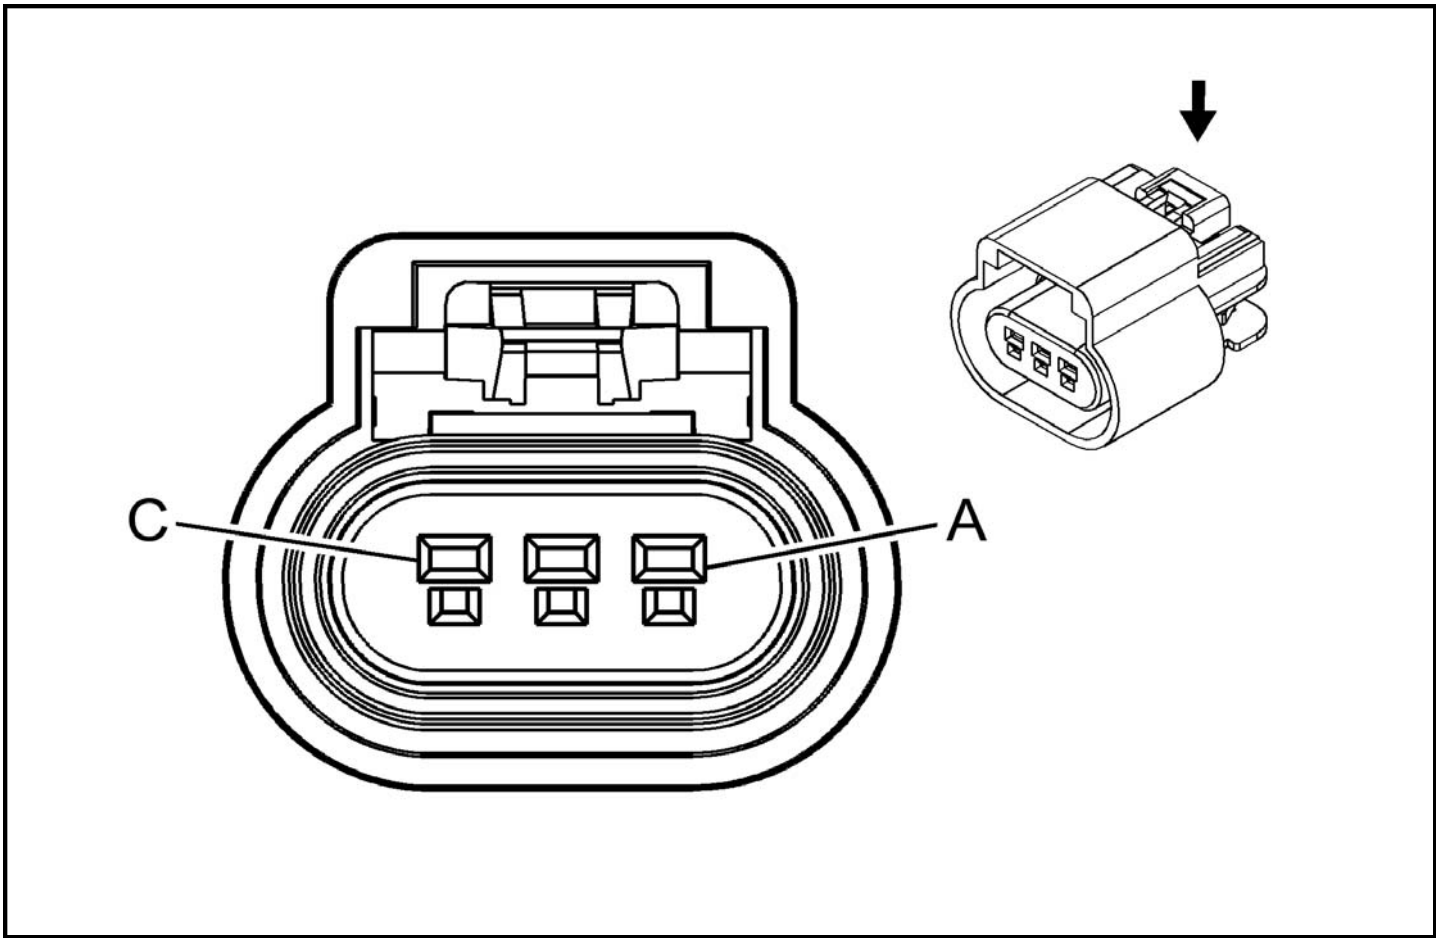
Terminal Part Information

- Terminal/Tray: 12124471/5
- Core/Insulation Crimp: 2/3
- Release Tool/Test Probe: 12094430/ Not Available

Backup Lamp - Right

Pin	Wire	Circuit	Function
A	0.5 BN	24	Backup Lamp Supply Voltage
B	0.5 BK	750	Ground
	0.5 BK	750	Ground

BATTERY CURRENT SENSOR



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15326808
- Service Connector: 13580871
- Description: 3-Way F GT 150 Series, Sealed (BK)

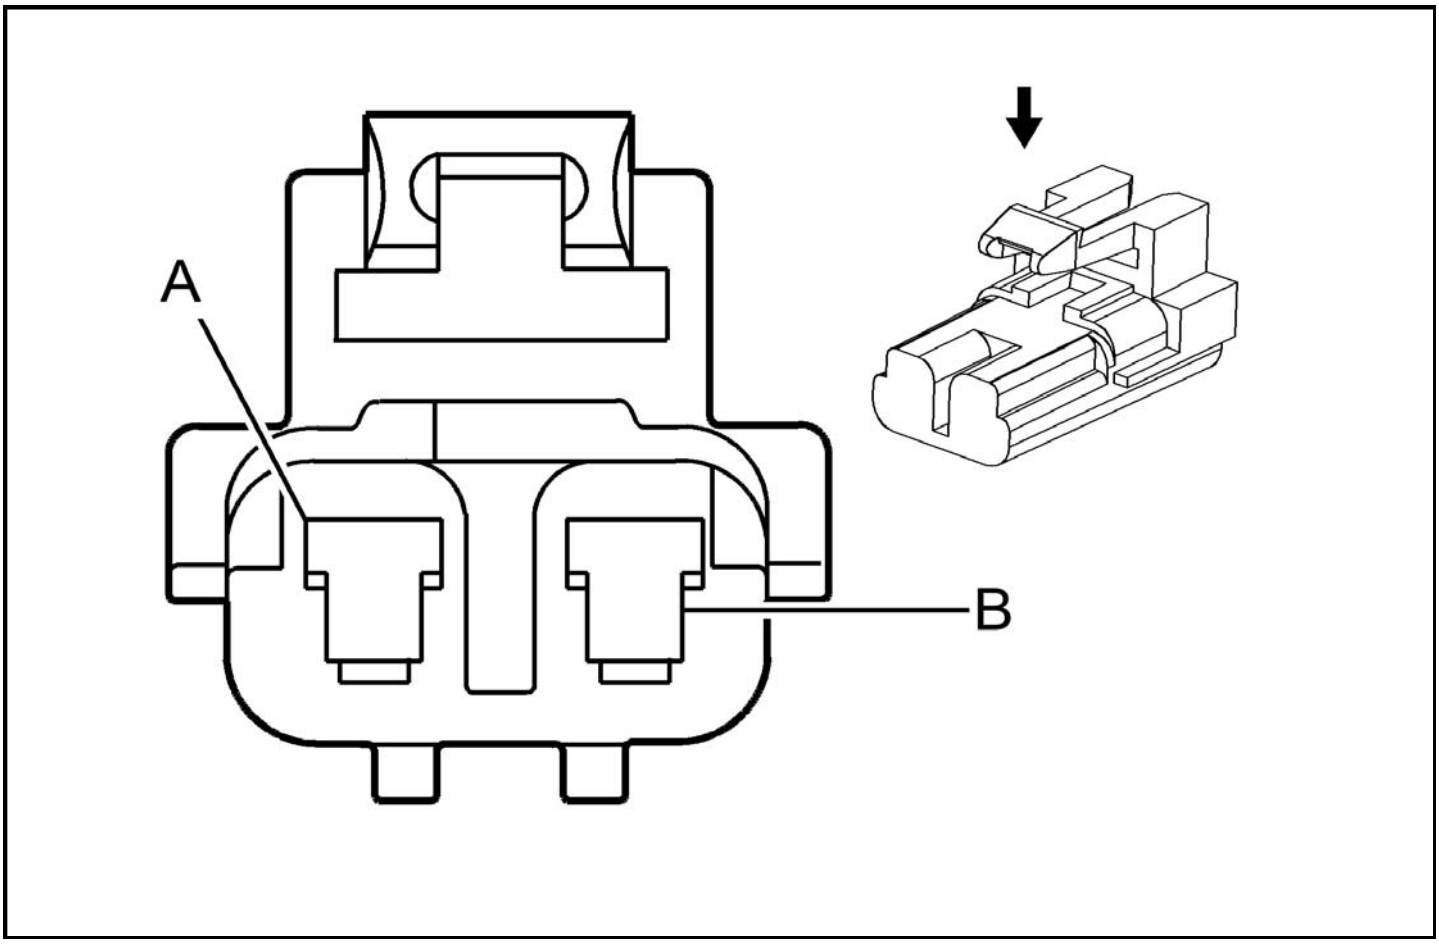
Terminal Part Information

- Terminated Lead: 13575396
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 15326427/5
- Core/Insulation Crimp: E/A

Battery Current Sensor

Pin	Wire	Circuit	Function
A	0.35 PK	5076	Current Sensor Supply Voltage
B	0.35 BN	5077	Low Reference
C	0.35 WH	5075	Current Sensor Signal

BLOWER MOTOR



Connector Part Information

- Harness Type: HVAC
- OEM Connector: 12084957
- Service Connector: 12126461
- Description: 2-Way F Metri-Pack 280 Series (BK)

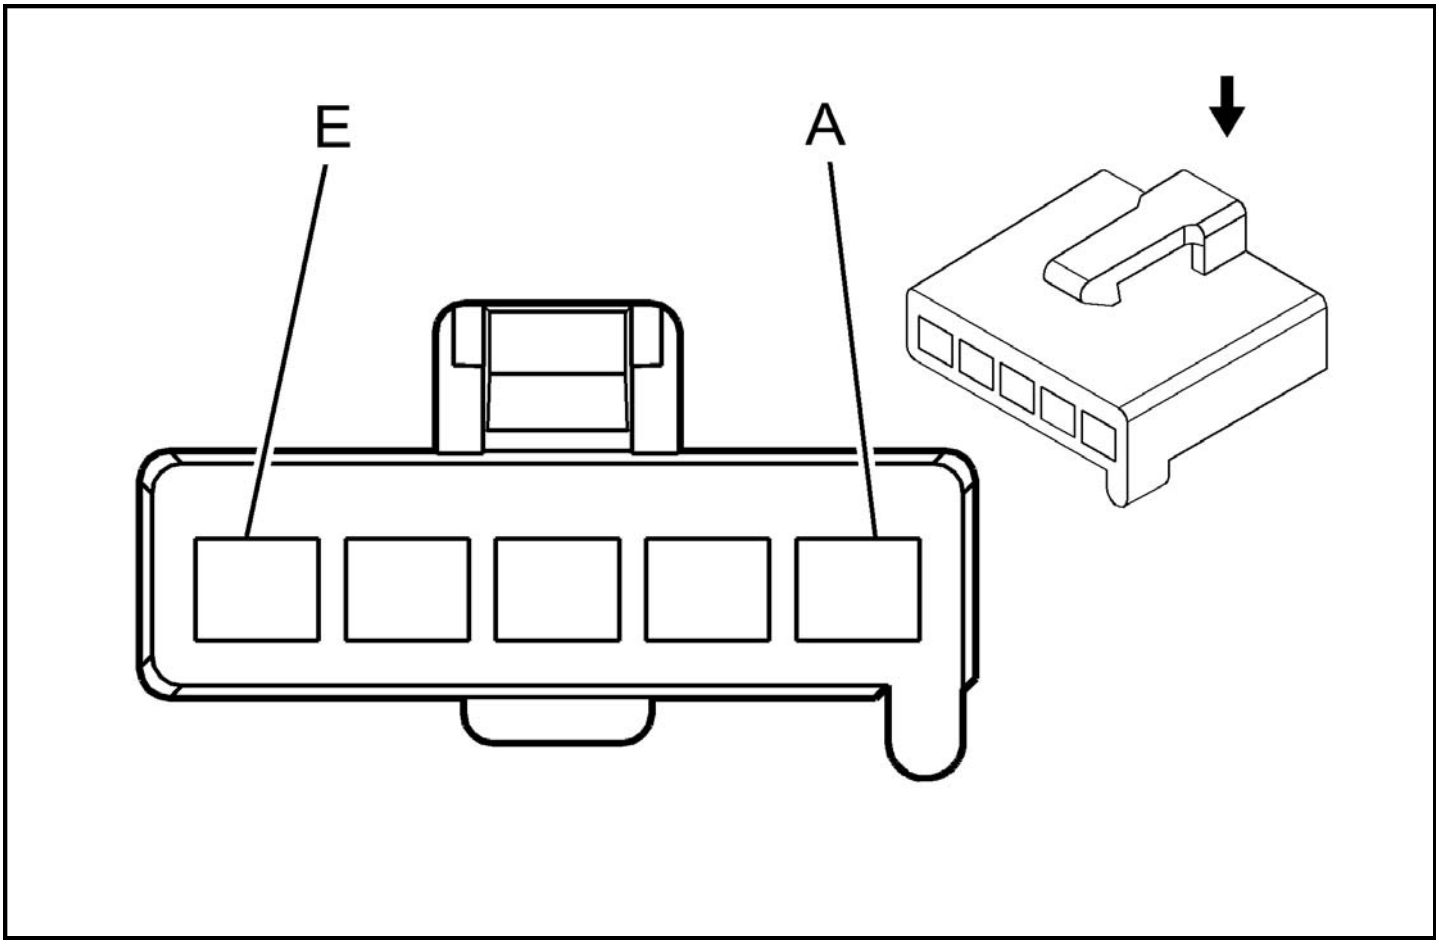
Terminal Part Information

- Terminal/Tray: 12015858/4
- Core/Insulation Crimp: F/G
- Release Tool/Test Probe: 12094430/J-35616-4A (PU)

Blower Motor

Pin	Wire	Circuit	Function
A	3 PU	65	Blower Motor Supply Voltage
B	3 OG	5987	Ground

BLOWER MOTOR CONTROL MODULE



Connector Part Information

- Harness Type: HVAC
- OEM Connector: 12041429
- Service Connector: 12167129
- Description: 5-Way F Metri-Pack 280 Series (BK)

Terminal Part Information

- Pins: A, C, D, E
- Terminal/Tray: 12015858/4
- Core/Insulation Crimp: F/G
- Release Tool/Test Probe: 12094430/J-35616-4A (PU)

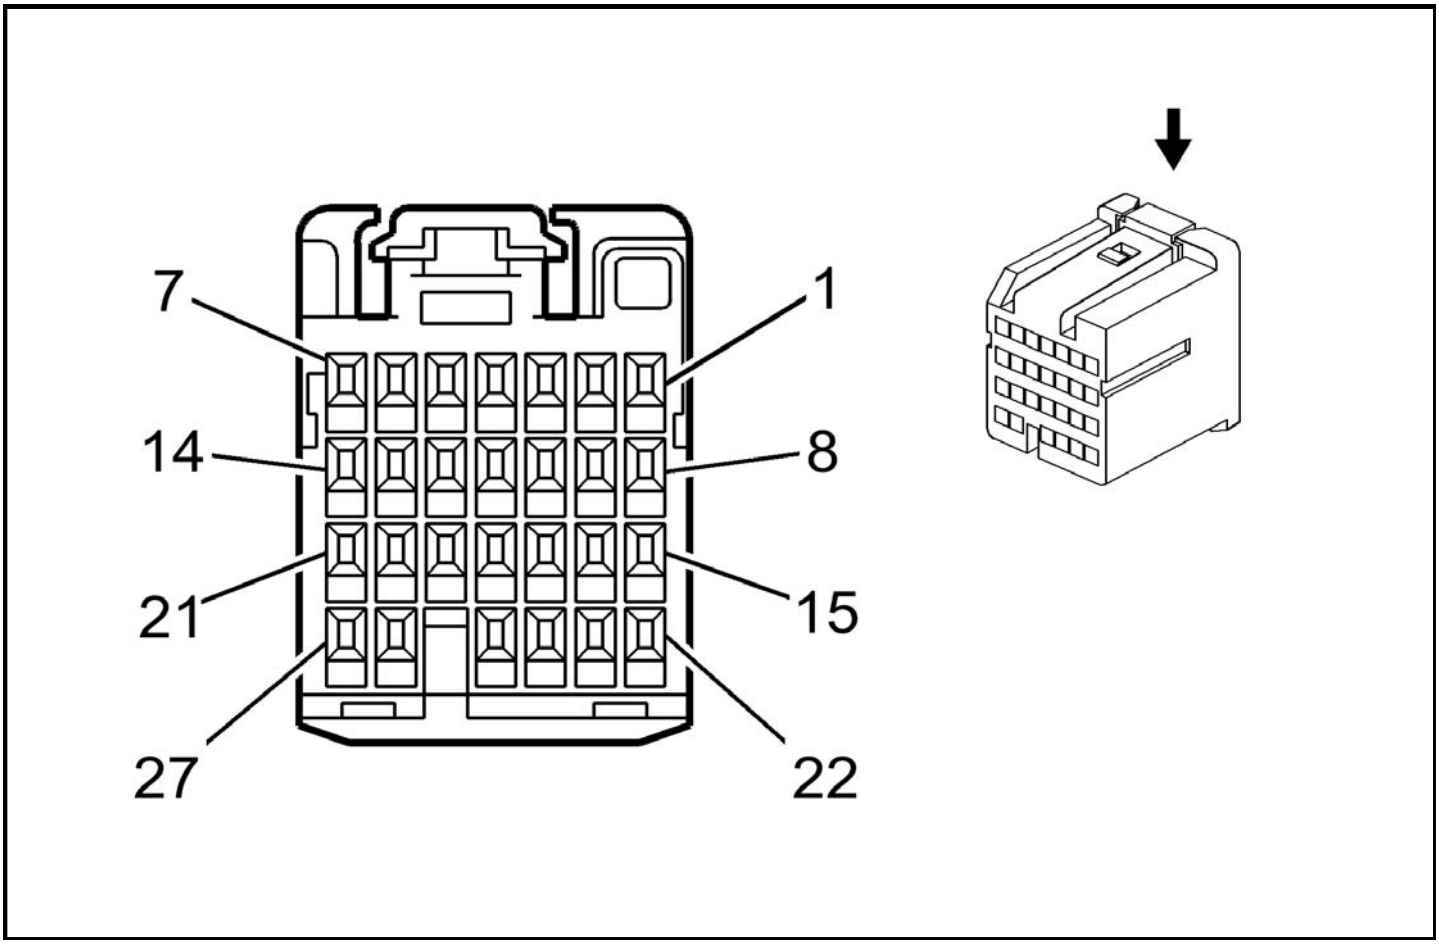
- Pins: B
- Terminal/Tray: 12034046/2
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 12094430/J-35616-4A (PU)

Blower Motor Control Module

Pin	Wire	Circuit	Function

Pin	Wire	Circuit	Function
A	3 BK	150	Ground
B	0.35 GY/BK	754	Blower Motor Speed Control
C	3 RD	442	Battery Positive Voltage
D	3 OG	5987	Ground
E	3 PU	65	Blower Motor Supply Voltage

BODY CONTROL MODULE (BCM) X1



Connector Part Information

- Harness Type: Steering Column
- OEM Connector: 15482789
- Service Connector: 88988838
- Description: 27-Way F HIT Series (L-GN)

Terminal Part Information

- Terminated Lead: 13575870
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: SNAC3-A021T-M0.64/20

- Core/Insulation Crimp: J/J

Body Control Module (BCM) X1

Pin	Wire	Circuit	Function
1	-	-	Not Used
2	0.35 WH	1390	Off/Run/Crank Voltage
3	0.35 GY	1884	Cruise Control Switch Signal
4	0.35 WH/BK	1073	5-Volt Reference
5	0.35 L-GN	1715	Windshield Wiper Switch High Signal
6	0.35 D-BU	1796	Steering Wheel Controls Signal
7	-	-	Not Used
8	0.35 BK/WH	1251	Ground
9	0.35 L-BU	1714	Windshield Wiper Switch Low Signal

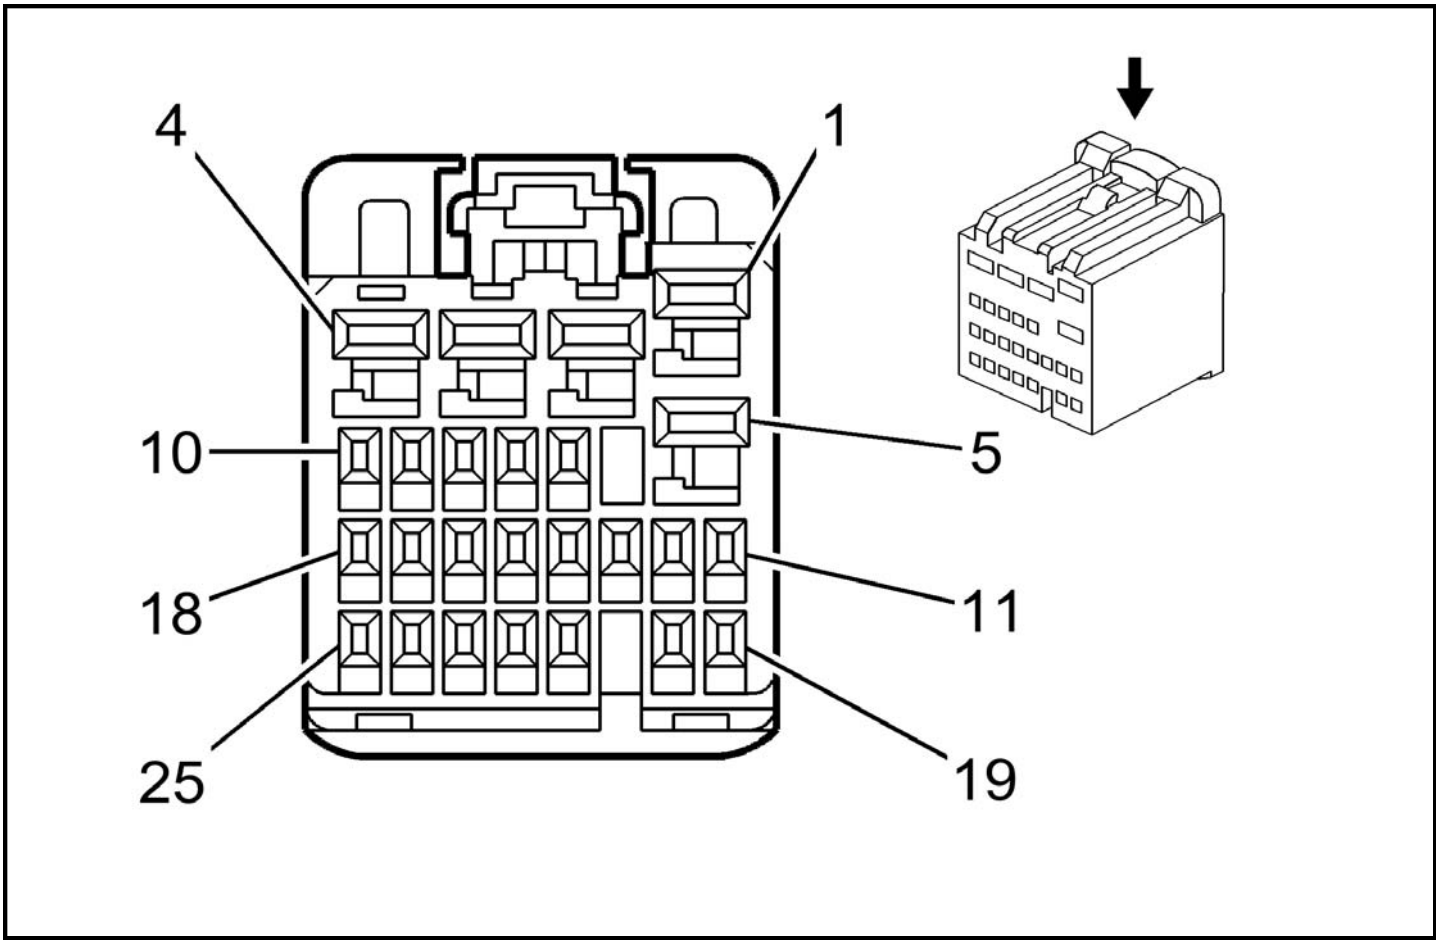
19	0.35 TN	2144	Hazard Switch Signal
20	-	-	Not Used
21	0.35 BN	4	Accessory Voltage
22-23	-	-	Not Used
24	0.35 PK	94	Windshield Washer Switch Signal
25	0.35 BN	1356	Flash To Pass Switch Signal
26	0.5 D-GN/WH	1135	A/T Shift Lock Control Solenoid Supply Voltage (without D55)
27	-	-	Not Used

BODY CONTROL MODULE (BCM) X2



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 15482790
- Service Connector: 88988839
- Description: 25-Way F HIT Series (NA)

Terminal Part Information

- Pins: 1-3, 5
- Terminated Lead: 13327199
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-35 (VT)
- Terminal/Tray: SNAC-A061T-M2.8/20
- Core/Insulation Crimp: E/A

- Pins: 8, 10-12, 17, 18, 21, 22
- Terminated Lead: 13575870
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: SNAC3-A021T-M0.64/20

- Core/Insulation Crimp: J/J

Body Control Module (BCM) X2

Pin	Wire	Circuit	Function

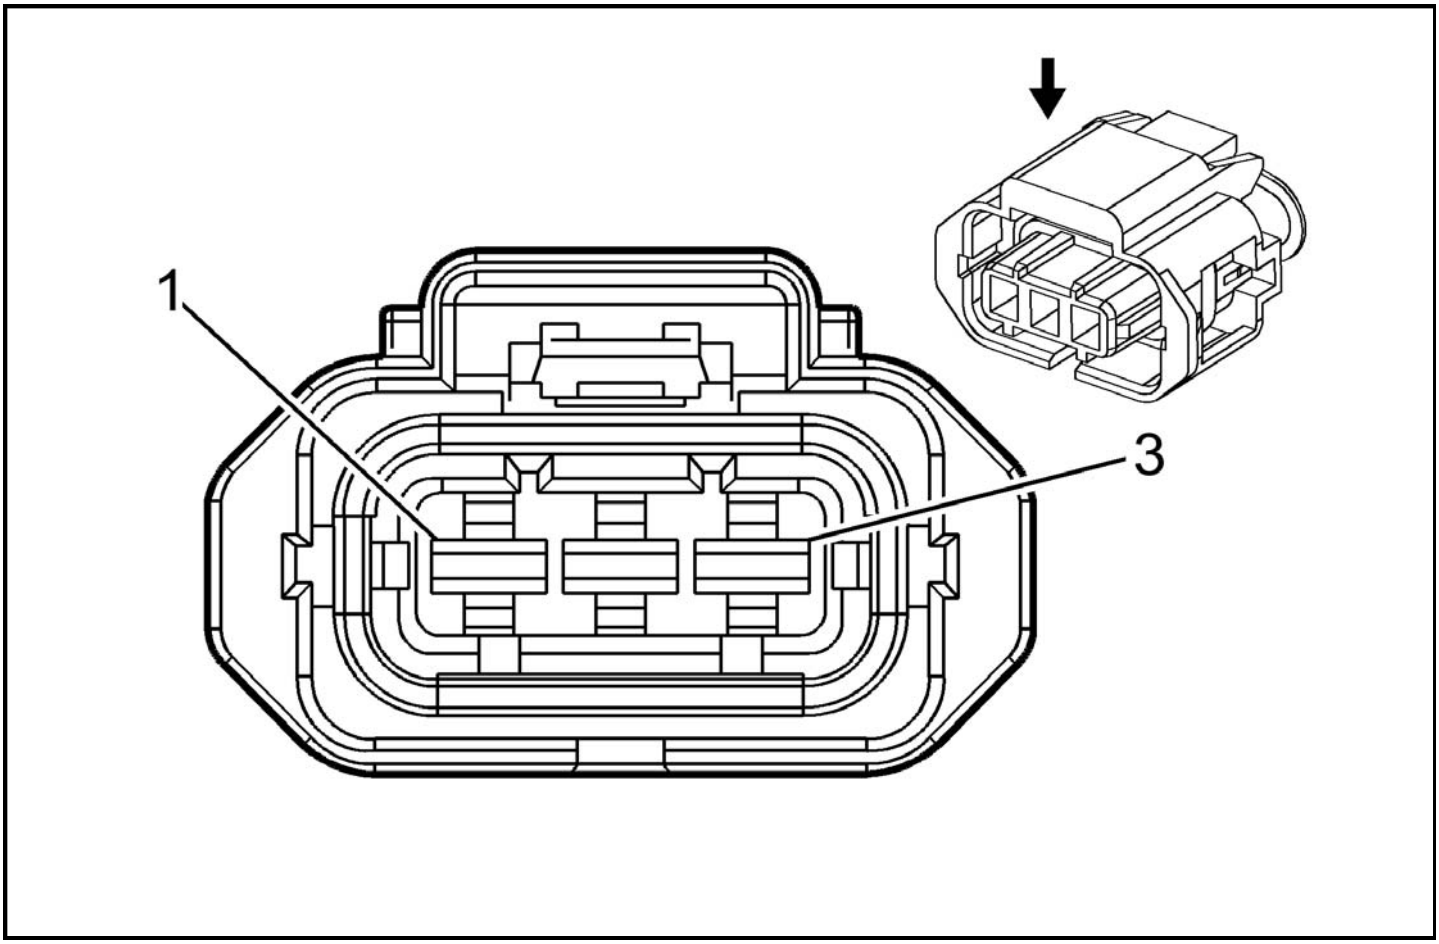
3	0.35 L-GN	526	Stop Lamp Switch Signal

Pin	Wire	Circuit	Function
4	0.5 BN	5361	Brake Apply Sensor Signal
5	0.5 BN	5360	Low Reference
6	0.5 WH	5359	Brake Apply Sensor Supply Voltage

CAMSHAFT POSITION (CMP) SENSOR - BANK 1 EXHAUST



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15345983
- Service Connector: 13580231
- Description:3-Way F 2.8 Junior Power Timer Series, Sealed (GY)

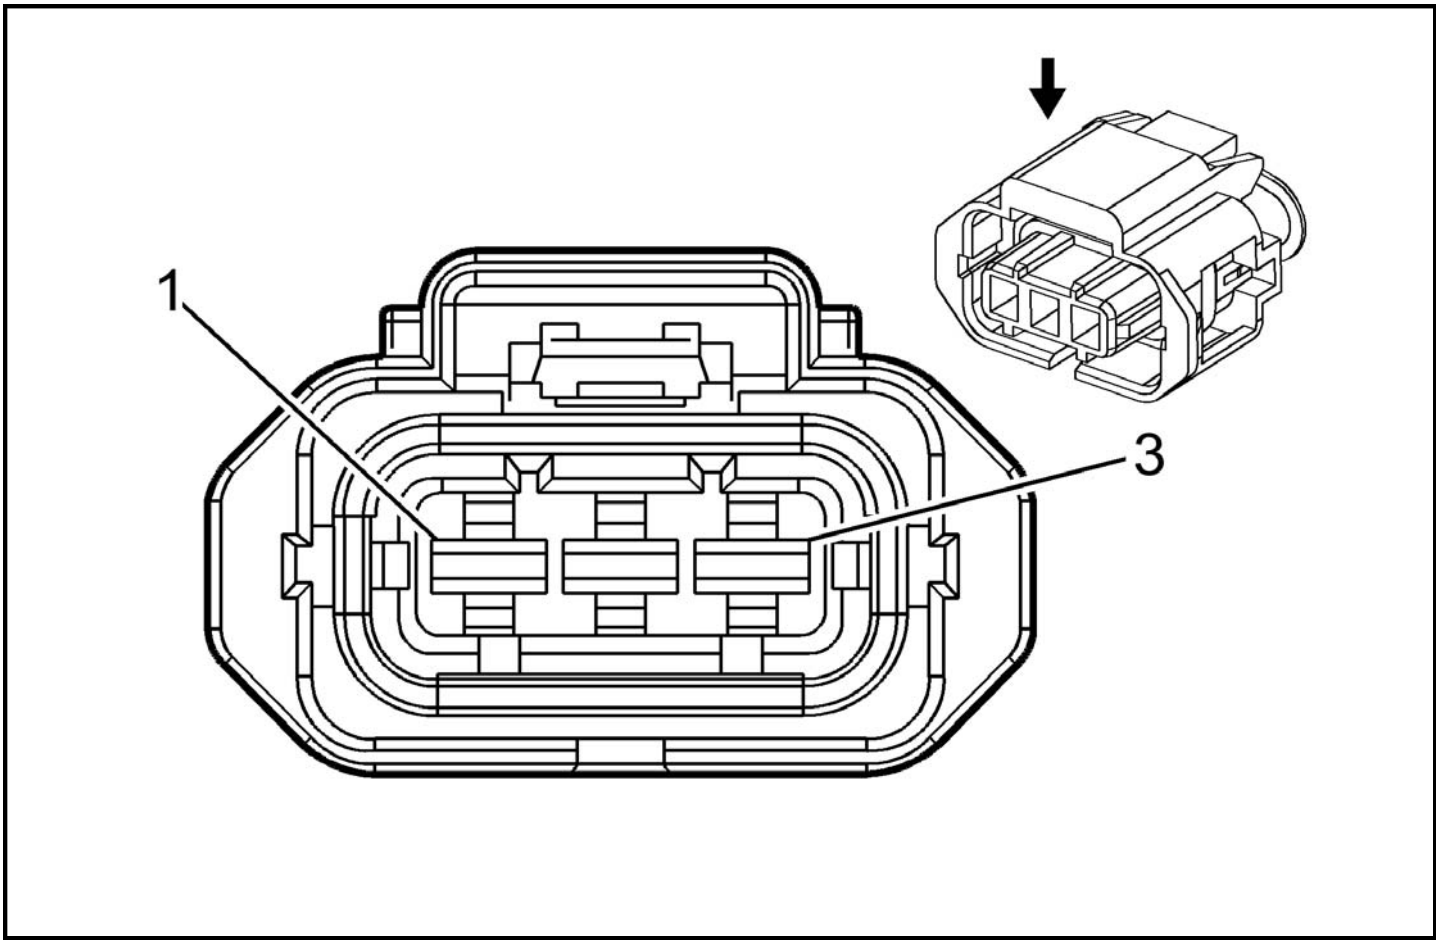
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-561
- Diagnostic Test Probe: J-35616-35 (VT)
- Release Tool: Not Available
- Diagnostic Test Probe: Not Available

Camshaft Position (CMP) Sensor - Bank 1 Exhaust

Pin	Wire	Circuit	Function
1	0.5 GY	5296	Low Reference
2	0.5 D-GN	5273	Camshaft Position Sensor- Exhaust Bank 1 Signal
3	0.5 YE/BK	5297	5-Volt 1 Reference

CAMSHAFT POSITION (CMP) SENSOR - BANK 1 INTAKE



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15345983
- Service Connector: 13580231
- Description: 3-Way F 2.8 Junior Power Timer Series, Sealed (GY)

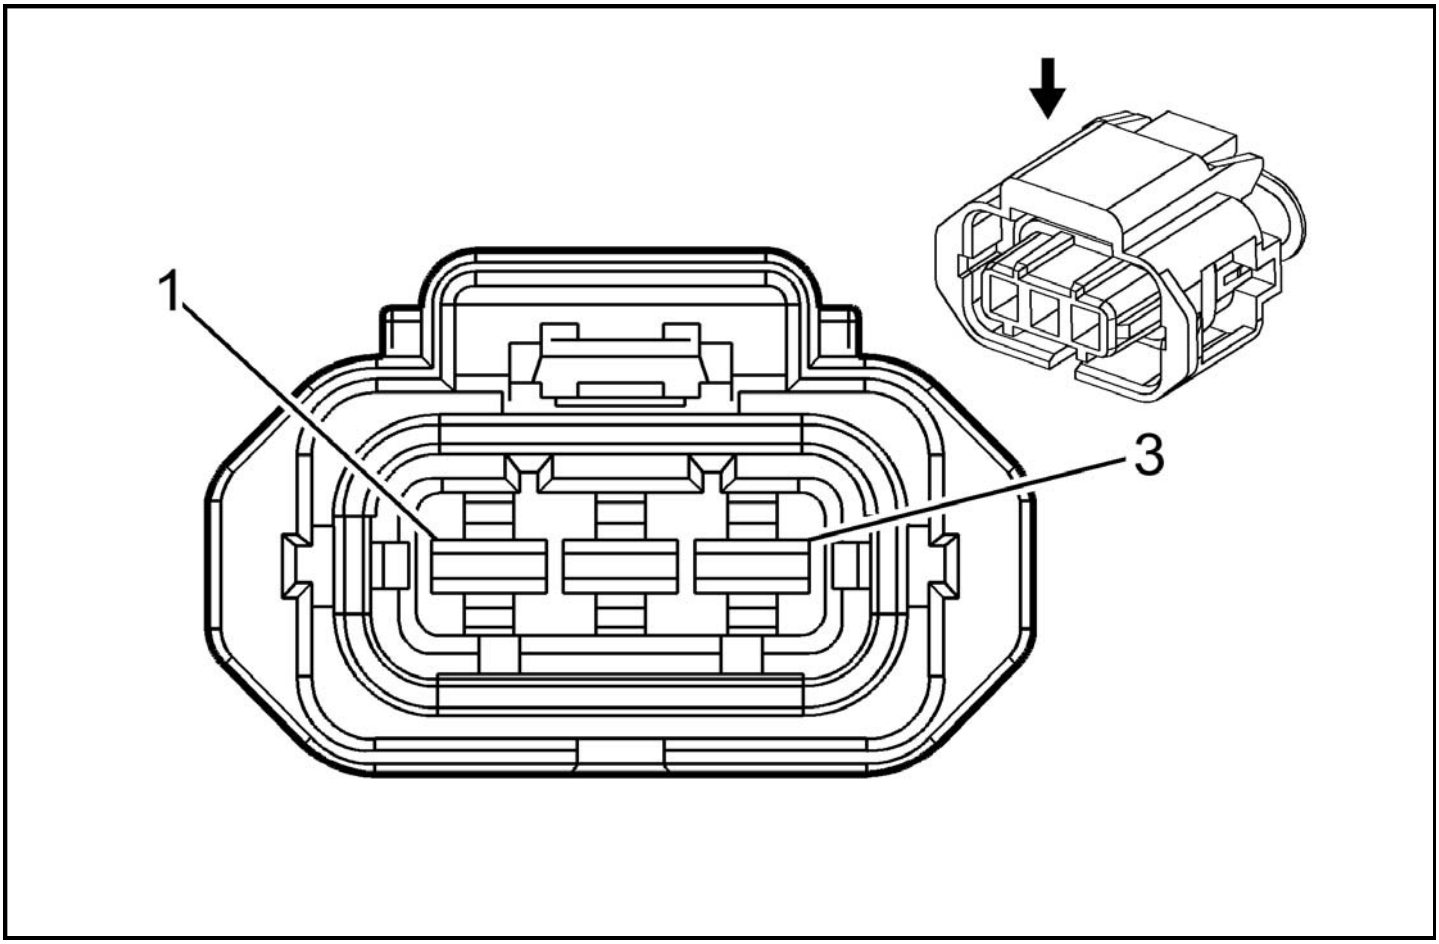
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-561
- Diagnostic Test Probe: J-35616-35 (VT)
- Release Tool: Not Available

Camshaft Position (CMP) Sensor - Bank 1 Exhaust

Pin	Wire	Circuit	Function
1	0.5 GY	5296	Low Reference
2	0.5 D-GN	5273	Camshaft Position Sensor- Exhaust Bank 1 Signal
3	0.5 YE/BK	5297	5-Volt 1 Reference

CAMSHAFT POSITION (CMP) SENSOR - BANK 1 INTAKE



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15345983
- Service Connector: 13580231
- Description: 3-Way F 2.8 Junior Power Timer Series, Sealed (GY)

Terminal Part Information

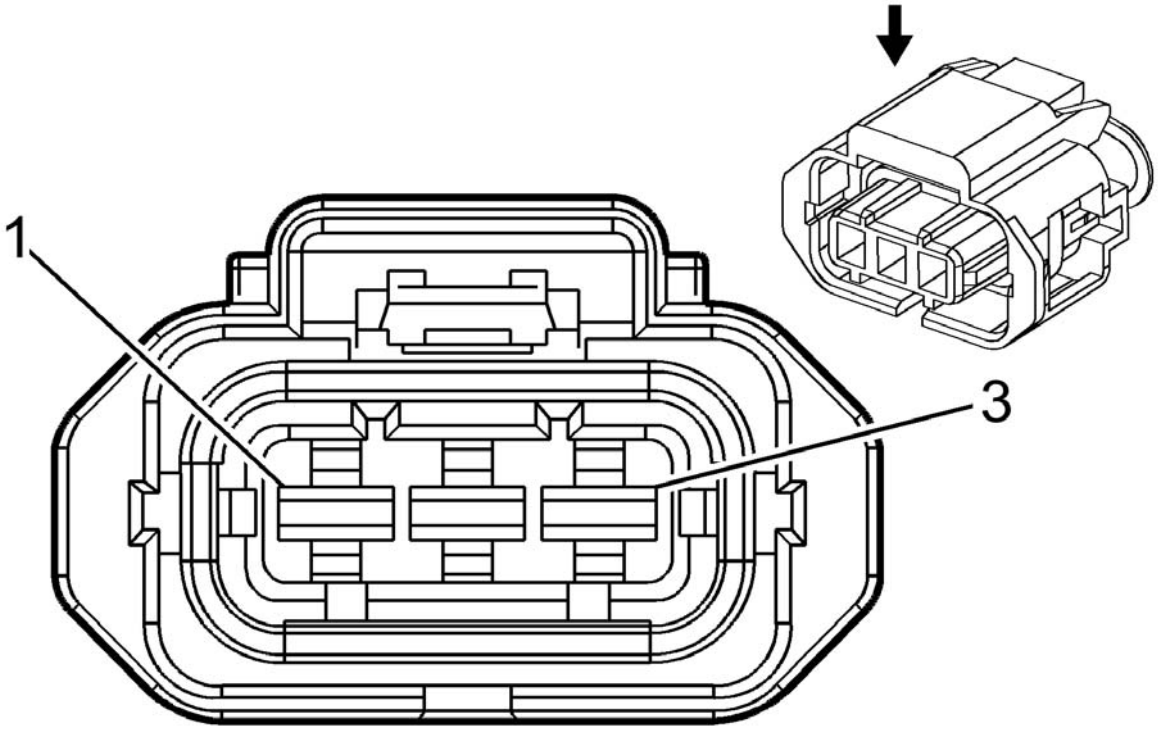
- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-561
- Diagnostic Test Probe: J-35616-35 (VT)
- Release Tool: Not Available

- Diagnostic Test Probe: Not Available

Camshaft Position (CMP) Sensor - Bank 1 Intake

Pin	Wire	Circuit	Function
1	0.5 TN	5301	Low Reference
2	0.5 OG	5275	Camshaft Position (CMP) Sensor- Intake Bank 1 Signal
3	0.5 D-BU	5300	5-Volt 1 Reference

CAMSHAFT POSITION (CMP) SENSOR - BANK 2 EXHAUST



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15345983
- Service Connector: 13580231
- Description: 3-Way F 2.8 Junior Power Timer Series, Sealed (GY)

Terminal Part Information

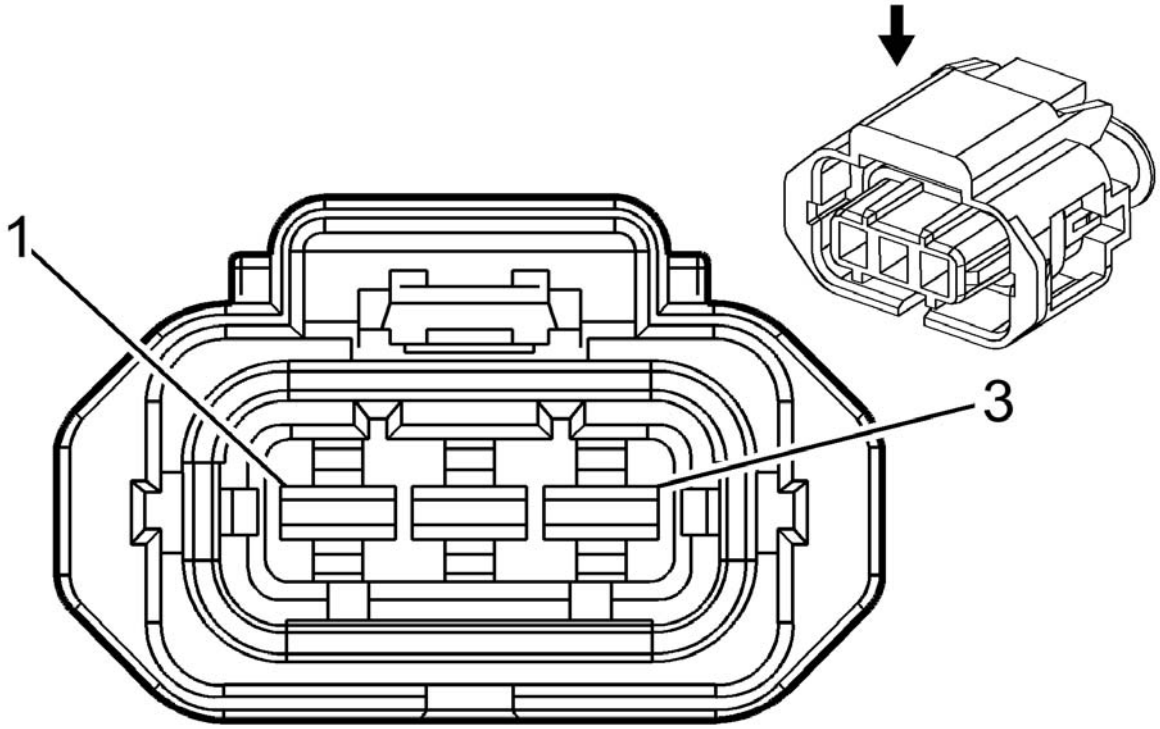
- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-561

- Diagnostic Test Probe: J-35616-35 (VT)
- Release Tool: Not Available
- Diagnostic Test Probe: Not Available

Camshaft Position (CMP) Sensor - Bank 2 Exhaust

Pin	Wire	Circuit	Function
1	0.5 BN	5299	Low Reference
2	0.5 PU	5274	Camshaft Position (CMP) Sensor- Exhaust Bank 2 Signal
3	0.5 L-GN	5298	5-Volt 1 Reference

CAMSHAFT POSITION (CMP) SENSOR - BANK 2 INTAKE



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15345983
- Service Connector: 13580231
- Description: 3-Way F 2.8 Junior Power Timer Series, Sealed (GY)

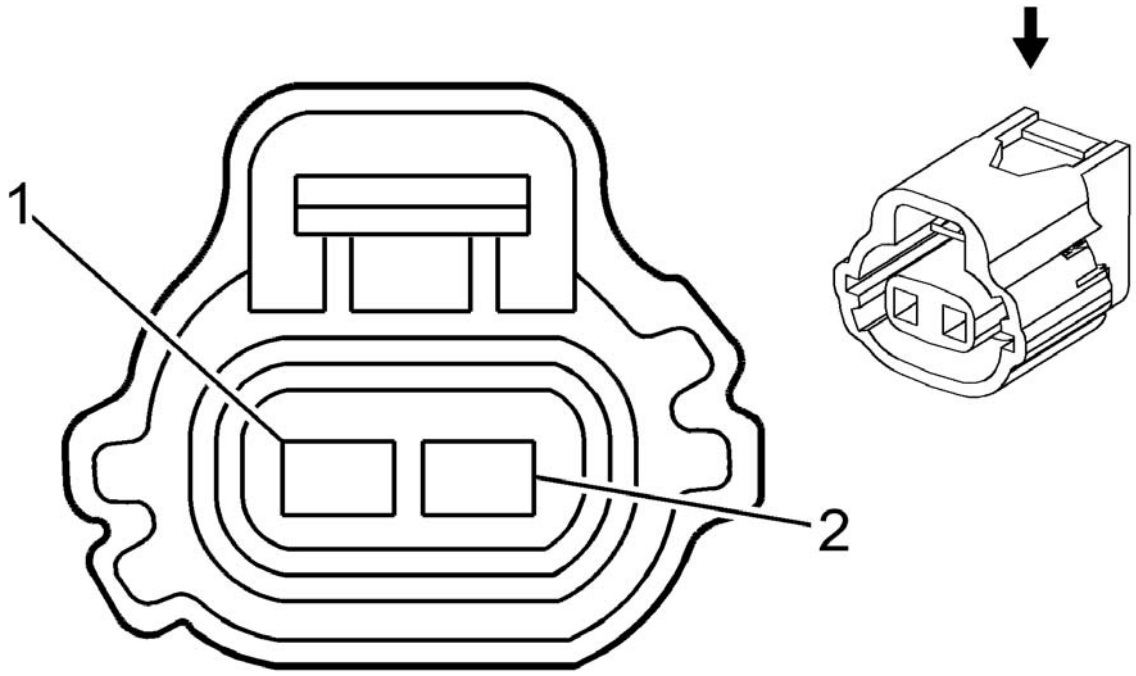
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-561
- Diagnostic Test Probe: J-35616-35 (VT)
- Release Tool: Not Available
- Diagnostic Test Probe: Not Available

Camshaft Position (CMP) Sensor - Bank 2 Intake

Pin	Wire	Circuit	Function
1	0.5 BN/WH	5303	Low Reference
2	0.5 YE	5276	Camshaft Position (CMP) Sensor- Intake Bank 2 Signal
3	0.5 L-BU	5302	5-Volt 1 Reference

CAMSHAFT POSITION (CMP) ACTUATOR SOLENOID VALVE - BANK 1 EXHAUST



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15411401

- Service Connector: 89047244
- Description:2-Way F 090 Series, Sealed (GY)

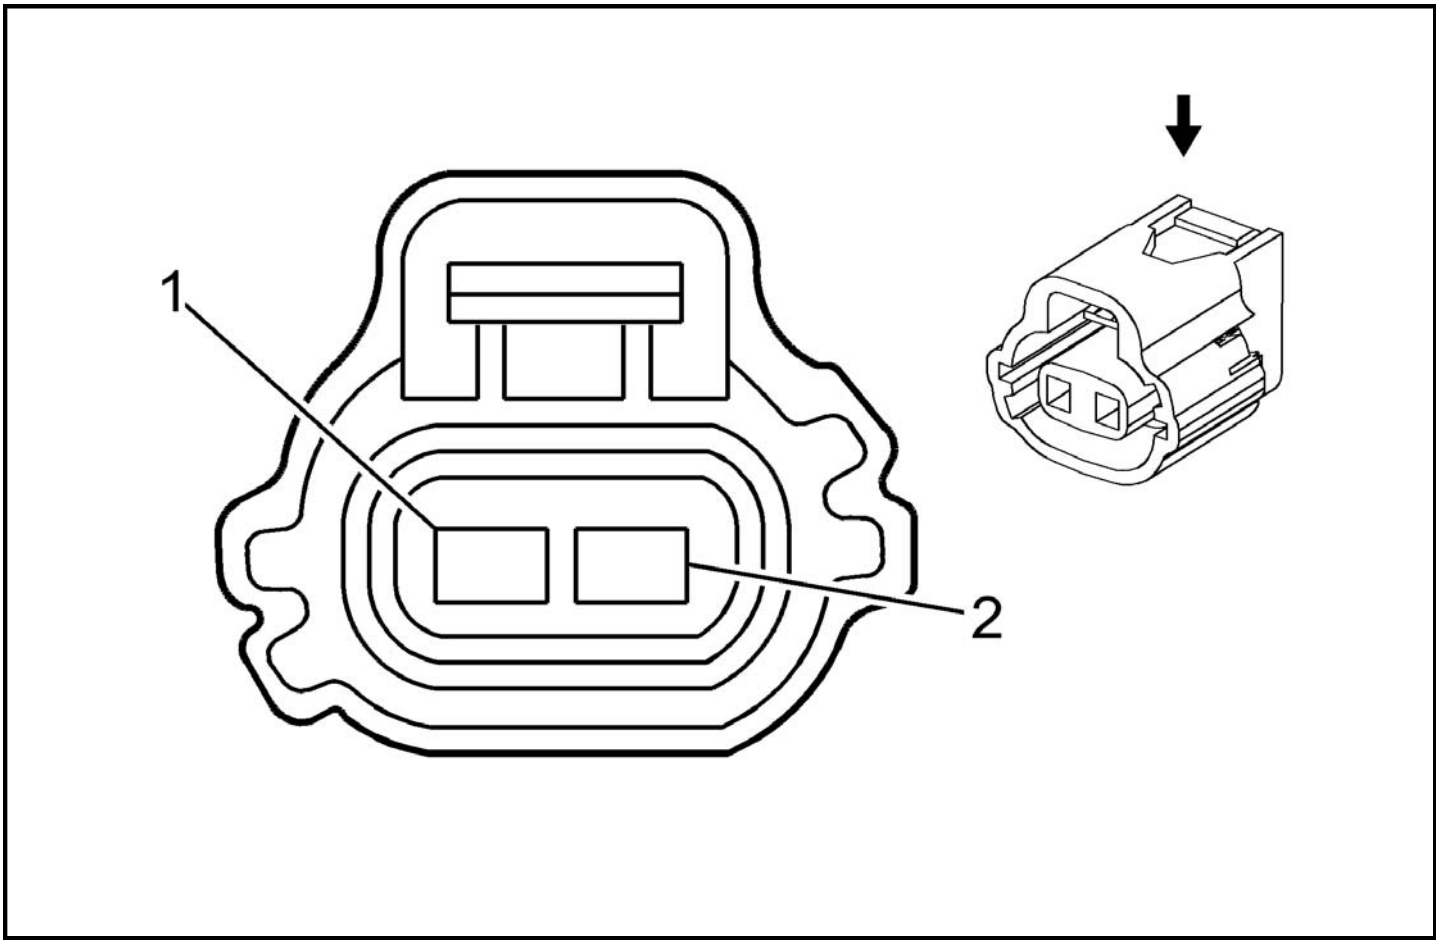
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-552
- Diagnostic Test Probe: J-35616-18 (BK)
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Camshaft Position (CMP) Actuator Solenoid Valve - Bank 1 Exhaust

Pin	Wire	Circuit	Function
1	0.5 L-GN	5282	Camshaft Phaser Exhaust Solenoid (1)
2	0.5 BN/WH	6754	Low Reference

CAMSHAFT POSITION (CMP) ACTUATOR SOLENOID VALVE - BANK 1 INTAKE



Connector Part Information

- Harness Type: Engine

- OEM Connector: 15411401
- Service Connector: 89047244
- Description: 2-Way F 090 Series, Sealed (GY)

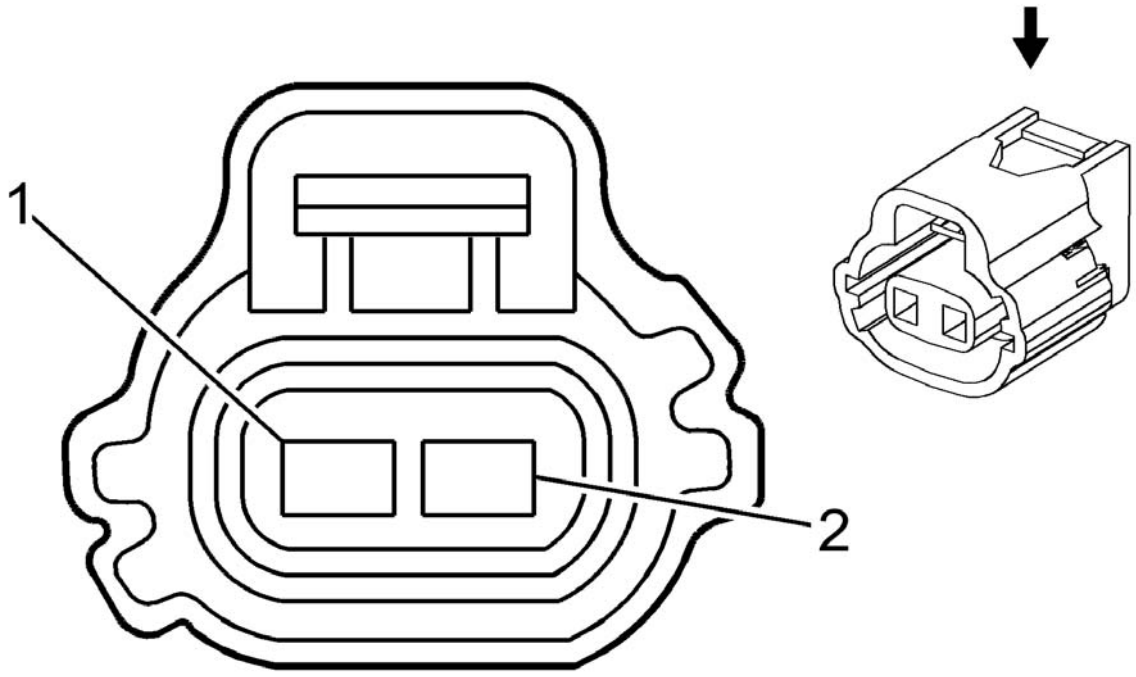
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-552
- Diagnostic Test Probe: J-35616-18 (BK)
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Camshaft Position (CMP) Actuator Solenoid Valve - Bank 1 Intake

Pin	Wire	Circuit	Function
1	0.5 PU	5284	Camshaft Phaser Intake Solenoid (1)
2	0.5 BN	6753	Low Reference

CAMSHAFT POSITION (CMP) ACTUATOR SOLENOID VALVE - BANK 2 EXHAUST



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15411401
- Service Connector: 89047244
- Description: 2-Way F 090 Series, Sealed: (GY)

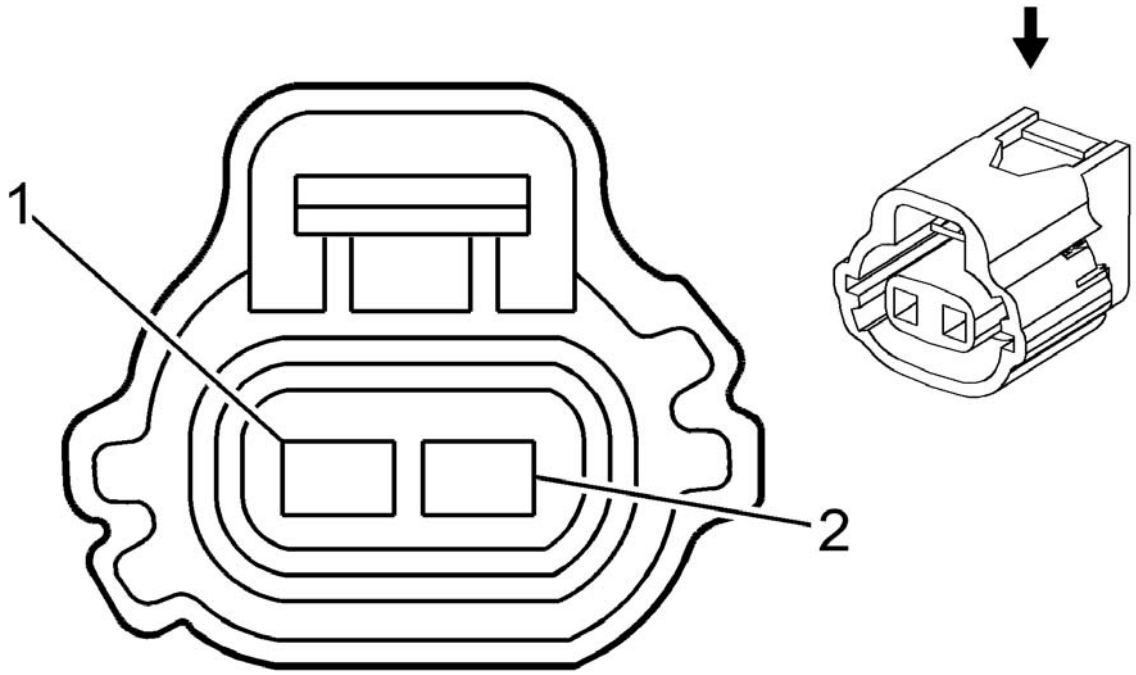
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-552
- Diagnostic Test Probe: J-35616-18 (BK)
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Camshaft Position (CMP) Actuator Solenoid Valve - Bank 2 Exhaust

Pin	Wire	Circuit	Function
1	0.5 WH/BK	5283	Cam Phaser Control
2	0.5 D-BU/WH	6756	Low Reference

CAMSHAFT POSITION (CMP) ACTUATOR SOLENOID VALVE - BANK 2 INTAKE



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15411401
- Service Connector: 89047244
- Description: 2-Way F 090 Series, Sealed (GY)

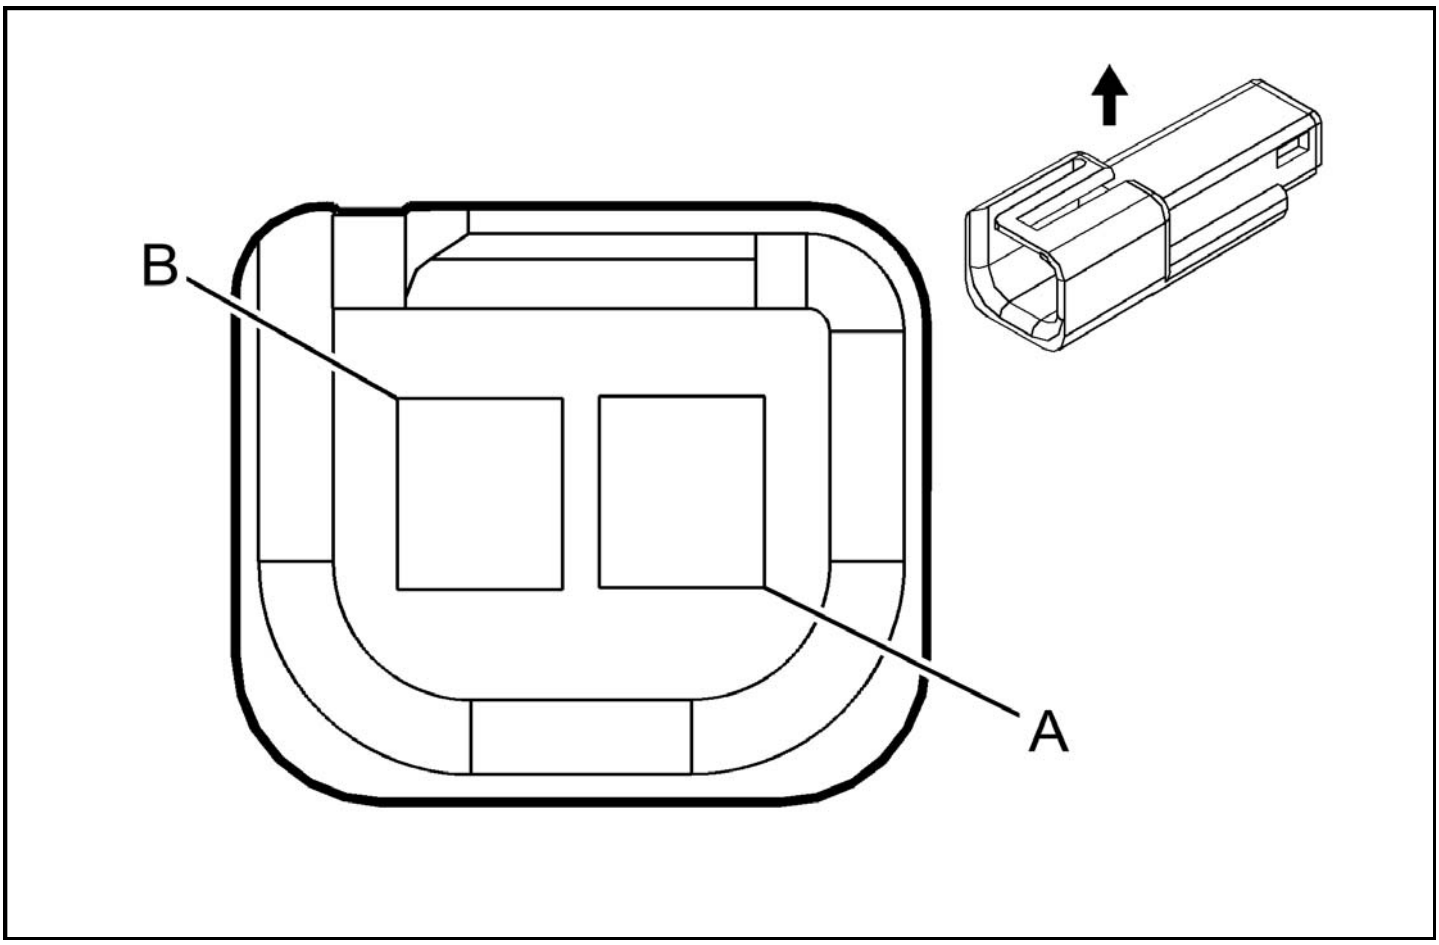
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-552
- Diagnostic Test Probe: J-35616-18 (BK)
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Camshaft Position (CMP) Actuator Solenoid Valve - Bank 2 Intake

Pin	Wire	Circuit	Function
1	0.5 TN/BK	6397	Cam Phaser Control
2	0.5 D-BU	6755	Low Reference

CELLULAR TELEPHONE MICROPHONE (UE1)



Connector Part Information

- Harness Type: Headliner
- OEM Connector: 12047663
- Service Connector: 13584278
- Description: 2-Way M Metri-Pack 150 Series (BK)

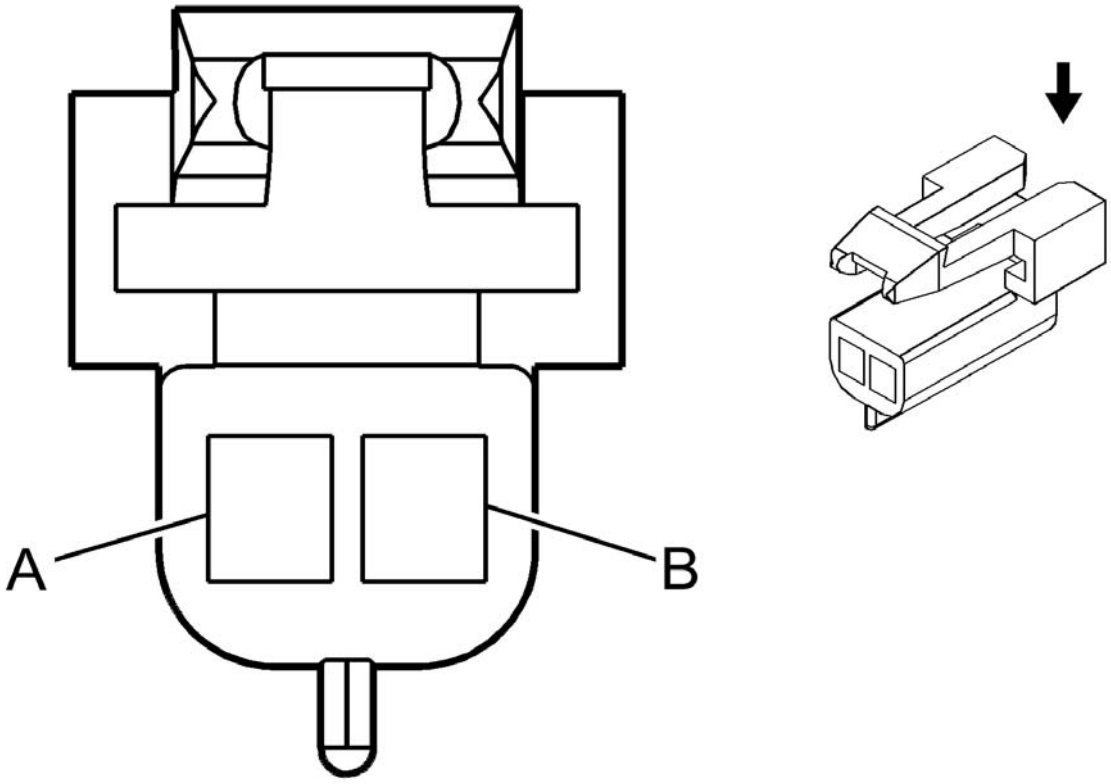
Terminal Part Information

- Terminated Lead: 13575462
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)
- Terminal/Tray: 12047581/2
- Core/Insulation Crimp: E/C
- Terminal/Tray: 12047581/2
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 12094429/J-35616-3 (GY)

Cellular Telephone Microphone (UE1)

Pin	Wire	Circuit	Function
A	0.35 BARE	1489	Drain Wire
B	0.35 GY	655	Cellular Microphone Signal

CENTER HIGH MOUNTED STOP LAMP (CHMSL)



Connector Part Information

- Harness Type: Body
- OEM Connector: 12052832
- Service Connector: 13583033
- Description: 2-Way F Metri-Pack 150 Series (BK)

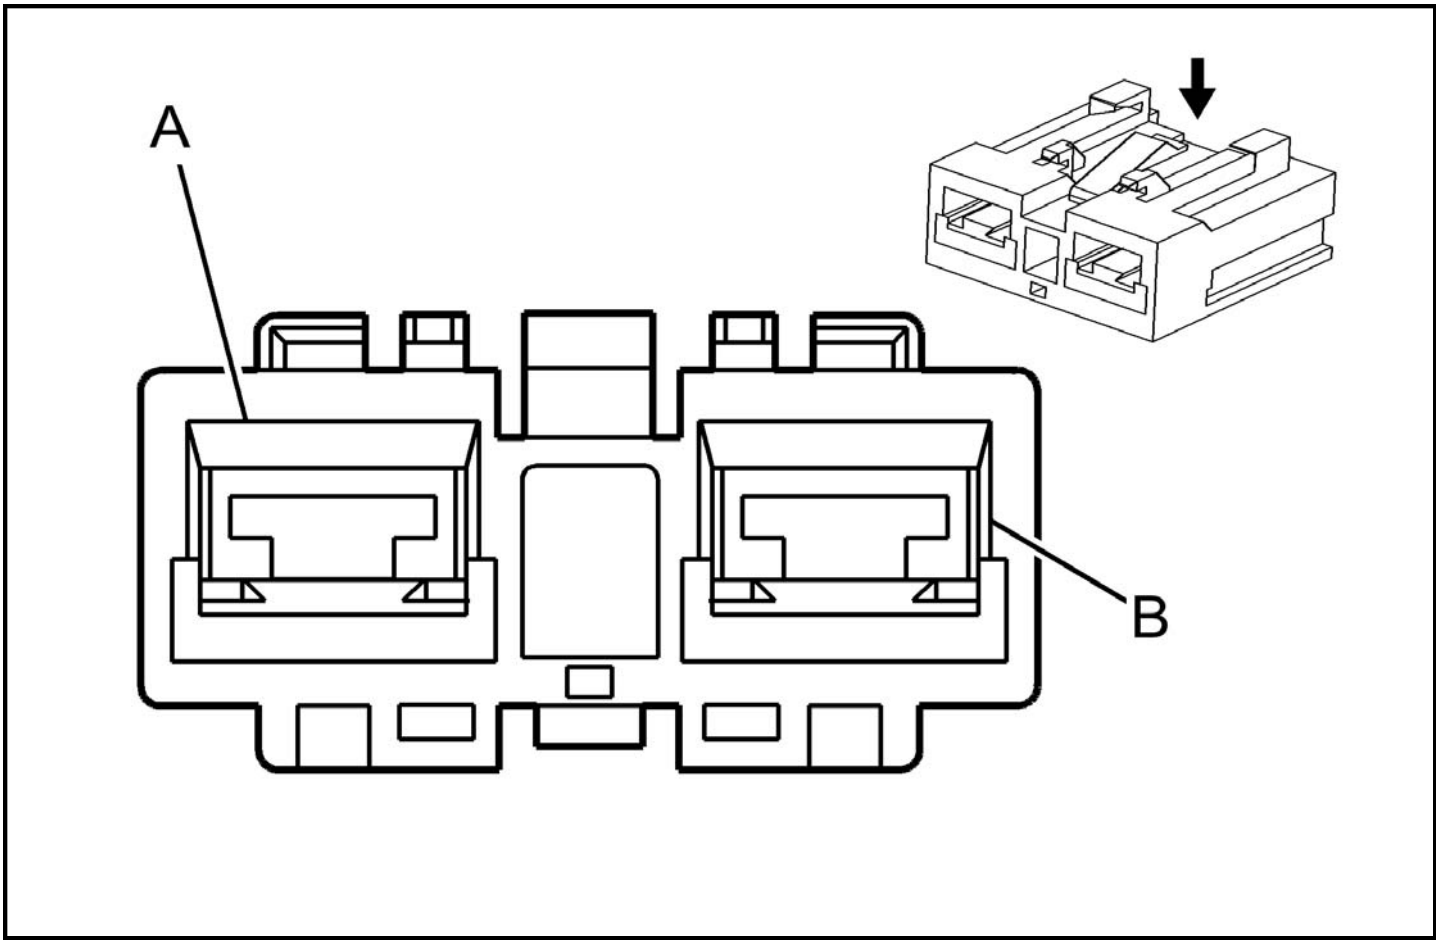
Terminal Part Information

- Terminated Lead: Service by Harness - See Part Catalog
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/2
- Core/Insulation Crimp: E/C

Center High Mounted Stop Lamp (CHMSL)

Pin	Wire	Circuit	Function
A	0.5 BK	750	Ground
B	0.5 L-BU	1320	CHMSL Supply Voltage

CIRCUIT BREAKER 1 (SEO 9C1/9C3)



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 12110057
- Service Connector: 12110057
- Description: 2-Way F MAXI (BK)

Terminal Part Information

- Pins: A
- Terminal/Tray: 12092445/18
- Core/Insulation Crimp: G/G
- Release Tool/Test Probe: 12150860/J-35616-44 (YE)

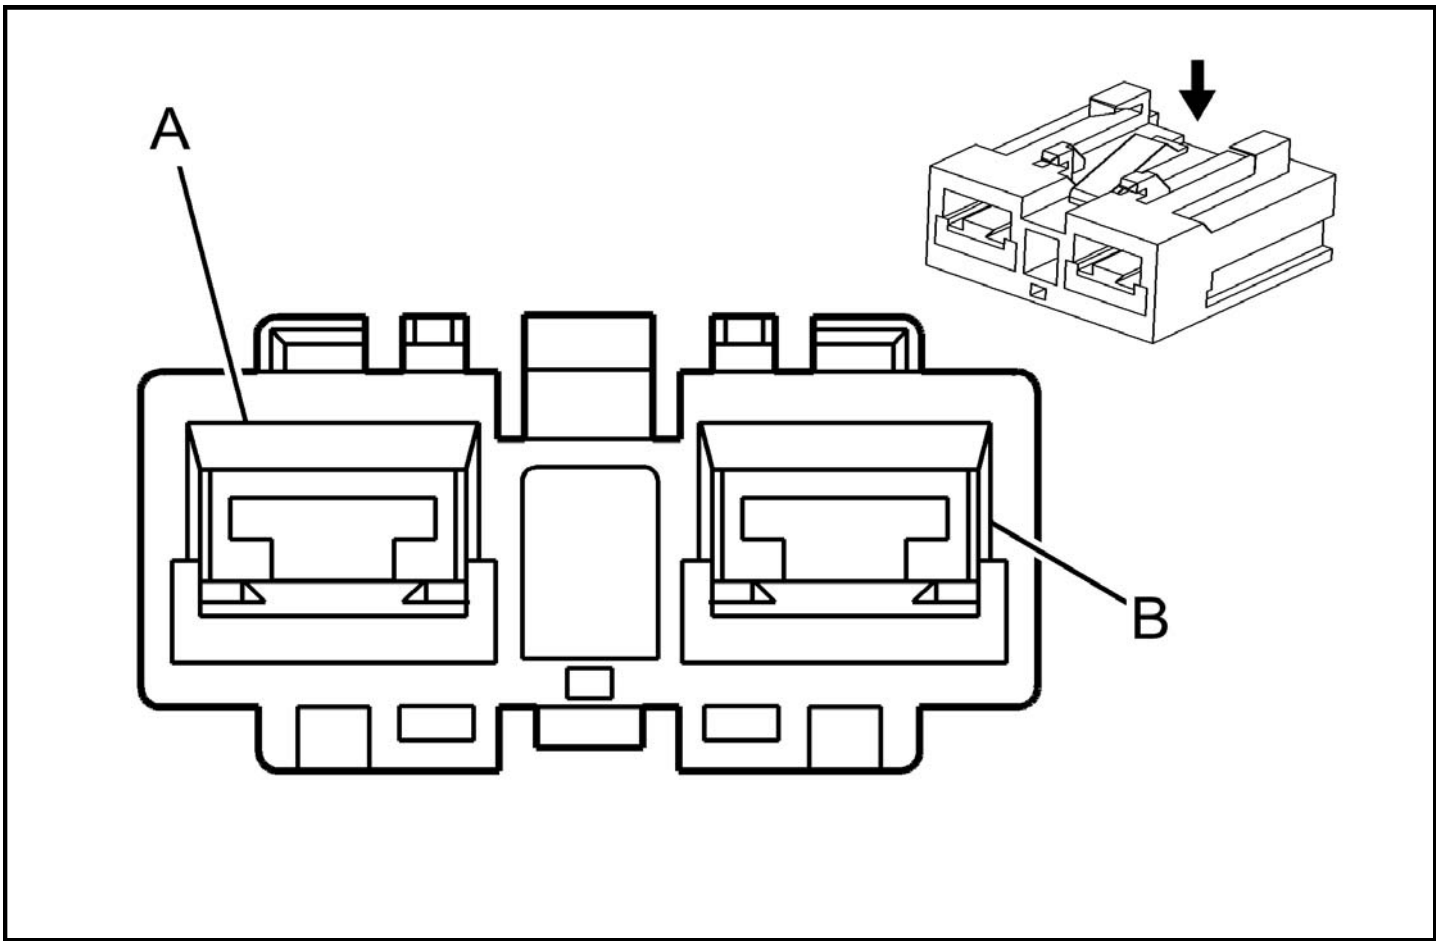
- Pins: B
- Terminal/Tray: 12110127/19
- Core/Insulation Crimp: F/G
- Release Tool/Test Probe: 12150860/J-35616-44 (YE)

Circuit Breaker 1 (SEO 9C1/9C3)

Pin	Wire	Circuit	Function

Pin	Wire	Circuit	Function
A	8 RD/BK	502	Battery Positive Voltage
B	3 RD/WH	3040	Battery Positive Voltage

CIRCUIT BREAKER 2 (SEO 9C1/9C3)



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 12110057
- Service Connector: 12110057
- Description: 2-Way F MAXI (BK)

Terminal Part Information

- Pins: A
- Terminal/Tray: 12092445/18
- Core/Insulation Crimp: G/G
- Release Tool/Test Probe: 12150860/J-35616-44 (YE)

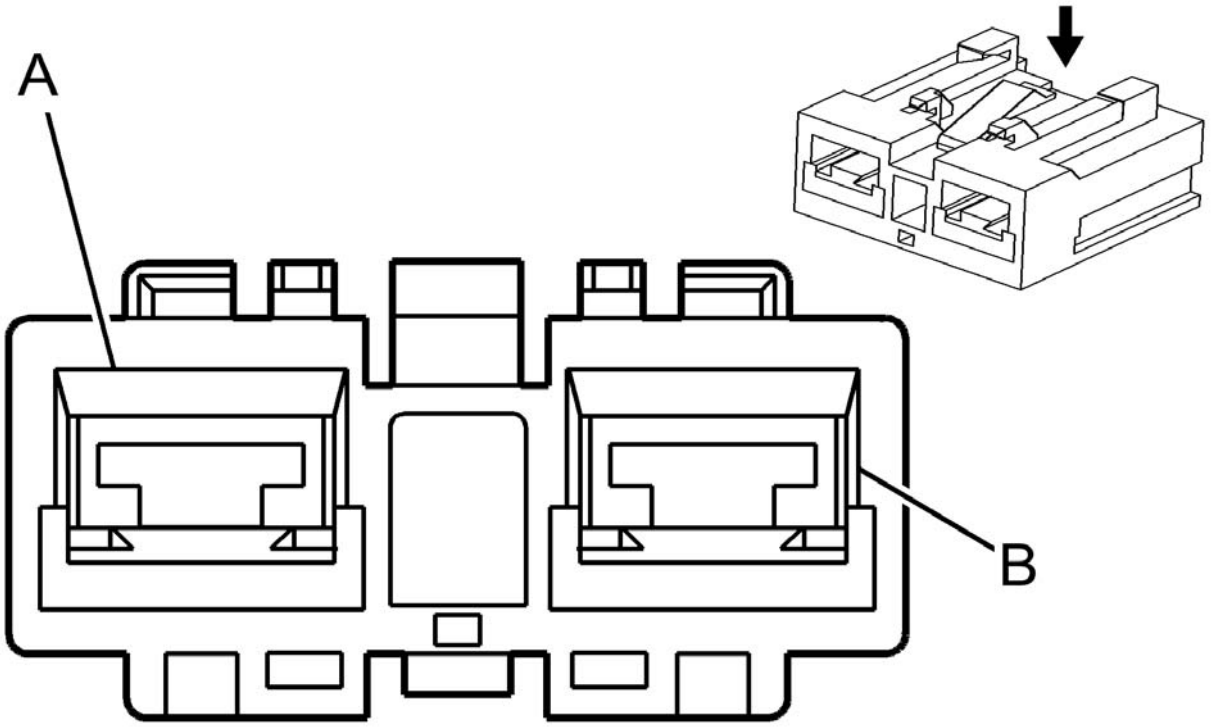
- Pins: B
- Terminal/Tray: 12110127/19

- Core/Insulation Crimp: F/G
- Release Tool/Test Probe: 12150860/J-35616-44 (YE)

Circuit Breaker 2 (SEO 9C1/9C3)

Pin	Wire	Circuit	Function
A	8 RD/BK	502	Battery Positive Voltage
B	3 RD/WH	3140	Battery Positive Voltage

CIRCUIT BREAKER 3 (SEO 9C1/9C3)



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 12110057
- Service Connector: 12110057
- Description: 2-Way F MAXI (BK)

Terminal Part Information

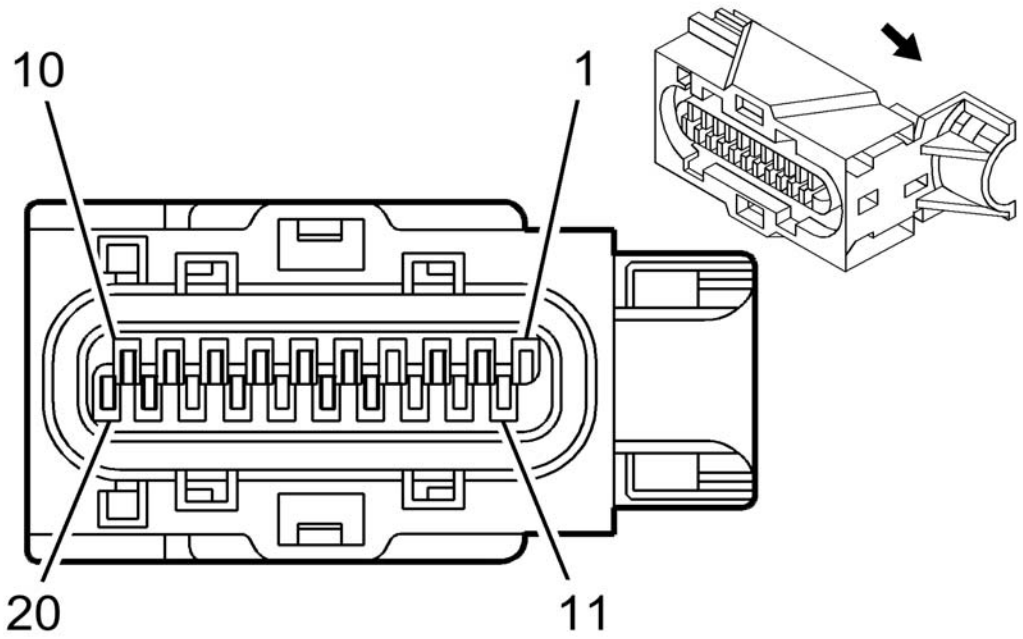
- Terminal/Tray: 12110127/19
- Core/Insulation Crimp: F/G

- Release Tool/Test Probe: 12150860/J-35616-44 (YE)

Circuit Breaker 3 (SEO 9C1/9C3)

Pin	Wire	Circuit	Function
A	5 RD/BK	402	Battery Positive Voltage
B	5 RD/WH	3740	Battery Positive Voltage

CONTROL SOLENOID VALVE ASSEMBLY X1



Connector Part Information	Terminal Part Information
• Harness Type: Engine • OEM Connector: 15476346 • Service Connector: 19151494 • Description: 20-Way F GT 150 Sealed (L-GY)	• Terminated Lead: Pins 1, 10, 18 - 13575400 • Terminated Lead: Pins 2, 5, 12-15 - 13575433 • Release Tool: J-38125-553 • Diagnostic Test Probe: J-35616-2A (GY) • Terminal/Tray: 15326267/19 • Core/Insulation Crimp: Pins 2, 5, 12-15 - E/4 • Core/Insulation Crimp: Pins 1, 10, 18 - E/1

Control Solenoid Valve Assembly X1

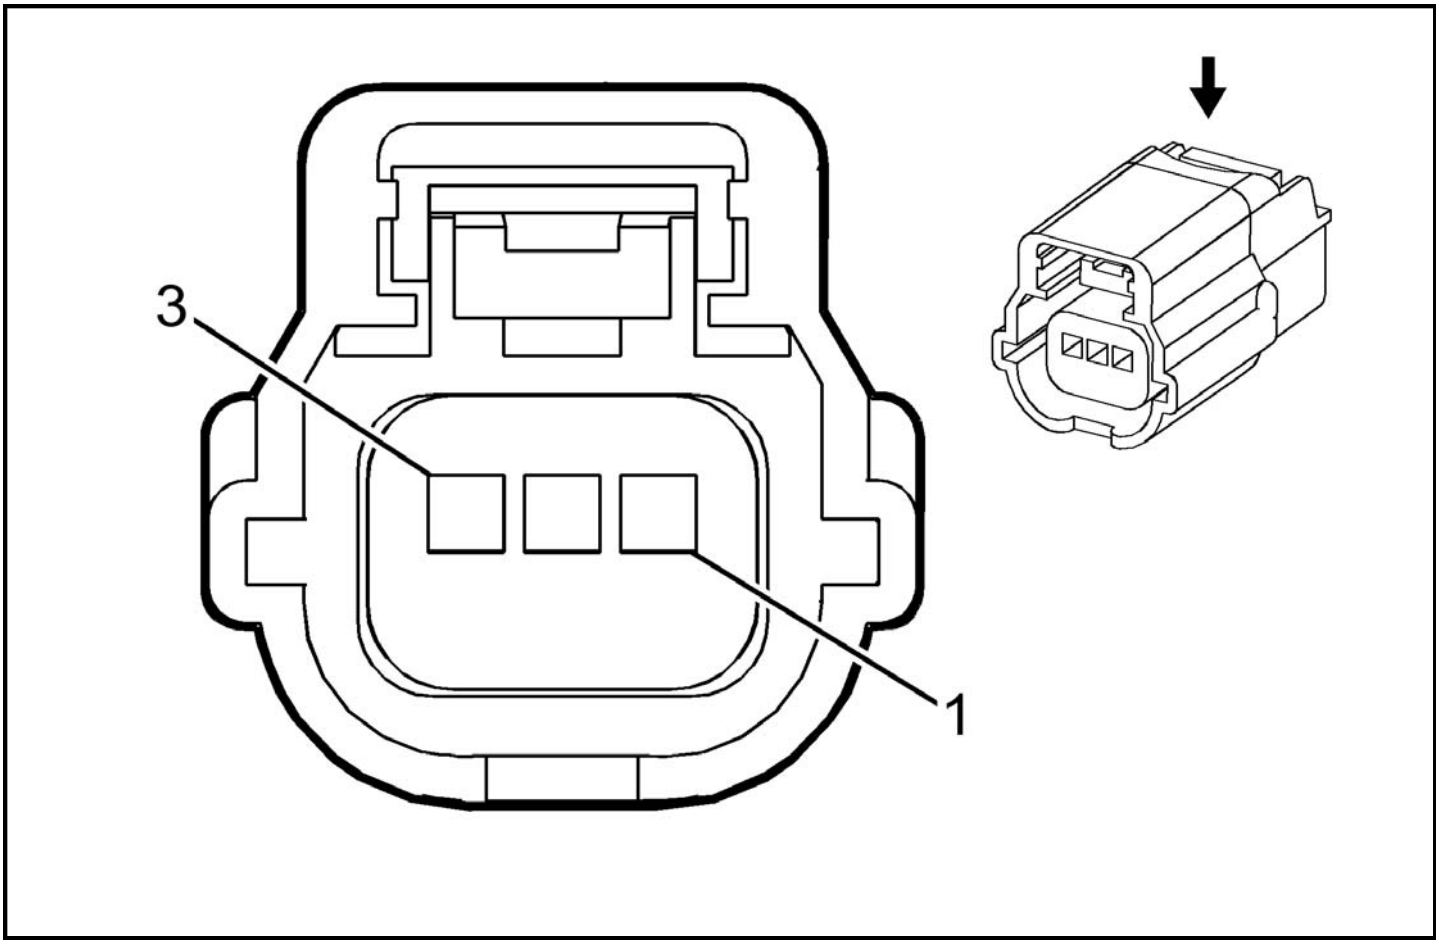
A	0.5	WD	-	Output Speed High Signal Output	-
B	0.5	BK	-	Output Speed Low Signal	-

CRANKSHAFT POSITION (CKP) SENSOR



Connector Part Information

- Harness Type: Engine
- OEM Connector: 13525738
- Service Connector: 88988337
- Description: 3-Way F USCAR 064 Series, Sealed (BK)

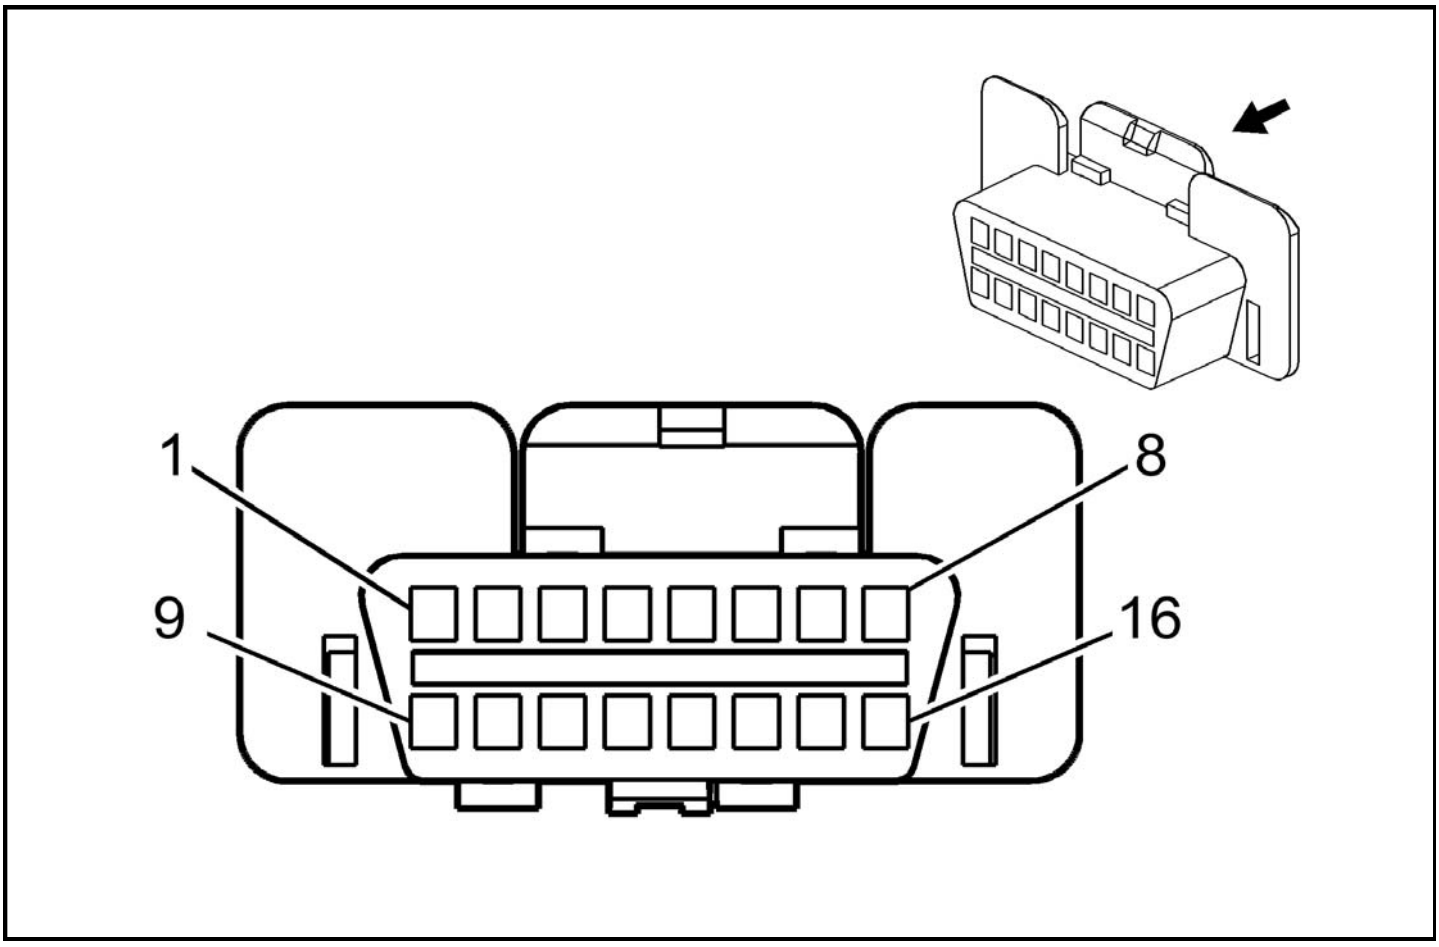
Terminal Part Information

- Terminated Lead: 13575575
- Release Tool: J-38125-213
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Crankshaft Position (CKP) Sensor

Pin	Wire	Circuit	Function
1	0.35 GY/BK	6272	Crankshaft Low reference
2	0.35 WH/BK	6271	Crankshaft Sensor Signal
3	0.35PU/WH	6270	5V Reference Voltage

DATA LINK CONNECTOR (DLC)



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 15488184
- Service Connector: 19115029
- Description: 16-Way F Metri-Pack 150 Series (BK)

Terminal Part Information

- Terminated Lead: 13575725
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 12129484/19
- Core/Insulation Crimp: E/C

Data Link Connector (DLC)

Pin	Wire	Circuit	Function
1	0.35 D-GN	5060	Low Speed GMLAN Serial Data
2-3	-	-	Not Used

Pin	Wire	Circuit	Function
4	0.5 BK	1450	Ground

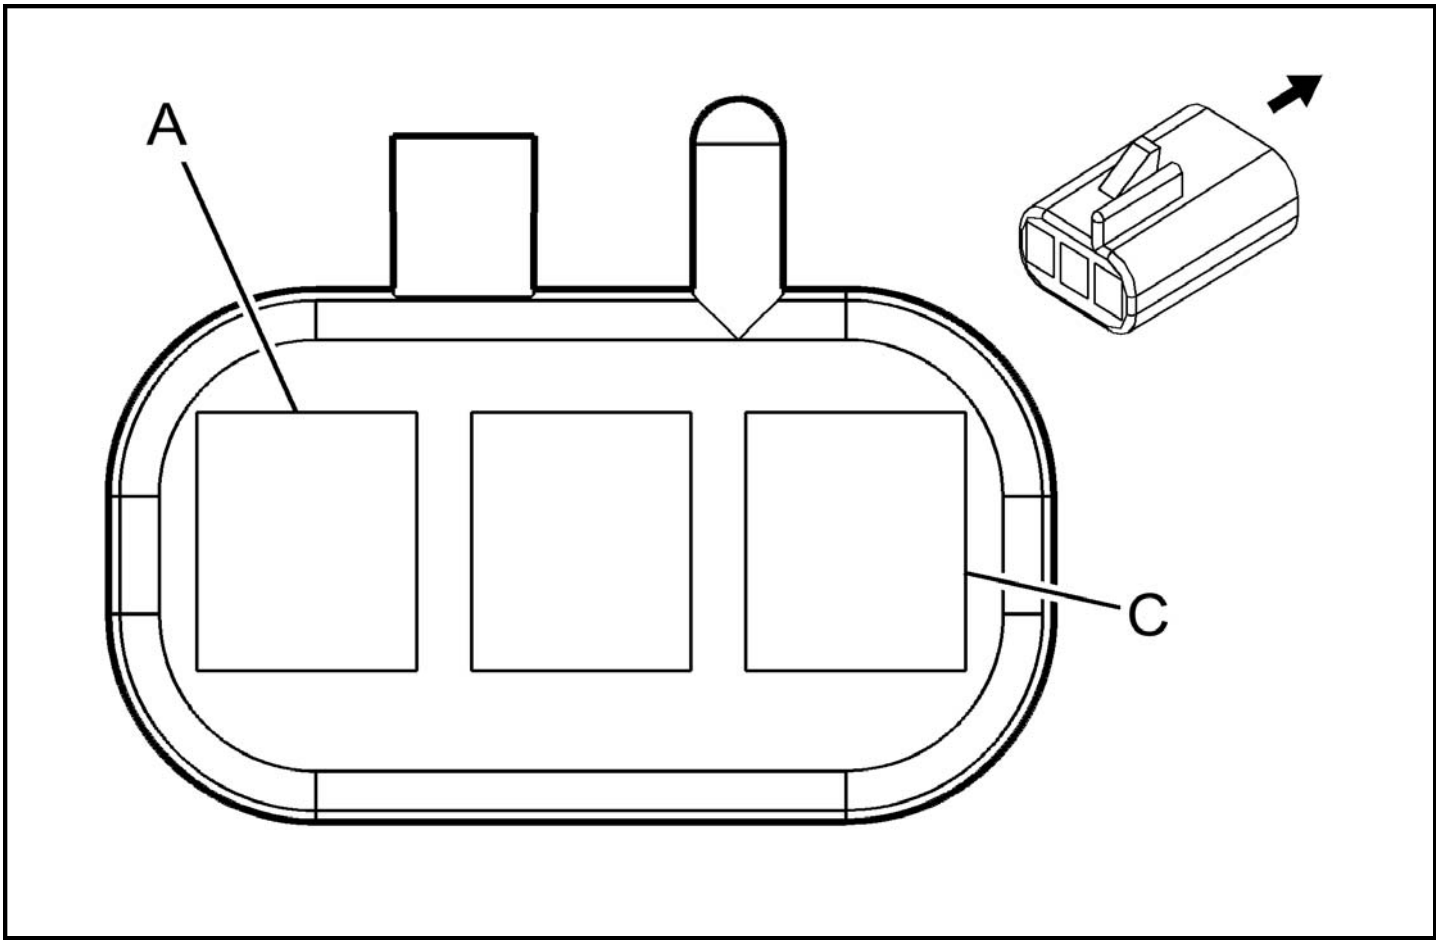
10-15	-	-	Not Used
16	0.5 RD/WH	3540	Battery Positive Voltage

DOME/READING LAMPS



Connector Part Information

- Harness Type: Headliner
- OEM Connector: 12047781
- Service Connector: 13586139
- Description: 3-Way F Metri-Pack 150 Series (BK)

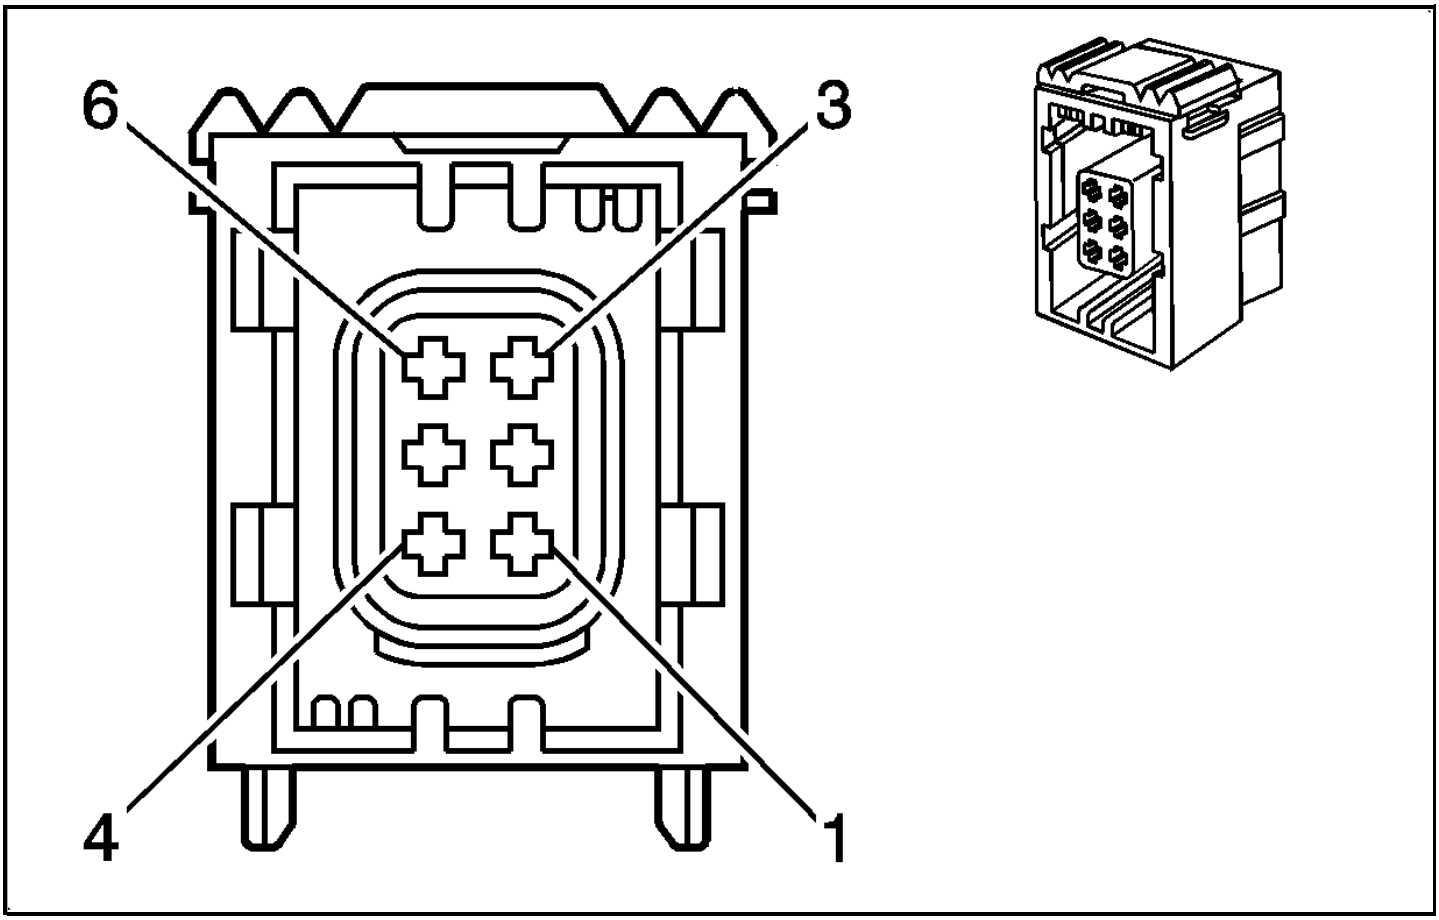
Terminal Part Information

- Terminated Lead: Service by Connector Assembly - 12101864
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/2
- Core/Insulation Crimp: E/C

Dome/Reading Lamps

Pin	Wire	Circuit	Function
A	0.5 GY/BK	690	Courtesy Lamp Supply Voltage
B	0.5 BK	550	Ground
C	0.5 OG	1732	Inadvertent Power Courtesy Lamp

DOOR LOCK - DRIVER (WITHOUT UA6)



Connector Part Information

- Harness Type: Left Front Door
- OEM Connector: 10768369
- Service Connector: 88986251
- Description: 6-Way F 1.2 Timer Series (BK)

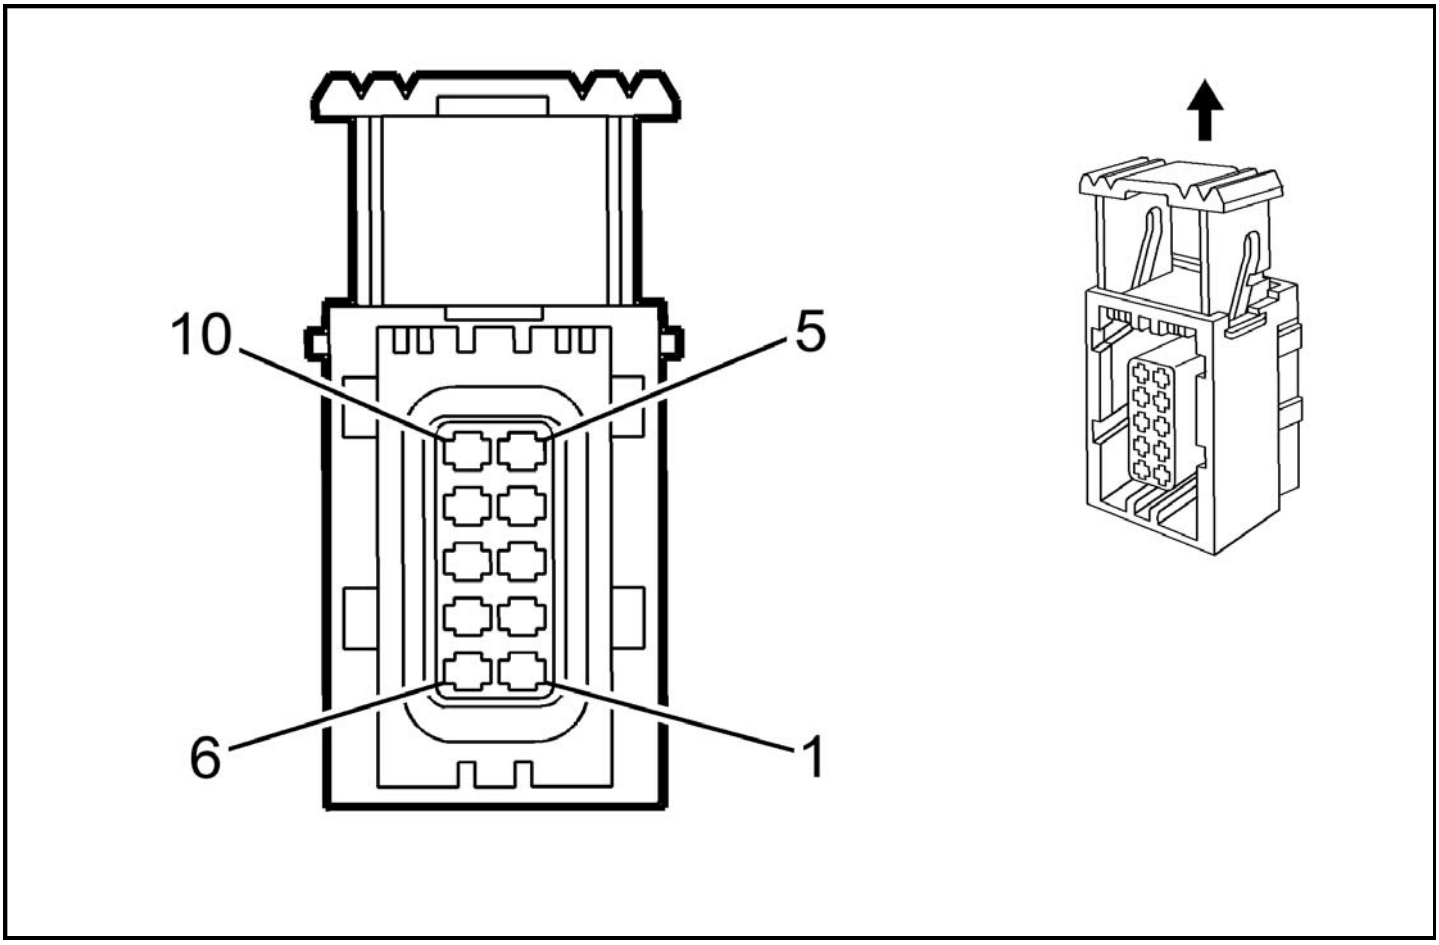
Terminal Part Information

- Terminated Lead: 13575359
- Release Tool: J-38125-560
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 964274-2/16
- Core/Insulation Crimp: E/1

Door Lock - Driver (without UA6)

Pin	Wire	Circuit	Function
1	-	-	Not Used
2	1 TN	694	Driver Door Lock Actuator Unlock Control
3	1 GY	295	Door Lock Actuator Lock Control
4	0.5 GY/BK	745	Left Front Door Ajar Switch Signal
5	0.5 TN	126	Left Front Door Open Switch Signal
6	0.35 BK	550	Ground

DOOR LOCK - DRIVER (UA6)



Connector Part Information

- Harness Type: Left Front Door
- OEM Connector: 10768367
- Service Connector: 88952463
- Description: 10-Way F Sealed (BK)

Terminal Part Information

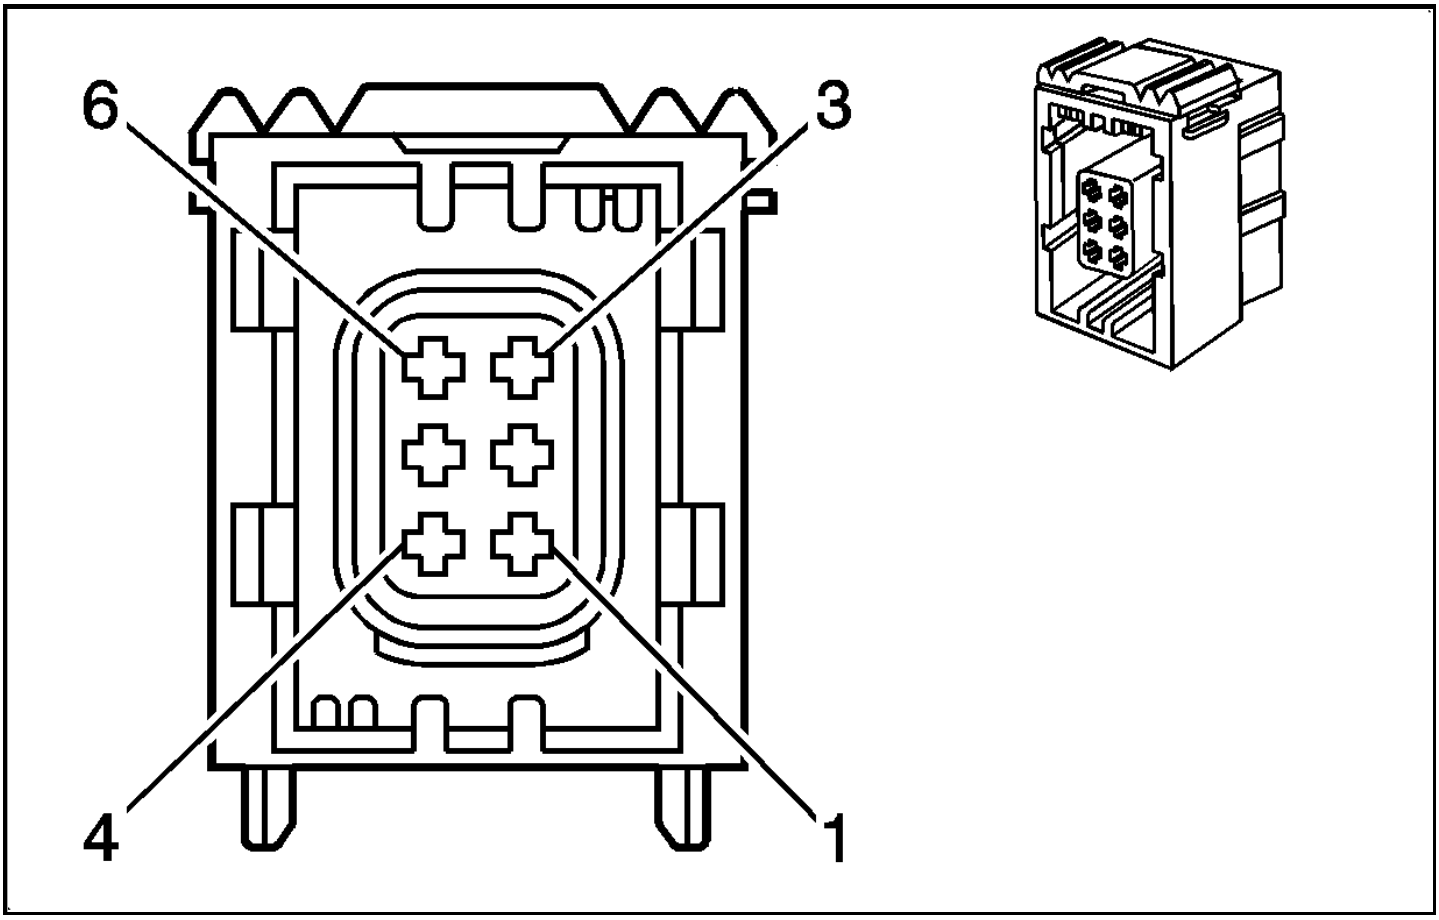
- Terminated Lead: 13575359
- Release Tool: J-38125-560
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 964274-2/16
- Core/Insulation Crimp: E/1

Door Lock - Driver (UA6)

Pin	Wire	Circuit	Function
1	-	-	Not Used
2	1 TN	694	Driver Door Lock Actuator Unlock Control
3	1 GY	295	Door Lock Actuator Lock Control
4-5	-	-	Not Used

Pin	Wire	Circuit	Function
6	0.5 GY/BK	745	Left Front Door Ajar Switch Signal
7	0.5 TN	126	Left Front Door Open Switch Signal
8	0.35 BK	550	Ground
9	0.5 PU	1124	Door Lock Key Switch Unlock Signal
10	-	-	Not Used

DOOR LOCK - LEFT REAR



Connector Part Information

- Harness Type: Left Rear Door
- OEM Connector: 10768369
- Service Connector: 88986251
- Description: 6-Way F 1.2 Timer Series (BK)

Terminal Part Information

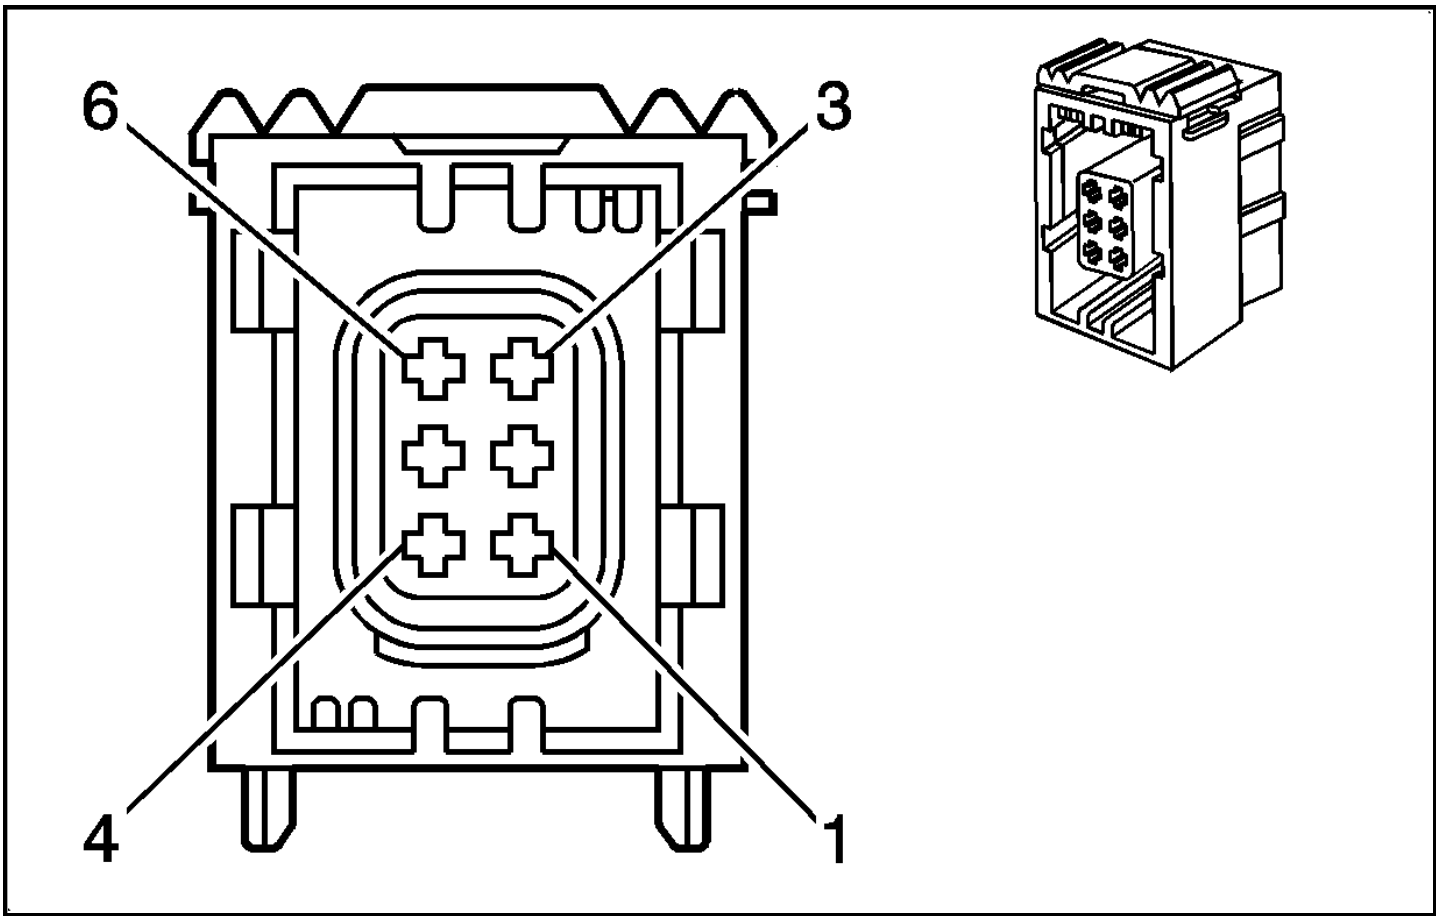
- Terminated Lead: 13575359
- Release Tool: J-38125-560
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 964274-2/16

- Core/Insulation Crimp: E/1

Door Lock - Left Rear

Pin	Wire	Circuit	Function
1	-	-	Not Used
2	1 TN	294	Door Lock Actuator Unlock Control
3	1 GY	295	Door Lock Actuator Lock Control
4	0.5 L-BU/BK	747	Left Rear Door Ajar Switch Signal
5	0.5 OG	5922	Passenger Door Open Switch Signal
6	0.5 BK	550	Ground

DOOR LOCK - PASSENGER



Connector Part Information

- Harness Type: Right Front Door
- OEM Connector: 10768369
- Service Connector: 88986251
- Description: 6-Way F 1.2 Timer Series (BK)

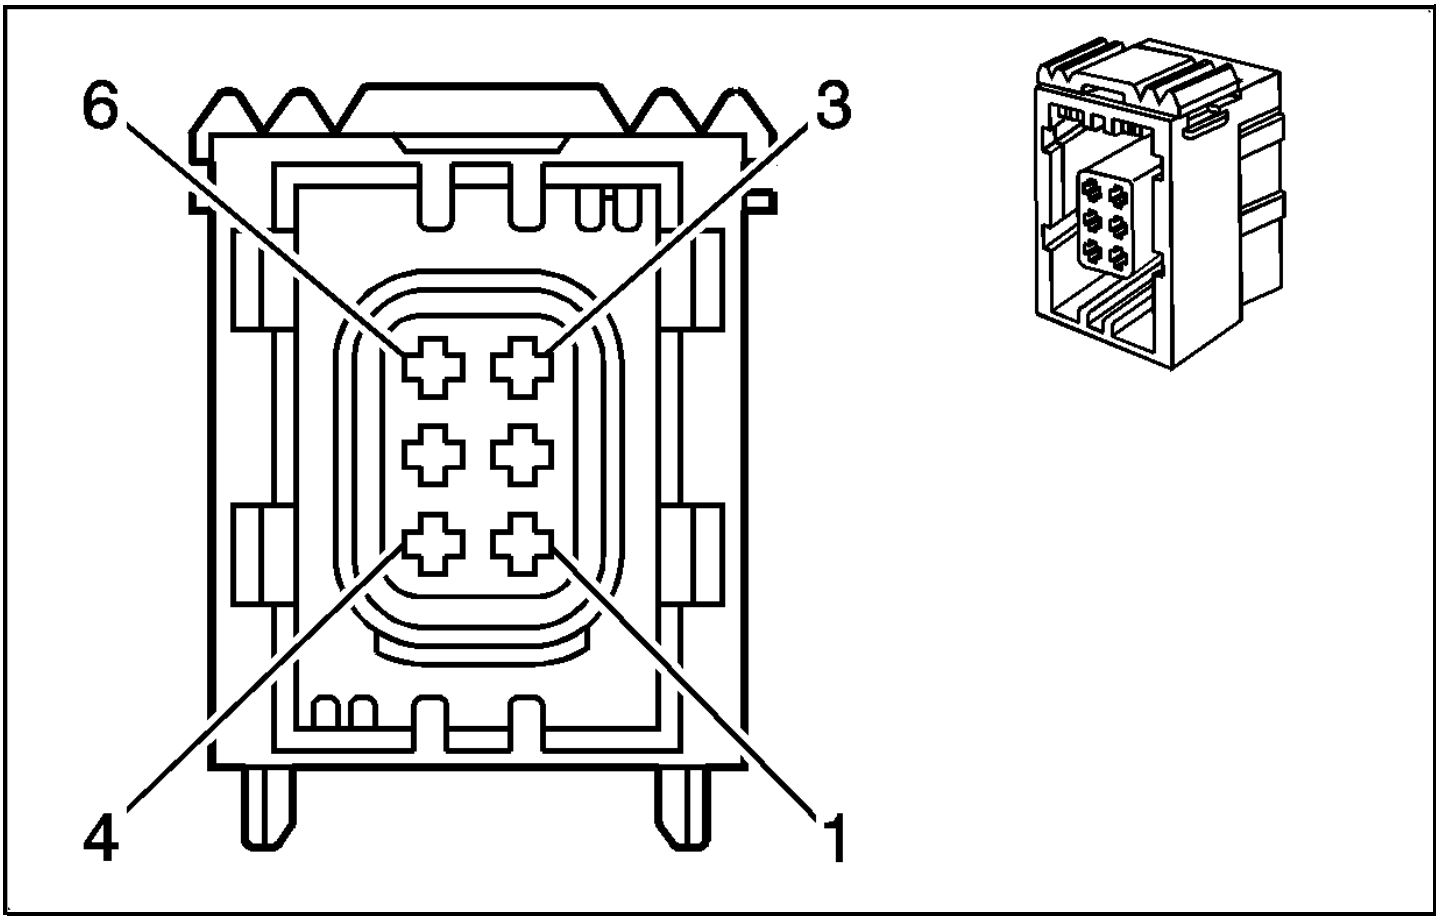
Terminal Part Information

- Terminated Lead: 13575359
- Release Tool: J-38125-560
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 964274-2/16
- Core/Insulation Crimp: E/1

Door Lock - Passenger

Pin	Wire	Circuit	Function
1	0.5 TN/WH	746	Right Front Door Ajar Switch Signal
2	0.5 OG	5922	Passenger Door Open Switch Signal
3	0.35 BK	750	Ground
4	-	-	Not Used
5	1 TN	294	Door Lock Actuator Unlock Control
6	1 GY	295	Door Lock Actuator Lock Control

DOOR LOCK - RIGHT REAR



Connector Part Information

- Harness Type: Right Rear Door

- OEM Connector: 10768369
- Service Connector: 88986251
- Description: 6-Way F 1.2 Timer Series (BK)

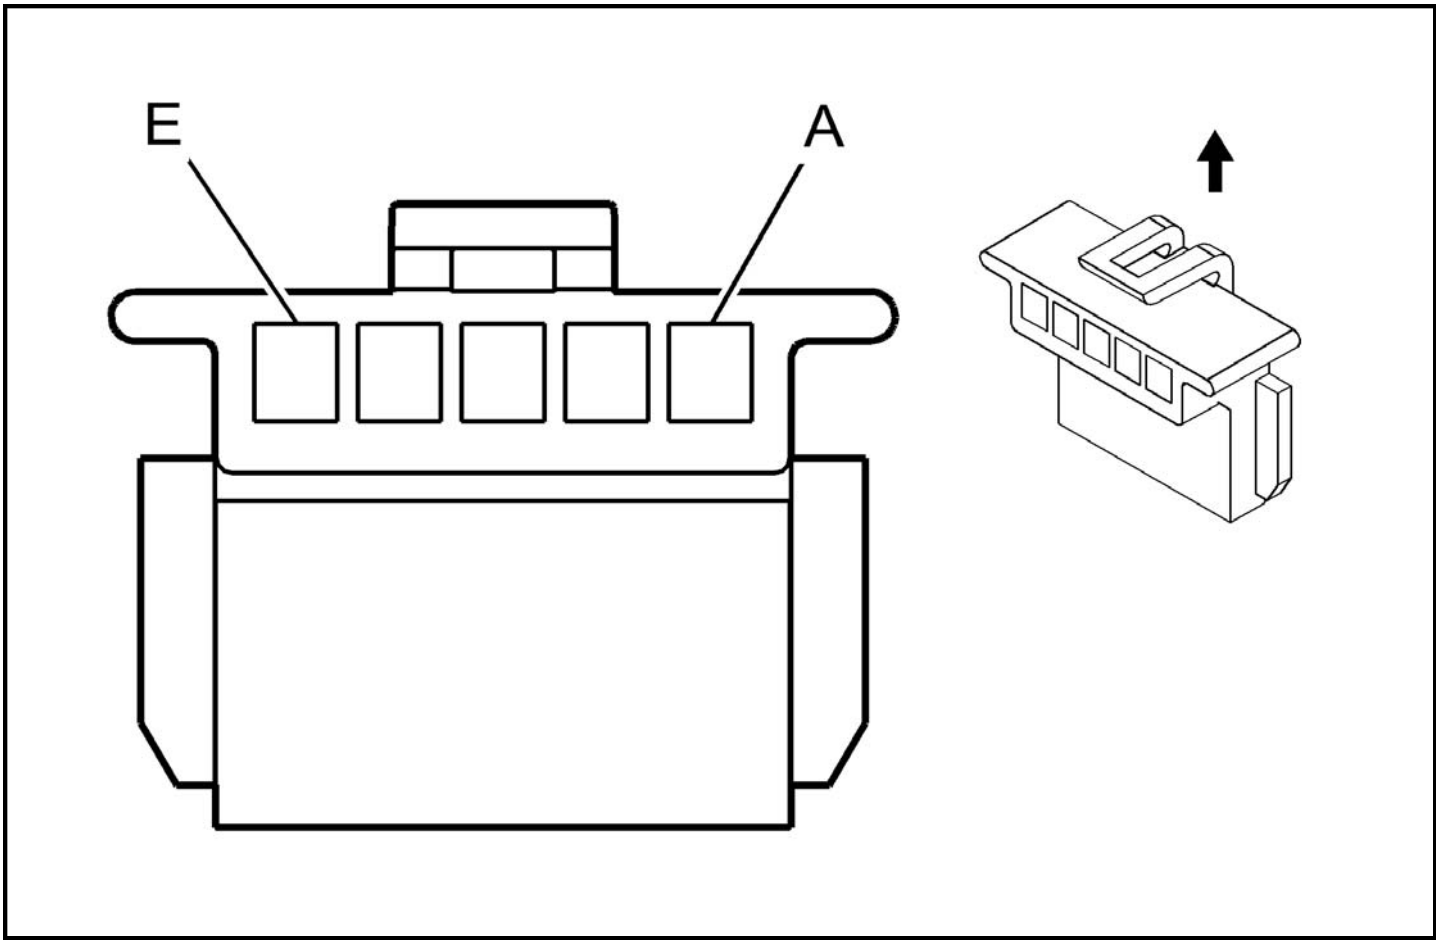
Terminal Part Information

- Terminated Lead: 13575359
- Release Tool: J-38125-560
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 964274-2/16
- Core/Insulation Crimp: E/1

Door Lock - Right Rear

Pin	Wire	Circuit	Function
1	0.5 L-GN/BK	748	Right Rear Door Ajar Switch Signal
2	0.5 OG	5922	Passenger Door Open Switch Signal
3	0.5 BK	750	Ground
4	-	-	Not Used
5	1 TN	294	Door Lock Actuator Unlock Control
6	1 GY	295	Door Lock Actuator Lock Control

DOOR LOCK SWITCH - DRIVER



Connector Part Information

- Harness Type: Left Front Door Trim
- OEM Connector: 12124997
- Service Connector: 12167130
- Description: 5-Way F Metri-Pack 150 Series (BK)

Terminal Part Information

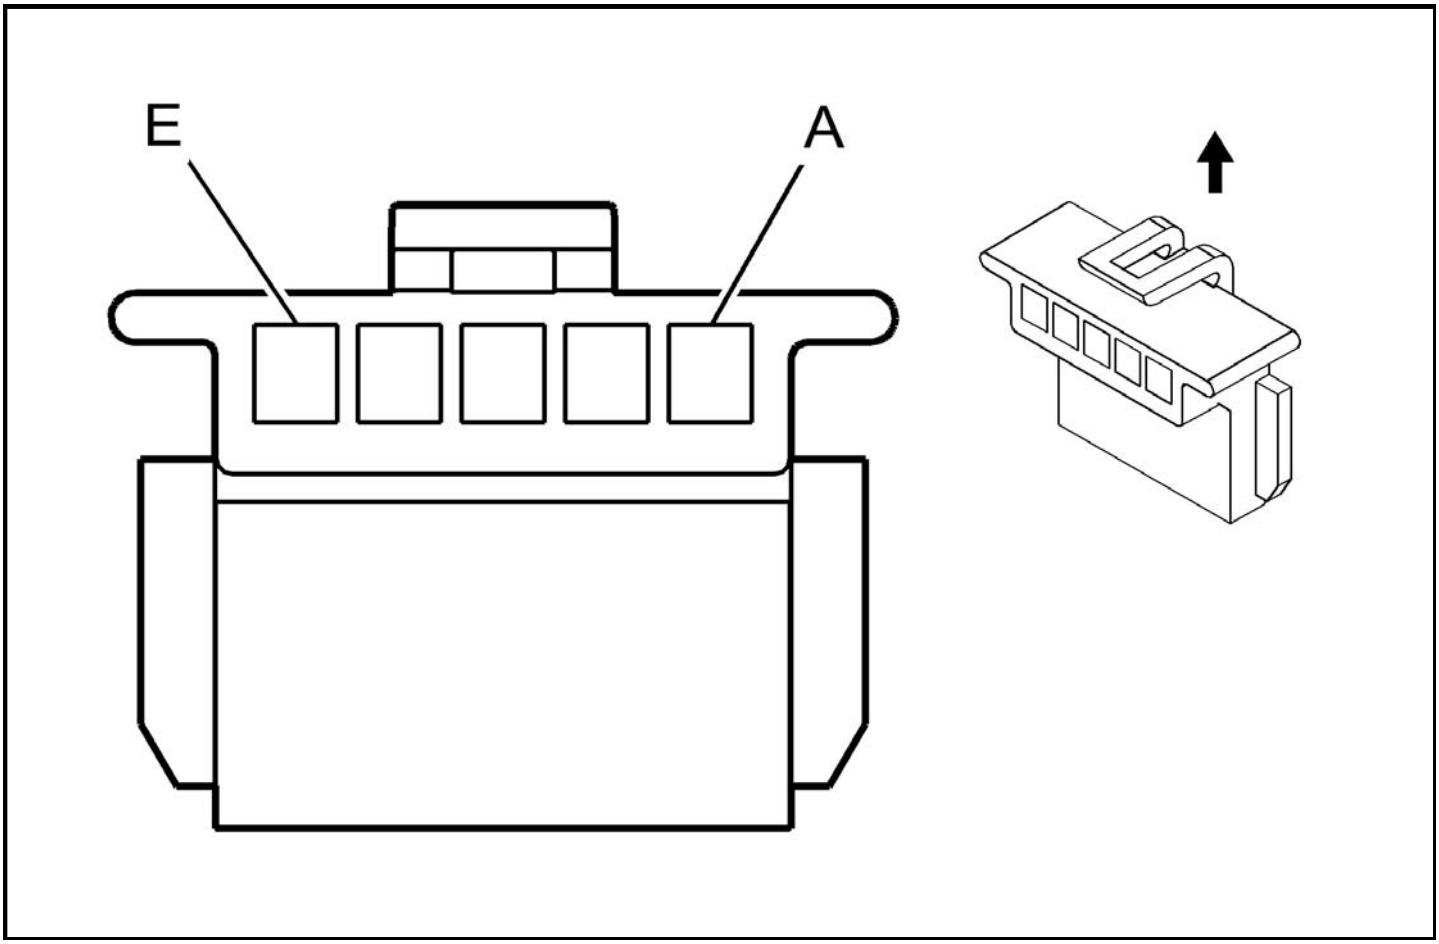
- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 12103359/18
- Core/Insulation Crimp: E/C

Door Lock Switch - Driver

Pin	Wire	Circuit	Function
A	0.35 GY	8	Instrument Panel Lamp Supply Voltage
B	0.35 BK	550	Ground
C	-	-	Not Used
D	0.35 OG/BK	780	Driver Door Lock Switch Lock Signal

Pin	Wire	Circuit	Function
E	0.35 OG	781	Driver Door Lock Switch Unlock Signal

DOOR LOCK SWITCH - PASSENGER



Connector Part Information

- Harness Type: Right Front Door
- OEM Connector: 12124997
- Service Connector: 12167130
- Description: 5-Way F Metri-Pack 150 Series (BK)

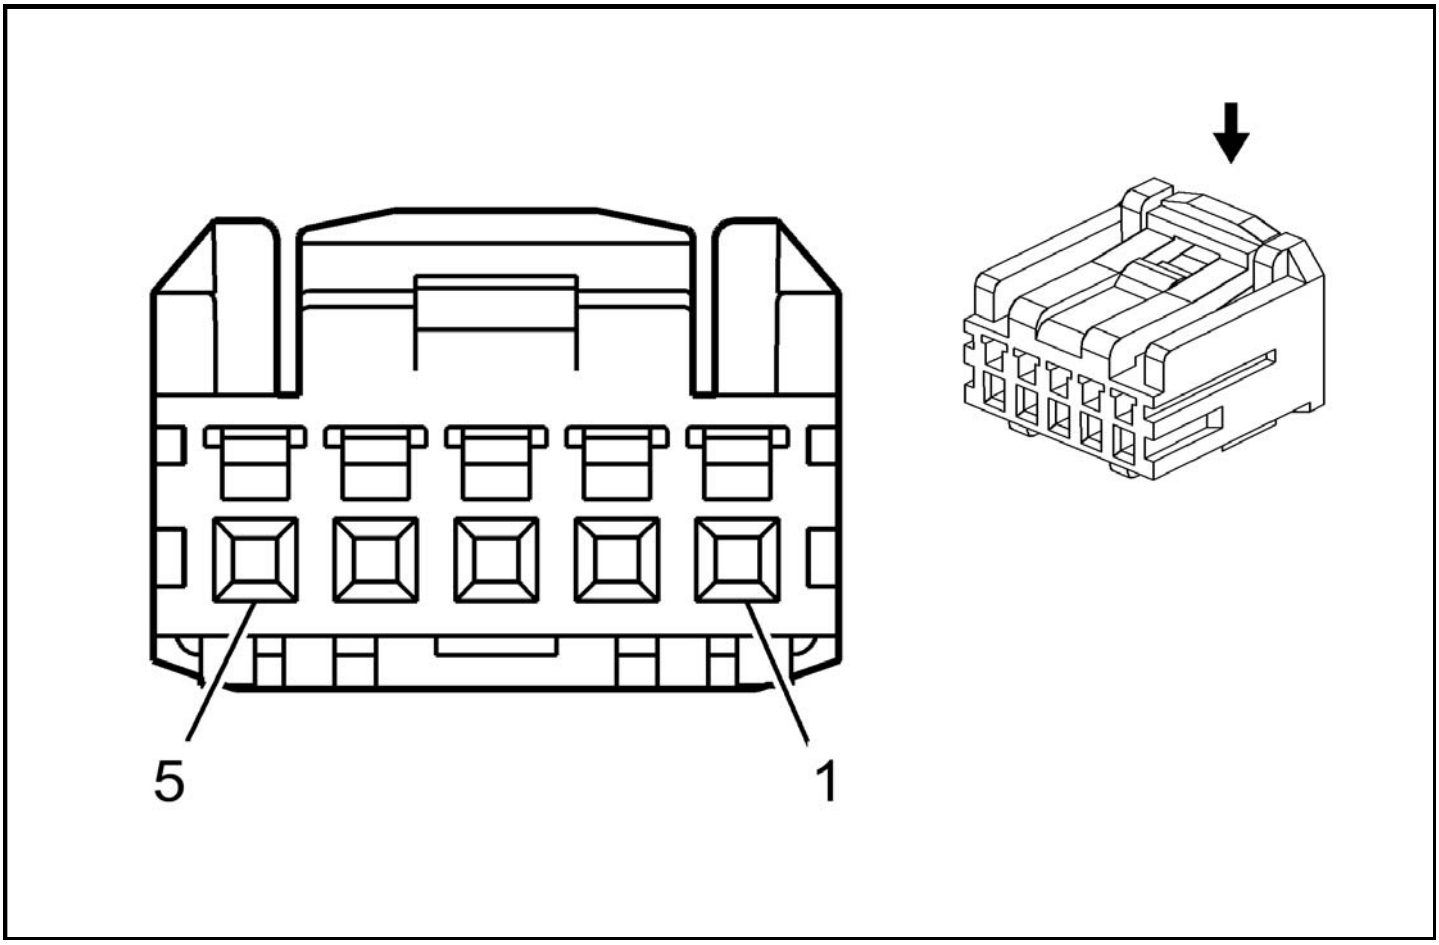
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 12103359/18
- Core/Insulation Crimp: E/C

Door Lock Switch - Passenger

Pin	Wire	Circuit	Function
A	0.35 GY	8	Instrument Panel Lamp Supply Voltage
B	0.5 BK	750	Ground
C	-	-	Not Used
D	0.35 L-BU	244	Passenger Door Lock Switch Lock Signal
E	0.35 D-BU	245	Passenger Door Lock Switch Unlock Signal

DRIVER INFORMATION CENTER (DIC) SWITCH



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 15491277
- Service Connector: 88988747
- Description: 5-Way F HCM Series (BK)

Terminal Part Information

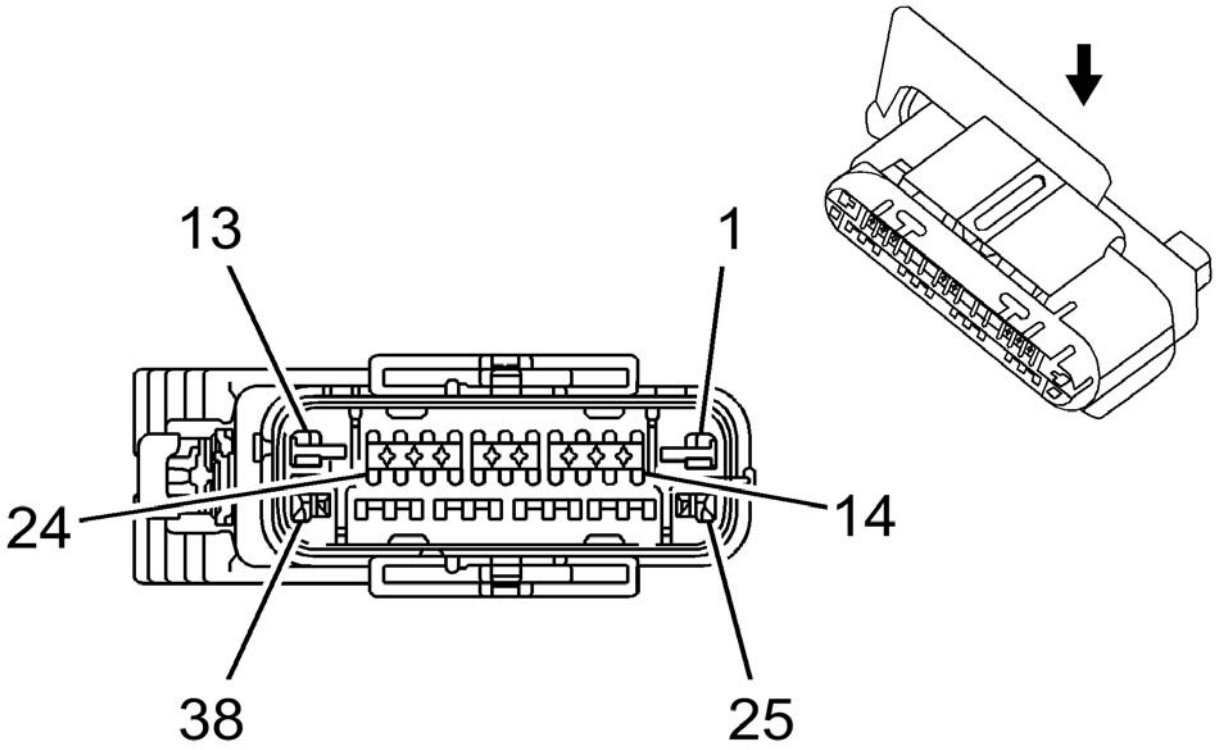
- Terminated Lead: 13575868
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: SHCM-A03T-P025/20

- Core/Insulation Crimp: J/J

Driver Information Center (DIC) Switch

Pin	Wire	Circuit	Function
1	0.35 D-GN/WH	1358	DIC Switch Signal
2	0.35 BN	897	DIC Switch Low Reference
3	0.35 PK	893	DIC Select Menu Switch Signal
4	0.35 PU/WH	1382	LED Dimming Supply
5	0.5 BK	1450	Ground

ELECTRONIC BRAKE CONTROL MODULE (EBCM)



Connector Part Information

- Harness Type: Engine
- OEM Connector: 13546206
- Service Connector: 19178086
- Description: 38-Way F 250/280/6.3 Series, Sealed (BK)

Terminal Part Information

- Pin: 1

- Terminated Lead: 13581358
- Release Tool: J-38125-11A
- Diagnostic Test Probe: J-35616-42 (RD)
- Terminal/Tray: 7116-4142-02/10
- Core/Insulation Crimp: A/3

- Pins: 3, 4, 6, 15-16, 27, 28, 31
- Terminated Lead: 13578883
- Release Tool: J-38125-215A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: SAITS-A03T-M064/14
- Core/Insulation Crimp: 9/9

- Pins: 8, 9, 12, 17, 18, 19, 21, 23, 24, 30, 32, 33, 36, 37
- Terminated Lead: 13578883
- Release Tool: J-38125-215A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: SAITS-A03T-M064/14
- Core/Insulation Crimp: 9/9

- Pin: 13
- Terminated Lead: 13579767
- Release Tool: J-38125-11A
- Diagnostic Test Probe: J-35616-42 (RD)
- Terminal/Tray: 7116-4142-02/10
- Core/Insulation Crimp: D/3

- Pin: 25
- Terminated Lead: 13575408
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 15392777/23
- Core/Insulation Crimp: D/5

- Pin: 38
- Terminated Lead: 13575402
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 15392777/23
- Core/Insulation Crimp: B/5

Electronic Brake Control Module (EBCM)

Pin	Wire	Circuit	Function

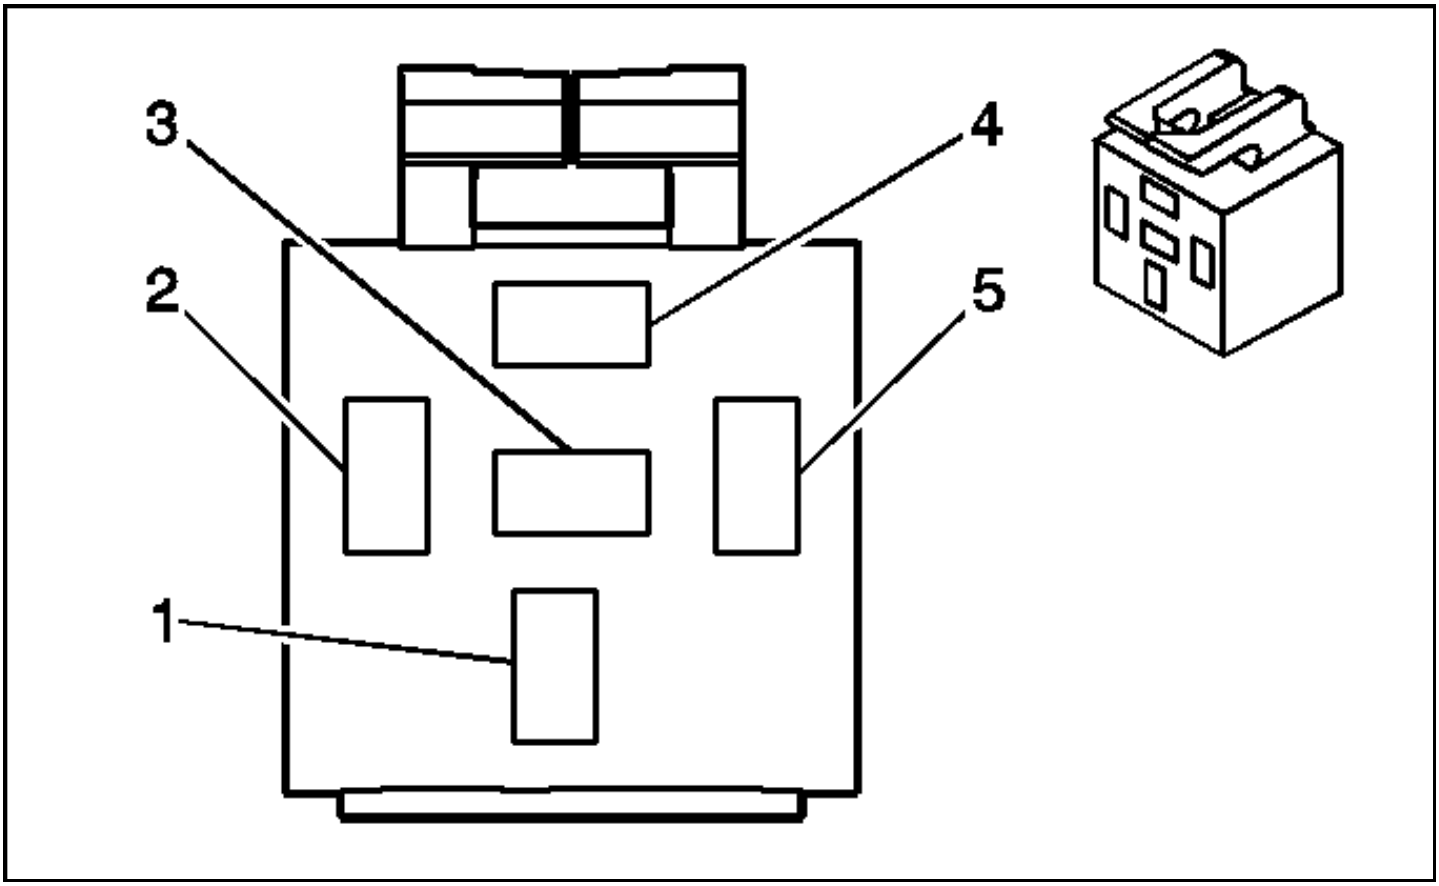
EMERGENCY VEHICLE FRONT LAMP FLASHER (6J3)



Connector Part Information

- Harness Type: 6J3 Jumper
- OEM Connector: 12034003
- Service Connector: Service by Harness - See Part Catalog
- Description: 5-Way F Metri-Pack 630 Series (BK)

Terminal Part Information

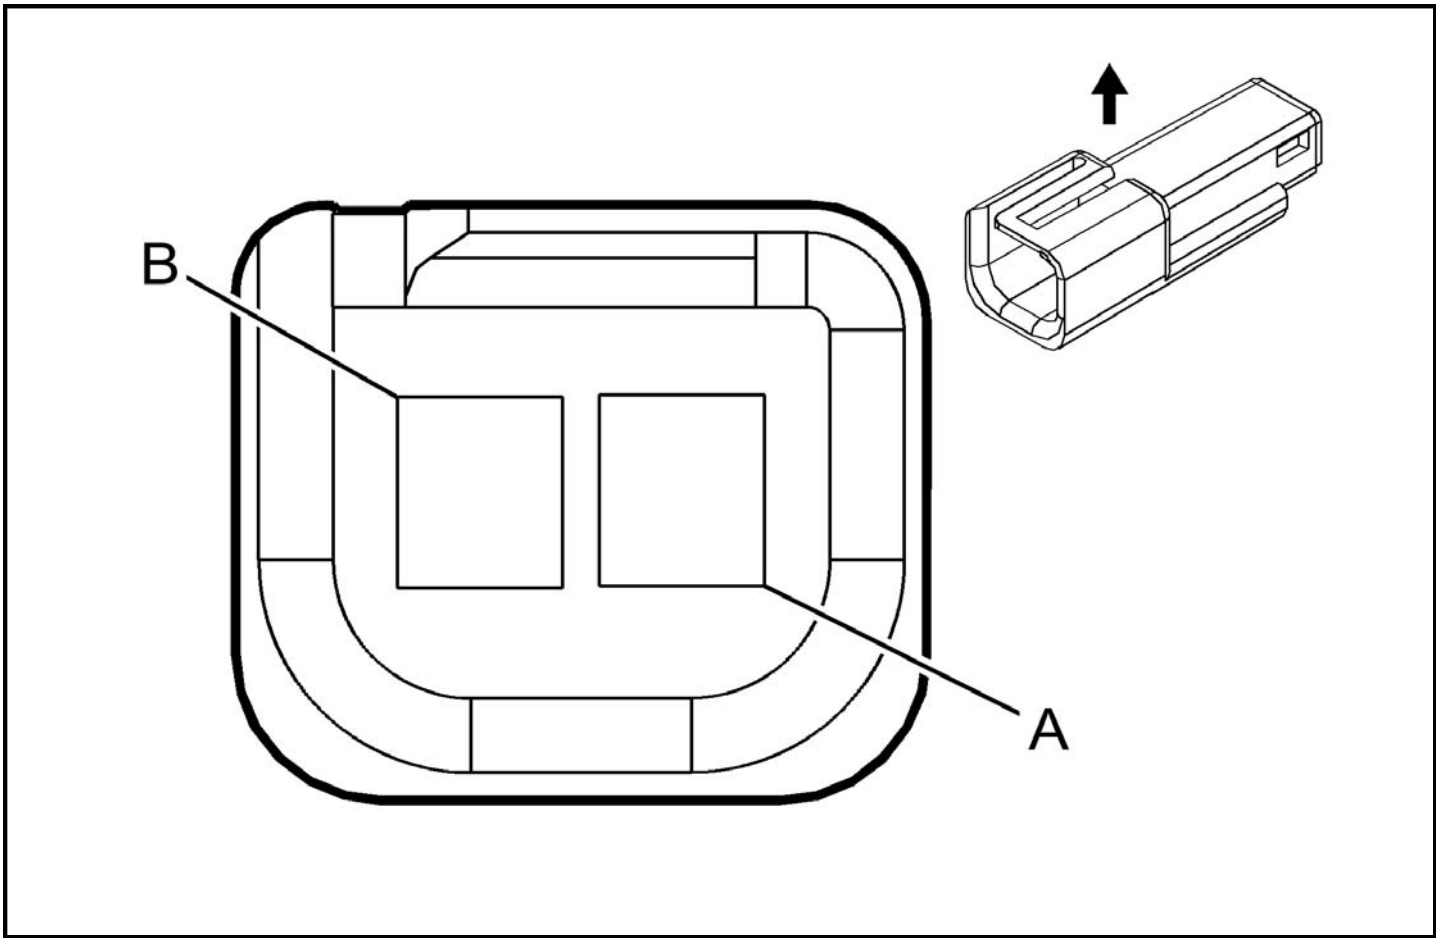
- Terminated Lead: Service by Harness - See Part Catalog
- Release Tool: Not Available
- Diagnostic Test Probe: Not Available
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Emergency Vehicle Front Lamp Flasher (6J3)

Pin	Wire	Circuit	Function
1	-	-	Not Used
2	1.0 GY	6838	Front Emergency Flasher Control
3	-	-	Not Used
4	1.0 TN	6835	Front Emergency Lamp Supply Voltage

Pin	Wire	Circuit	Function
5	1.0 PU	6834	Front Emergency Lamp Flasher Supply Voltage

EMERGENCY VEHICLE REAR WINDOW PANEL LAMP - LEFT (6J6)



Connector Part Information

- Harness Type: Body
- OEM Connector: 12047663
- Service Connector: 13584278
- Description: 2-Way M Metri-Pack 150 Series (BK)

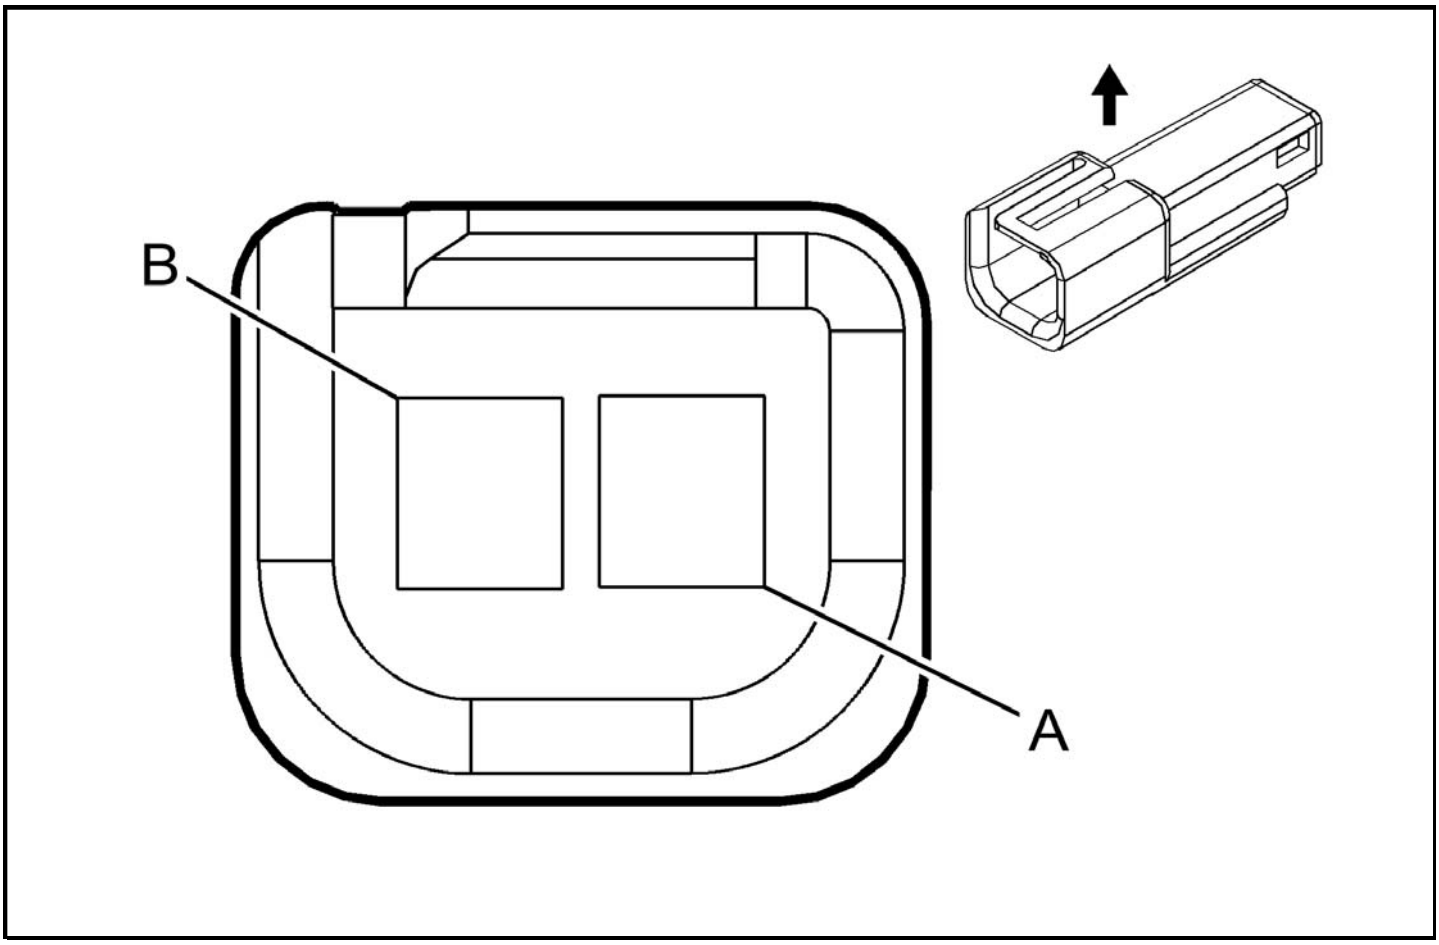
Terminal Part Information

- Terminated Lead: 13505668
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)
- Terminal/Tray: 12047581/2
- Core/Insulation Crimp: E/A

Emergency Vehicle Rear Window Panel Lamp - Left (6J6)

Pin	Wire	Circuit	Function
A	0.8 YE	18	Left Rear Stop/Turn Lamp Supply Voltage
B	-	-	Not Used

EMERGENCY VEHICLE REAR WINDOW PANEL LAMP - RIGHT (6J6)



Connector Part Information

- Harness Type: Body
- OEM Connector: 12047663
- Service Connector: 13584278
- Description: 2-Way M Metri-Pack 150 Series (BK)

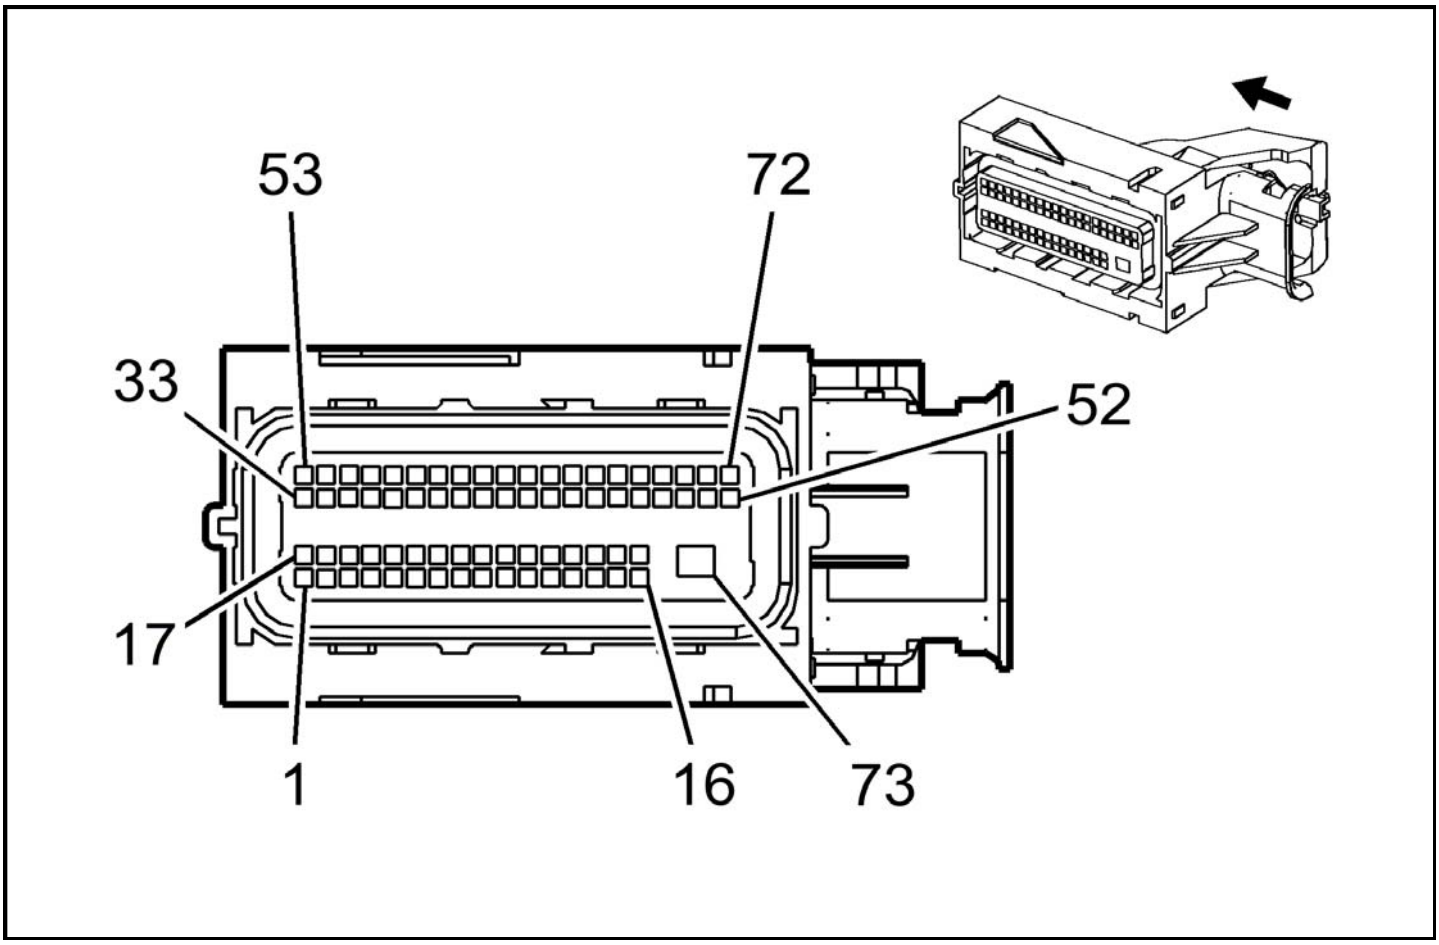
Terminal Part Information

- Terminated Lead: 13505668
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)
- Terminal/Tray: 12047581/2
- Core/Insulation Crimp: E/A

Emergency Vehicle Rear Window Panel Lamp - Right (6J6)

Pin	Wire	Circuit	Function
A	0.8 D-GN	19	Right Rear Stop/Turn Lamp Supply Voltage
B	-	-	Not Used

ENGINE CONTROL MODULE (ECM) X1 (LFX)



Connector Part Information

- Harness Type: Engine
- OEM Connector: 13611938
- Service Connector: 13574782
- Description: 73-Way F 0.64, 2.8 Series, Sealed (BK with BU Terminal Position Assurance Lock)

Terminal Part Information

- Pins: 3-5, 6, 9, 10, 14, 15, 18, 19, 21, 22, 25, 26, 30, 32-34, 38-40, 42, 44, 46-48, 51-53, 55-59, 62, 63, 66-68, 70, 72
- Terminated Lead: 13575812
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: 33467-0003

- Core/Insulation Crimp: Not Available
- Pin: 73
- Terminated Lead: 13575797
- Release Tool: J-38125-11A
- Diagnostic Test Probe: J-35616-35 (VT)
- Terminal/Tray: 7116-4152-02/9
- Core/Insulation Crimp: A/5

Engine Control Module (ECM) X1 (LFX)

Pin	Wire	Circuit	Function

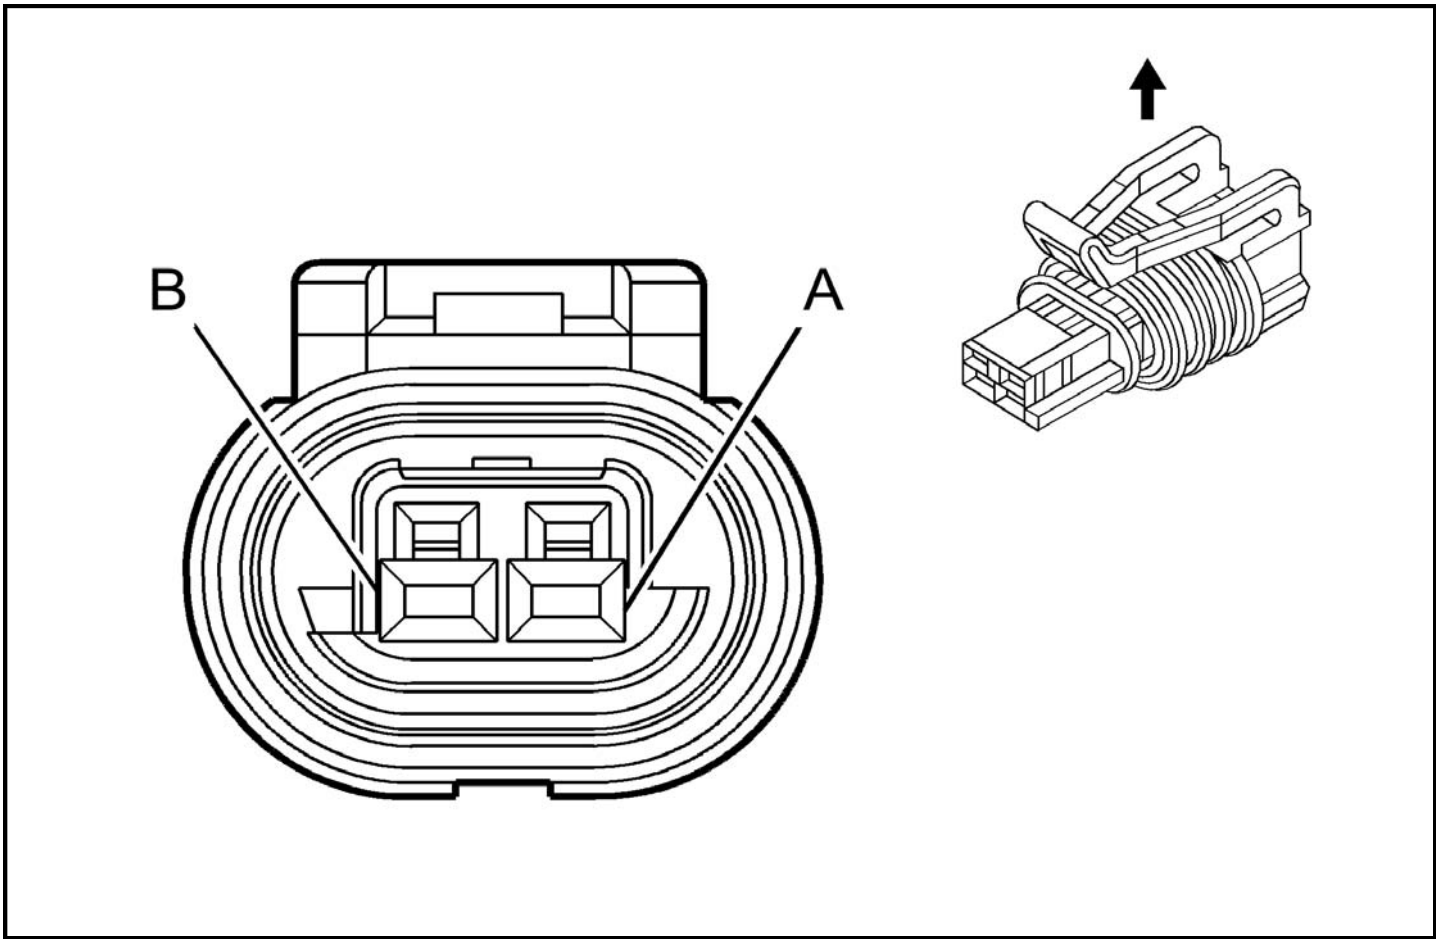
ENGINE COOLANT TEMPERATURE (ECT) SENSOR



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15449028
- Service Connector: 88987993
- Description: 2-Way F GT 150 Series, Sealed (BK)

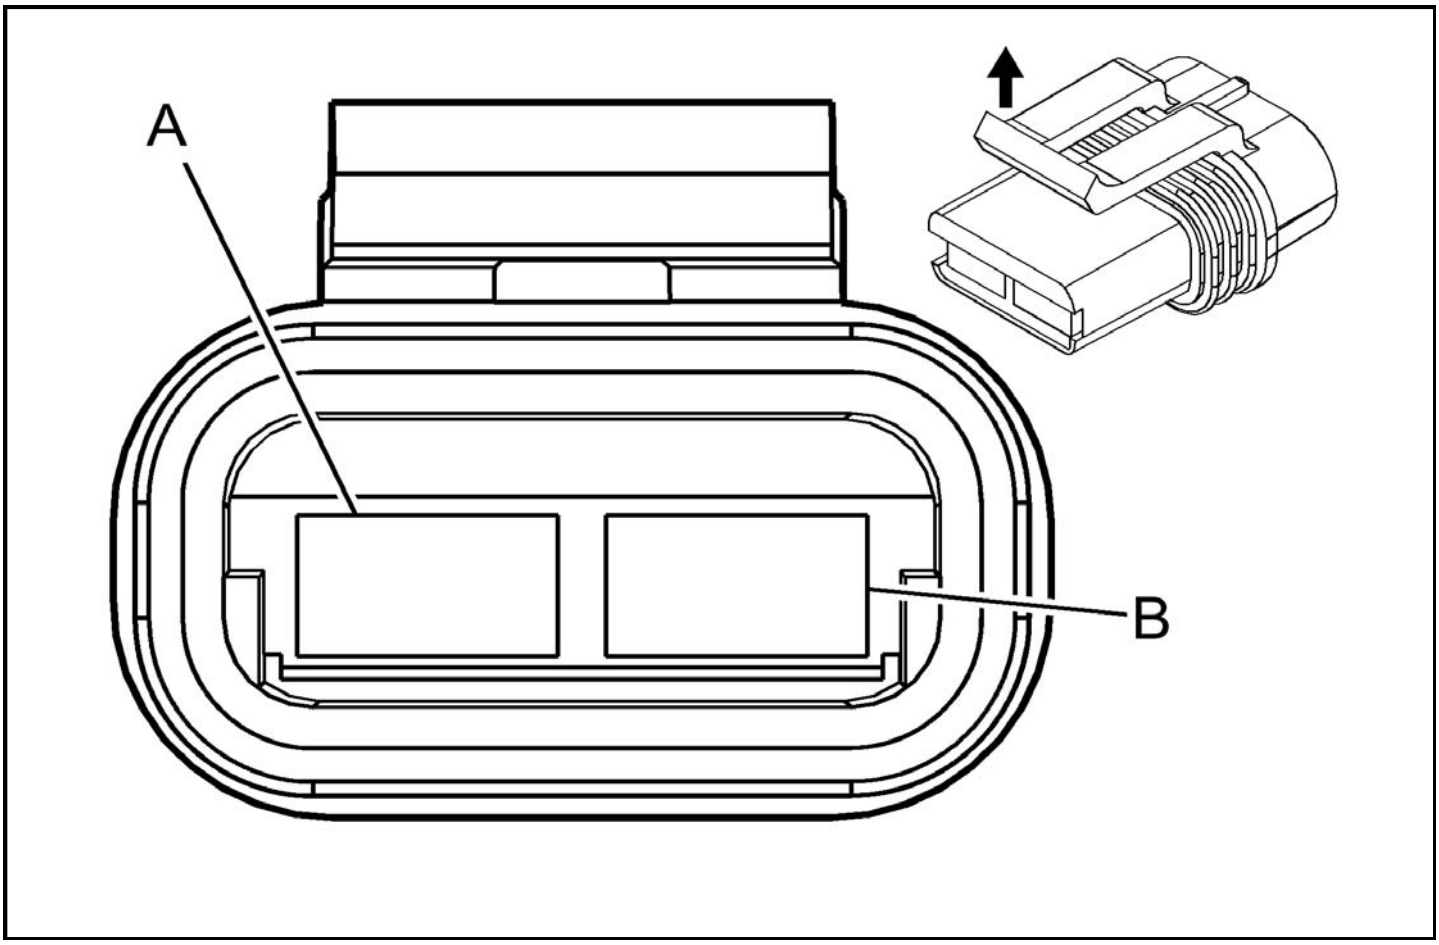
Terminal Part Information

- Terminated Lead: 13576360
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 15326267/19
- Core/Insulation Crimp: E/4

Engine Coolant Temperature (ECT) Sensor

Pin	Wire	Circuit	Function
A	0.5 OG/BK	469	Low Reference
B	0.5 YE	410	ECT Sensor Signal

ENGINE COOLING FAN - LEFT



Connector Part Information

- Harness Type: Forward Lamp
- OEM Connector: 12033769
- Service Connector: 12101917
- Description: 2-Way F Metri-Pack 630 Series, Sealed, Pull To Seat (BK)

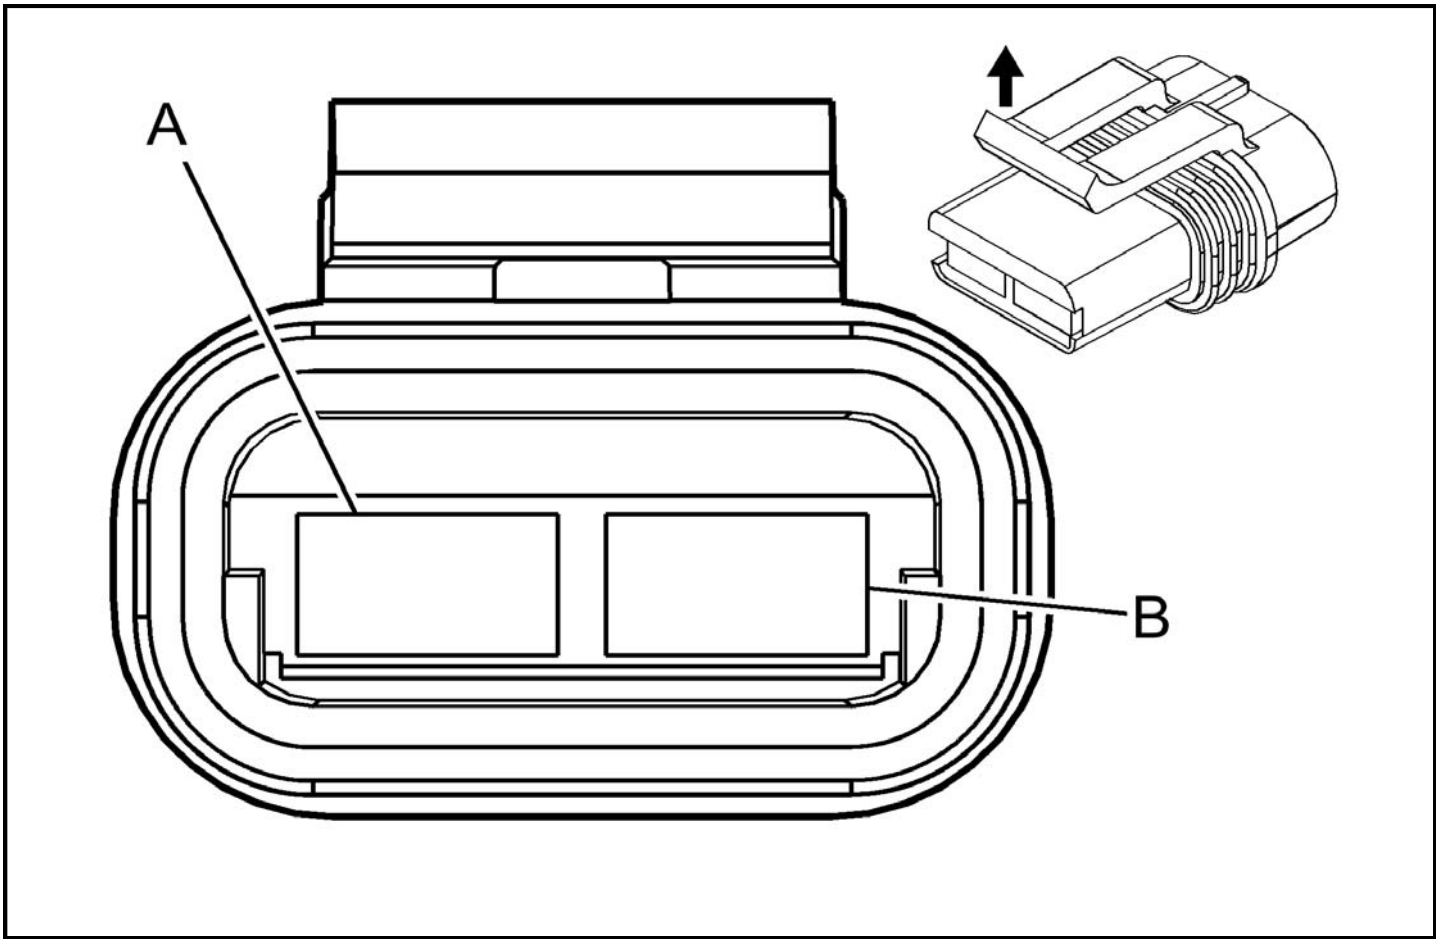
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-11A
- Diagnostic Test Probe: J-35616-42 (RD)
- Terminal/Tray: 12033997/8
- Core/Insulation Crimp: D/B

Engine Cooling Fan - Left

Pin	Wire	Circuit	Function
A	3 GY	532	Cooling Fan Low Reference
B	3 WH	504	Cooling Fan Motor Supply Voltage

ENGINE COOLING FAN - RIGHT



Connector Part Information

- Harness Type: Forward Lamp
- OEM Connector: 12033769
- Service Connector: 12101917
- Description: 2-Way F Metri-Pack 630 Series, Sealed, Pull To Seat (BK)

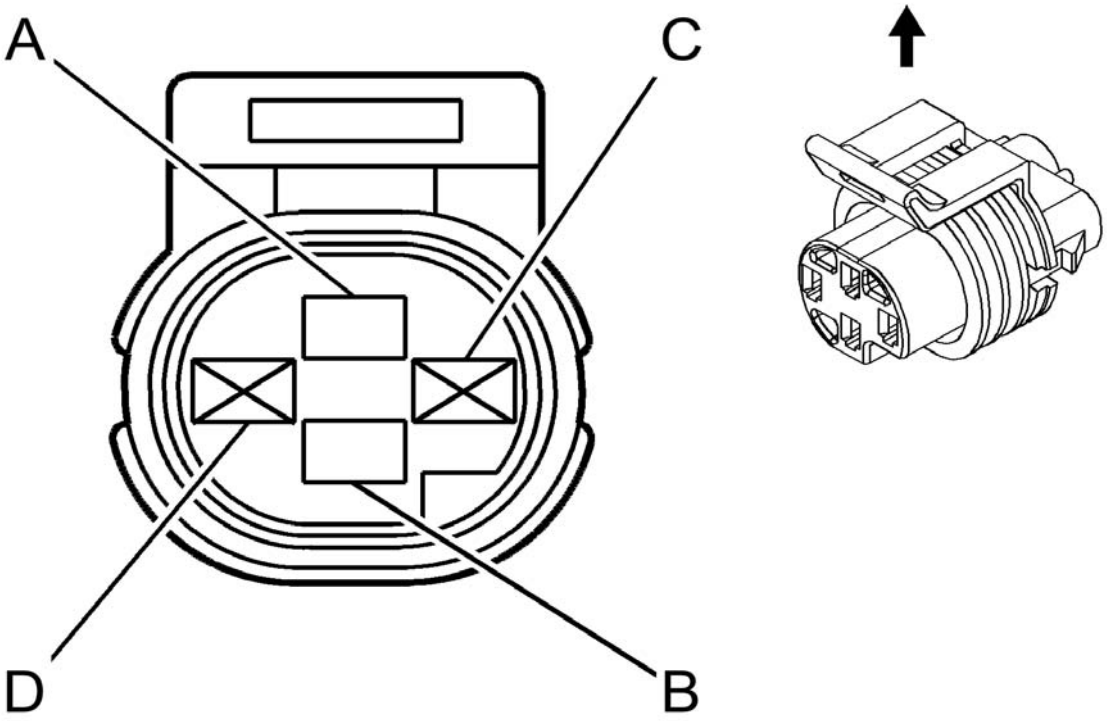
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-11A
- Diagnostic Test Probe: J-35616-42 (RD)
- Terminal/Tray: 12033997/8
- Core/Insulation Crimp: D/B

Engine Cooling Fan - Right

Pin	Wire	Circuit	Function
A	3 BK	250	Ground
B	3 L-BU	409	Cooling Fan Motor Supply Voltage

ENGINE OIL PRESSURE (EOP) SWITCH



Connector Part Information

- Harness Type: Engine
- OEM Connector: 12065400
- Service Connector: 13585859
- Description: 4-Way F Metri-Pack 150 Series (L-GN)

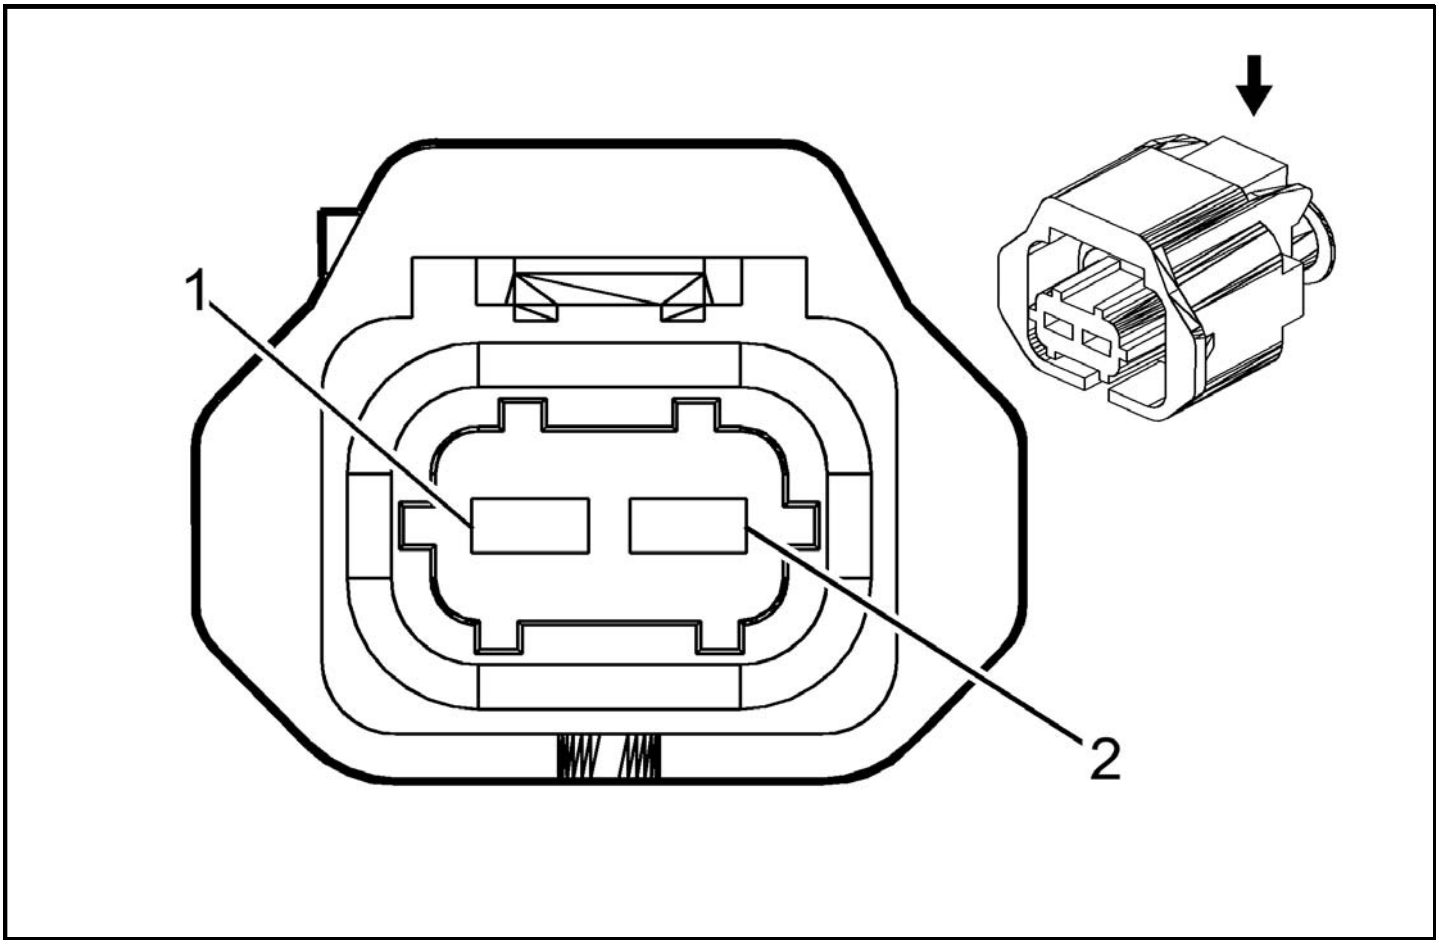
Terminal Part Information

- Terminated Lead: 13575427
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 12048074/2
- Core/Insulation Crimp: E/1

Engine Oil Pressure (EOP) Switch

Pin	Wire	Circuit	Function
A	0.5 TN/BK	231	Oil Pressure Signal
B	0.5 BK/WH	451	Ground
C-D	-	-	Not Available

EVAPORATIVE EMISSION (EVAP) CANISTER PURGE SOLENOID VALVE



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15397337
- Service Connector: 13355748
- Description: 2-Way F Power Timer Series (BK)

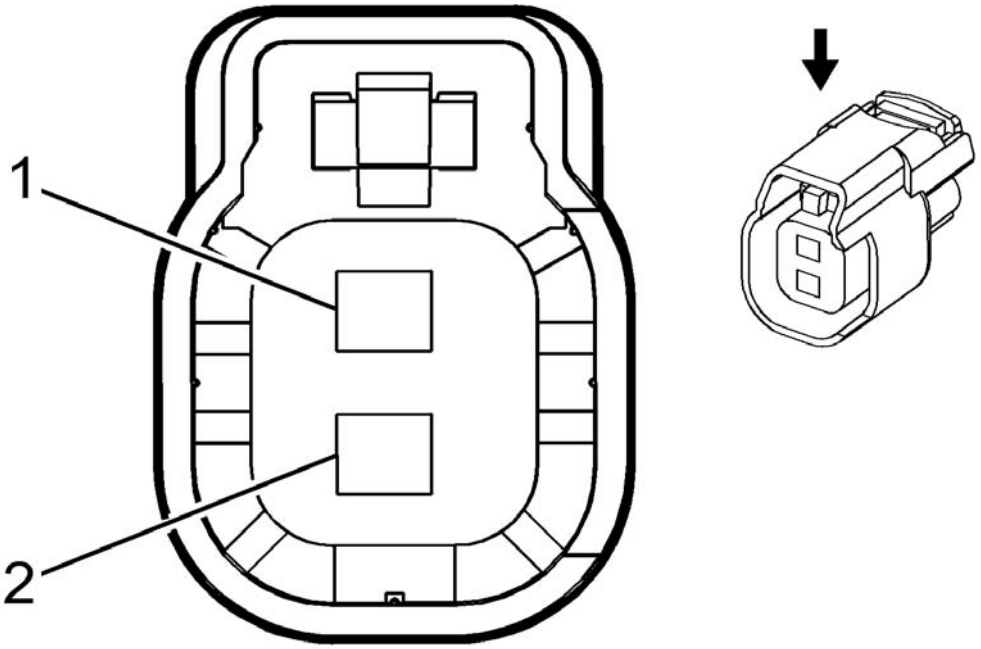
Terminal Part Information

- Terminated Lead: 13581346
- Release Tool: J-38125-36
- Diagnostic Test Probe: J-35616-35 (VT)
- Terminal/Tray: 4-964286-1/16
- Core/Insulation Crimp: E/1

Evaporative Emission (EVAP) Canister Purge Solenoid Valve

Pin	Wire	Circuit	Function
1	0.5 PK/BK	5293	Ignition 1 Voltage
2	0.35 D-GN/WH	428	EVAP Canister Purge Solenoid Control

EVAPORATIVE EMISSION (EVAP) CANISTER VENT SOLENOID VALVE



Connector Part Information

- Harness Type: Body
- OEM Connector: 13771883
- Service Connector: 13579002
- Description: 2-Way F 1.5 Series, Sealed (BK)

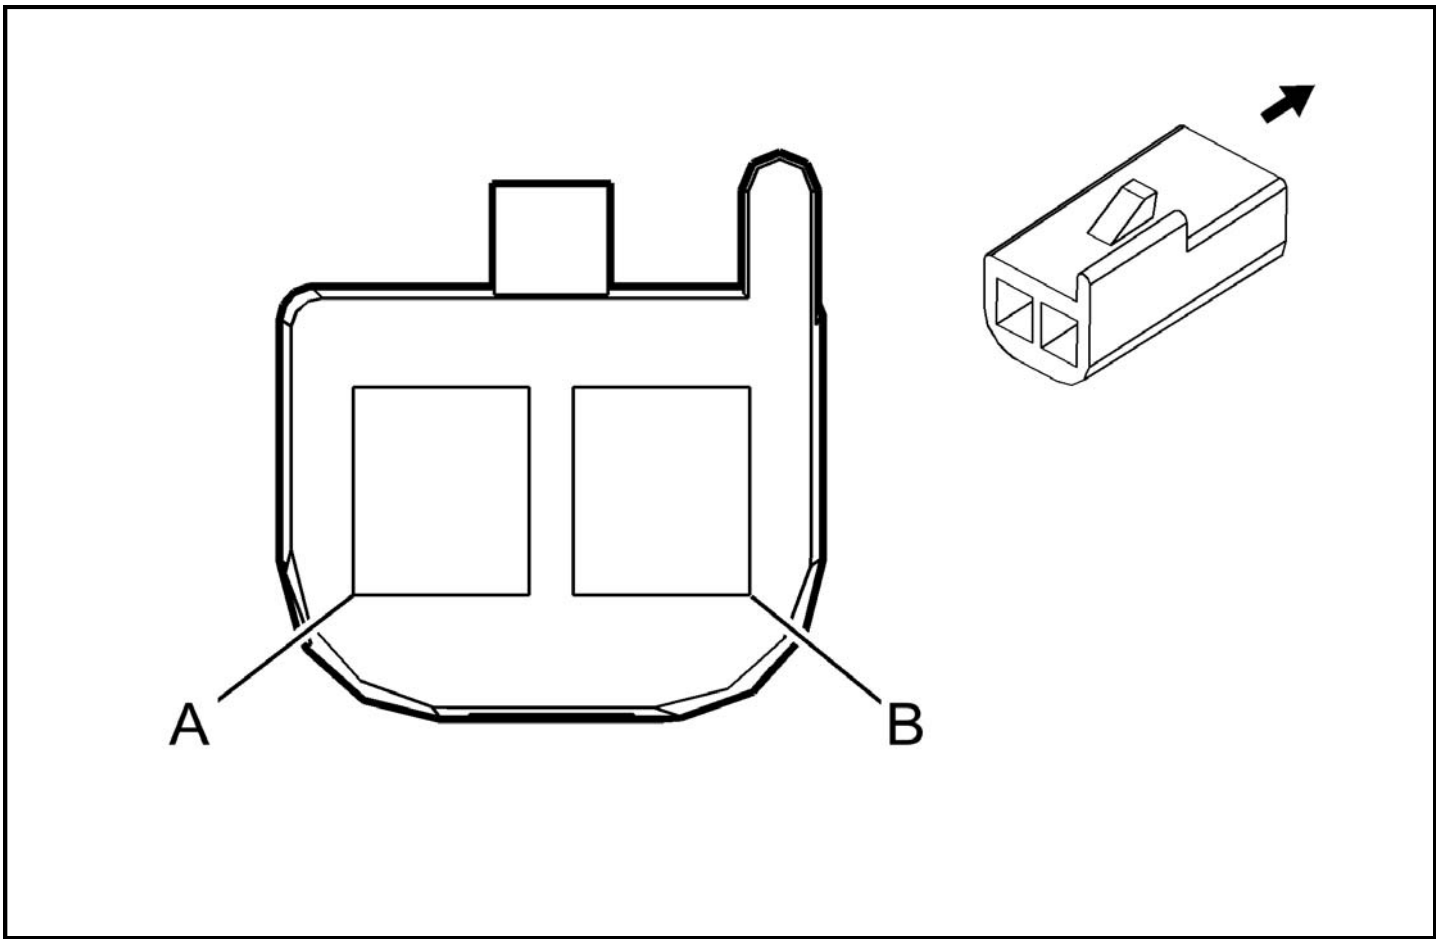
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-217
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: Not Stocked in Kit/NA
- Core/Insulation Crimp: 7/7

Evaporative Emission (EVAP) Canister Vent Solenoid Valve

Pin	Wire	Circuit	Function
1	0.35 WH	1310	EVAP Canister Vent Solenoid Control
2	0.5 RD/WH	2840	Battery Positive Voltage

EVAPORATOR TEMPERATURE SENSOR



Connector Part Information

- Harness Type: HVAC
- OEM Connector: 12047662
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F Metri-Pack 150 Series (BK)

Terminal Part Information

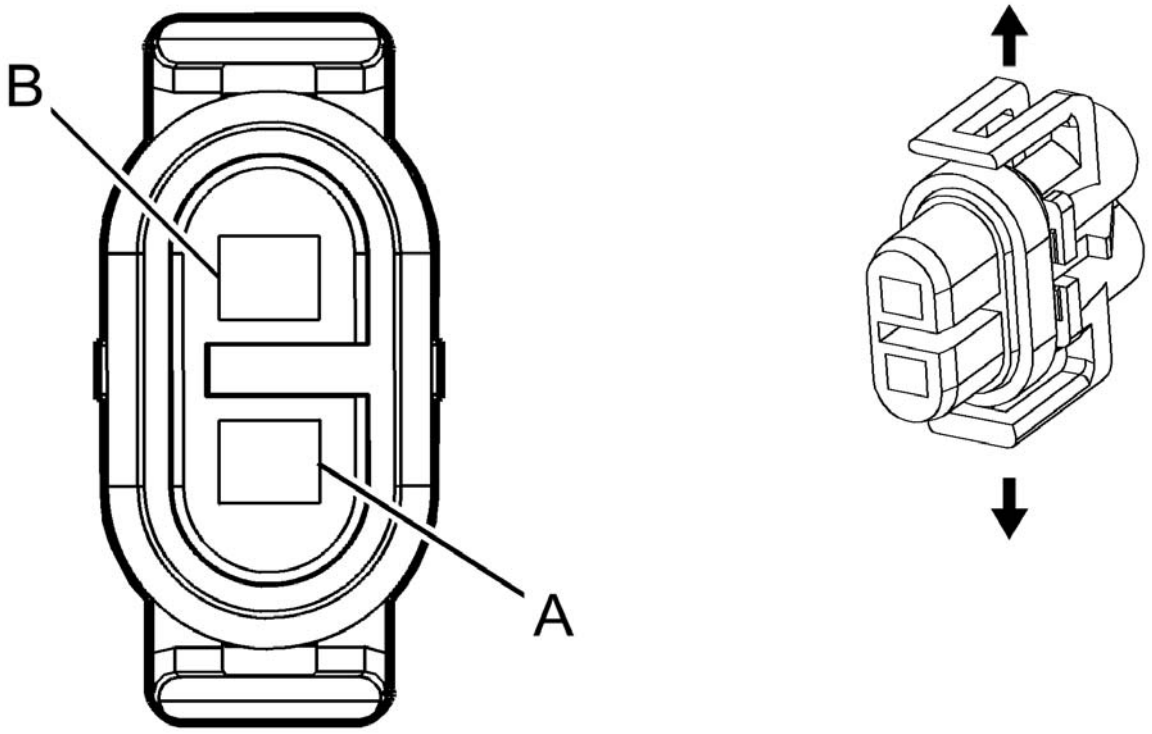
- Terminal/Tray: Service by Harness - See Part Catalog
- Core/Insulation Crimp: Service by Harness - See Part Catalog
- Release Tool/Test Probe: Service by Harness - See Part Catalog

Evaporator Temperature Sensor

Pin	Wire	Circuit	Function

Pin	Wire	Circuit	Function
A	0.35 WH	2622	Front Frost Sensor Control
B	0.35 D-GN	6101	Low Reference

FOG LAMP - LEFT FRONT (T96)



Connector Part Information

- Harness Type: Forward Lamp
- OEM Connector: 13511639
- Service Connector: 13584255
- Description: 2-Way F Metri-Pack 280 Series, Sealed (BU)

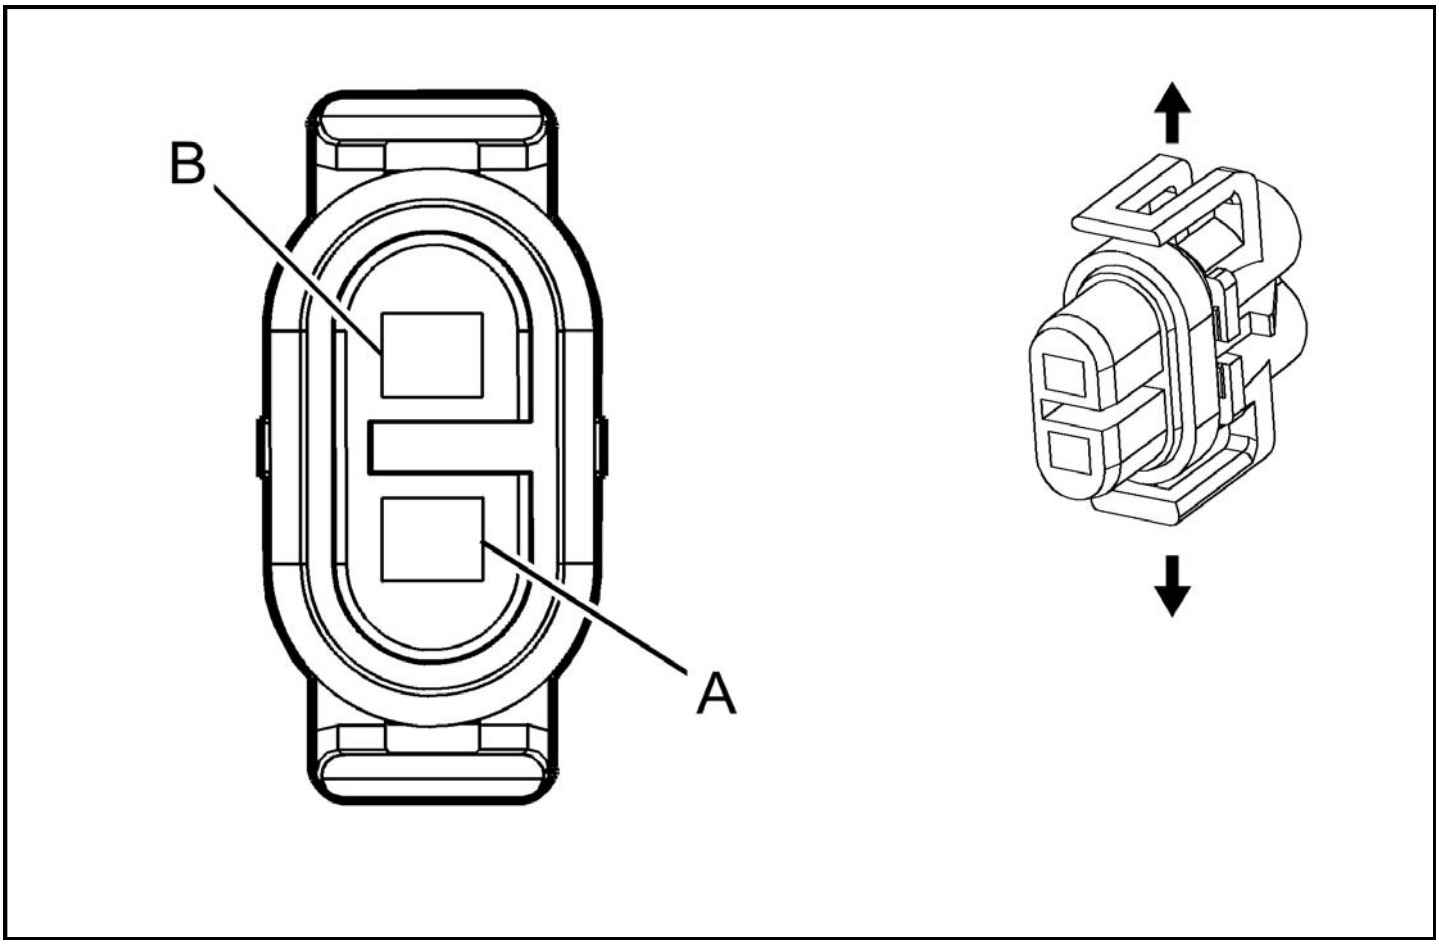
Terminal Part Information

- Terminated Lead: 13575418
- Release Tool: J-38125-11A
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 12077411/2
- Core/Insulation Crimp: 2/5

Fog Lamp - Left Front (T96)

Pin	Wire	Circuit	Function
A	0.5 PU	34	Front Fog Lamp Supply Voltage
B	0.5 BK	1350	Ground

FOG LAMP - RIGHT FRONT (T96)



Connector Part Information

- Harness Type: Forward Lamp
- OEM Connector: 13511639
- Service Connector: 13584255
- Description: 2-Way F Metri-Pack 280 Series, Sealed (BU)

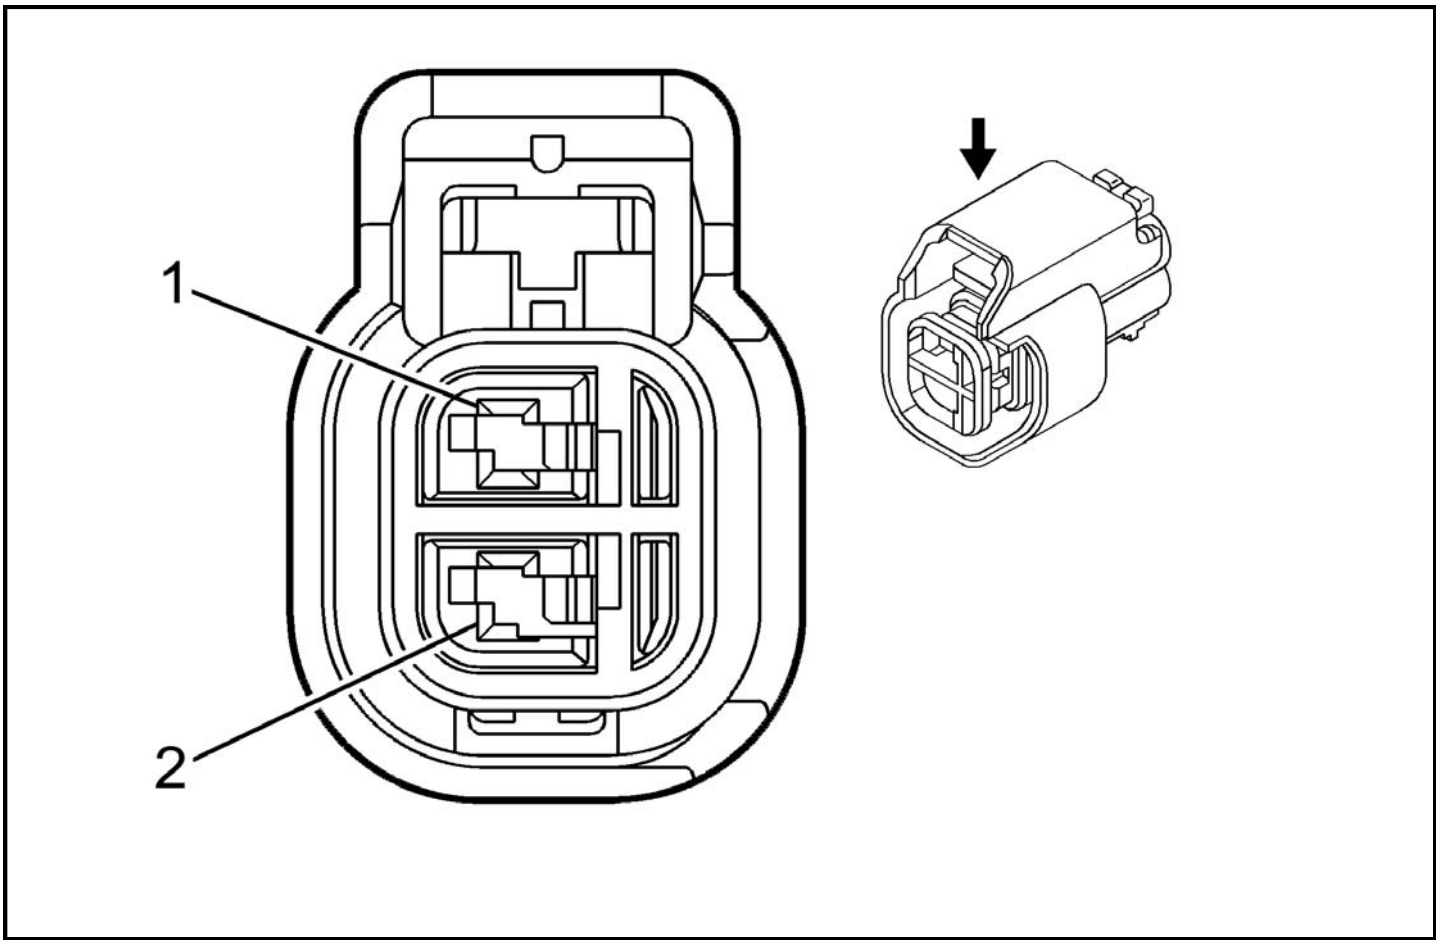
Terminal Part Information

- Terminated Lead: 13575418
- Release Tool: J-38125-11A
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 12077411/2
- Core/Insulation Crimp: 2/5

Fog Lamp - Right Front (T96)

Pin	Wire	Circuit	Function
A	0.5 PU	34	Front Fog Lamp Supply Voltage
B	0.5 BK	1250	Ground

FUEL INJECTOR 1



Connector Part Information

- Harness Type: Odd Fuel Injector
- OEM Connector: E-2157
- Service Connector: 88988054
- Description: 2-Way F Sleeve Assembly Wire Connector (BK)

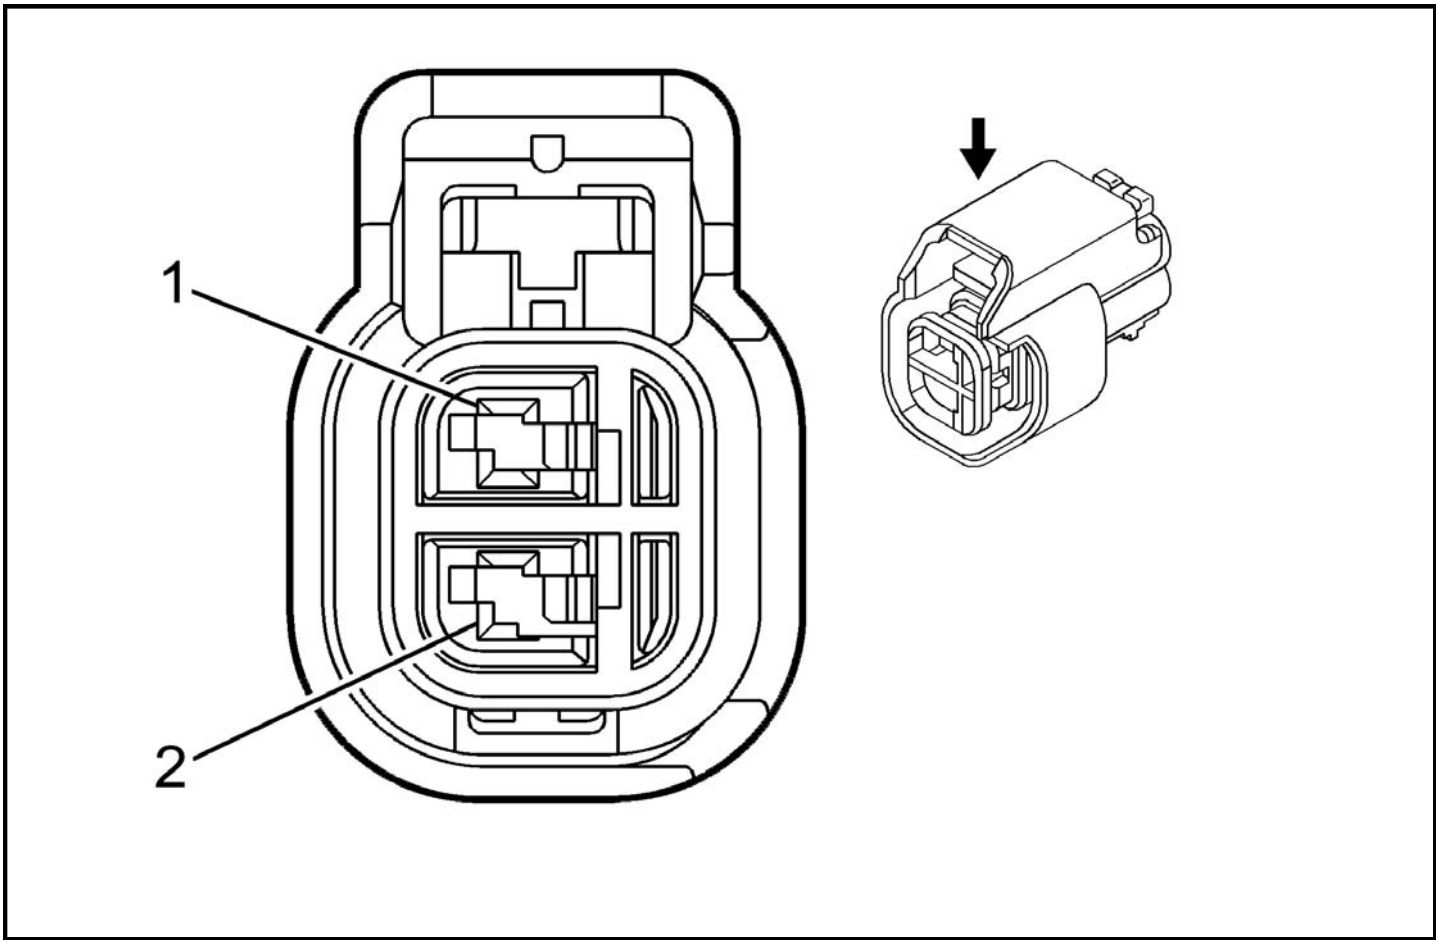
Terminal Part Information

- Terminated Lead: Service by Harness - See Part Catalog
- Terminal/Tray: 7116-4103-08/9
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: J-38125-11A/J-35616-2A (GY)

Fuel Injector 1

Pin	Wire	Circuit	Function
1	0.8 BN	4801	Direct Fuel Injector (DFI) High Voltage Control Cylinder 1
2	0.8 BN/WH	4901	Direct Fuel Injector (DFI) High Voltage Supply Cylinder 1

FUEL INJECTOR 2



Connector Part Information

- Harness Type: Even Fuel Injector
- OEM Connector: E-2157
- Service Connector: 88988054
- Description: 2-Way F Sleeve Assembly Wire Connector (BK)

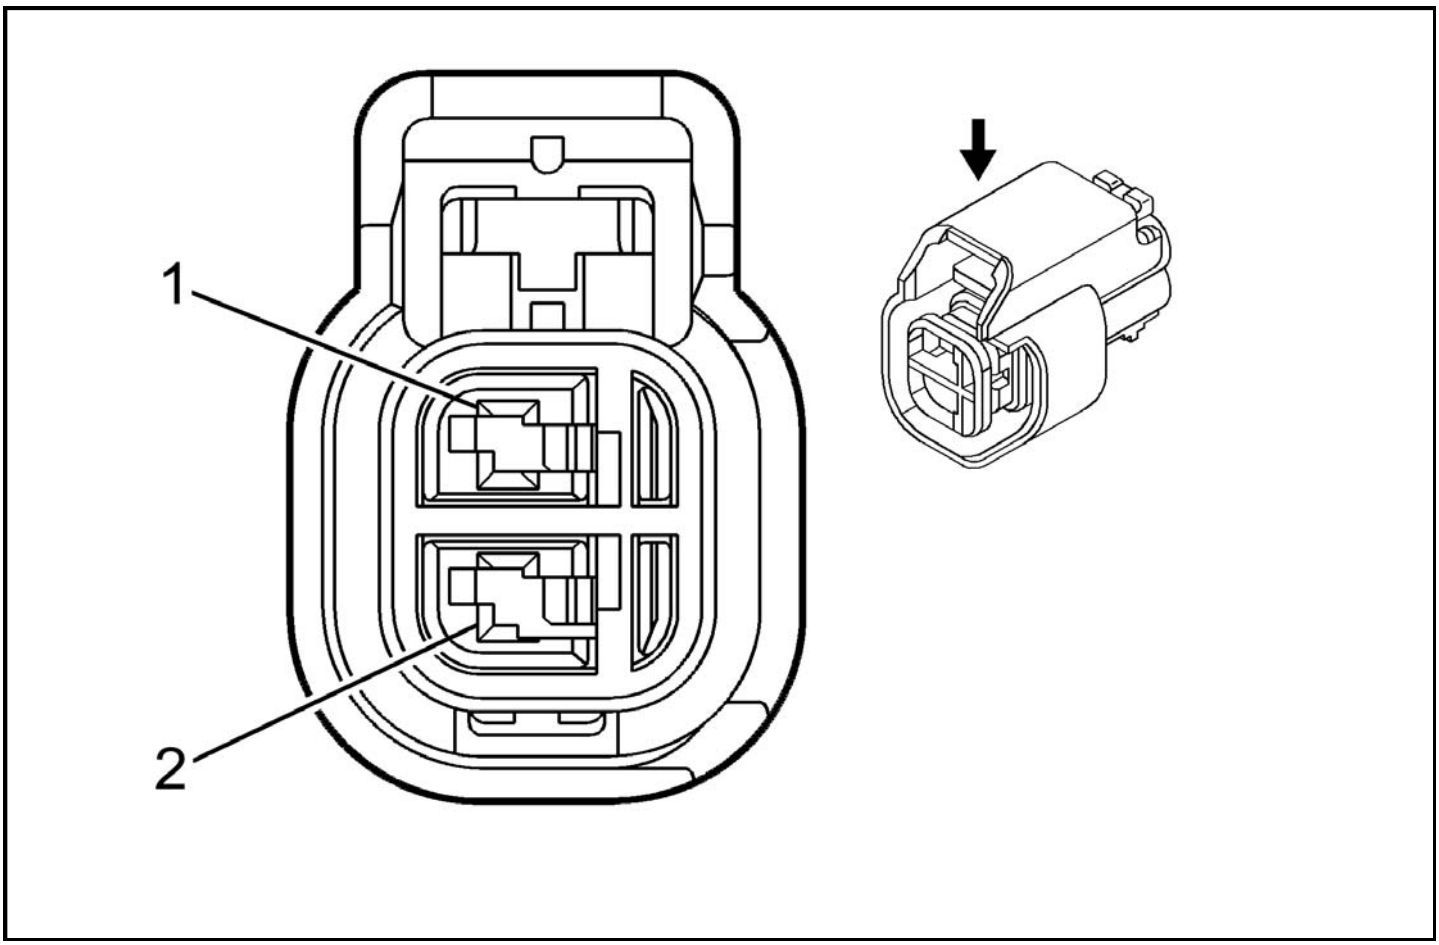
Terminal Part Information

- Terminated Lead: Service by Harness - See Part Catalog
- Terminal/Tray: 7116-4103-08/9
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: J-38125-11A/J-35616-2A (GY)

Fuel Injector 2

Pin	Wire	Circuit	Function
1	0.8 D-BU	4802	Direct Fuel Injector (DFI) High Voltage Control Cylinder 2
2	0.8 D-BU/WH	4902	Direct Fuel Injector (DFI) High Voltage Supply Cylinder 2

FUEL INJECTOR 3



Connector Part Information

- Harness Type: Odd Fuel Injector
- OEM Connector: E-2157
- Service Connector: 88988054
- Description: 2-Way F Sleeve Assembly Wire Connector (BK)

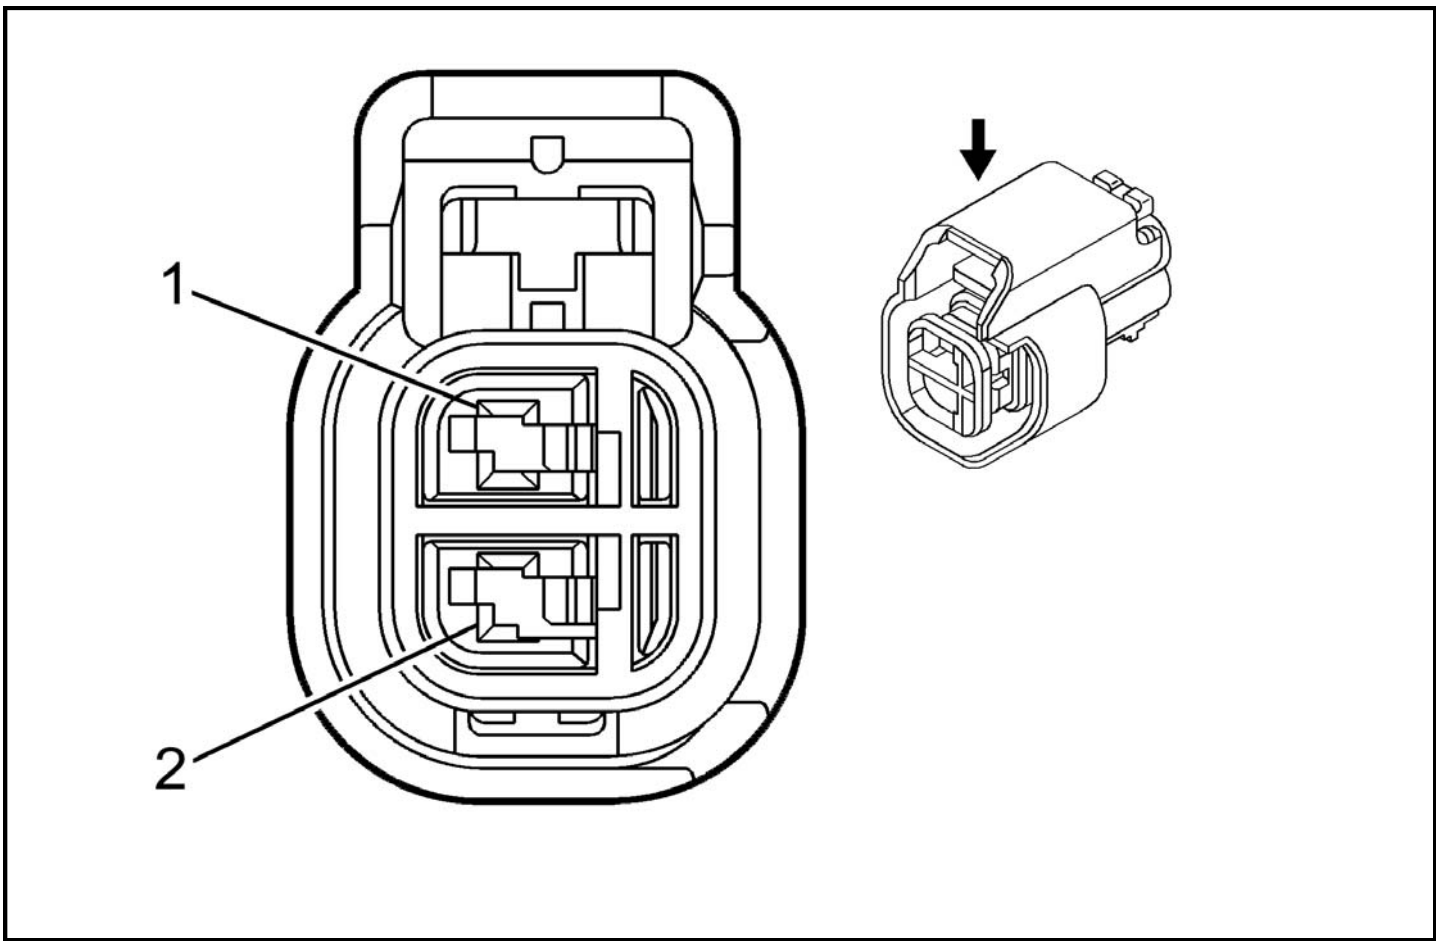
Terminal Part Information

- Terminated Lead: Service by Harness - See Part Catalog
- Terminal/Tray: 7116-4103-08/9
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: J-38125-11A/J-35616-2A (GY)

Fuel Injector 3

Pin	Wire	Circuit	Function
1	0.8 D-GN	4803	Direct Fuel Injector (DFI) High Voltage Control Cylinder 3
2	0.8 D-GN/WH	4903	Direct Fuel Injector (DFI) High Voltage Supply Cylinder 3

FUEL INJECTOR 4



Connector Part Information

- Harness Type: Even Fuel Injector
- OEM Connector: E-2157
- Service Connector: 88988054
- Description: 2-Way F Sleeve Assembly Wire Connector (BK)

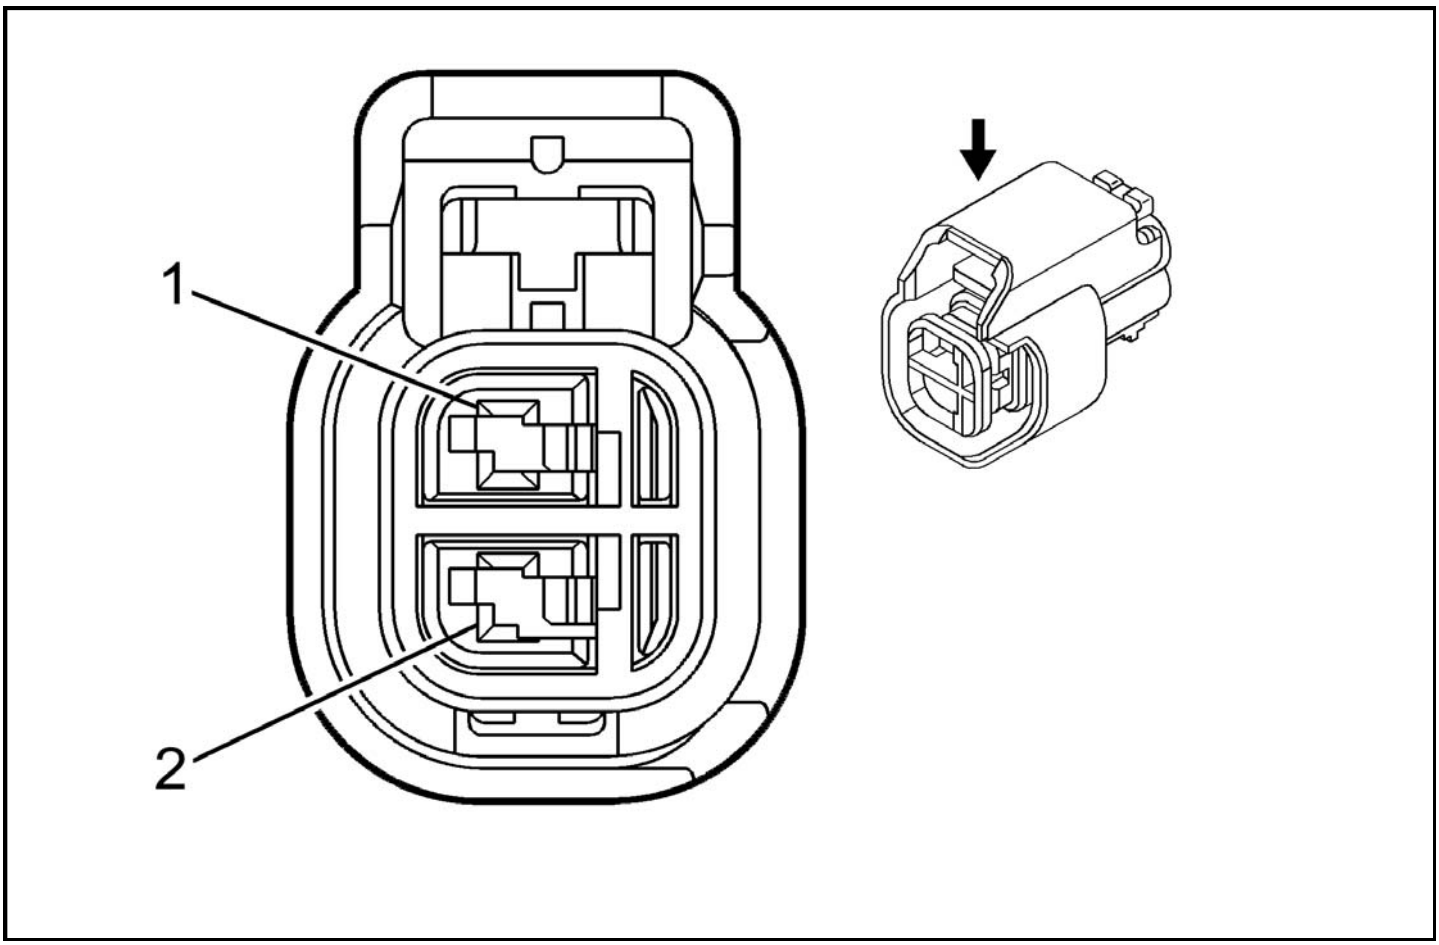
Terminal Part Information

- Terminated Lead: Service by Harness - See Part Catalog
- Terminal/Tray: 7116-4103-08/9
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: J-38125-11A/J-35616-2A (GY)

Fuel Injector 4

Pin	Wire	Circuit	Function
1	0.8 L-BU	4804	Direct Fuel Injector (DFI) High Voltage Control Cylinder 4
2	0.8 L-BU/WH	4904	Direct Fuel Injector (DFI) High Voltage Supply Cylinder 4

FUEL INJECTOR 5



Connector Part Information

- Harness Type: Odd Fuel Injector
- OEM Connector: E-2157
- Service Connector: 88988054
- Description: 2-Way F Sleeve Assembly Wire Connector (BK)

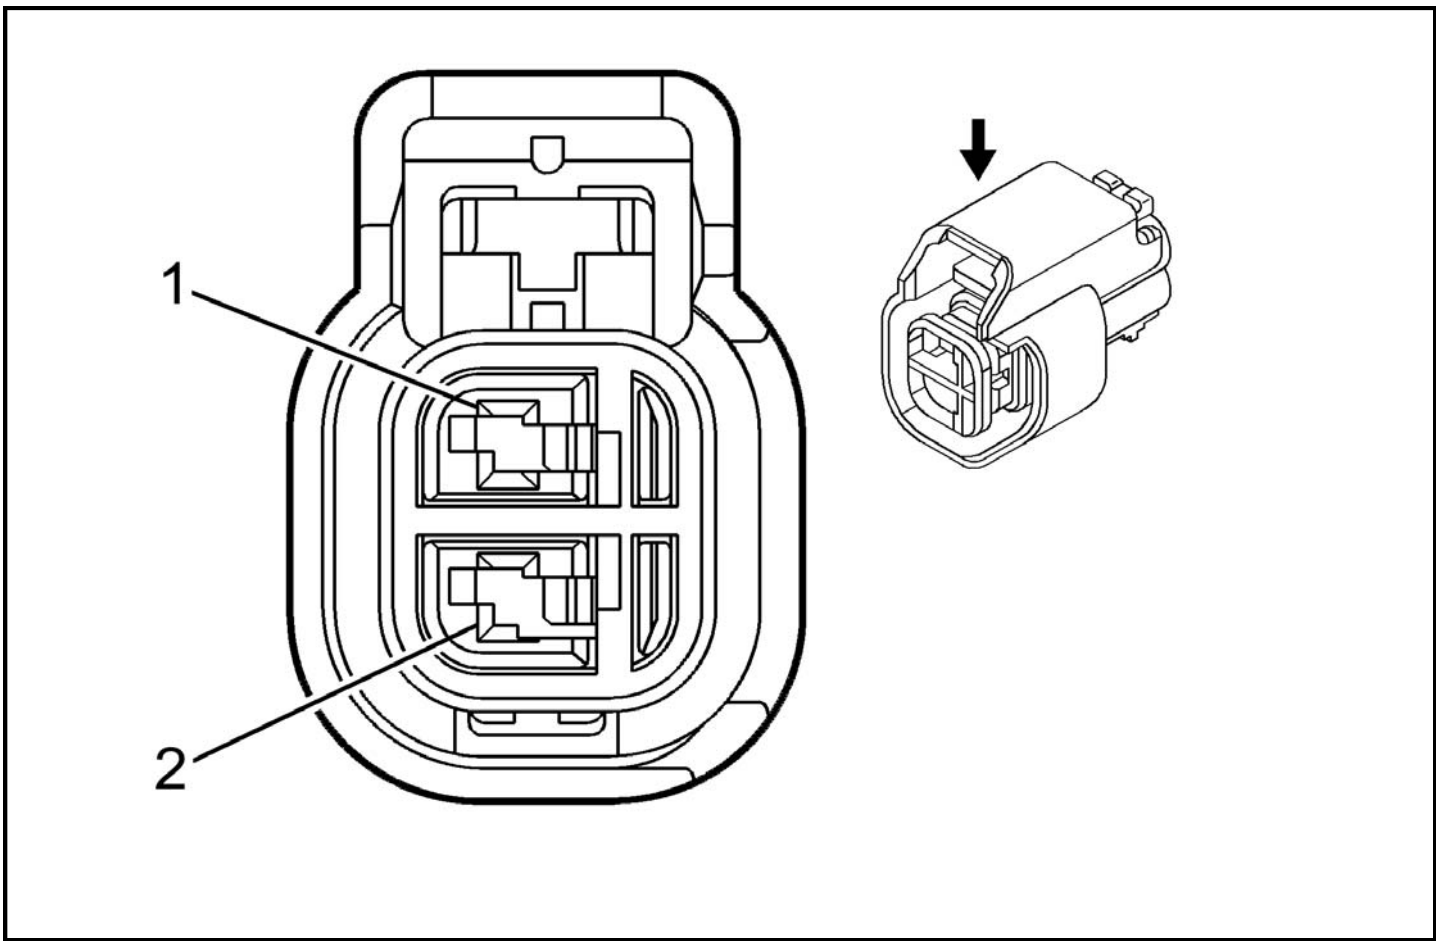
Terminal Part Information

- Terminated Lead: Service by Harness - See Part Catalog
- Terminal/Tray: 7116-4103-08/9
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: J-38125-11A/J-35616-2A (GY)

Fuel Injector 5

Pin	Wire	Circuit	Function
1	0.8 L-GN	4805	Direct Fuel Injector (DFI) High Voltage Control Cylinder 5
2	0.8 L-GN/WH	4905	Direct Fuel Injector (DFI) High Voltage Supply Cylinder 5

FUEL INJECTOR 6



Connector Part Information

- Harness Type: Even Fuel Injector
- OEM Connector: E-2157
- Service Connector: 88988054
- Description: 2-Way F Sleeve Assembly Wire Connector (BK)

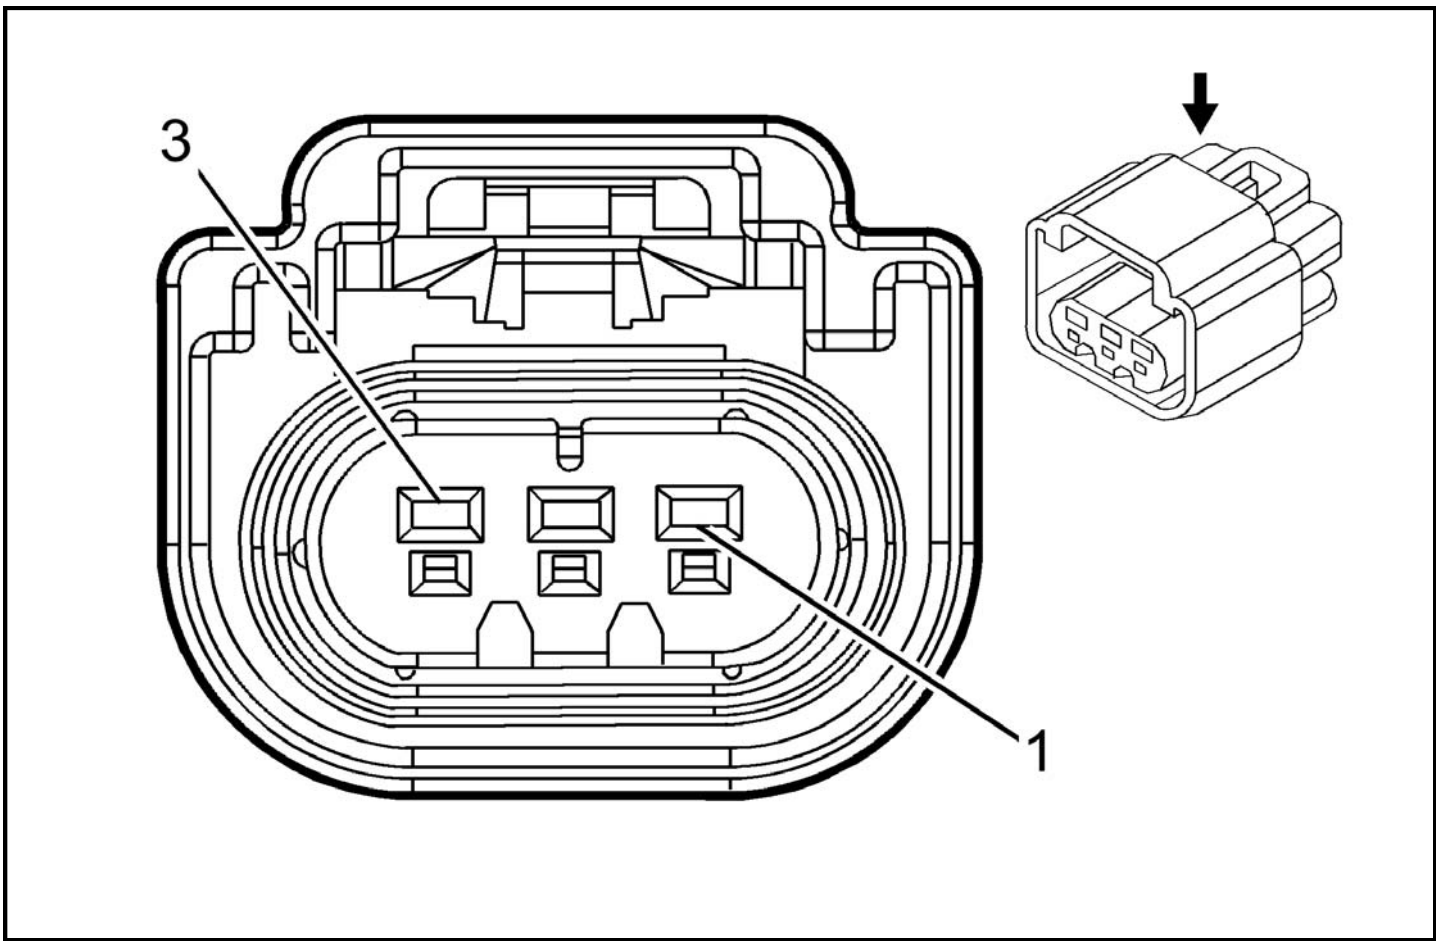
Terminal Part Information

- Terminated Lead: Service by Harness - See Part Catalog
- Terminal/Tray: 7116-4103-08/9
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: J-38125-11A/J-35616-2A (GY)

Fuel Injector 6

Pin	Wire	Circuit	Function
1	0.8 PU	4806	Direct Fuel Injector (DFI) High Voltage Control Cylinder 6
2	0.8 PU/WH	4906	Direct Fuel Injector (DFI) High Voltage Supply Cylinder 6

FUEL PRESSURE SENSOR



Connector Part Information

- Harness Type: Engine
- OEM Connector: 13511131
- Service Connector: 19168035
- Description: 3-Way F GT 150 Series, Sealed (BK)

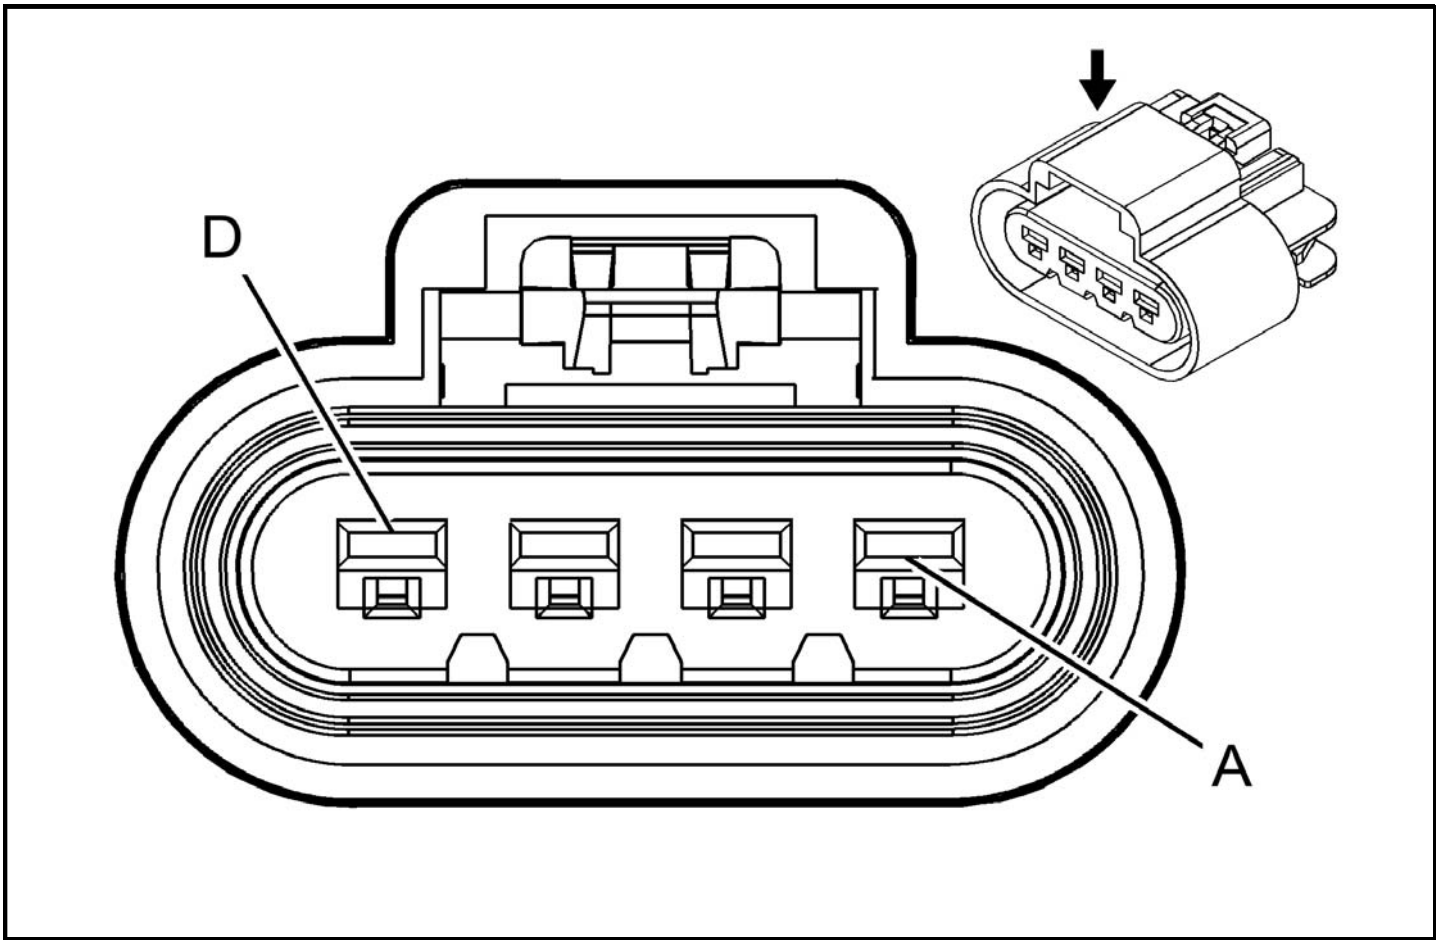
Terminal Part Information

- Terminal/Tray: 12191818/8
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: J-38125-553/J-35616-2A (GY)

Fuel Pressure Sensor

Pin	Wire	Circuit	Function
1	0.5 PU	7446	Fuel Line Pressure Sensor Signal
2	0.5 GY	7447	Low Reference
3	0.5 BN	7445	5V Reference

FUEL PUMP AND SENDER ASSEMBLY



Connector Part Information

- Harness Type: Rear Chassis
- OEM Connector: 15326631
- Service Connector: 13580864
- Description: 4-Way F GT 280 5.8 Series, Sealed (BK)

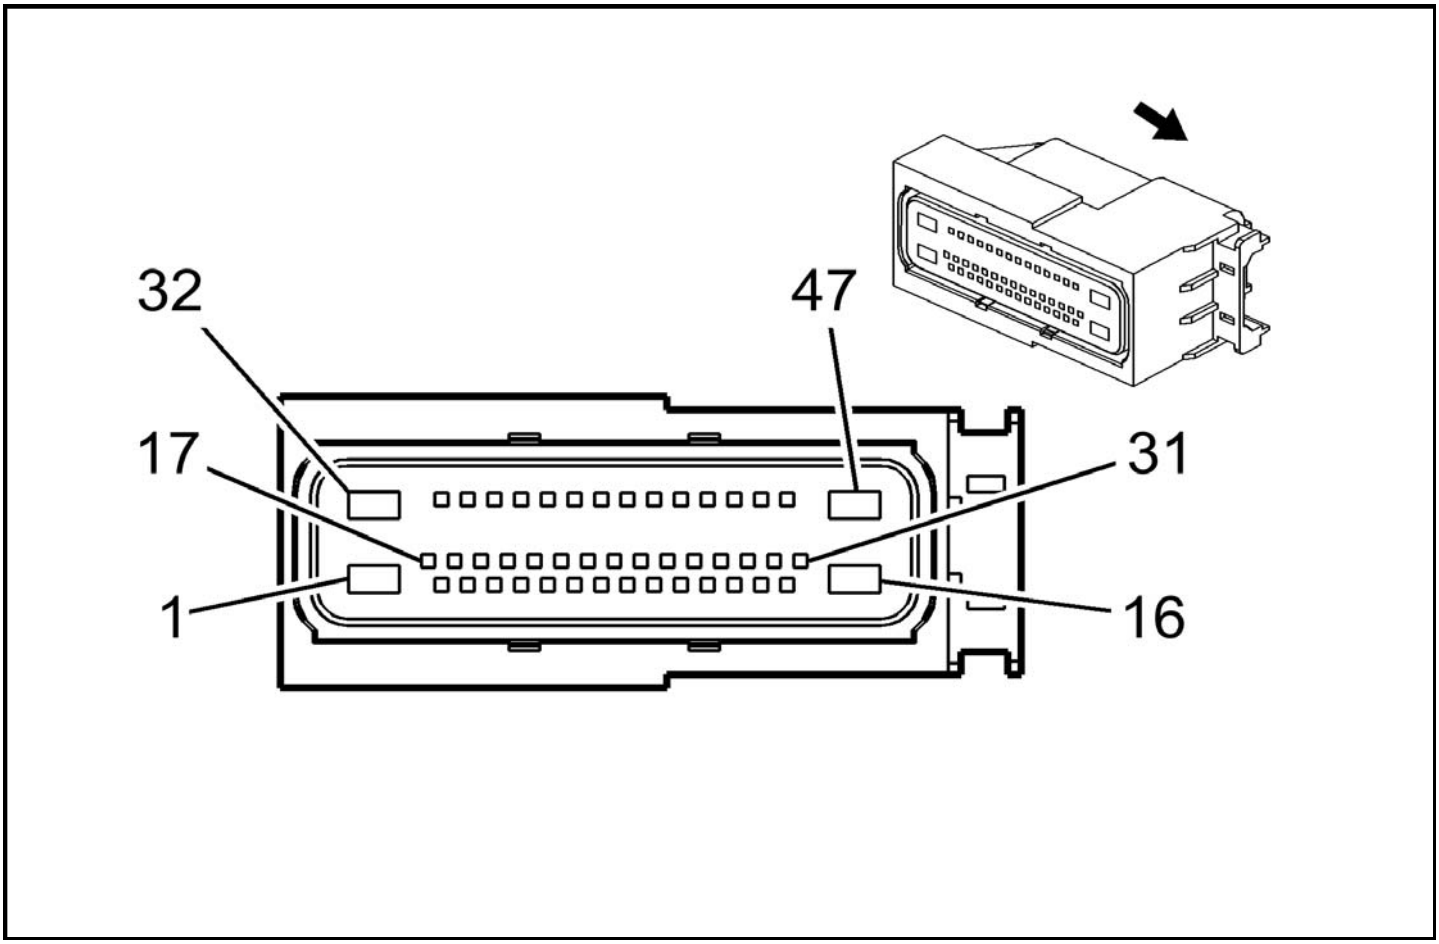
Terminal Part Information

- Terminated Lead: 13575405
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 15304719/19
- Core/Insulation Crimp: 2/5

Fuel Pump and Sender Assembly

Pin	Wire	Circuit	Function
A	2 PK	1580	Fuel Pump Ground
B	0.5 PU	30	Fuel Level Sensor Signal
C	0.35 BK/WH	510	Low Reference
D	2 GY	120	Fuel Pump Supply Voltage

FUEL PUMP FLOW CONTROL MODULE



Connector Part Information

- Harness Type: Body
- OEM Connector: 19153034
- Service Connector: 89047377
- Description: 47-Way F ASG Series (BK)

Terminal Part Information

- Pins: 1, 16, 32, 47
- Terminated Lead: 13327187
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-42 (RD)

- Terminal/Tray: 15476168/5
- Core/Insulation Crimp: F/3

- Pins: 5-7, 10, 13, 17, 21, 22, 36, 44
- Terminated Lead: 13576387
- Release Tool: J-38125-215A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: SAITS-A03T-M064/14
- Core/Insulation Crimp: 9/9

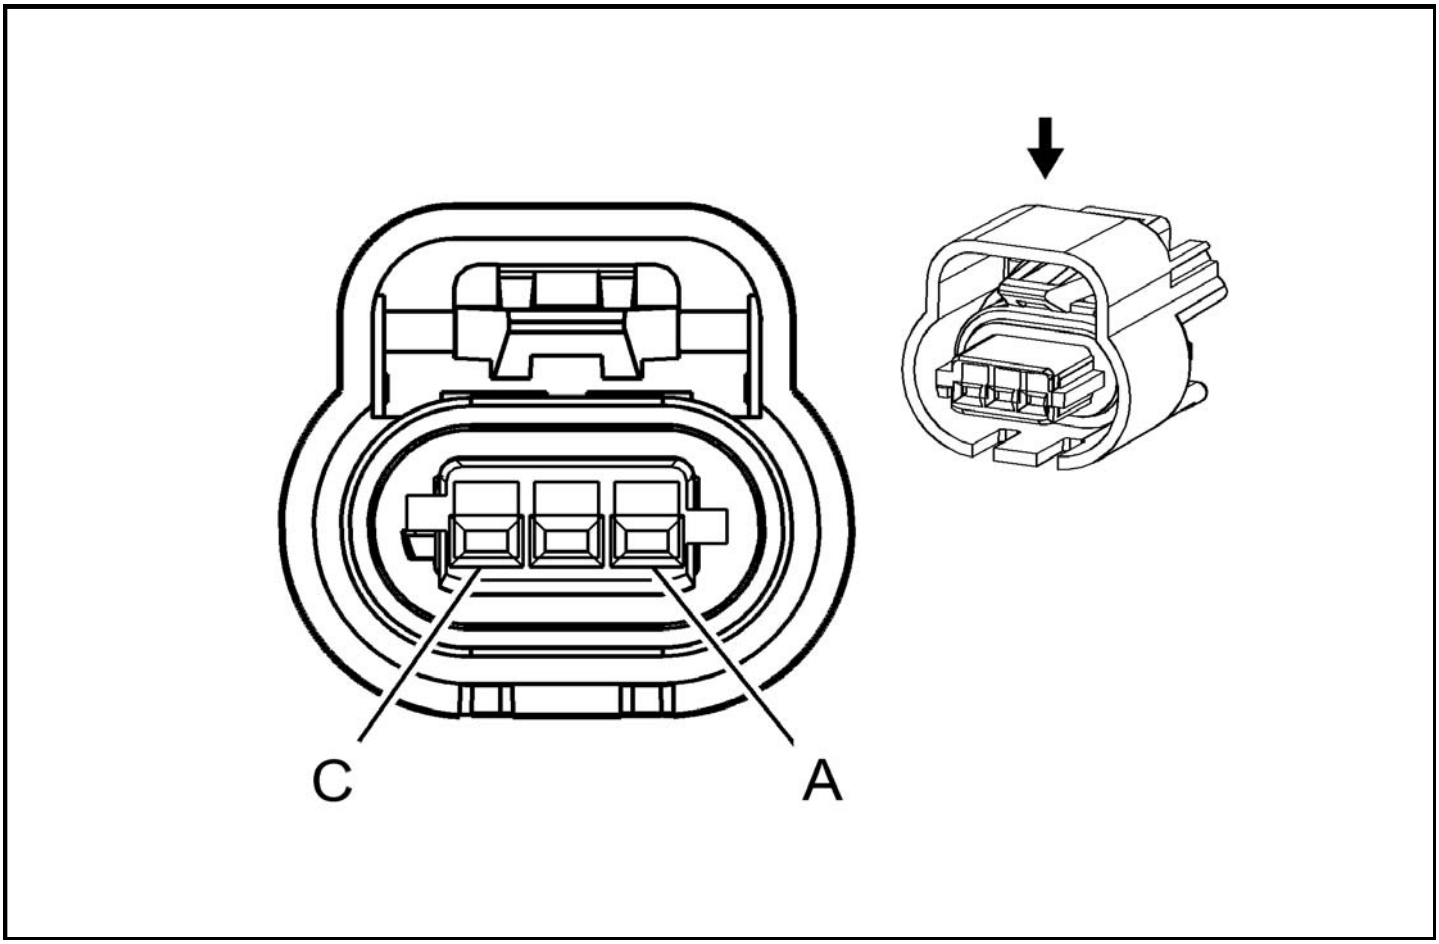
- Pins: 15
- Terminated Lead: 13576388
- Release Tool: J-38125-215A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: SAITS-A03T-M064/14
- Core/Insulation Crimp: 9/9

Fuel Pump Flow Control Module

Pin	Wire	Circuit	Function
1	2 BK	750	Ground
2-4	-	-	Not Available
5	0.35 GY	7447	Fuel Pressure Sensor Low Reference
6	0.35 TN	2501	High Speed GMLAN Serial Data Bus-
7	0.35 TN/BK	2500	High Speed GMLAN Serial Data Bus+
8-9	-	-	Not Available
10	0.5 PU	7446	Fuel Pressure Sensor Signal
11-12	-	-	Not Available
13	0.5 D-GN/WH	465	Fuel Pump Relay Control - Primary
14	-	-	Not Available
15	0.5 PK	339	Ignition 1 Voltage
16	2 PK	1580	Fuel Pump Ground
17	0.35 L-BU	5986	Serial Data Communication Enable
18-20	-	-	Not Available
21	0.35 TN	2501	High Speed GMLAN Serial Data Bus-
22	0.35 TN/BK	2500	High Speed GMLAN Serial Data Bus+
23-31	-	-	Not Available
32	2 RD/WH	3640	Battery Positive Voltage
33-35	-	-	Not Available
36	0.5 BN	7445	Fuel Pressure Sensor 5V Reference
37-43	-	-	Not Available
44	0.5 BARE	7444	Drain Wire
45-46	-	-	Not Available

Pin	Wire	Circuit	Function
47	2 GY	120	Fuel Pump Supply Voltage

FUEL RAIL PRESSURE (FRP) SENSOR



Connector Part Information

- Harness Type: Even Fuel Injector
- OEM Connector: 15326556
- Service Connector: 88953359
- Description: 3-Way F GT 150 Series, Sealed (BK)

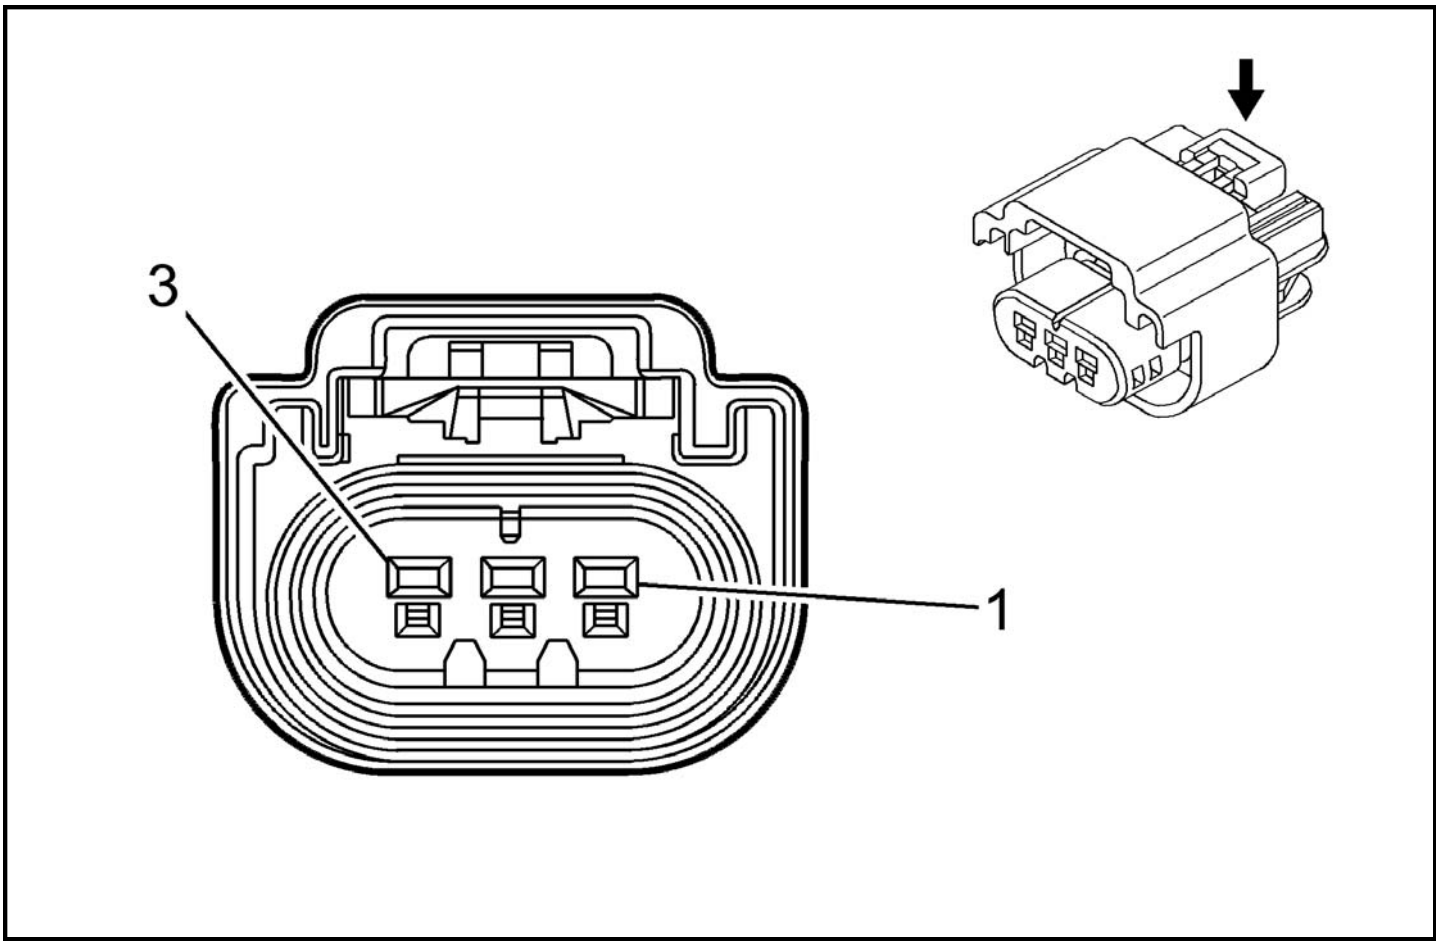
Terminal Part Information

- Terminated Lead: 13576362
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 15326267/19
- Core/Insulation Crimp: E/4

Fuel Rail Pressure (FRP) Sensor

Pin	Wire	Circuit	Function
A	0.5 GY	598	5-Volt Reference 1
B	0.5 YE	2918	Fuel Rail Pressure Sensor Signal
C	0.5 TN	808	Low Reference

FUEL TANK PRESSURE (FTP) SENSOR



Connector Part Information

- Harness Type: Rear Chassis
- OEM Connector: 13522407
- Service Connector: 19179274
- Description: 3-Way F GT 150 Series, Sealed (BK)

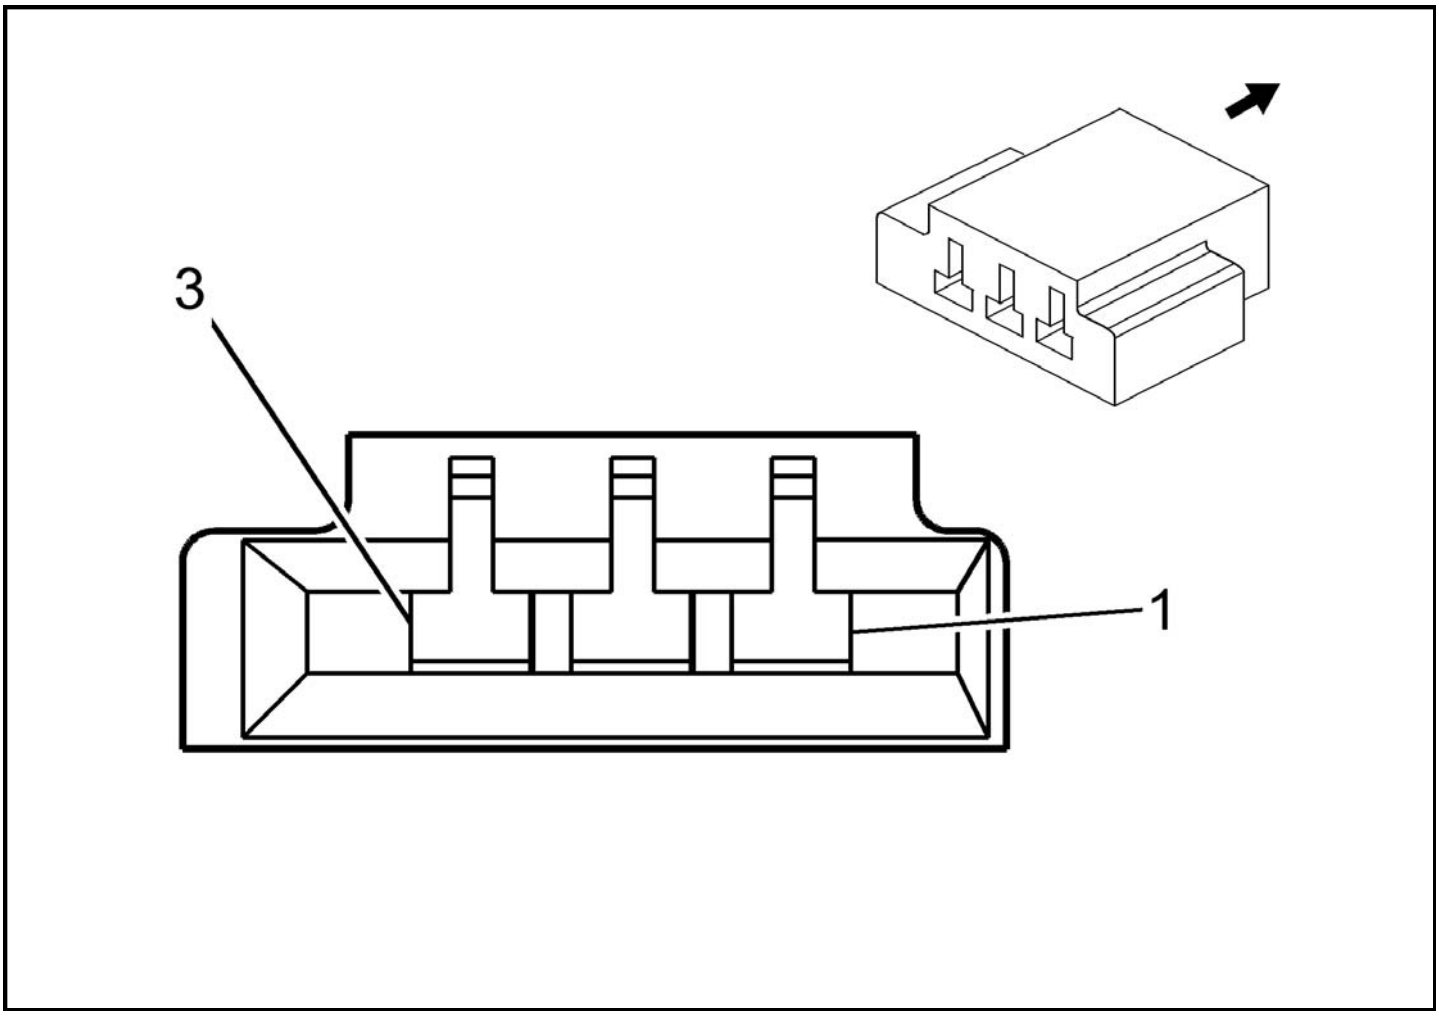
Terminal Part Information

- Terminal/Tray: 12048074/2
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12094429/J-35616-2A (GY)

Fuel Tank Pressure (FTP) Sensor

Pin	Wire	Circuit	Function
1	0.35 D-GN	890	Fuel Tank Pressure Sensor Signal
2	0.35 TN	2759	Low Reference
3	0.35 GY	416	5-Volt Reference 1

GARAGE DOOR OPENER (UG1)



Connector Part Information

- Harness Type: Headliner
- OEM Connector: 12162335
- Service Connector: 13505907
- Description: 3-Way F P/C Series (NA)

Terminal Part Information

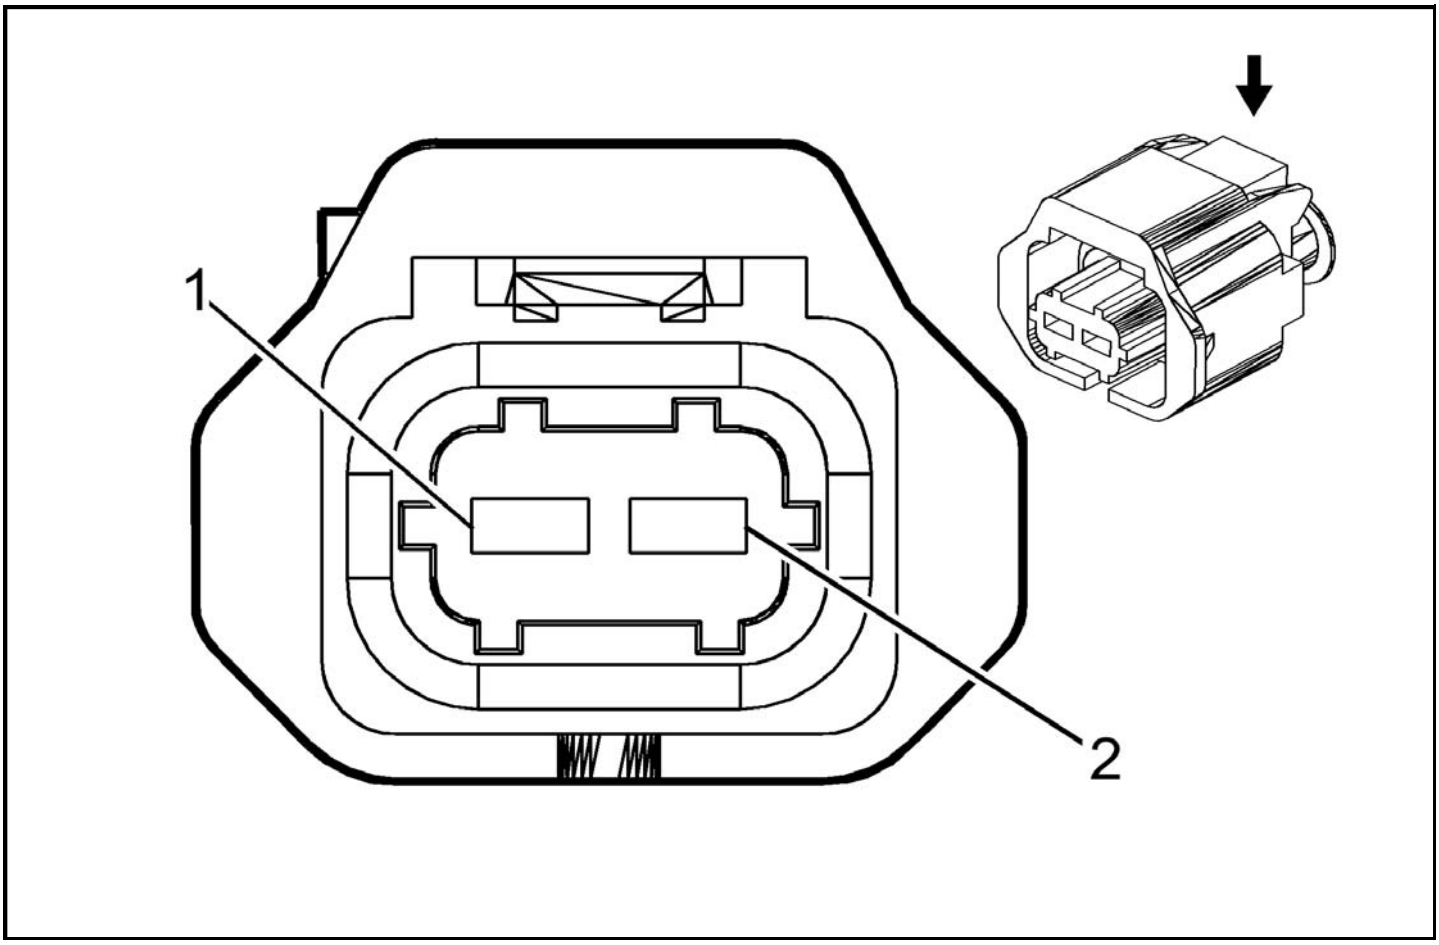
- Terminated Lead: Service by Connector Assembly - 13505907
- Release Tool: J-38125-213
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 08-50-0115/20

- Core/Insulation Crimp: E/C

Garage Door Opener (UG1)

Pin	Wire	Circuit	Function
1	0.35 RD/WH	2340	Battery Positive Voltage
2	-	-	Not Used
3	0.35 BK	550	Ground

GENERATOR X1



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15397337
- Service Connector: 13355748
- Description: 2-Way F Power Timer Series (BK)

Terminal Part Information

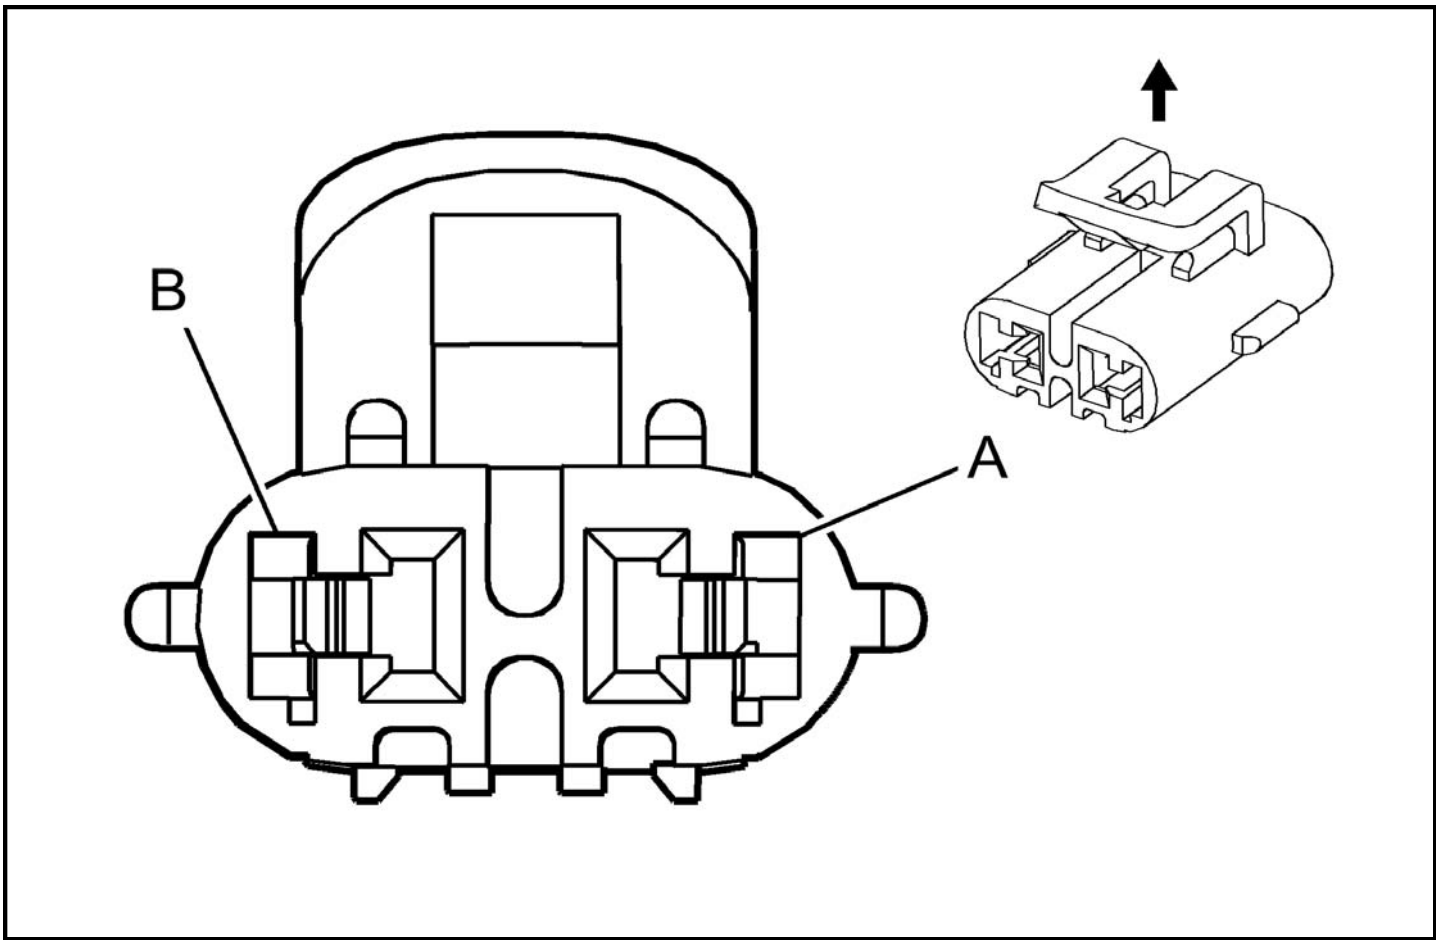
- Terminated Lead: 13575440
- Release Tool: J-38125-36

- Diagnostic Test Probe: J-35616-35 (VT)
- Terminal/Tray: 4-964286-1/16
- Core/Insulation Crimp: E/1

Generator X1

Pin	Wire	Circuit	Function
1	0.5 OG	225	Generator Turn On Signal
2	0.5 GY	23	Generator Field Duty Cycle Signal

HEADLAMP - LEFT HIGH BEAM



Connector Part Information

- Harness Type: Left Front Headlamp Assembly
- OEM Connector: H9
- Service Connector: Service by Harness- See Part Catalog
- Description: 2-Way F (BK)

Terminal Part Information

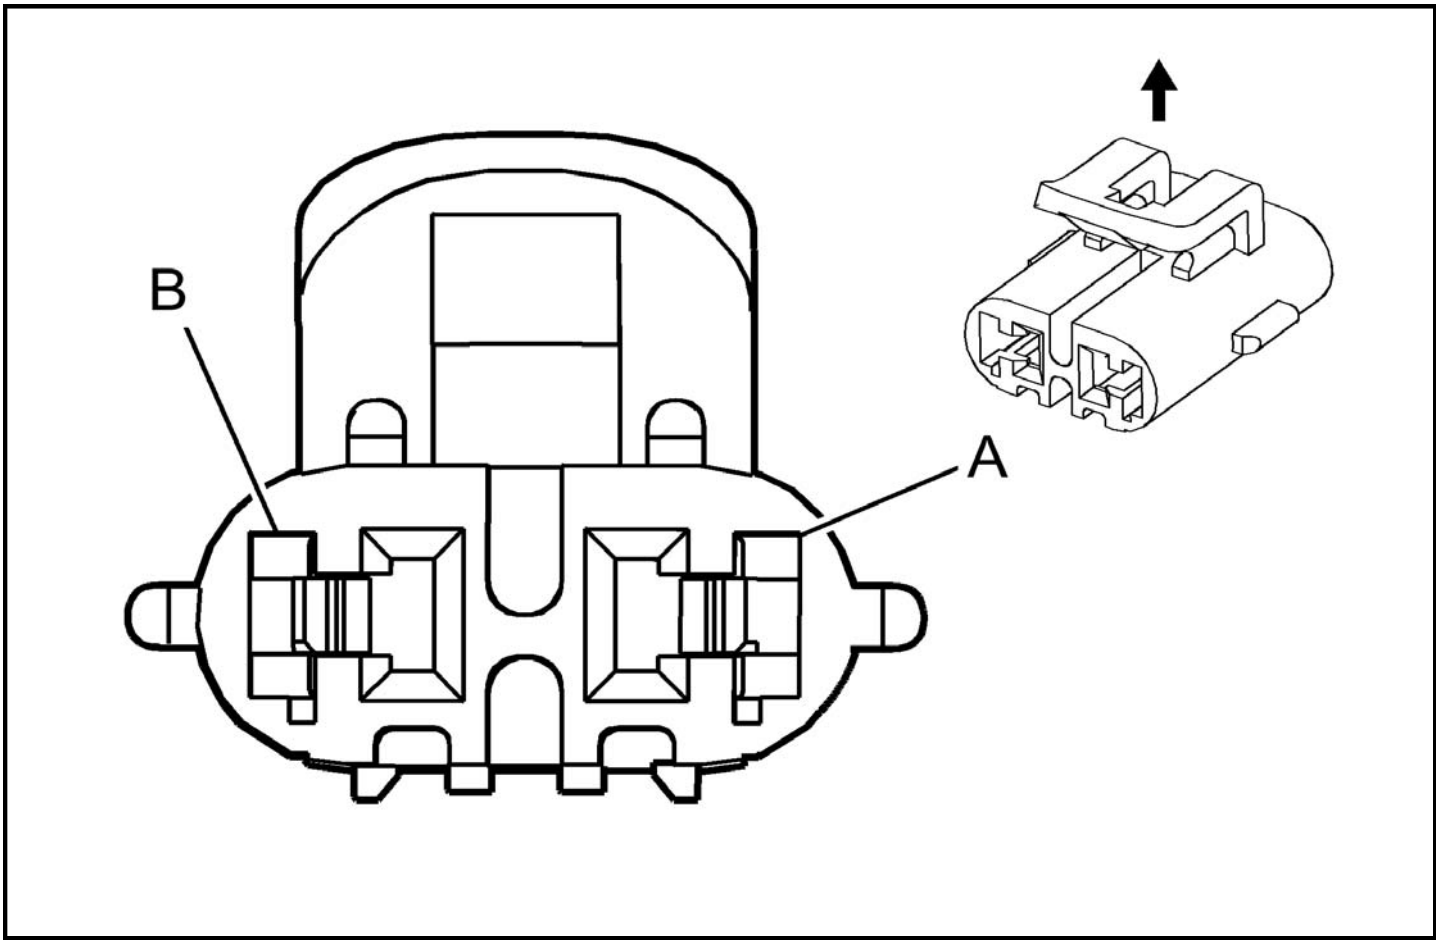
- Terminated Lead: Service by Harness- See Part Catalog

- Release Tool: Not Available
- Diagnostic Test Probe: Not Available
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Headlamp - Left High Beam

Pin	Wire	Circuit	Function
A	0.8 BU	711	Left Headlamp High Beam Supply Voltage
B	0.8 BK	1350	Ground

HEADLAMP - RIGHT HIGH BEAM



Connector Part Information

- Harness Type: Right Front Headlamp Assembly
- OEM Connector: H9
- Service Connector: Service by Harness- See Part Catalog
- Description: 2-Way F (BK)

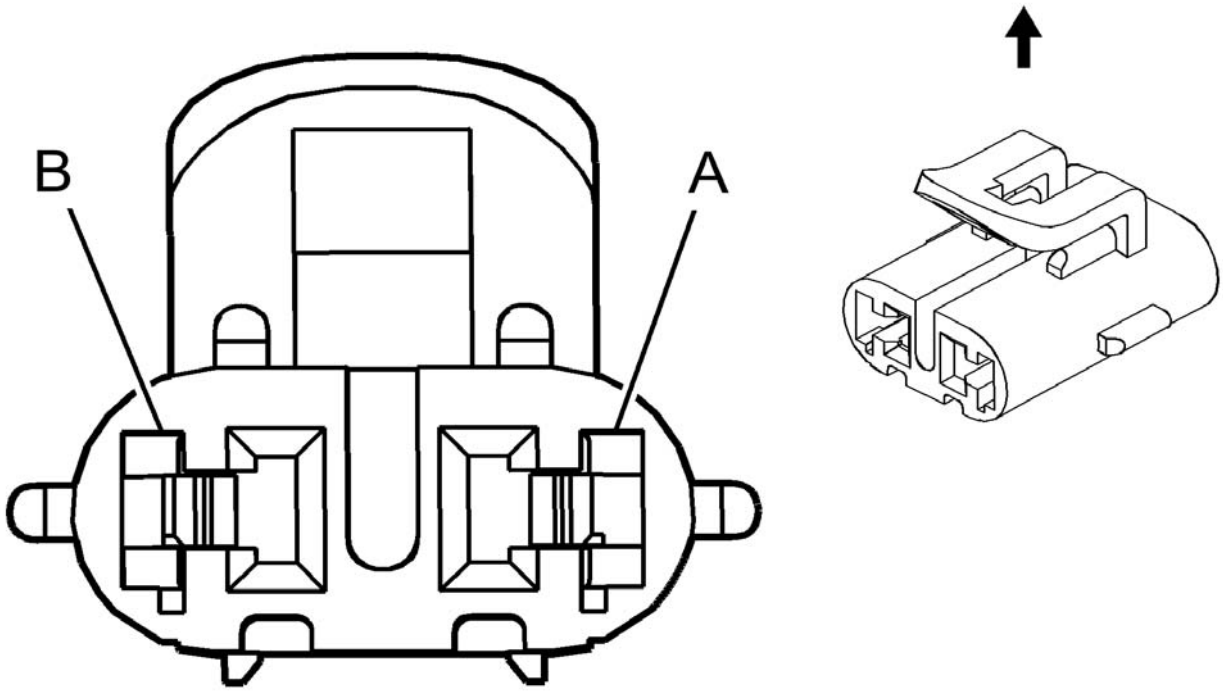
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: Not Available
- Diagnostic Test Probe: Not Available
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Headlamp - Right High Beam

Pin	Wire	Circuit	Function
A	0.8 BU	311	Right Headlamp High Beam Supply Voltage
B	0.8 BK	1250	Ground

HEADLAMP - LEFT LOW BEAM



Connector Part Information

- Harness Type: Left Front Headlamp Assembly
- OEM Connector: H11
- Service Connector: Service by Harness- See Part Catalog
- Description: 2-Way F (WH)

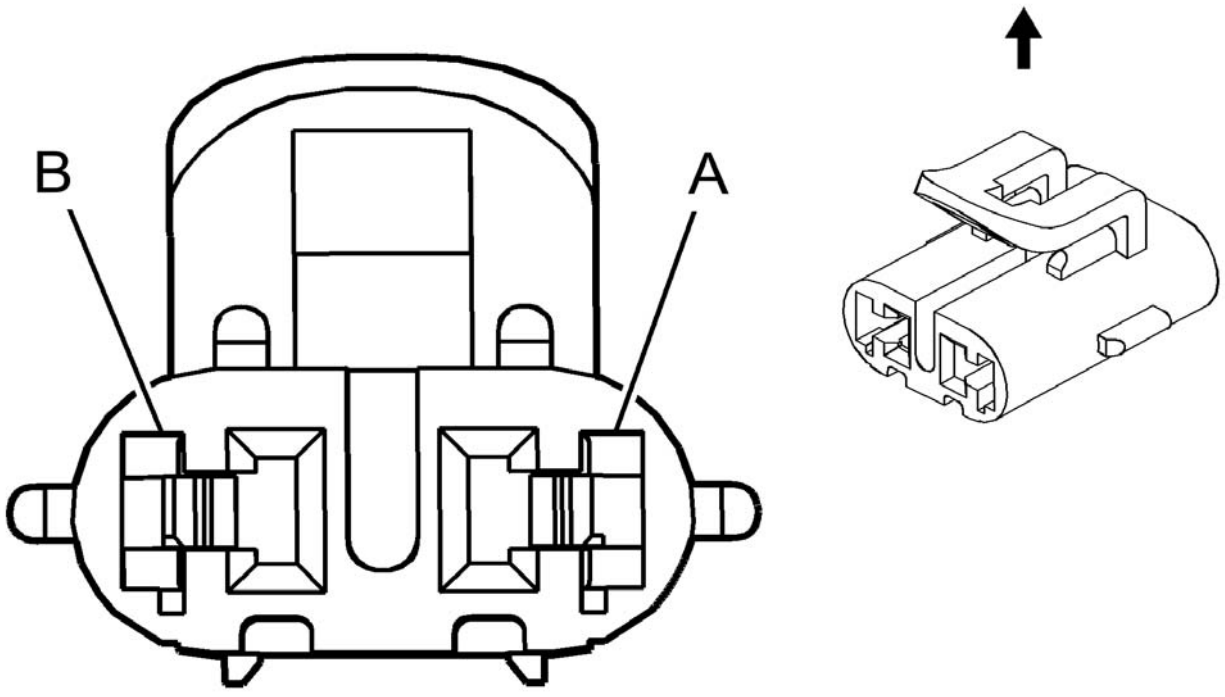
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: Not Available
- Diagnostic Test Probe: Not Available
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Headlamp - Left Low Beam

Pin	Wire	Circuit	Function
A	0.8 GN	712	Left Headlamp Low Beam Supply Voltage
B	0.8 BK	1350	Ground

HEADLAMP - RIGHT LOW BEAM



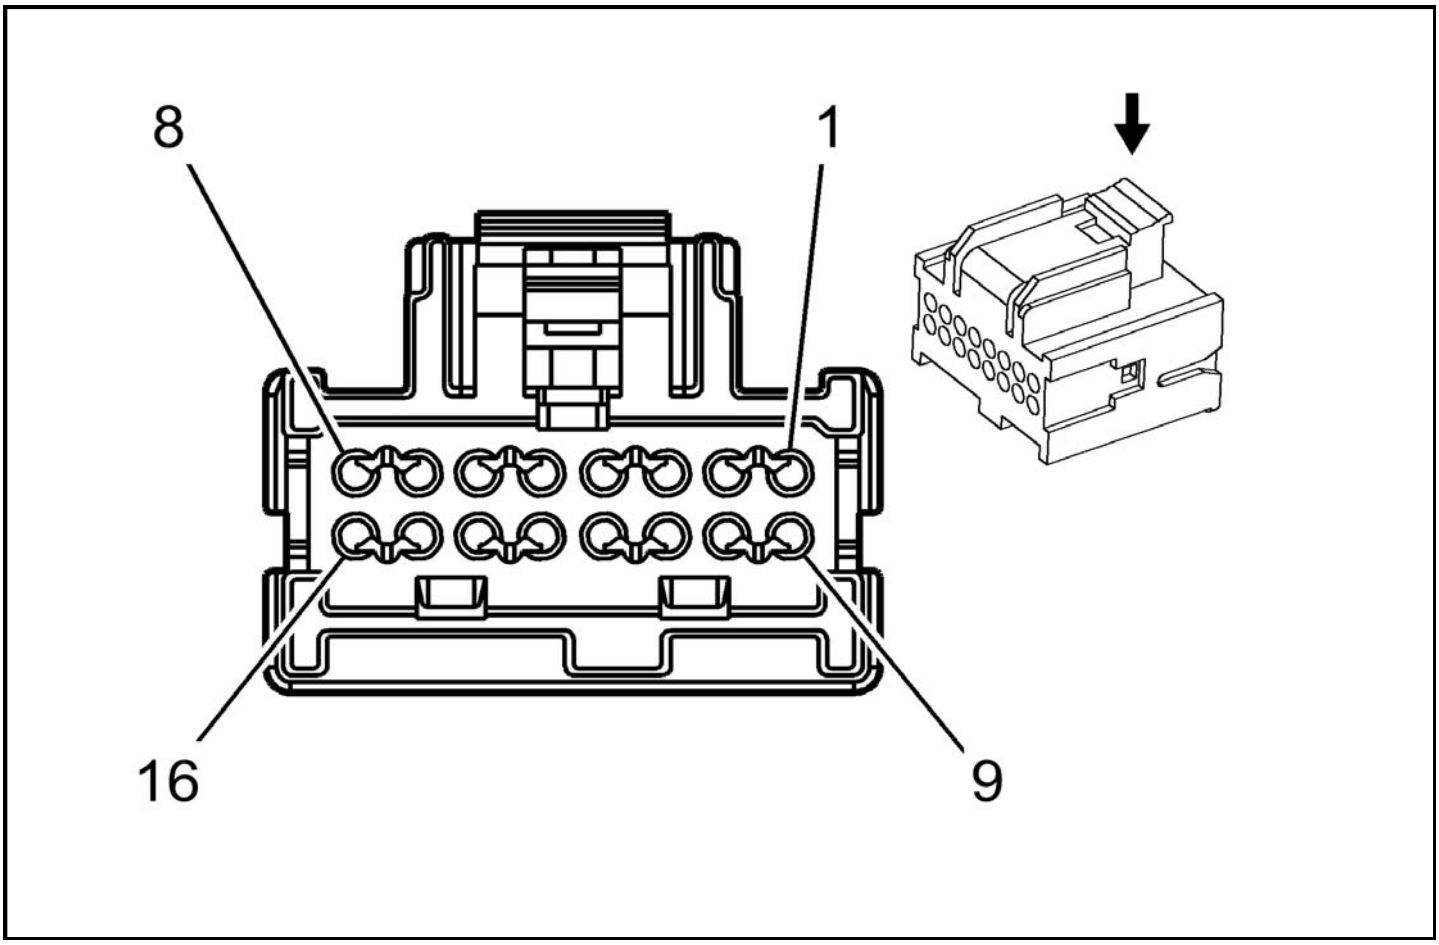
Connector Part Information

- Harness Type: Right Front Headlamp Assembly
- OEM Connector: H11
- Service Connector: Service by Harness- See Part Catalog
- Description: 2-Way F (WH)

Headlamp - Right Low Beam

Pin	Wire	Circuit	Function
A	0.8 GN	312	Right Headlamp Low Beam Supply Voltage
B	0.8 BK	1250	Ground

HEADLAMP SWITCH



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 15416970
- Service Connector: 13504130
- Description: 16-Way F Micro-Pack 64 Series (BK)

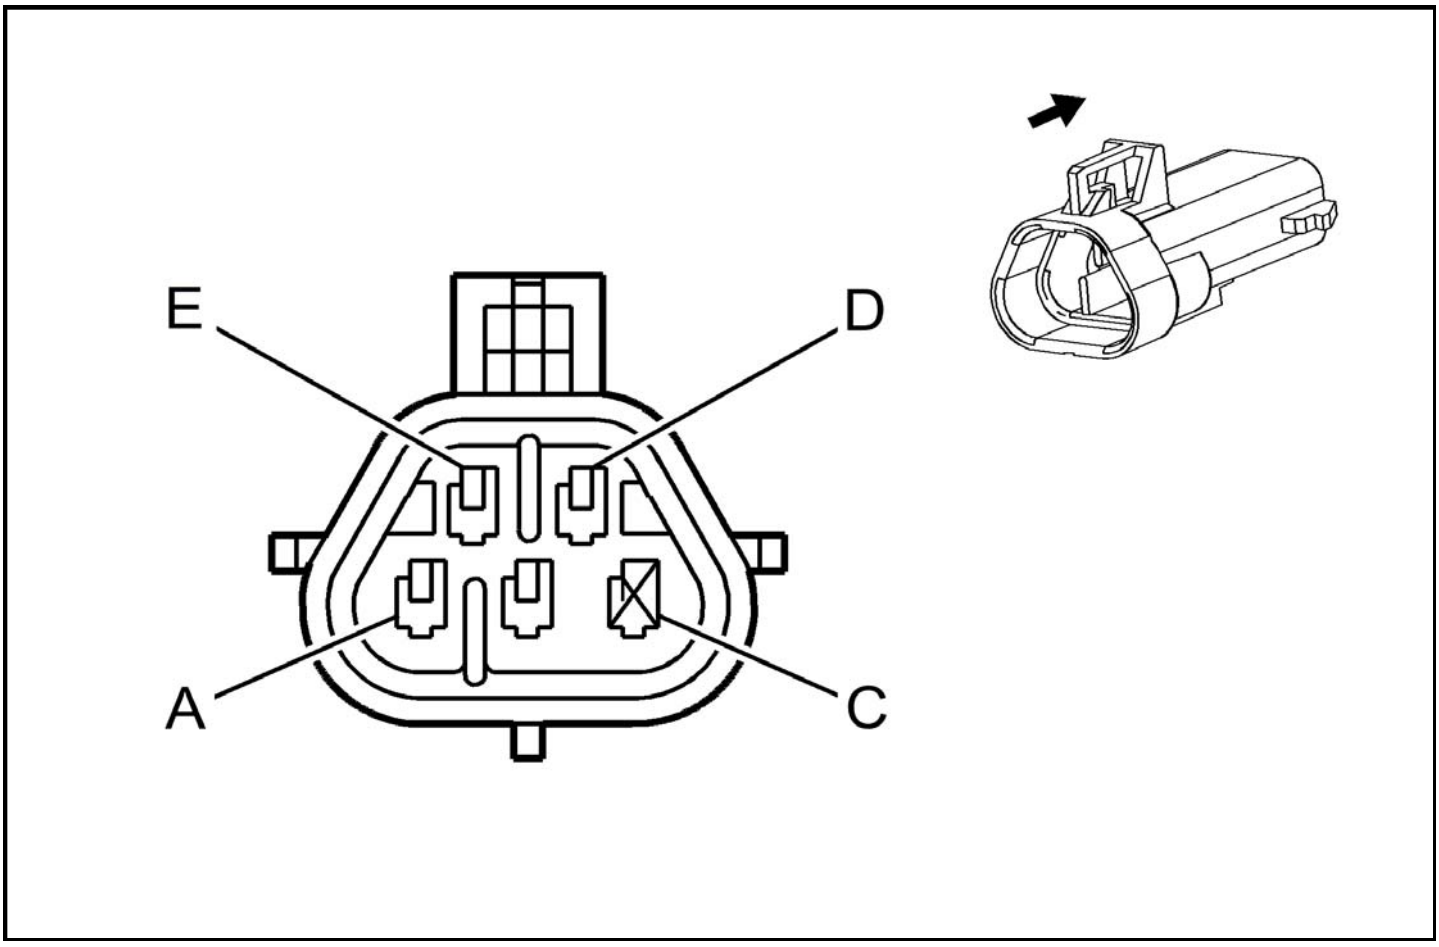
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-21
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: 15359541/4
- Core/Insulation Crimp: M/M

Headlamp Switch

Pin	Wire	Circuit	Function
1	0.35 WH	103	Headlamp Switch Headlamps On Signal
2	0.35 BN/WH	301	Park Lamp Switch On Signal
3	0.35 D-GN	306	Headlamp Switch Headlamps Off Signal
4-5	-	-	Not Used
6	0.35 OG	192	Front Fog Lamp Switch Signal (T96)
7	0.35 GY	8	Instrument Panel Lamp Supply Voltage
8	0.5 BK/WH	1551	Ground
9	0.35 L-BU	383	Trunk Release Control
10	0.35 BN/WH	1571	Traction Control Switch Signal
11	-	-	Not Used
12	0.35 PK/BK	1597	Courtesy Lamps Switch On Signal
13	0.35 D-GN	44	Instrument Panel Lamps Dimmer Switch Signal
14	-	-	Not Used
15	0.35 OG/WH	812	IP Dimming Voltage Reference
16	-	-	Not Used

HEATED OXYGEN SENSOR (HO2S) - BANK 1 SENSOR 1



Connector Part Information

- Harness Type: Engine
- OEM Connector: 12092839
- Service Connector: 1358584
- Description: 5-Way M Metri-Pack 150 Series, Sealed (BK)

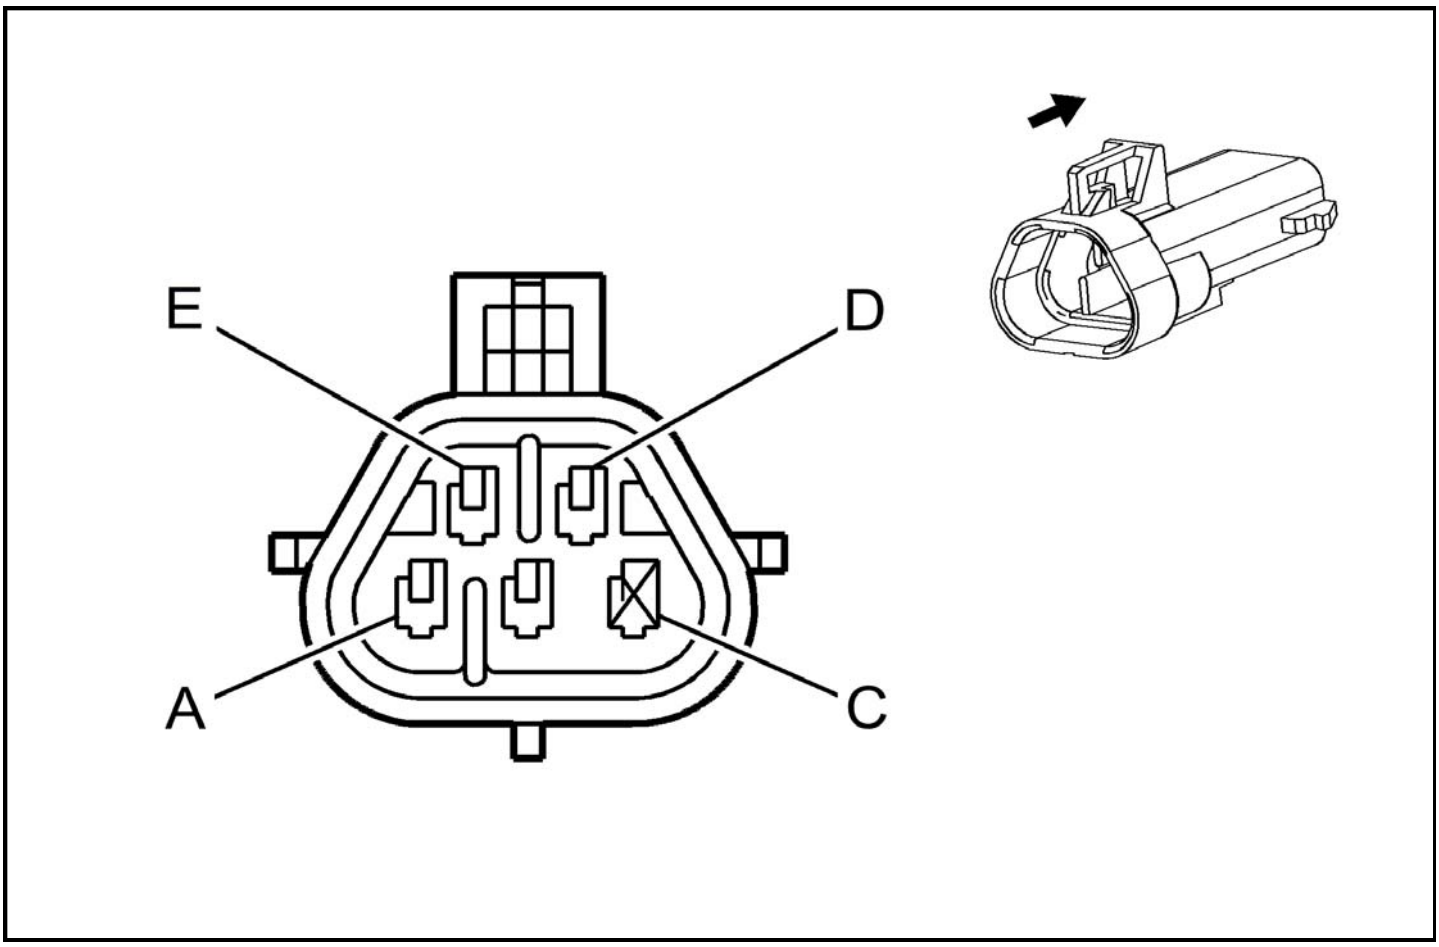
Terminal Part Information

- Terminated Lead: 13575420
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)
- Terminal/Tray: 12045773/2
- Core/Insulation Crimp: E/1

Heated Oxygen Sensor (HO2S) -Bank 1 Sensor 1

Pin	Wire	Circuit	Function
A	0.5 TN/WH	3111	HO2S Low Reference (Bank 1 Sensor 1)
B	0.5 PU/WH	3110	HO2S Reference Voltage (Bank 1 Sensor 1)
C	-	-	Not Used
D	0.5 PK/BK	5293	Ignition Voltage
E	0.5 GY/WH	3113	HO2S Heater Low Control (Bank 1 Sensor 1)

HEATED OXYGEN SENSOR (HO2S) - BANK 2 SENSOR 1



Connector Part Information

- Harness Type: Engine
- OEM Connector: 12092839
- Service Connector: 1358584
- Description: 5-Way M Metri-Pack 150 Series, Sealed (BK)

Terminal Part Information

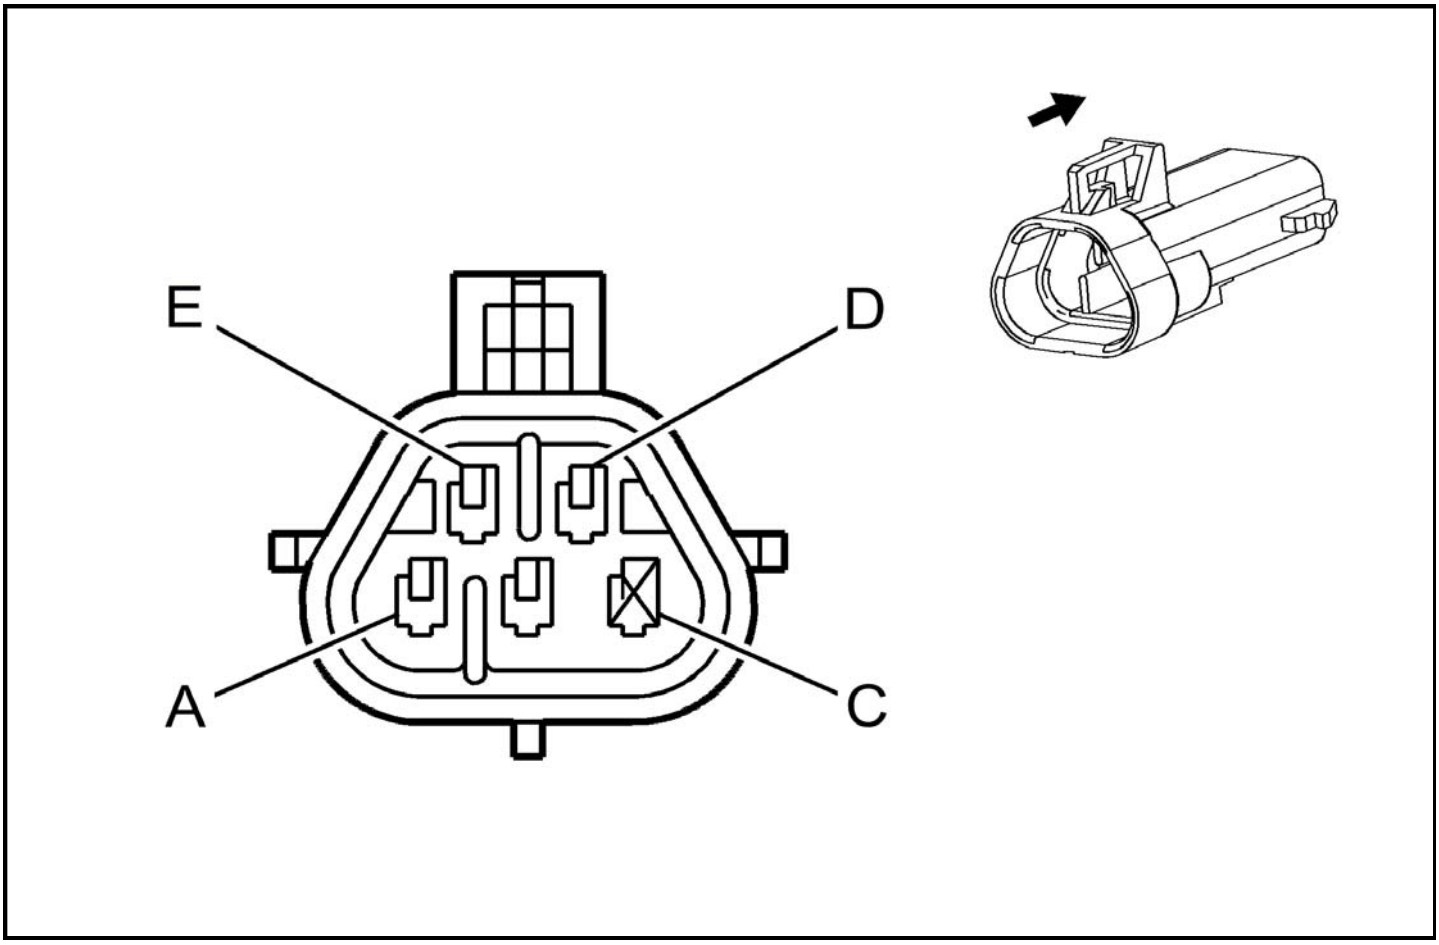
- Terminated Lead: 13575420
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)
- Terminal/Tray: 12045773/2
- Core/Insulation Crimp: E/1

Heated Oxygen Sensor (HO2S) - Bank 2 Sensor 1

Pin	Wire	Circuit	Function
A	0.5 TN/WH	3211	HO2S Low Reference (Bank 2 Sensor 1)
B	0.5 PU/WH	3210	HO2S Reference Voltage (Bank 2 Sensor 1)
C	-	-	Not Used
D	0.5 PK/BK	5293	Ignition Voltage

Pin	Wire	Circuit	Function
E	0.5 L-GN	3212	HO2S Heater Low Control (Bank 2 Sensor 1)

HEATED OXYGEN SENSOR (HO2S) - BANK 1 SENSOR 2



Connector Part Information

- Harness Type: Engine
- OEM Connector: 12092839
- Service Connector: 1358584
- Description: 5-Way M Metri-Pack 150 Series, Sealed (BK)

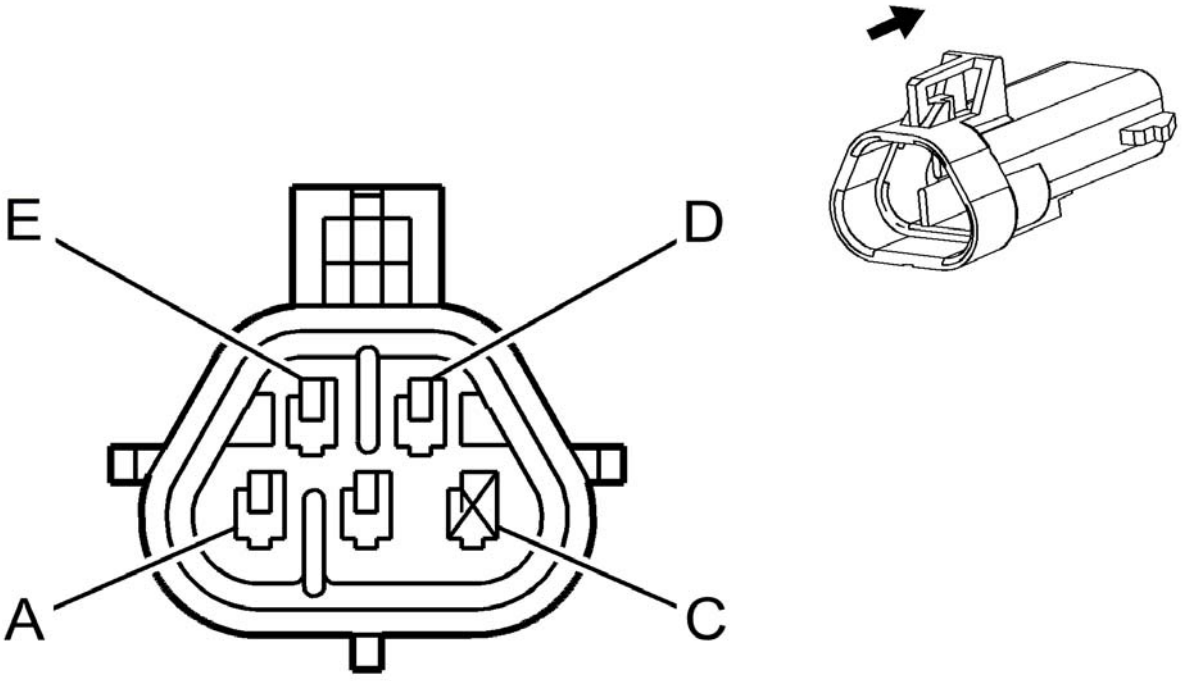
Terminal Part Information

- Terminated Lead: 13575420
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)
- Terminal/Tray: 12045773/2
- Core/Insulation Crimp: E/1

Heated Oxygen Sensor (HO2S) - Bank 1 Sensor 2

Pin	Wire	Circuit	Function
A	0.5 TN/WH	3121	HO2S Low Signal (Bank 1 Sensor 2)
B	0.5 PU	3120	HO2S High Signal (Bank 1 Sensor 2)
C	-	-	Not Used
D	0.5 PK/BK	5294	Battery Positive Voltage
E	0.5 GY/WH	3122	HO2S Heater Low Control (Bank 1 Sensor 2)

HEATED OXYGEN SENSOR (HO2S) - BANK 2 SENSOR 2



Connector Part Information

- Harness Type: Engine
- OEM Connector: 12092839
- Service Connector: 1358584
- Description: 5-Way M Metri-Pack 150 Series, Sealed (BK)

Terminal Part Information

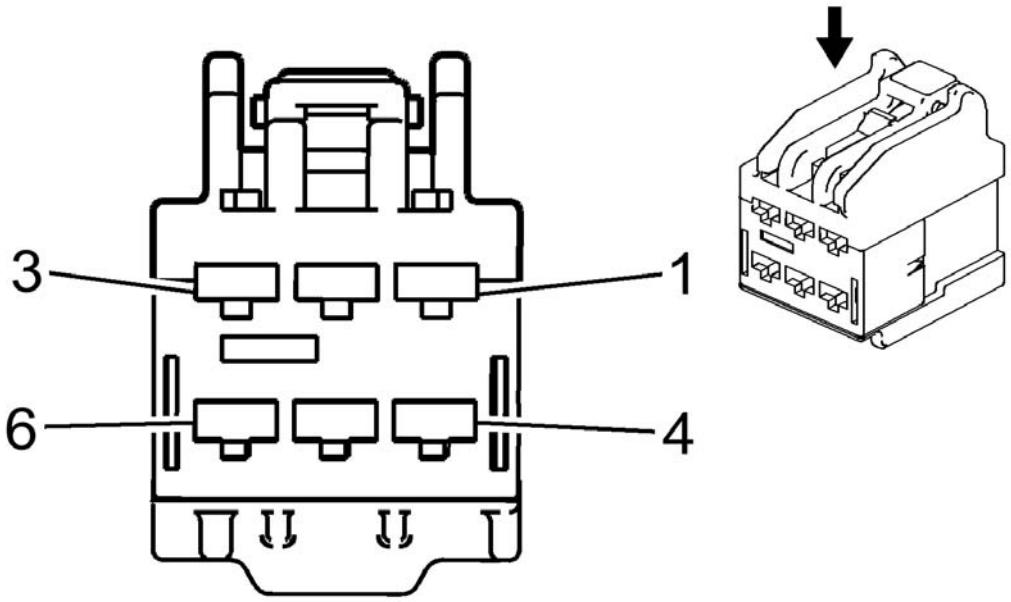
- Terminated Lead: 13575420
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)

- Terminal/Tray: 12045773/2
- Core/Insulation Crimp: E/1

Heated Oxygen Sensor (HO2S) - Bank 2 Sensor 2

Pin	Wire	Circuit	Function
A	0.5 TN	3221	HO2S Low Signal (Bank 2 Sensor 2)
B	0.5 PU	3220	HO2S High Signal (Bank 2 Sensor 2)
C	-	-	Not Used
D	0.5 PK/BK	5294	Battery Positive Voltage
E	0.5 OG/WH	3223	HO2S Heater Low Control (Bank 2 Sensor 2)

HEATED SEAT CONTROL MODULE (KA1) X1



Connector Part Information

- Harness Type: Left Front Seat
- OEM Connector: 15486524
- Service Connector: Service by Harness - See Part Catalog
- Description: 6-Way F 2.8 mm Sumitomo (BN)

Terminal Part Information

- Terminal/Tray: 8100-4444/22
- Core/Insulation Crimp: 2/A
- Release Tool/Test Probe: 15315247/J-35616-4A (PU)

Heated Seat Control Module (KA1) X1

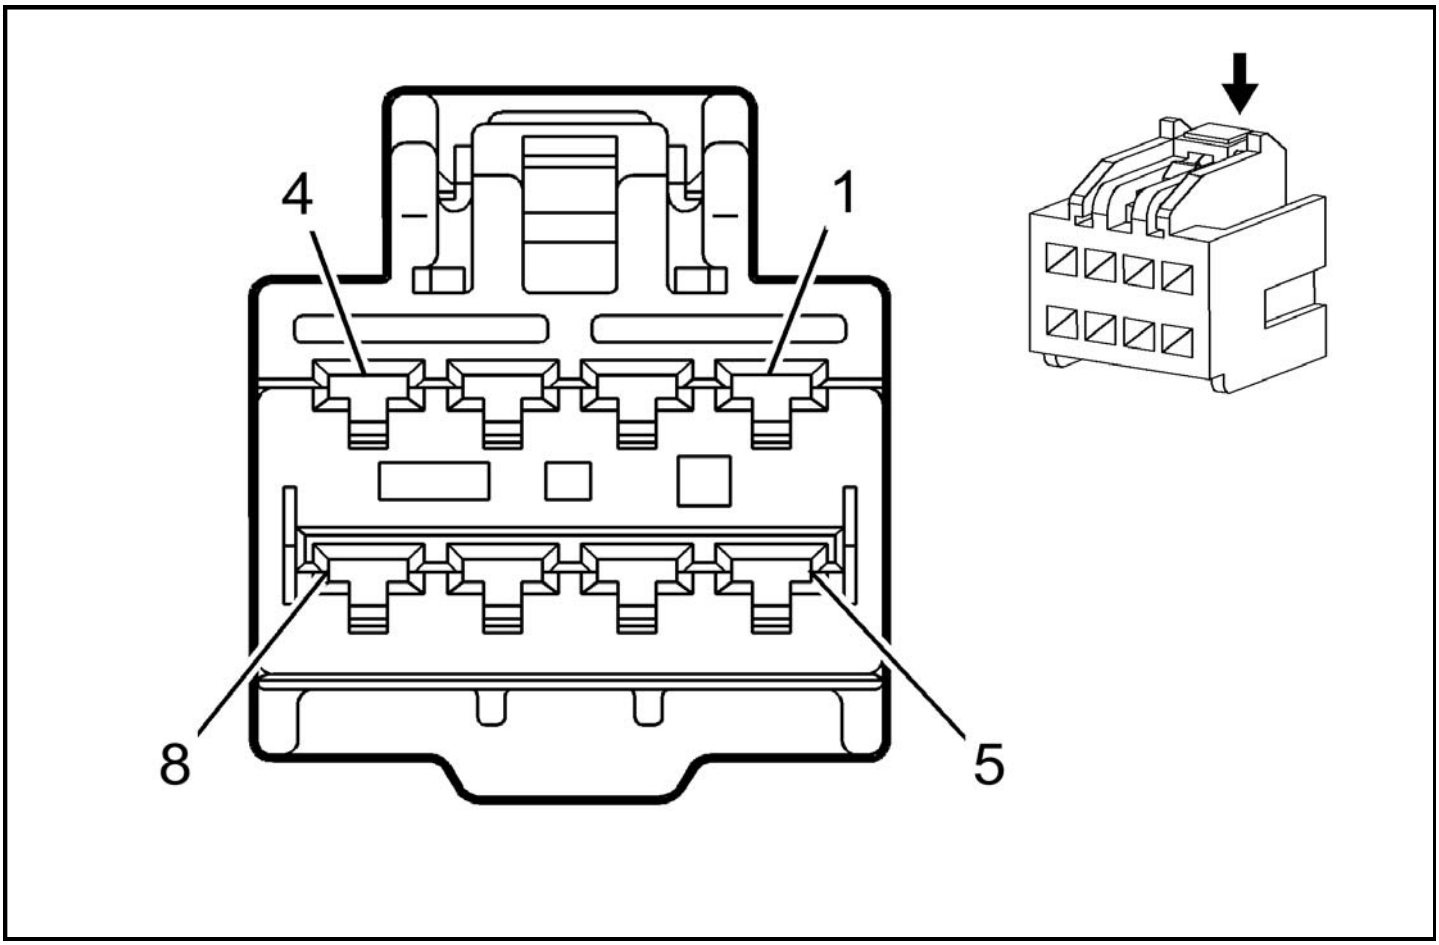
Pin	Wire	Circuit	Function
1	-	-	Not Used
2	0.8 L-BU	2433	Passenger Heated Seat Back Element Control
3	0.8 PK	2077	Driver Heated Seat Cushion Element Supply Voltage
4	-	-	Not Used
5	0.8 PU	2424	Driver Heated Seat Back Element Control
6	0.8 D-BU	2479	Passenger Heated Seat Element Supply Voltage

Article GUID: A00737159

COMPONENT CONNECTOR END VIEWS

NOTE: **Component Connector end views are sorted by component name, not by connector ID (Code). Searching for connector ID, NOT component name, may help in locating appropriate connector end view.**

HEATED SEAT CONTROL MODULE (KA1) X2



Connector Part Information

- Harness Type: Left Front Seat
- OEM Connector: 15491286
- Service Connector: 13580111
- Description: 8-Way F Receptacle 2.8 (BK)

Terminal Part Information

- Pins: 1, 2
- Terminal/Tray: 8100-4444/22

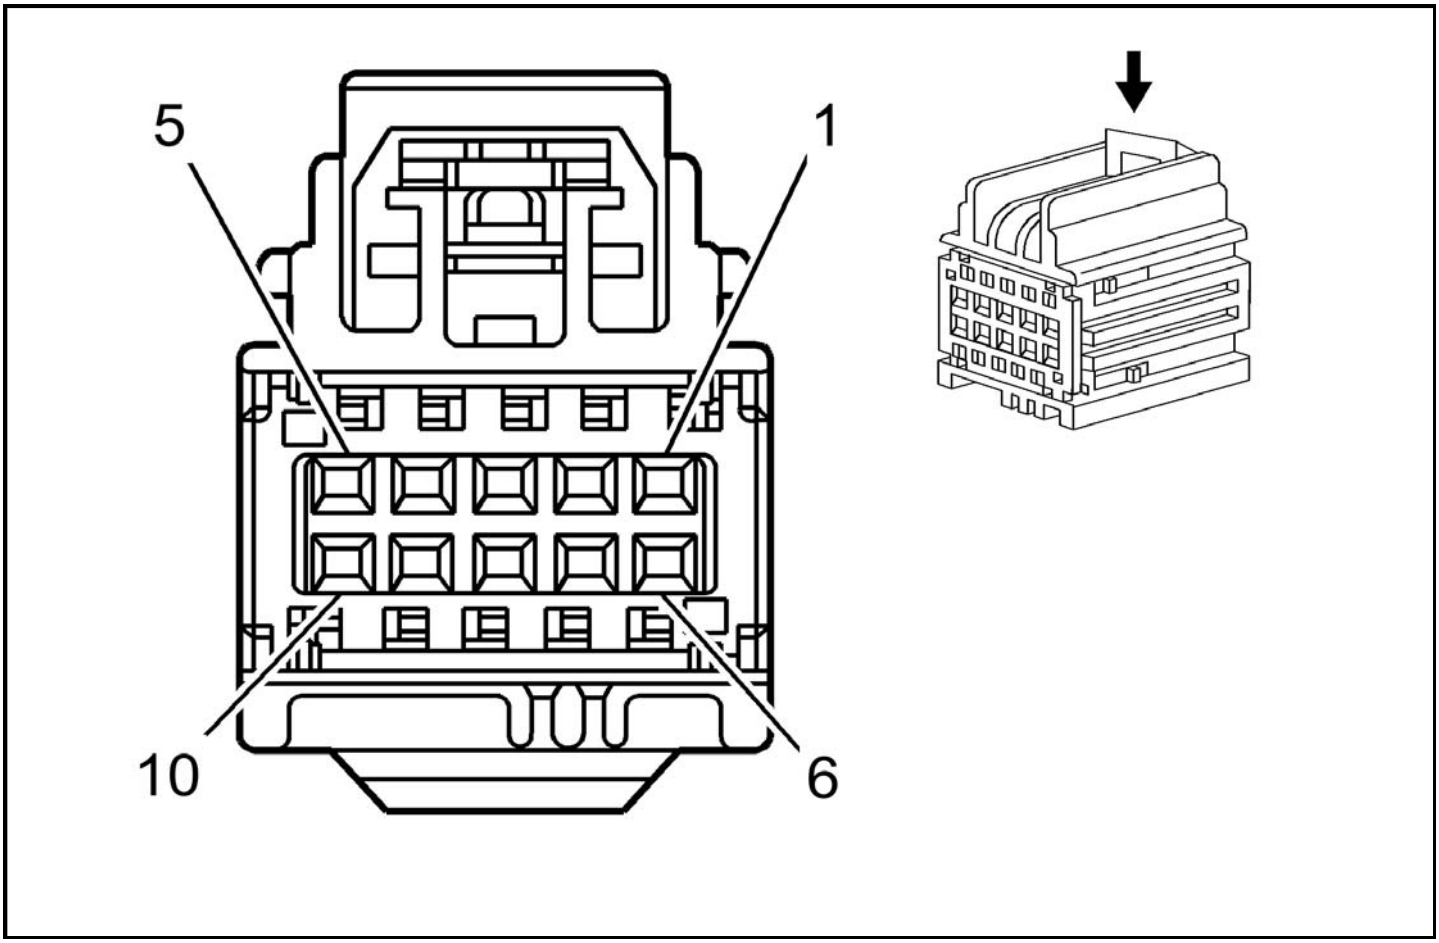
- Core/Insulation Crimp: 2/A
- Release Tool/Test Probe: 15315247/J-35616-4A (PU)

- Pins: 6, 8
- Terminal/Tray: 8100-4443/22
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 15315247/J-35616-4A (PU)

Heated Seat Control Module (KA1) X2

Pin	Wire	Circuit	Function
1	1 RD/WH	1440	Battery Positive Voltage
2	1 BK	550	Ground
3-5	-	-	Not Used
6	0.35 YE	2080	Driver Heated Seat Cushion Temperature Sensor Low Reference
7	-	-	Not Used
8	0.35 PK	2435	Passenger Heated Seat Cushion Temperature Sensor Low Reference

HEATED SEAT CONTROL MODULE (KA1) X3



Connector Part Information

- Harness Type: Left Front Seat
- OEM Connector: 15491259
- Service Connector: 15127042
- Description: 10-Way F 0.64 YESC Kaizen Series (BK)

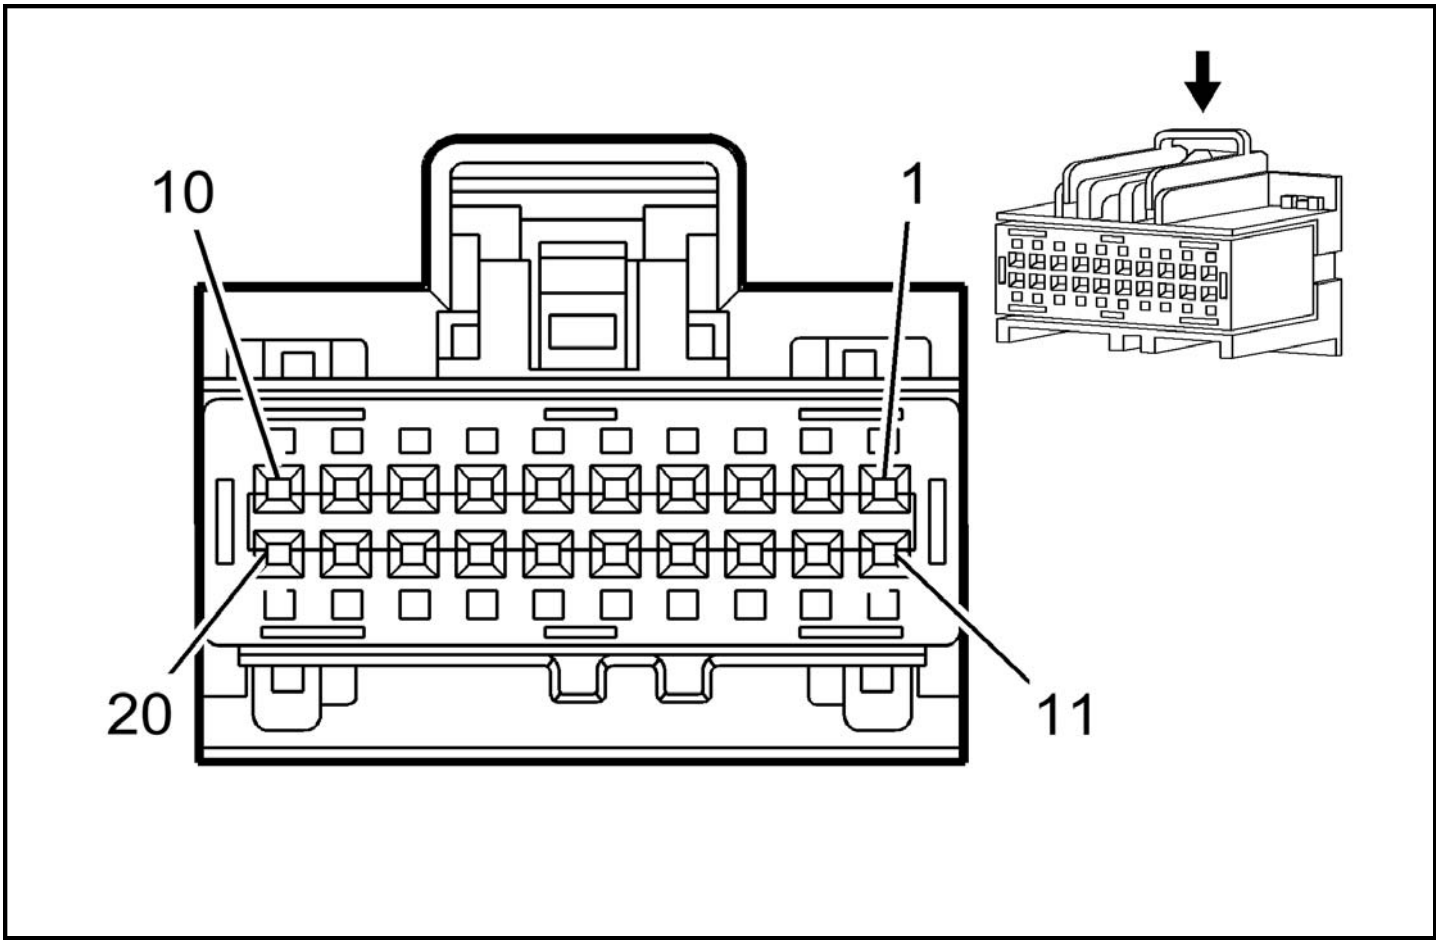
Terminal Part Information

- Terminal/Tray: SAIT-A03T-M064/14
- Core/Insulation Crimp: P/P
- Release Tool/Test Probe: J-38125-215A/J-35616-64B (L-BU)

Heated Seat Control Module (KA1) X3

Pin	Wire	Circuit	Function
1-5	-	-	Not Used
6	0.35 D-GN	5060	Low Speed GMLAN Serial Data
7-10	-	-	Not Used

HEATED SEAT CONTROL MODULE (KA1) X4



Connector Part Information

- Harness Type: Left Front Seat
- OEM Connector: 15489824
- Service Connector: 15126711
- Description: 20-Way F 64 Series (BK)

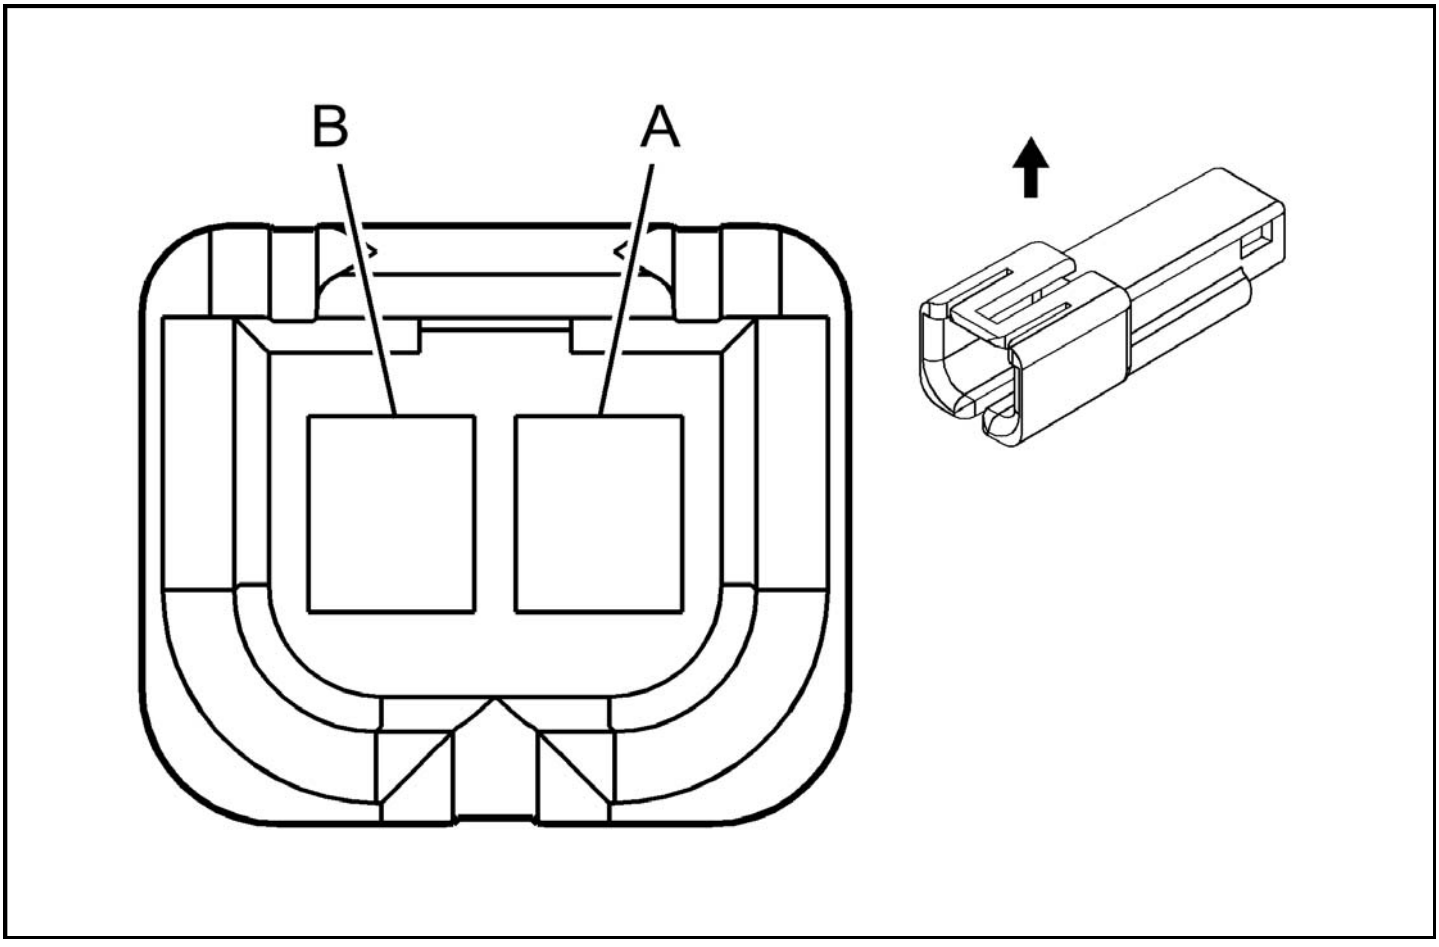
Terminal Part Information

- Terminal/Tray: SAIT-A03T-M064/14
- Core/Insulation Crimp: P/P
- Release Tool/Test Probe: J-38125-215A/J-35616-64B (L-BU)

Heated Seat Control Module (KA1) X4

Pin	Wire	Circuit	Function
1-8	-	-	Not Used
9	0.35 YE/BK	2079	Heated Seat Cushion Temperature Sensor Signal
10-19	-	-	Not Used
20	0.35 GY	2434	Passenger Heated Seat Cushion Temperature Sensor Signal

HEATED SEAT ELEMENT - DRIVER BACK (KA1)



Connector Part Information

- Harness Type: Left Front Seat
- OEM Connector: 12064778
- Service Connector: 12126020
- Description: 2-Way M Metri-Pack 150 Series (L-GN)

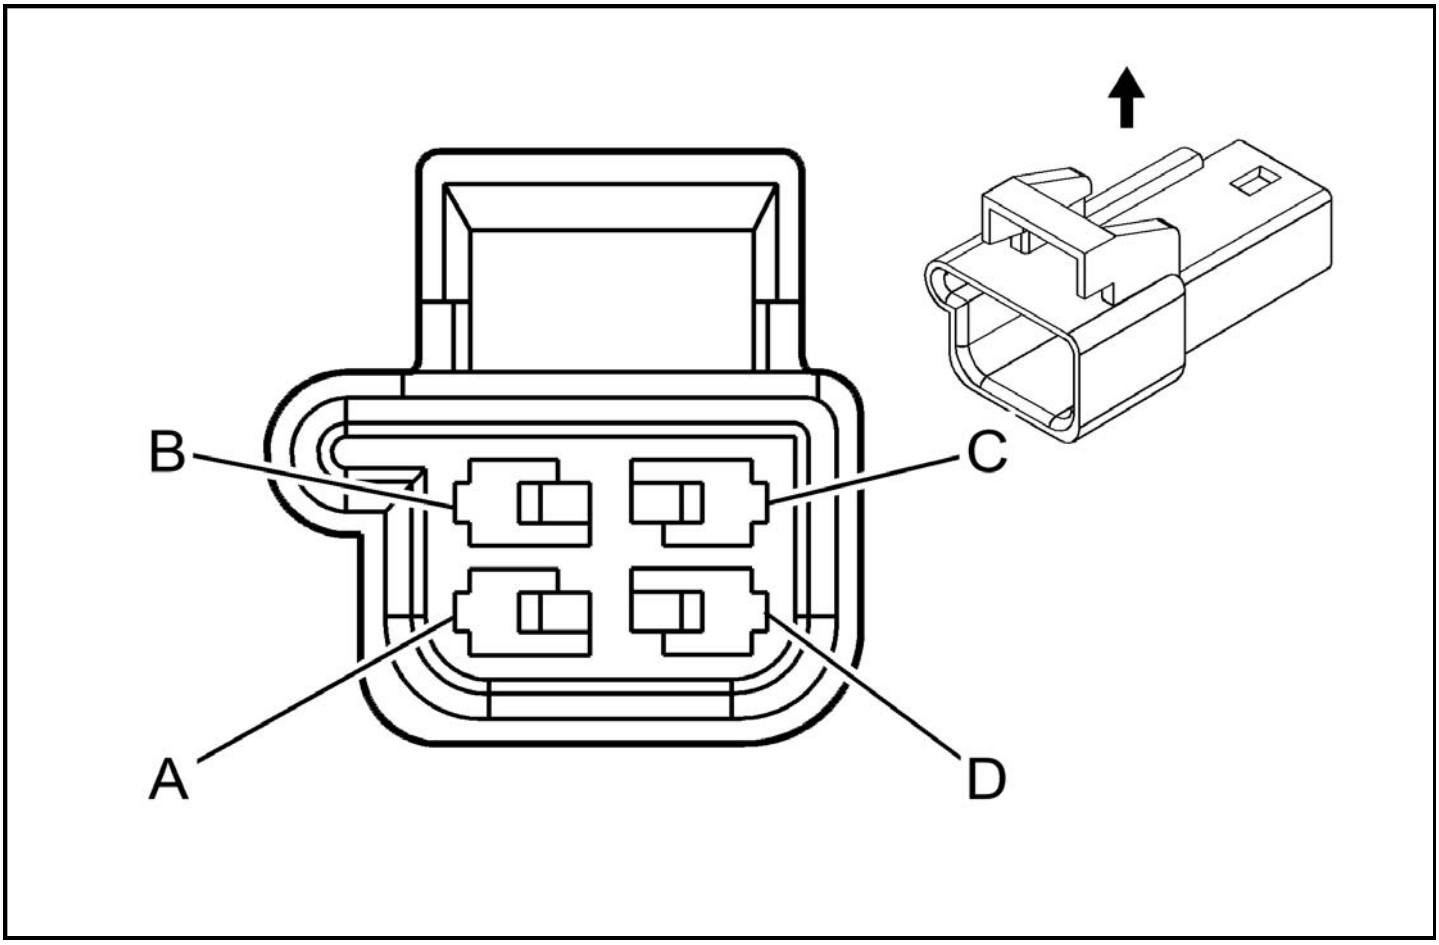
Terminal Part Information

- Terminated Lead: 13505668
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)
- Terminal/Tray: 12047581/2
- Core/Insulation Crimp: E/A

Heated Seat Element - Driver Back (KA1)

Pin	Wire	Circuit	Function
A	0.8 BN	2432	Driver Heated Seat Back Element Supply Voltage
B	0.8 PU	2424	Driver Heated Seat Back Element Control

HEATED SEAT ELEMENT - DRIVER CUSHION (KA1)



Connector Part Information

- Harness Type: Left Front Seat
- OEM Connector: 12066496
- Service Connector: Service by Harness - See Part Catalog
- Description: 4-Way M Metri-Pack 150 Series (BK)

Terminal Part Information

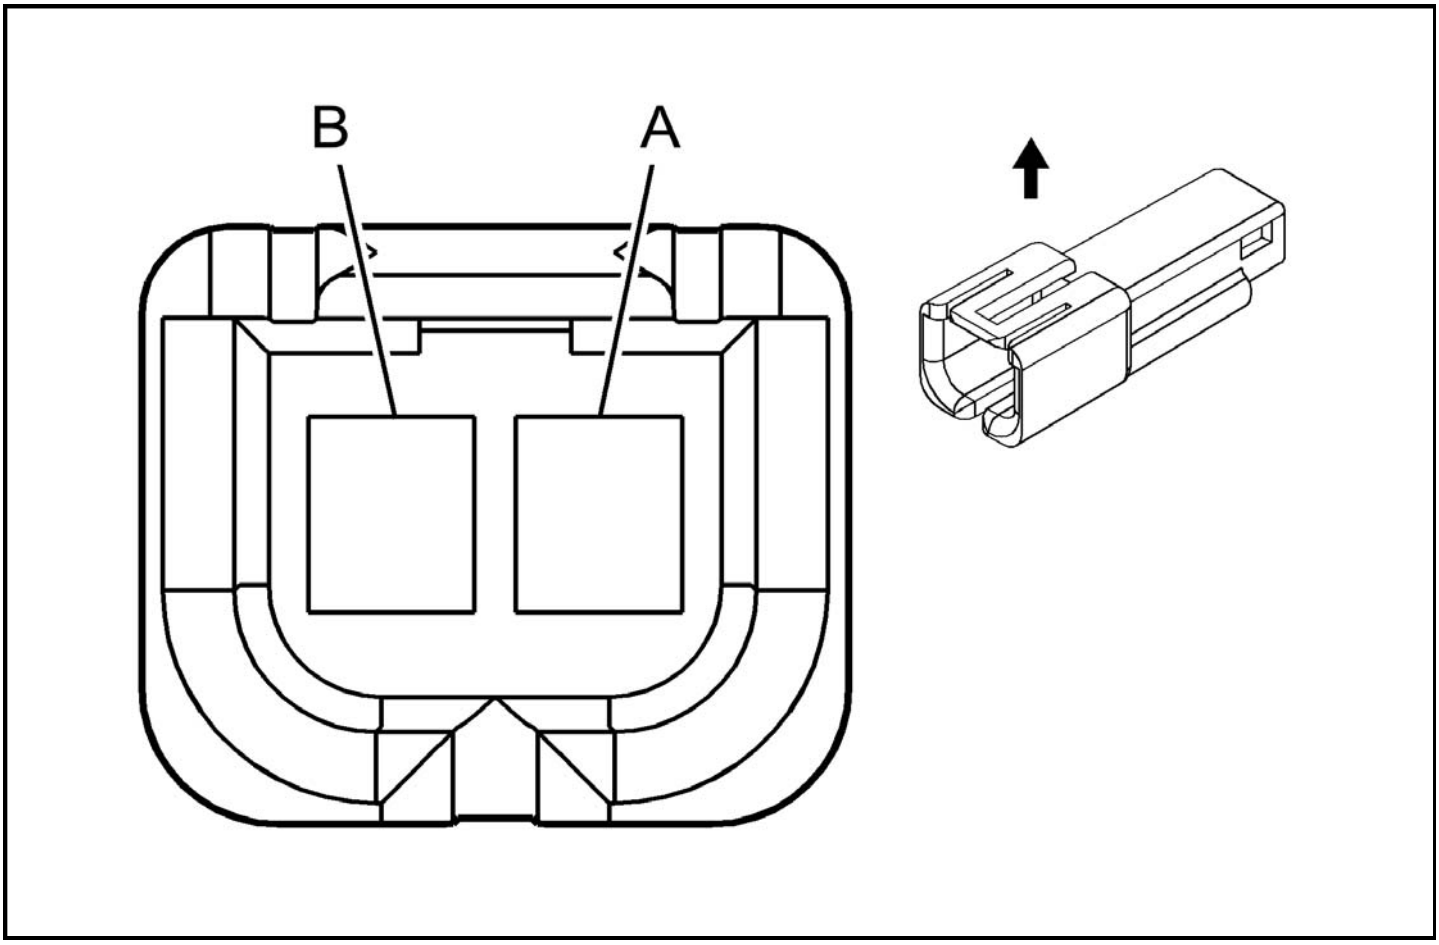
- Terminal/Tray: 12047581/2
- Core/Insulation Crimp: Pins A, B- E/A
- Core/Insulation Crimp: Pins C, D- E/C
- Release Tool/Test Probe: 12094429/J-35616-3 (GY)

Heated Seat Element - Driver Cushion (KA1)

Pin	Wire	Circuit	Function
A	0.8 PK	2077	Heated Seat Cushion Element Supply Voltage
B	0.8 BN	2432	Driver Heated Seat Back Element Supply Voltage
C	0.35 YE/BK	2079	Heated Seat Cushion Temperature Sensor Signal

Pin	Wire	Circuit	Function
D	0.35 YE	2080	Driver Heated Seat Cushion Temperature Sensor Low Reference

HEATED SEAT ELEMENT - PASSENGER BACK (KA1)



Connector Part Information

- Harness Type: Right Front Seat
- OEM Connector: 12064778
- Service Connector: 12126020
- Description: 2-Way M Metri-Pack 150 Series (L-GN)

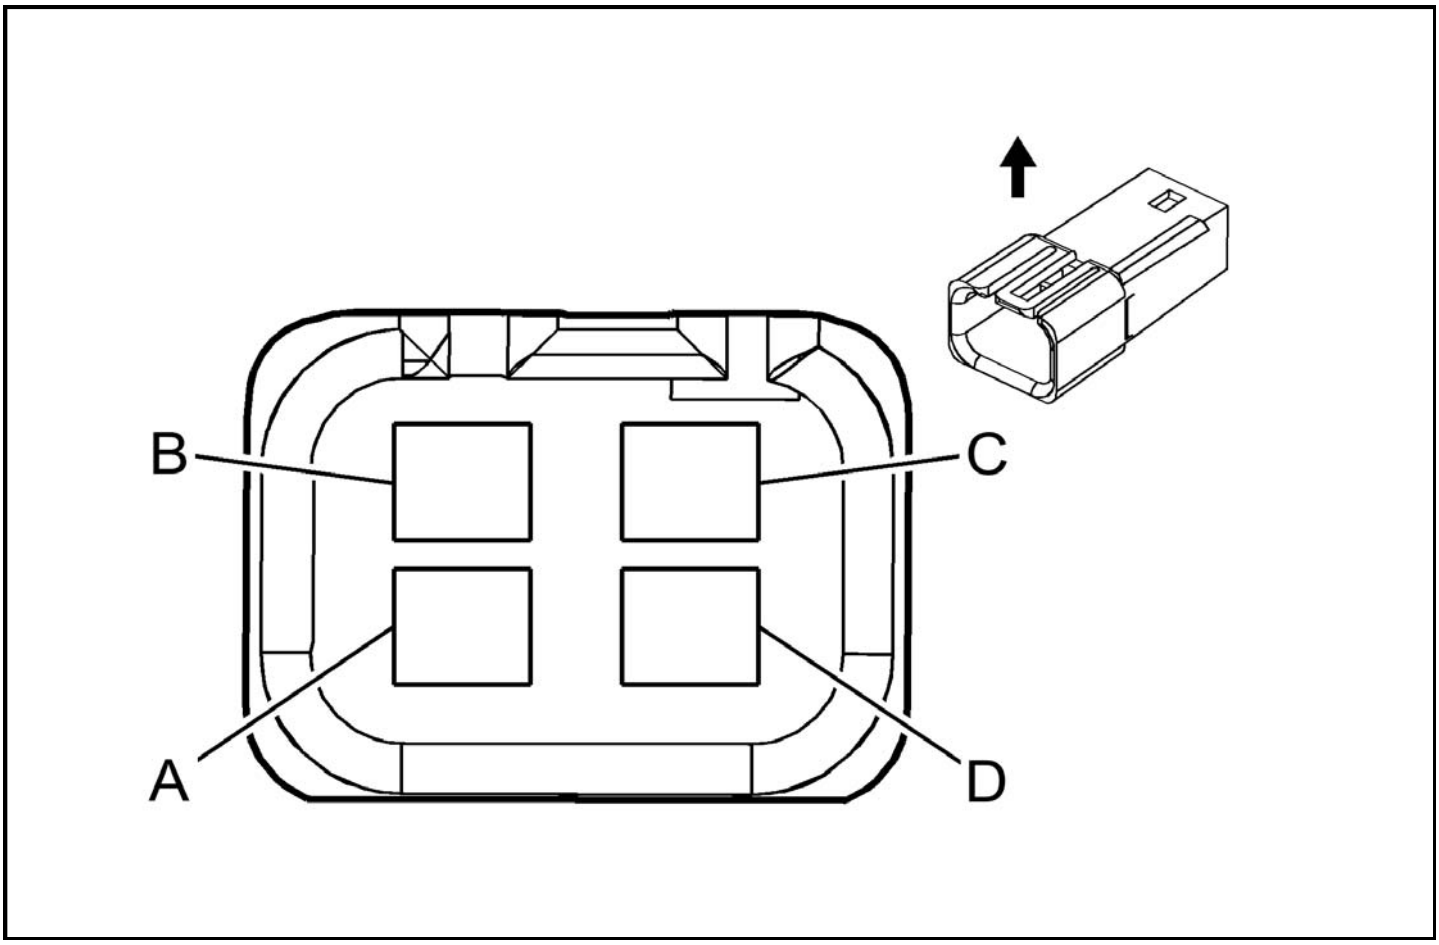
Terminal Part Information

- Terminated Lead: 13505668
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)
- Terminal/Tray: 12047581/2
- Core/Insulation Crimp: E/A

Heated Seat Element - Passenger Back (KA1)

Pin	Wire	Circuit	Function
A	0.8 TN	2481	Passenger Heated Seat Back Element Supply Voltage
B	0.8 L-BU	2433	Passenger Heated Seat Back Element Control

HEATED SEAT ELEMENT - PASSENGER CUSHION (KA1)



Connector Part Information

- Harness Type: Right Front Seat
- OEM Connector: 12066498
- Service Connector: 12085536
- Description: 4-Way F Metri-Pack 150 (BK)

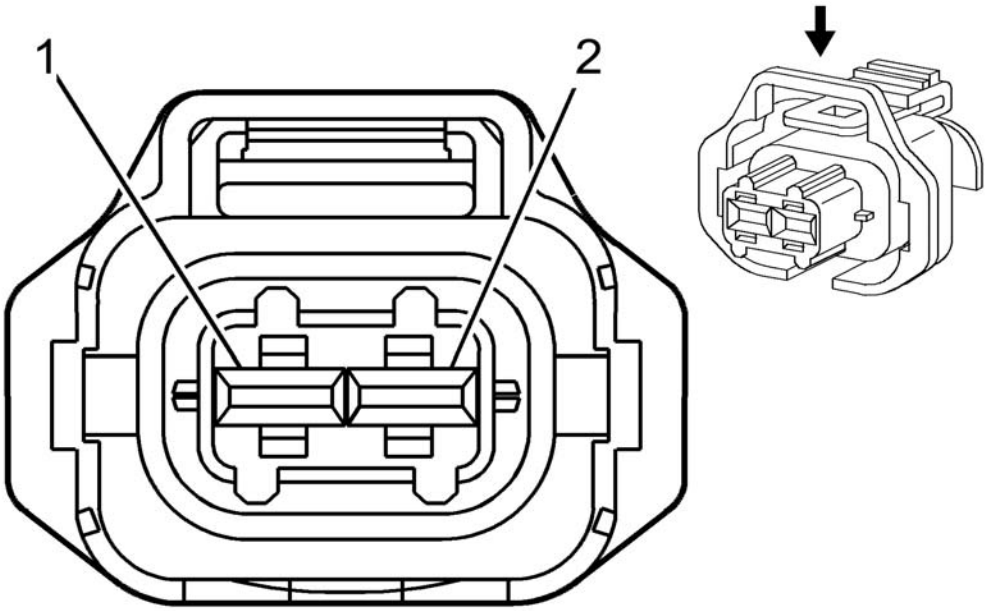
Terminal Part Information

- Terminated Lead: 13505668
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)
- Terminal/Tray: 12047581/2
- Core/Insulation Crimp: E/A

Heated Seat Element - Passenger Cushion (KA1)

Pin	Wire	Circuit	Function
A	0.8 D-BU	2479	Passenger Heated Seat Element Supply Voltage
B	0.8 TN	2481	Passenger Heated Seat Back Element Supply Voltage
C	0.35 GY	2434	Passenger Heated Seat Cushion Temperature Sensor Signal
D	0.35 PK	2435	Passenger Heated Seat Cushion Temperature Sensor Low Reference

G18 HIGH PRESSURE FUEL PUMP (LFX)



Connector Part Information

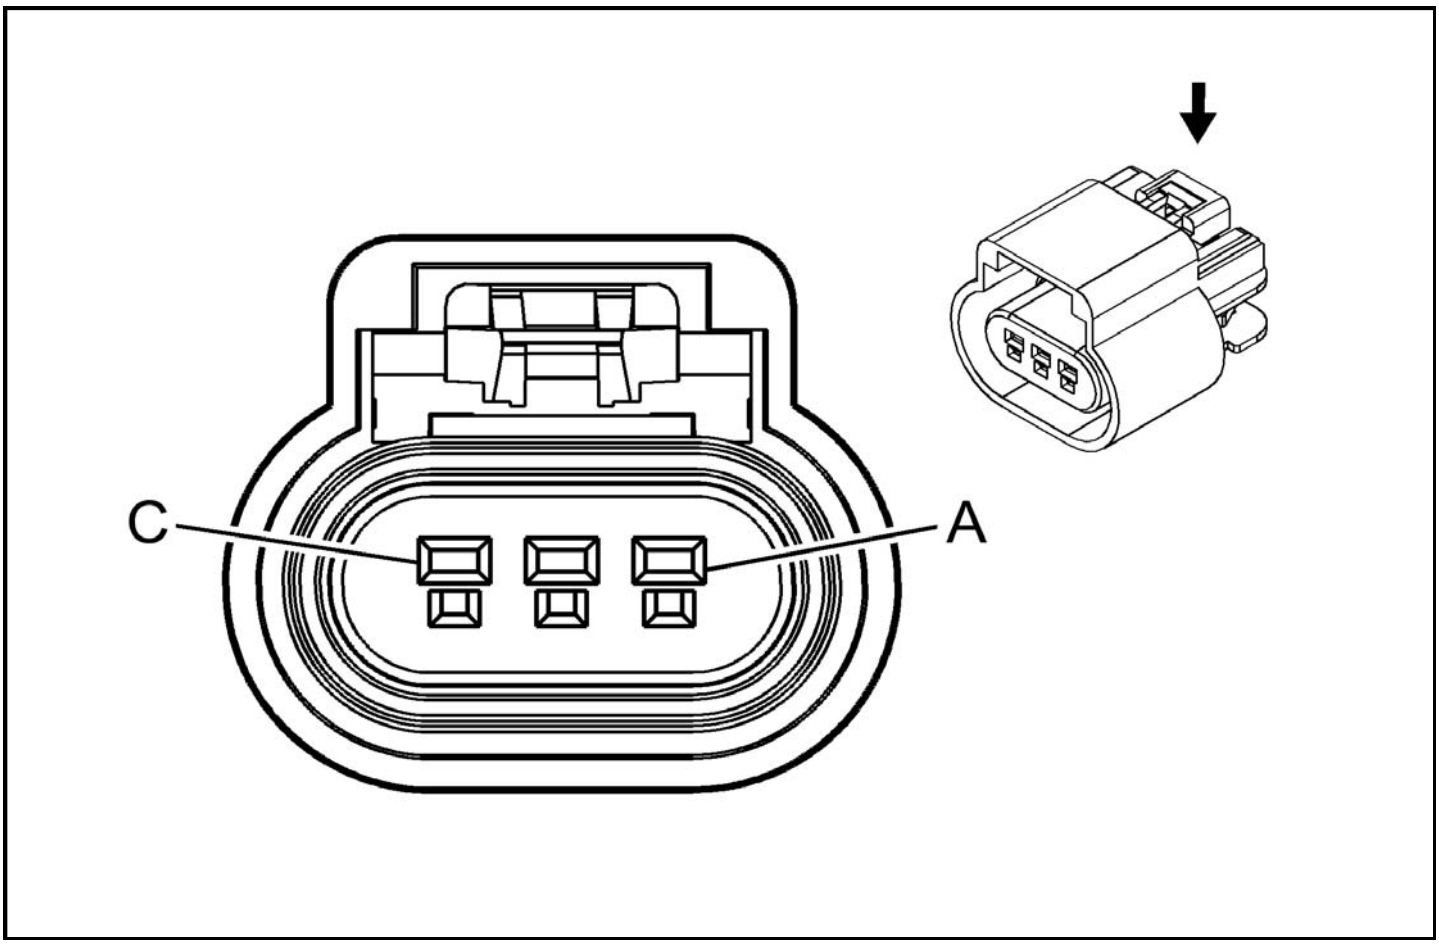
- Harness Type: Engine
- OEM Connector: 15397337
- Service Connector: 13355745
- Description: 2-Way F 2.8 Power Timer Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray	Core Crimp	Insulation Crimp
I	Not Available	J-35616-35 (VT)	J-38125-36	4-964286-1	4	E	1

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	1	PU	7300	High Pressure Fuel Pump Actuator Low Control	I	-
2	1	YE	7301	High Pressure Fuel Pump Actuator High Control	I	-

HOOD AJAR SWITCH (AP3)



Connector Part Information

- Harness Type: Forward Lamp
- OEM Connector: 13519047
- Service Connector: 13580871
- Description: 3-Way F GT 150 Series, Sealed (BK)

Terminal Part Information

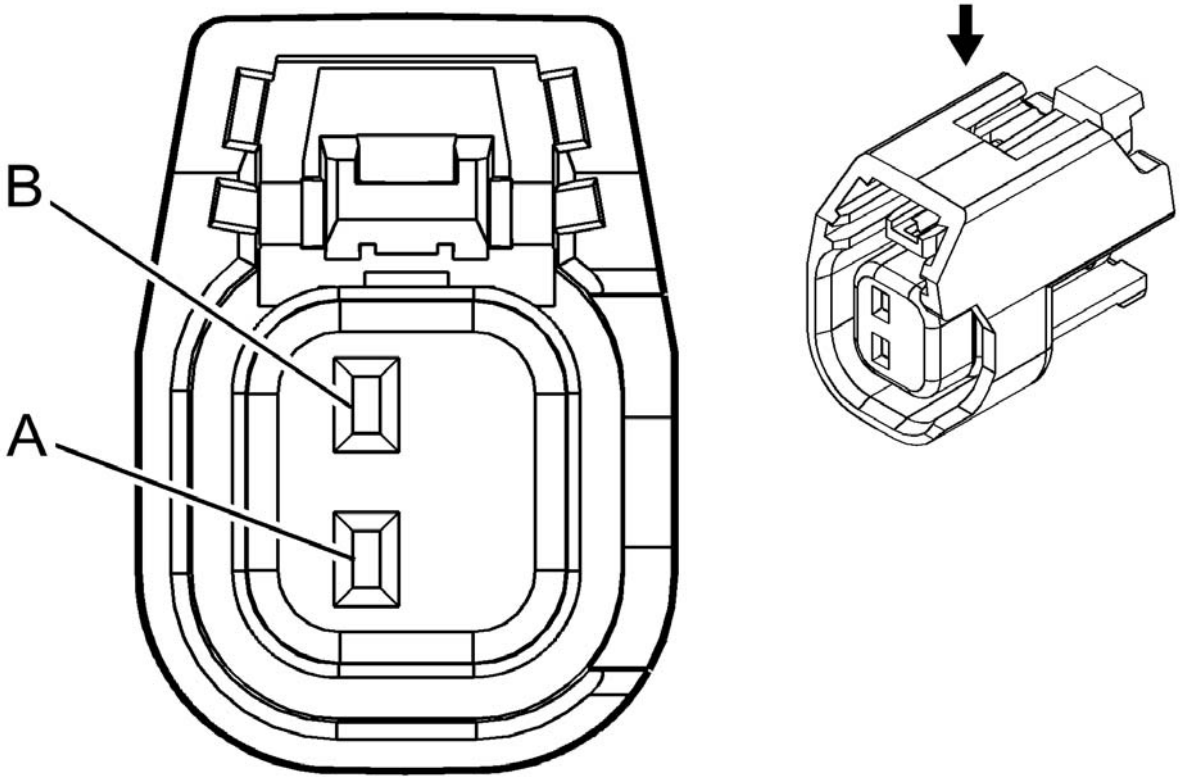
- Terminated Lead: 13327112
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 12191819/8

- Core/Insulation Crimp: E/1

Hood Ajar Switch (AP3)

Pin	Wire	Circuit	Function
A	0.35 PK/BK	109	Hood Ajar Switch Signal
B	0.35 PU	5531	Hood Closed Switch Signal
C	0.35 BK	1350	Ground

HORN ASSEMBLY



Connector Part Information

- Harness Type: Forward Lamp
- OEM Connector: 15419715
- Service Connector: 13580876
- Description: 2-Way F GT 150 Series, Sealed (GY)

Terminal Part Information

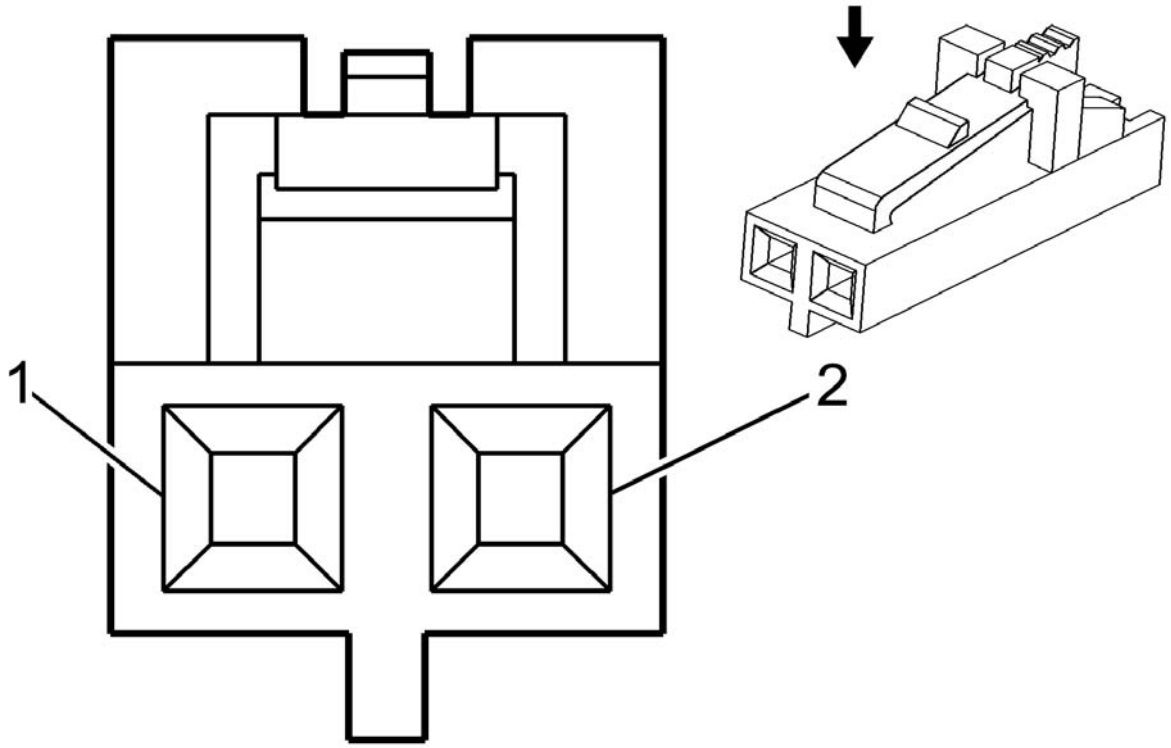
- Terminated Lead: 12191818
- Release Tool: J-38125-553

- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: E/1

Horn Assembly

Pin	Wire	Circuit	Function
A	0.5 BK	1250	Ground
B	0.8 D-GN	29	Horn Control

HORN SWITCH



Connector Part Information

- Harness Type: Steering Wheel
- OEM Connector: 50-57-9402
- Service Connector: 15306026
- Description: 2-Way F C/Grid/SL 70066G Series (BK)

Terminal Part Information

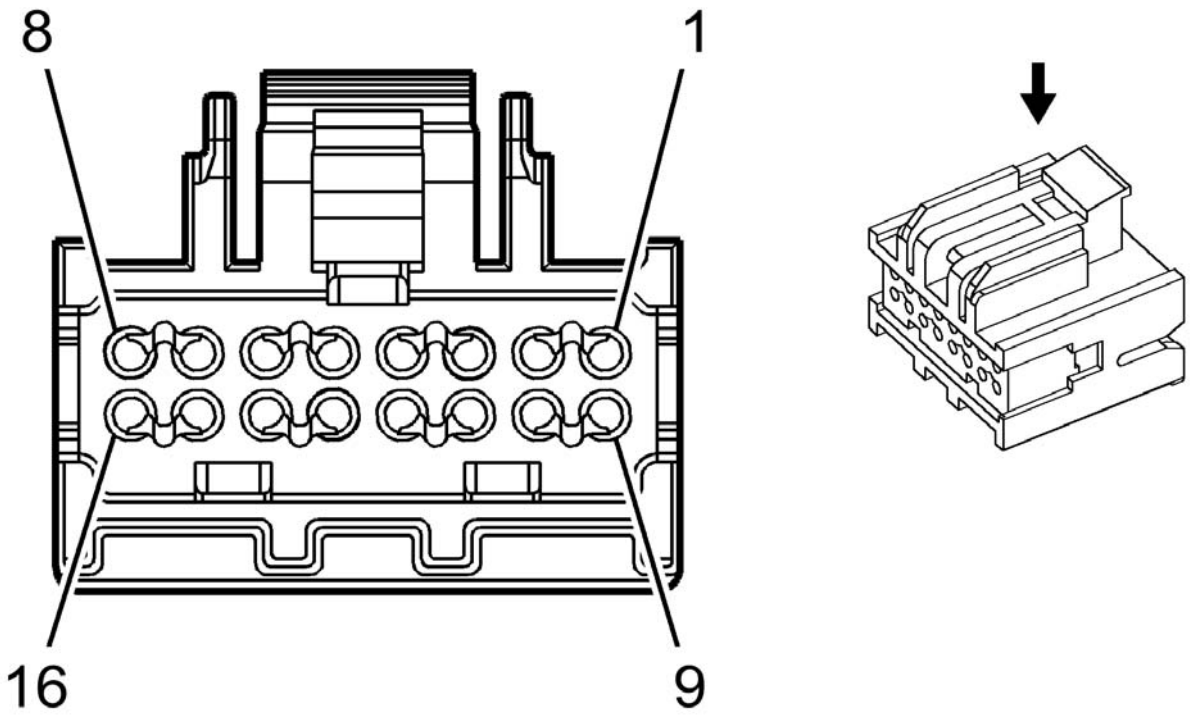
- Terminated Lead: Service by Harness- See Part Catalog

- Release Tool: Not Available
- Diagnostic Test Probe: Not Available
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Horn Switch

Pin	Wire	Circuit	Function
1	0.35 TN	28	Horn Relay Control
2	0.35 BK	1450	Ground

HVAC CONTROL MODULE X1



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 15429808
- Service Connector: 88988804
- Description: 16-Way F Mirco-Pack 64 Series (BU)

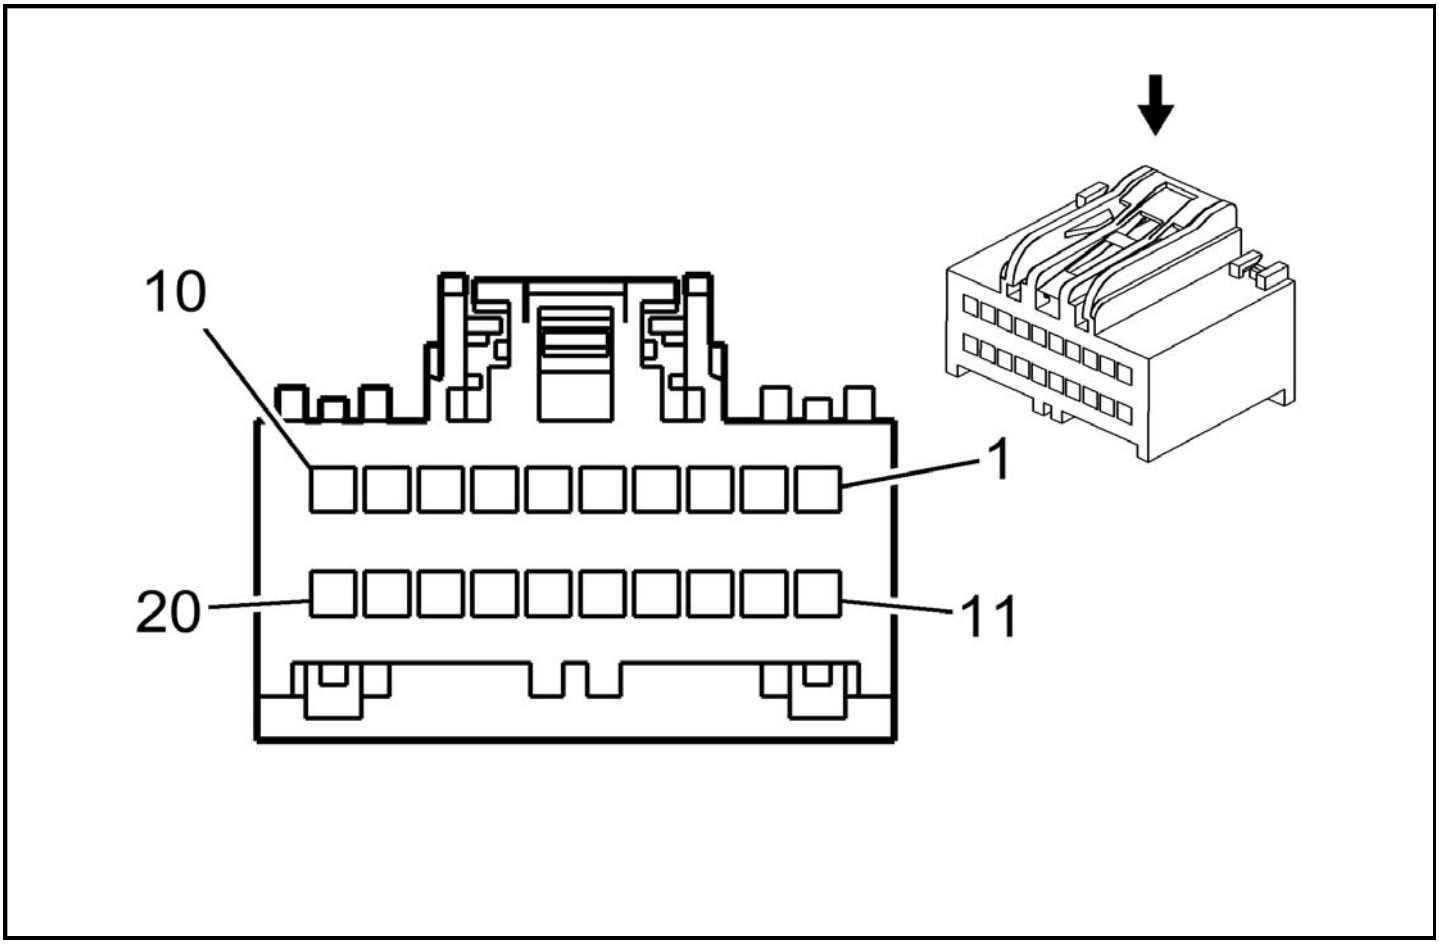
Terminal Part Information

- Terminated Lead: 13575535
- Release Tool: J-38125-21
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: 15359541/4
- Core/Insulation Crimp: M/M

HVAC Control Module X1

Pin	Wire	Circuit	Function
1	0.35 PU/WH	1382	LED Dimming Supply
2	0.35 PK	1139	Ignition 1 Voltage
3	0.5 BK/WH	1551	Ground
4	0.35 RD/WH	1840	Battery Positive Voltage
5-6	-	-	Not Used
7	0.5 PK	7574	A/C Compressor Solenoid Control
8	0.35 WH	193	Rear Defog Relay Control
9	0.35 L-GN/BK	735	Ambient Air Temperature Sensor Signal
10	0.5 BK	1450	Ground
11	-	-	Not Used
12	0.35 YE	61	Low Reference
13	0.35 L-GN/WH	5060	Low Speed GMLAN Serial Data
14	0.5 TN	7573	A/C Compressor Solenoid Voltage Supply
15-16	-	-	Not Used

HVAC CONTROL MODULE X2



Connector Part Information

- Harness Type: HVAC
- OEM Connector: 15491304
- Service Connector: 15126710
- Description: 20-Way F USCAR 64 Series (GY)

Terminal Part Information

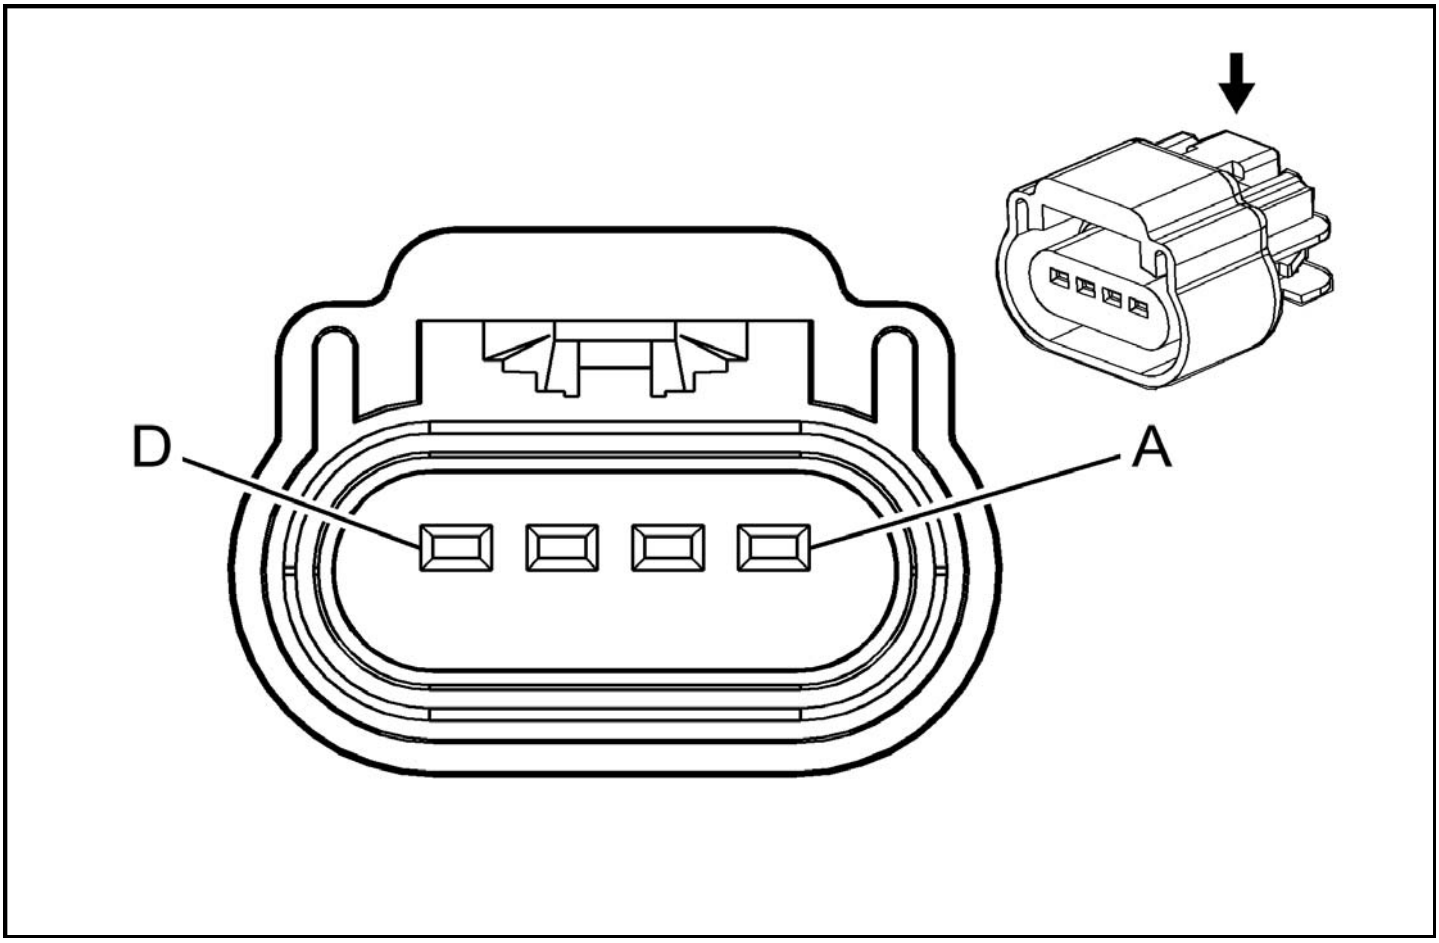
- Terminal/Tray: SAIT-A03T-M064/14
- Core/Insulation Crimp: P/P
- Release Tool/Test Probe: J-38125-215A/J-35616-64B (L-BU)

HVAC Control Module X2

Pin	Wire	Circuit	Function
1-3	-	-	Not Used
4	0.35 GY/BK	754	Blower Motor Speed Control
5	0.35 L-GN	2275	Mode Door Control A
6	0.35 YE	1791	Left Air Temperature Door Control A
7	0.35 PK/WH	1648	Recirculation Door Control A
8	0.35 D-BU	1646	Air Temperature Door Control A

Pin	Wire	Circuit	Function
9-13	-	-	Not Used
14	0.35 WH	2622	Front Frost Sensor Control
15	0.35 TN	2273	Mode Door Control B
16	0.35 D-BU/WH	1199	Left Air Temperature Door Control B
17	0.35 L-GN/BK	1647	Recirculation Door Control B
18	0.35 WH/BK	1236	Air Temperature Door Control B
19	0.35 D-GN	6101	Low Reference
20	-	-	Not Used

IGNITION COIL 1



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15466325
- Service Connector: 13585847
- Description: 4-Way F GT 150 Series, Sealed (BK)

Terminal Part Information

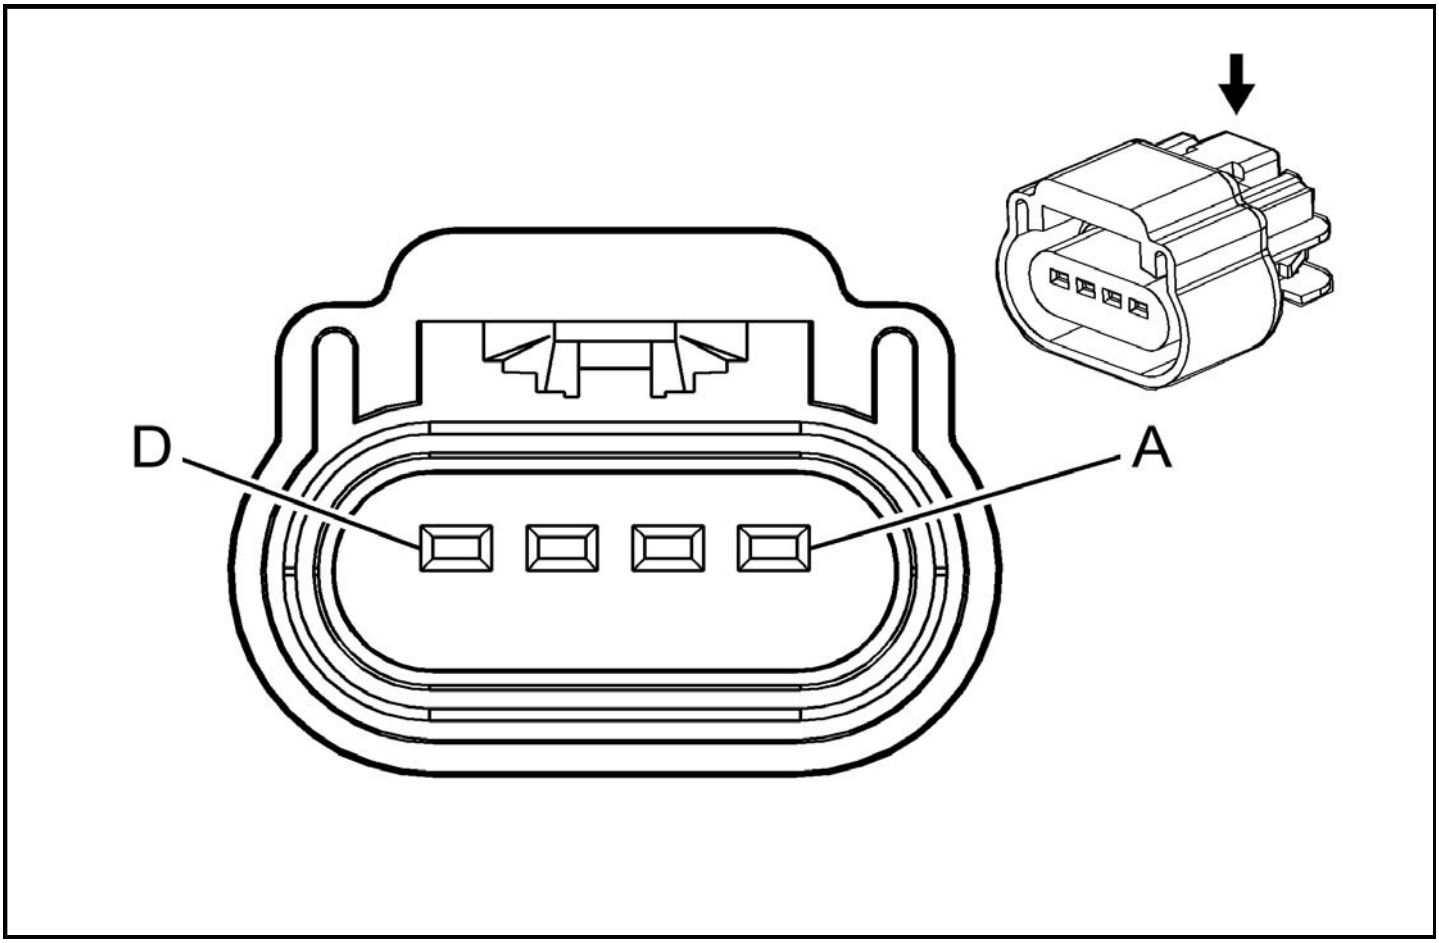
- Terminated Lead: Pins A, D- 13327113

- Terminated Lead: Pins B, C- 13578912
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: Pins A, D- 2/1
- Core/Insulation Crimp: Pins B, C- E/1

Ignition Coil 1

Pin	Wire	Circuit	Function
A	1 BK/WH	51	Ground
B	0.5 BN	2129	Low Reference
C	0.5 PU	2121	IC 1 Control
D	1 PK/BK	5291	Ignition Voltage

IGNITION COIL 2



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15466325
- Service Connector: 13585847

- Description: 4-Way F GT 150 Series, Sealed (BK)

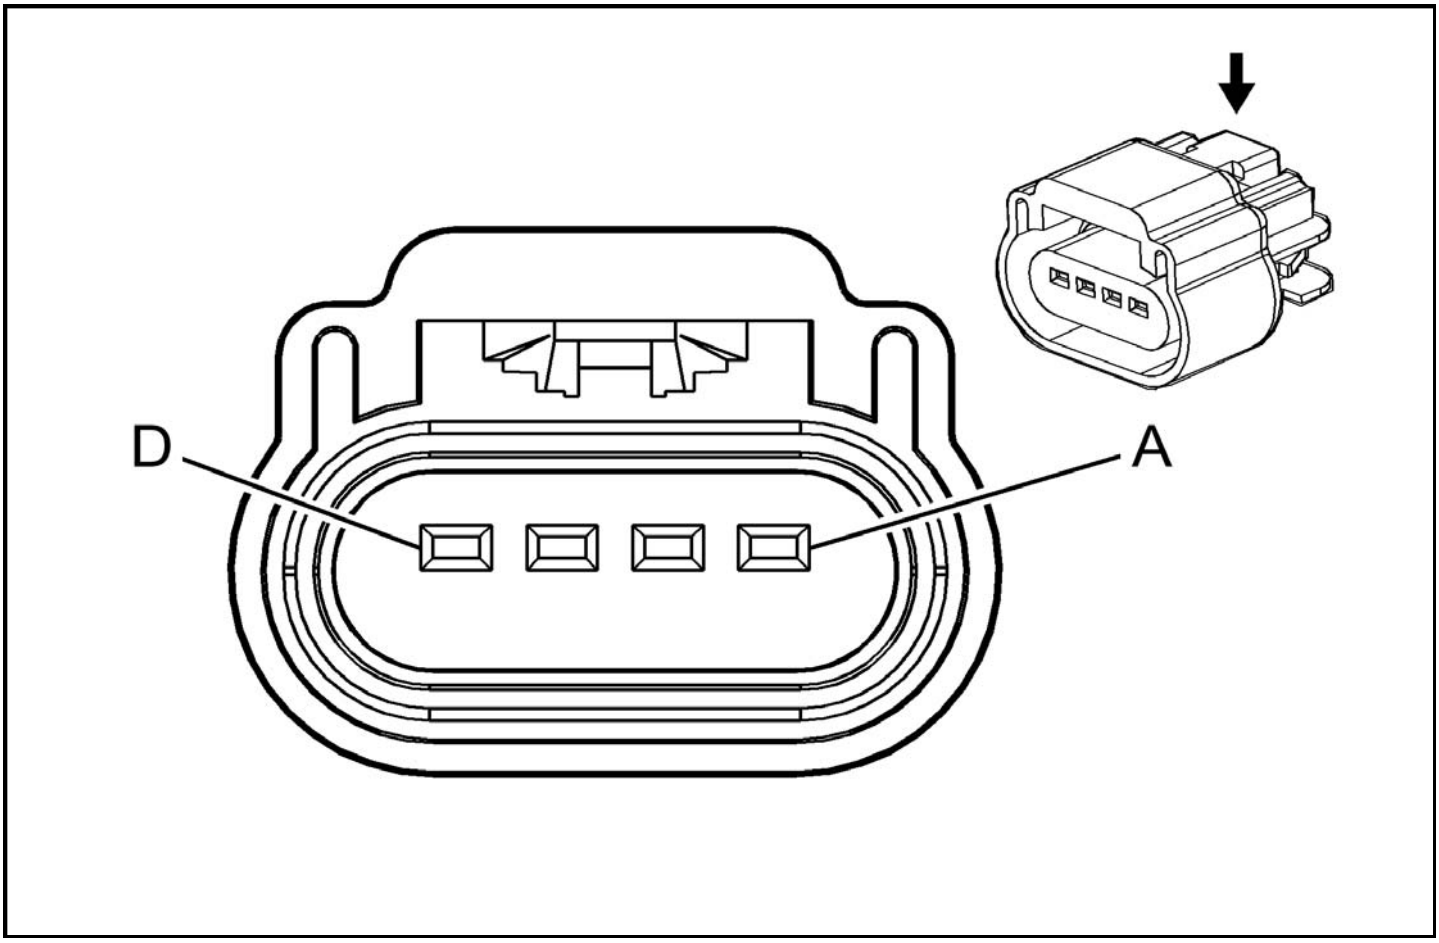
Terminal Part Information

- Terminated Lead: Pins A, D- 13327113
- Terminated Lead: Pins B, C- 13578912
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: Pins A, D- 2/1
- Core/Insulation Crimp: Pins B, C- E/1

Ignition Coil 2

Pin	Wire	Circuit	Function
A	1 BK/WH	51	Ground
B	0.5 BN/WH	2130	Low Reference
C	0.5 OG/WH	2122	IC 2 Control
D	1 PK/BK	5292	Ignition Voltage

IGNITION COIL 3



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15466325
- Service Connector: 13585847
- Description: 4-Way F GT 150 Series, Sealed (BK)

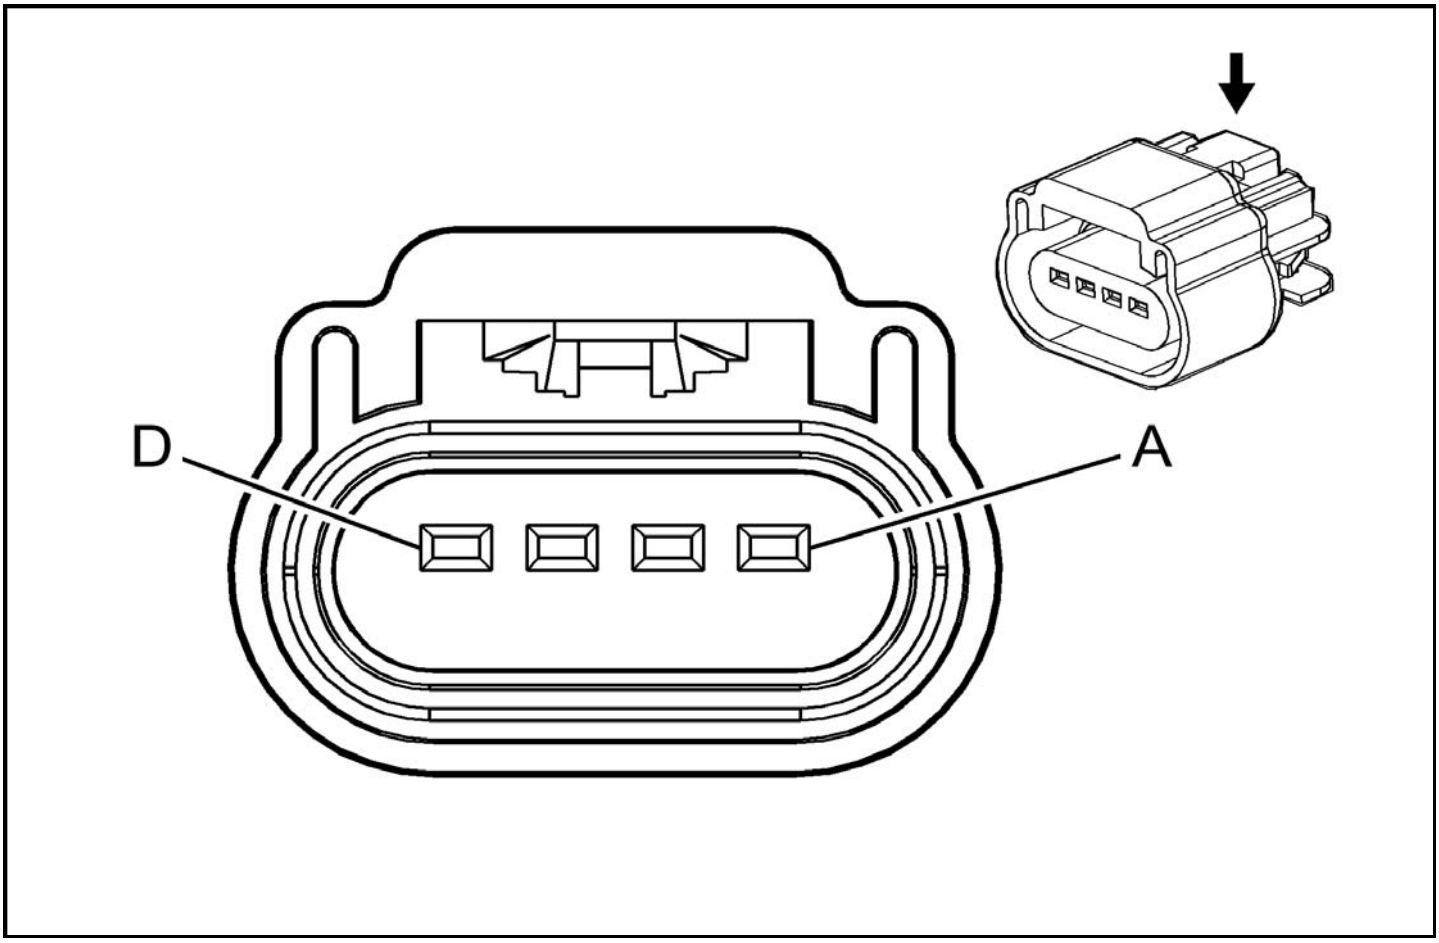
Terminal Part Information

- Terminated Lead: Pins A, D- 13327113
- Terminated Lead: Pins B, C- 13578912
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: Pins A, D- 2/1
- Core/Insulation Crimp: Pins B, C- E/1

Ignition Coil 3

Pin	Wire	Circuit	Function
A	1 BK/WH	51	Ground
B	0.5 BN	2129	Low Reference
C	0.5 L-BU	2123	IC 3 Control
D	1 PK/BK	5291	Ignition Voltage

IGNITION COIL 4



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15466325
- Service Connector: 13585847
- Description: 4-Way F GT 150 Series, Sealed (BK)

Terminal Part Information

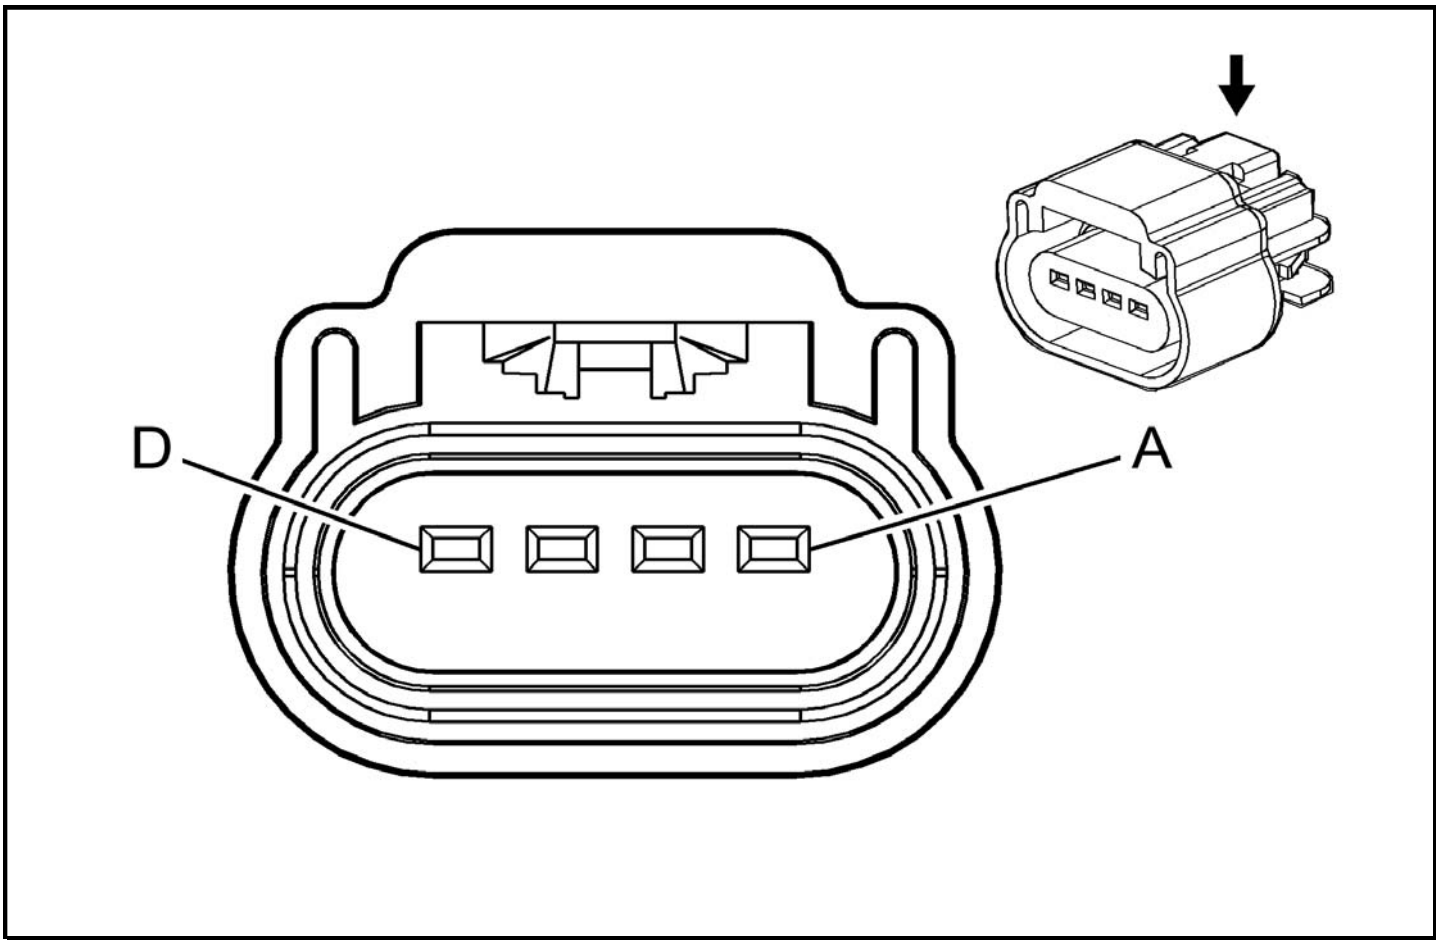
- Terminated Lead: Pins A, D- 13327113
- Terminated Lead: Pins B, C- 13578912
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: Pins A, D- 2/1
- Core/Insulation Crimp: Pins B, C- E/1

Ignition Coil 4

Pin	Wire	Circuit	Function
A	1 BK/WH	51	Ground
B	0.5 BN/WH	2130	Low Reference

Pin	Wire	Circuit	Function
C	0.5 D-GN/WH	2124	IC 4 Control
D	1 PK/BK	5292	Ignition Voltage

IGNITION COIL 5



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15466325
- Service Connector: 13585847
- Description: 4-Way F GT 150 Series, Sealed (BK)

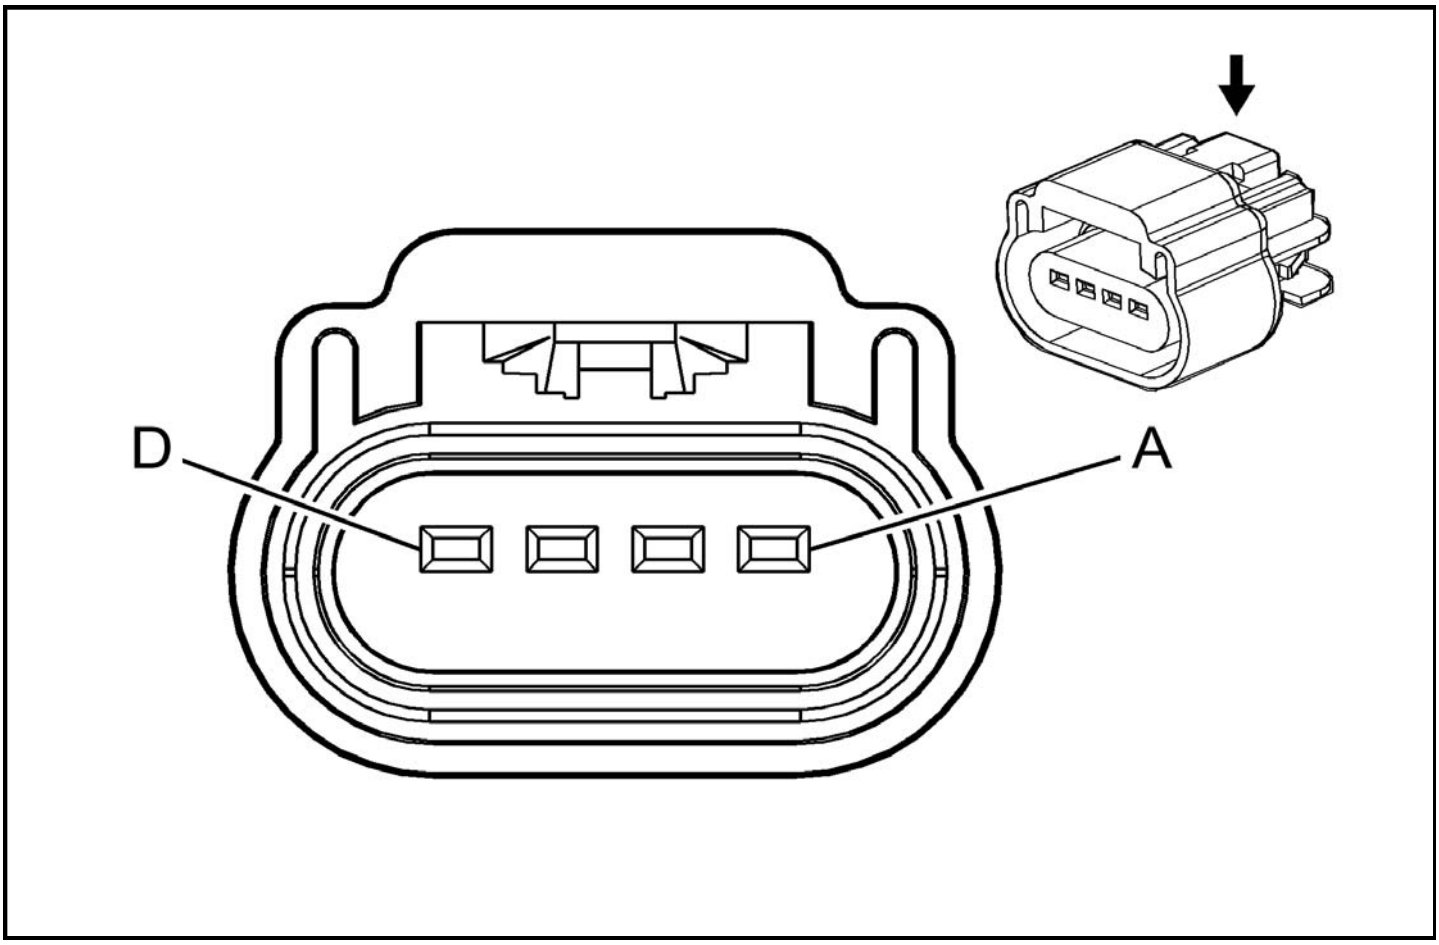
Terminal Part Information

- Terminated Lead: Pins A, D- 13327113
- Terminated Lead: Pins B, C- 13578912
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: Pins A, D- 2/1
- Core/Insulation Crimp: Pins B, C- E/1

Ignition Coil 5

Pin	Wire	Circuit	Function
A	1 BK/WH	51	Ground
B	0.5 BN	2129	Low Reference
C	0.5 D-GN	2125	IC 5 Control
D	1 PK/BK	5291	Ignition Voltage

IGNITION COIL 6



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15466325
- Service Connector: 13585847
- Description: 4-Way F GT 150 Series, Sealed (BK)

Terminal Part Information

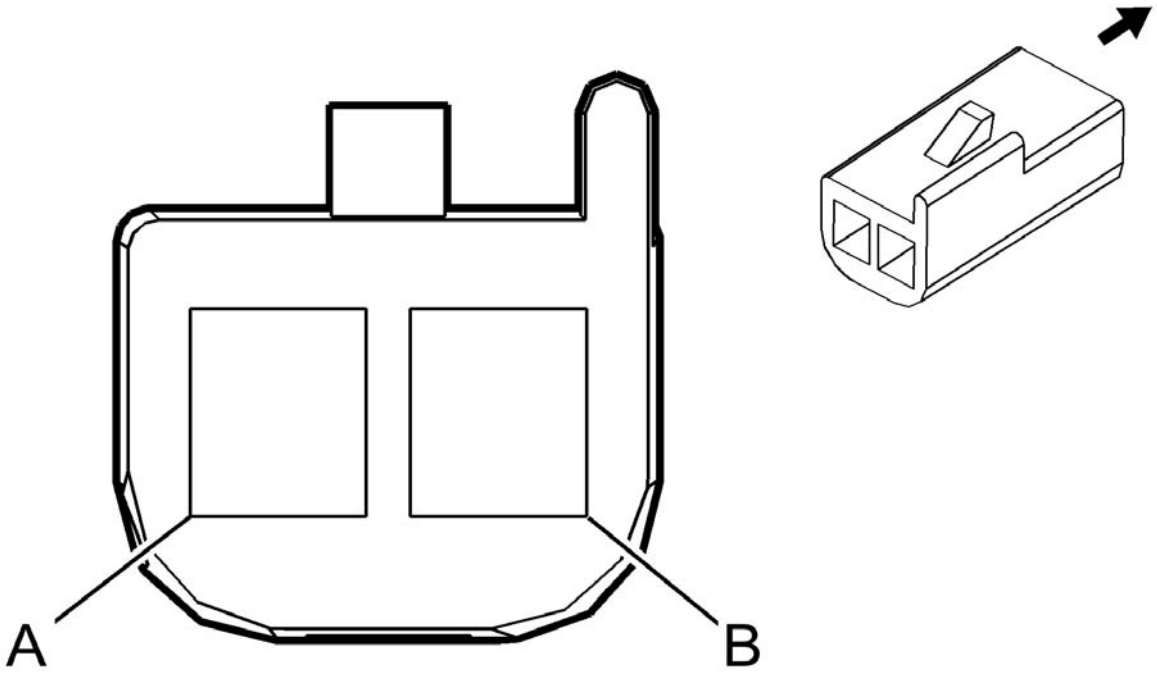
- Terminated Lead: Pins A, D- 13327113
- Terminated Lead: Pins B, C- 13578912
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)

- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: Pins A, D- 2/1
- Core/Insulation Crimp: Pins B, C- E/1

Ignition Coil 6

Pin	Wire	Circuit	Function
A	1 BK/WH	51	Ground
B	0.5 BN/WH	2130	Low Reference
C	0.5 L-BU/WH	2126	IC 6 Control
D	1 PK/BK	5292	Ignition Voltage

IGNITION LOCK CYLINDER CONTROL ACTUATOR (D55)



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 12047662
- Service Connector: 12085535
- Description: 2-Way F Metri-Pack 150 Series (BK)

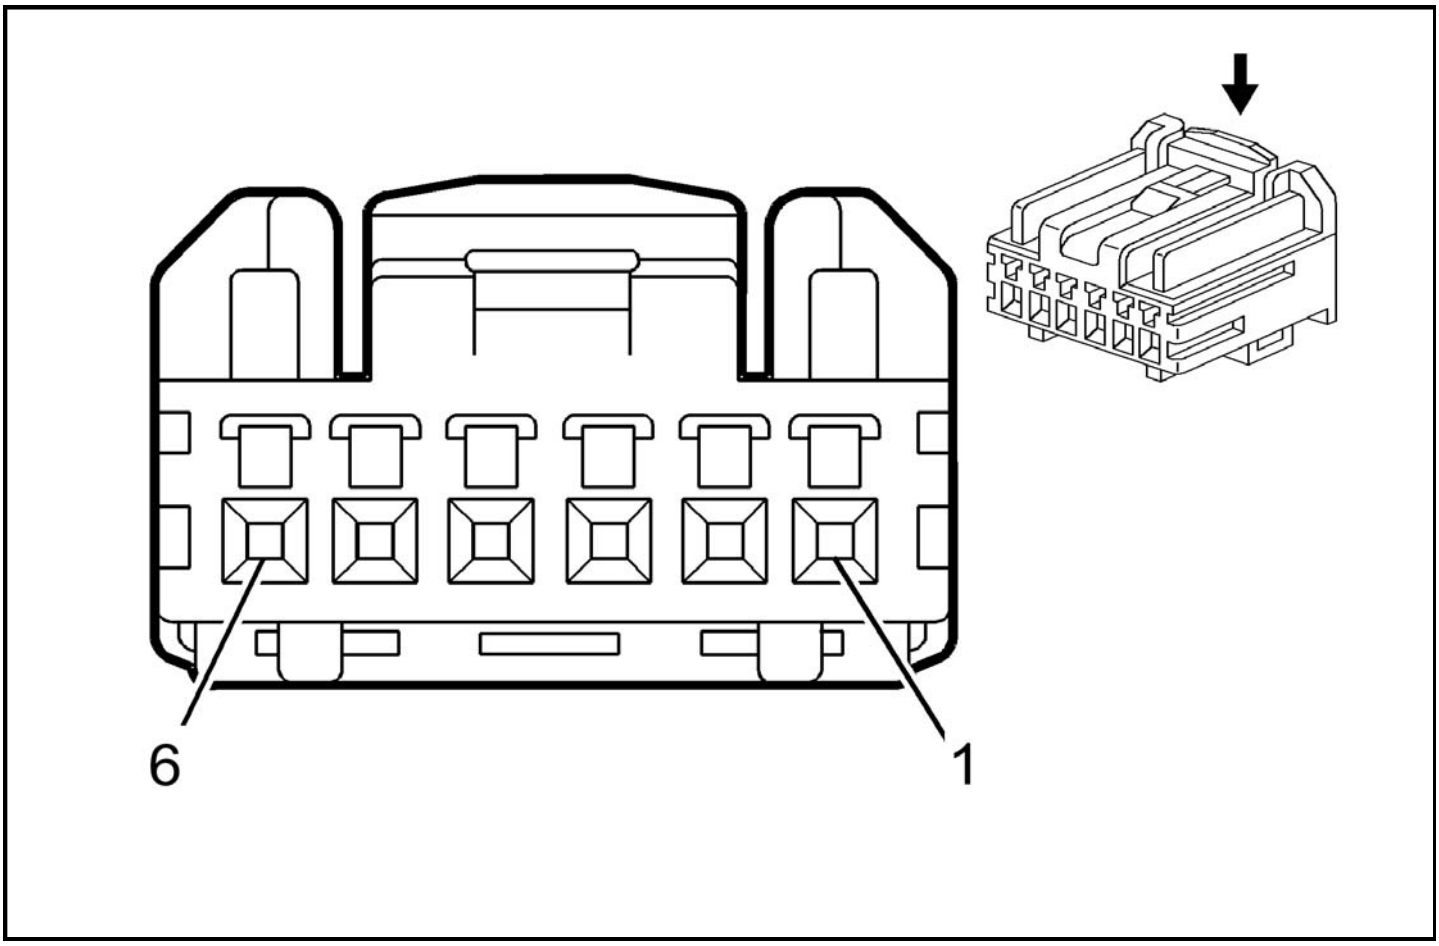
Terminal Part Information

- Terminated Lead: 13575464
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/5
- Core/Insulation Crimp: E/C

Ignition Lock Cylinder Control Actuator (D55)

Pin	Wire	Circuit	Function
A	0.35 PU/WH	1630	Steering Column Key Cylinder Lock Solenoid Control
B	0.35 BK	1450	Ground

IGNITION SWITCH



Connector Part Information

- Harness Type: Steering Column
- OEM Connector: 15484551
- Service Connector: 19153174

- Description: 6-Way F HCM Series (BK)

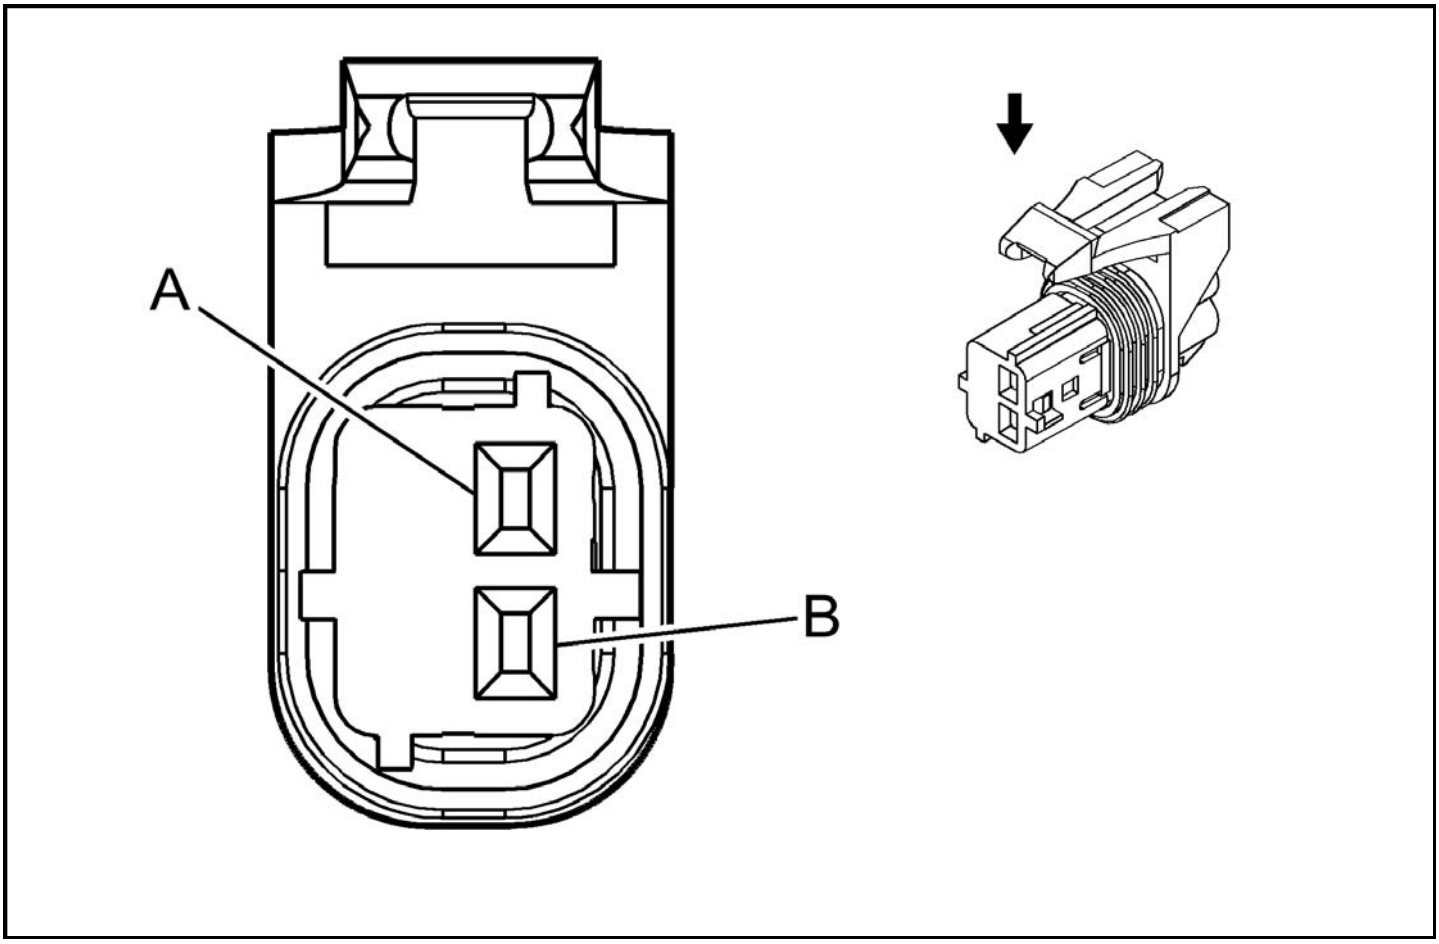
Terminal Part Information

- Terminated Lead: 13575868
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: SHCM-A03T-P025/20
- Core/Insulation Crimp: J/J

Ignition Switch

Pin	Wire	Circuit	Function
1	0.35 PK	3	Ignition 1 Voltage
2	0.35 RD/WH	1040	Battery Positive Voltage
3	0.35 BN	4	Accessory Voltage
4	-	-	Not Used
5	0.35 WH	1390	Off/Run/Crank Voltage
6	0.35 WH/BK	1073	5-Volt Reference

INFLATABLE RESTRAINT FRONT END SENSOR - LEFT



Connector Part Information

- Harness Type: Forward Lamp
- OEM Connector: 15356723
- Service Connector: 15306439
- Description: 2-Way F GT 150 Series, Sealed (YE)

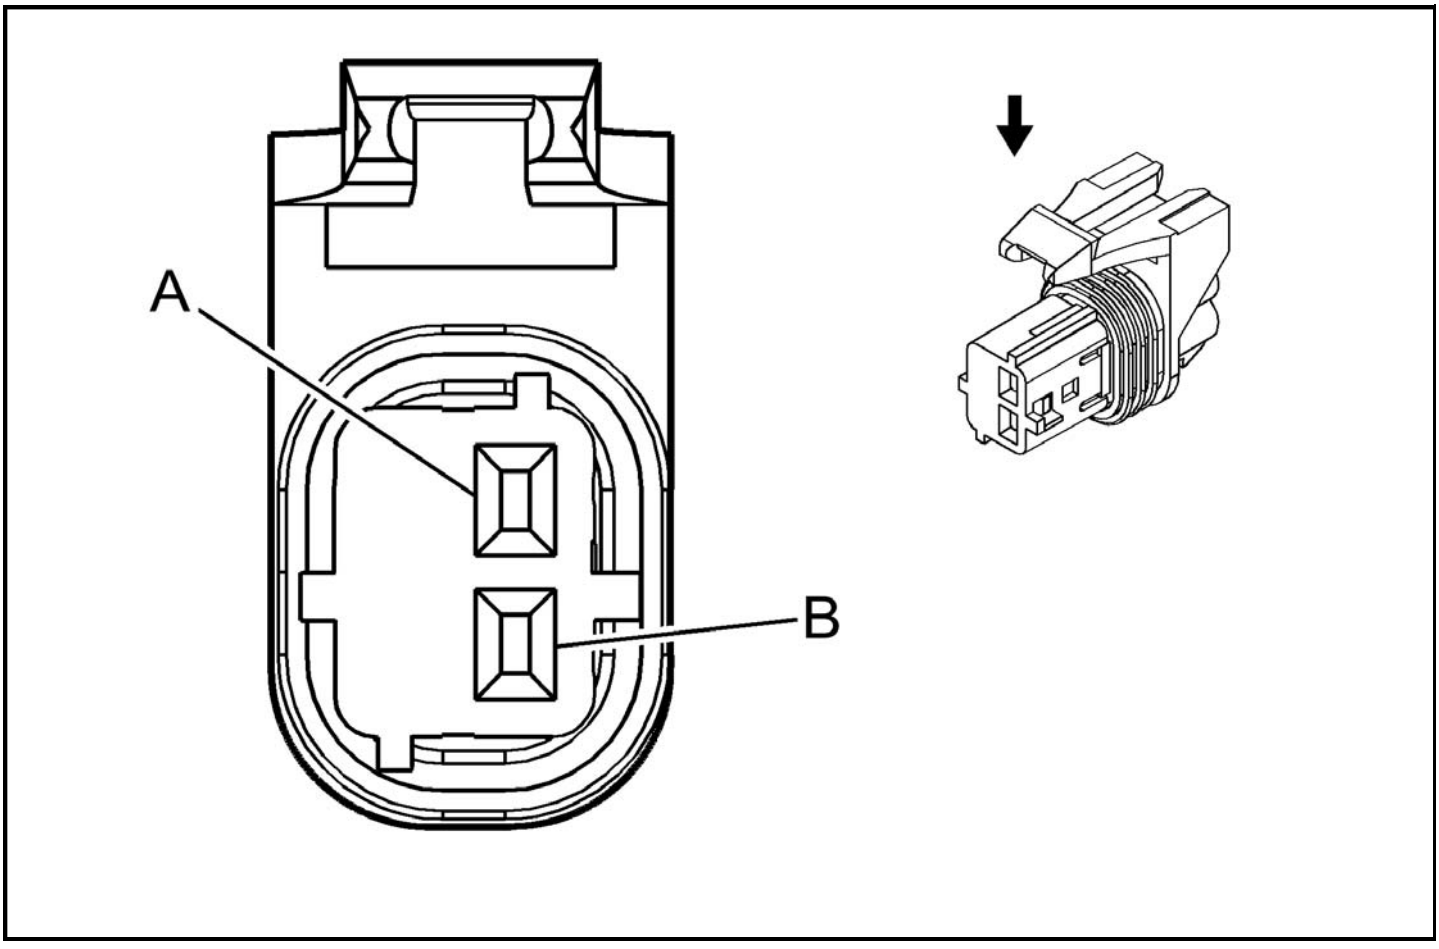
Terminal Part Information

- Terminated Lead: 13327113
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: 2/1

Inflatable Restraint Front End Sensor - Left

Pin	Wire	Circuit	Function
A	0.8 TN/OG	5045	Discriminating Sensor- Left- Low Reference
B	0.8 YE	354	Discriminating Sensor- Left- Signal

INFLATABLE RESTRAINT FRONT END SENSOR - RIGHT



Connector Part Information

- Harness Type: Forward Lamp
- OEM Connector: 15356723
- Service Connector: 15306439
- Description: 2-Way F GT 150 Series, Sealed (YE)

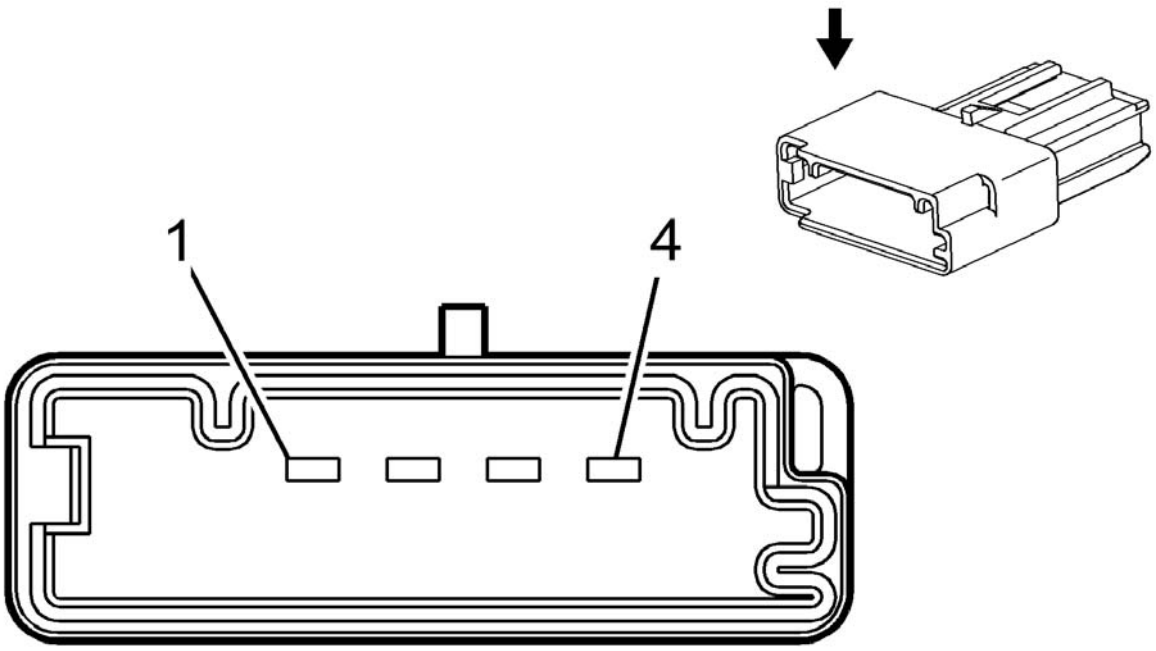
Terminal Part Information

- Terminated Lead: 13327113
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: 2/1

Inflatable Restraint Front End Sensor - Right

Pin	Wire	Circuit	Function
A	0.8 GY	5600	Discriminating Sensor- Right- Low Reference
B	0.8 D-GN	1409	Discriminating Sensor- Right- Signal

INFLATABLE RESTRAINT FRONT PASSENGER PRESENCE SYSTEM (PPS) MODULE



Connector Part Information

- Harness Type: Right Front Seat
- OEM Connector: 13640937
- Service Connector: Service by Harness - See Part Catalog
- Description: 4-Way M Low Profile 1.5 Series (BK)

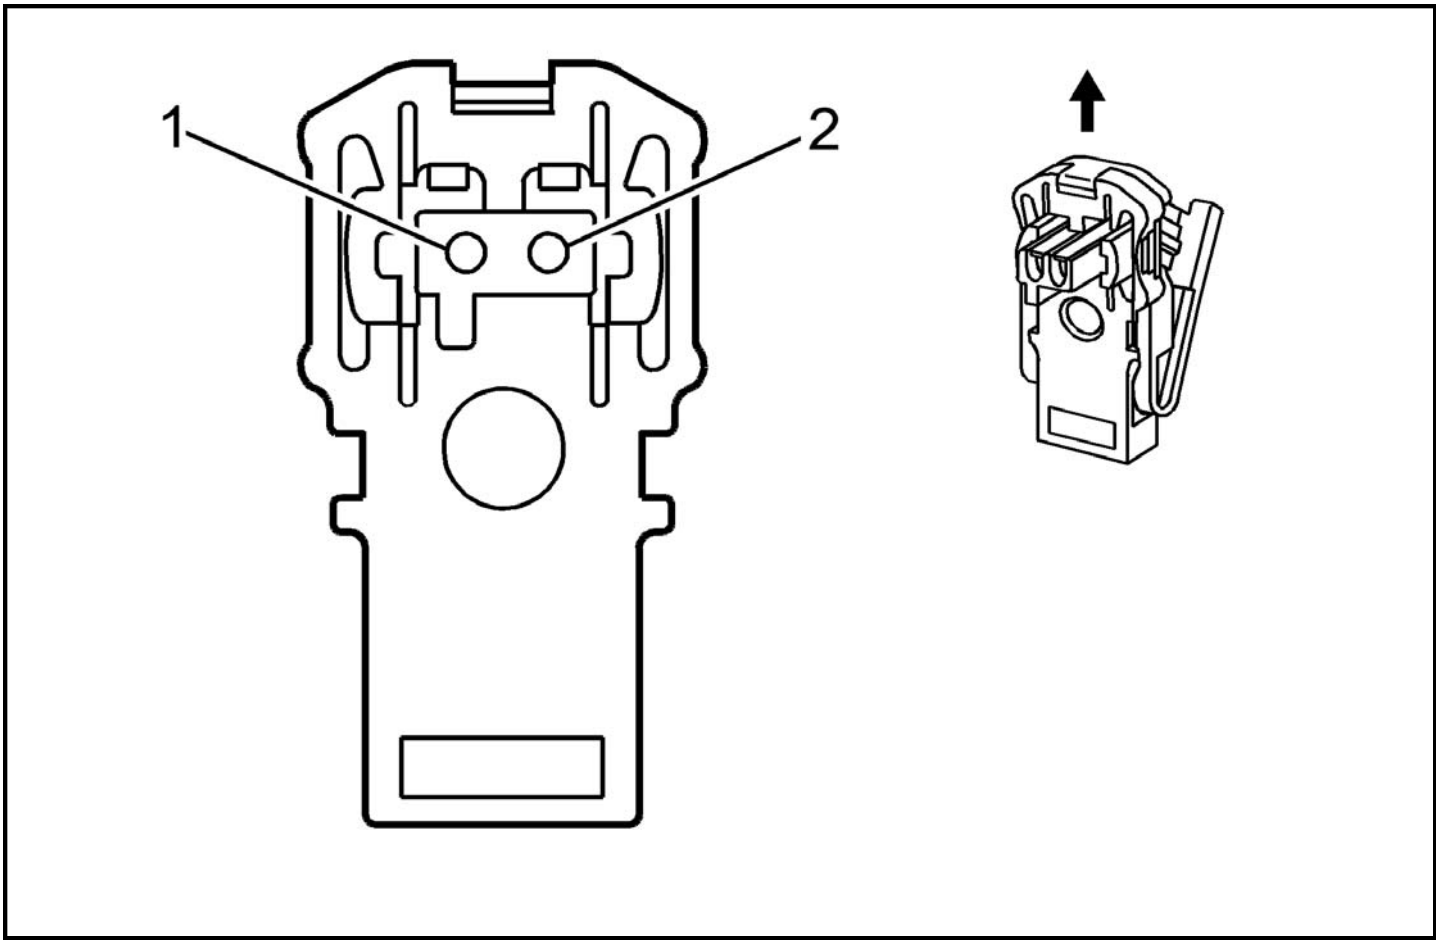
Terminal Part Information

- Terminated Lead: 13575502
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-3 (GY)
- Terminal/Tray: 15304702/19
- Core/Insulation Crimp: E/C

Inflatable Restraint Front Passenger Presence System (PPS) Module

Pin	Wire	Circuit	Function
1	0.35 D-GN	5060	Low Speed GMLAN Serial Data
2	-	-	Not Used
3	0.35 RD/WH	1340	Battery Positive Voltage
4	0.35 BK/WH	1751	Ground

INFLATABLE RESTRAINT I/P MODULE X1



Connector Part Information

- Harness Type: Inflatable Restraint Jumper
- OEM Connector: 54561236
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F AMP (WH with YE Lock)

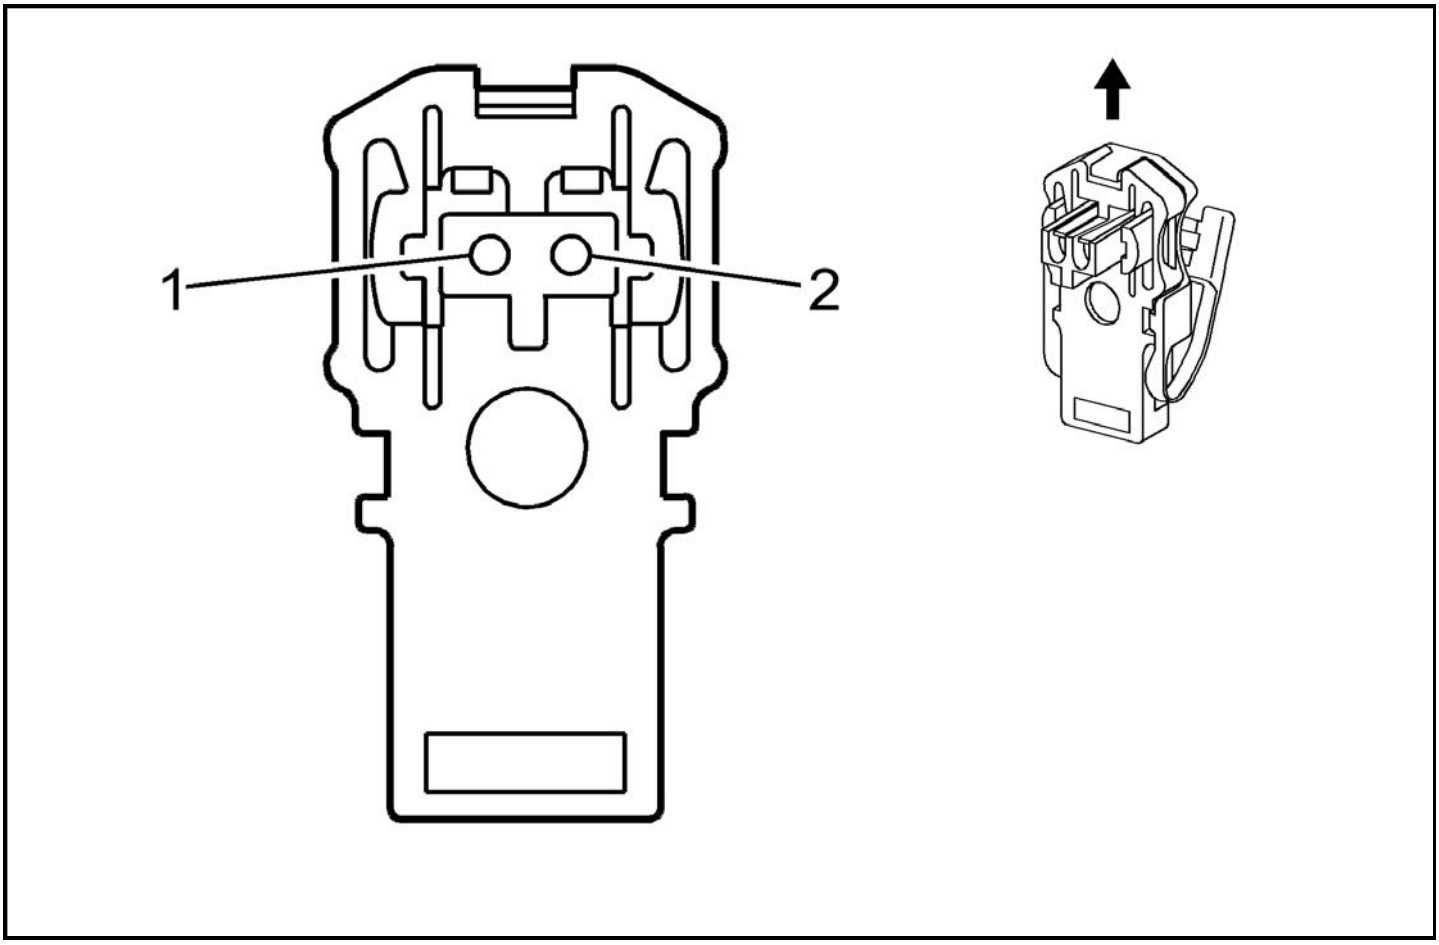
Terminal Part Information

- Terminal/Tray: Service with Pigtail
- Core/Insulation Crimp: Not Available
- Release Tool/Test Probe: Not Available

Inflatable Restraint I/P Module X1

Pin	Wire	Circuit	Function
1	0.35 YE	3025	I/P Module- Stage 1- High Control
2	0.35 OG	3024	I/P Module- Stage 1- Low Control

INFLATABLE RESTRAINT I/P MODULE X2



Connector Part Information

- Harness Type: Inflatable Restraint Jumper
- OEM Connector: 54560222
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F AMP (PK with YE Lock)

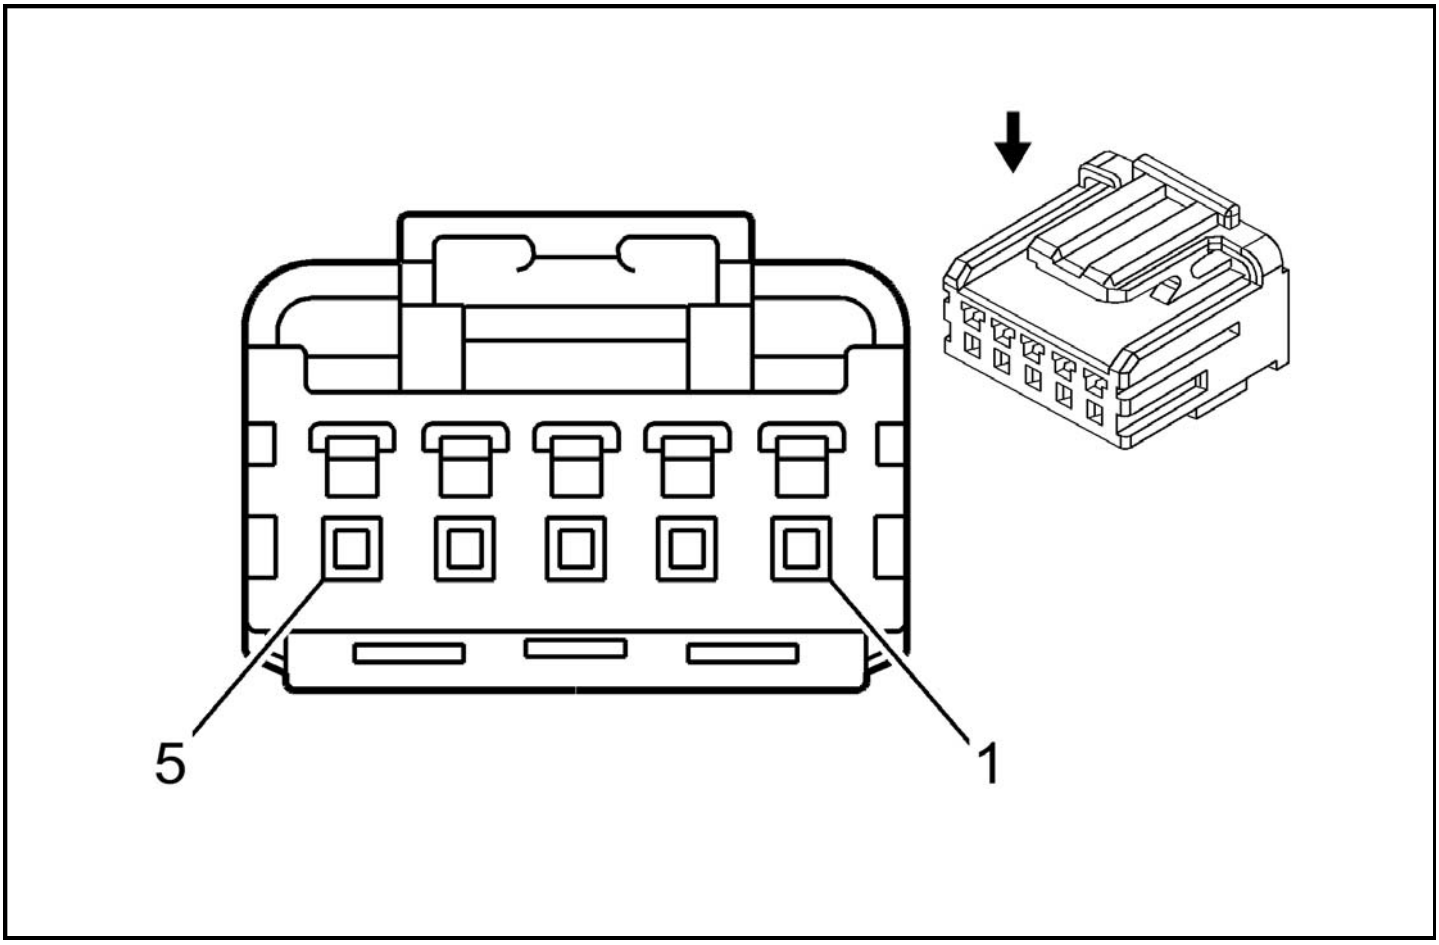
Terminal Part Information

- Terminal/Tray: Service with Pigtail
- Core/Insulation Crimp: Not Available
- Release Tool/Test Probe: Not Available

Inflatable Restraint I/P Module X2

Pin	Wire	Circuit	Function
1	0.35 GY	3027	I/P Module- Stage 2- High Control
2	0.35 PU	3026	I/P Module- Stage 2- Low Control

INFLATABLE RESTRAINT I/P MODULE INDICATOR



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 15398877
- Service Connector: 88988112
- Description: 5-Way F HCM Series (NA)

Terminal Part Information

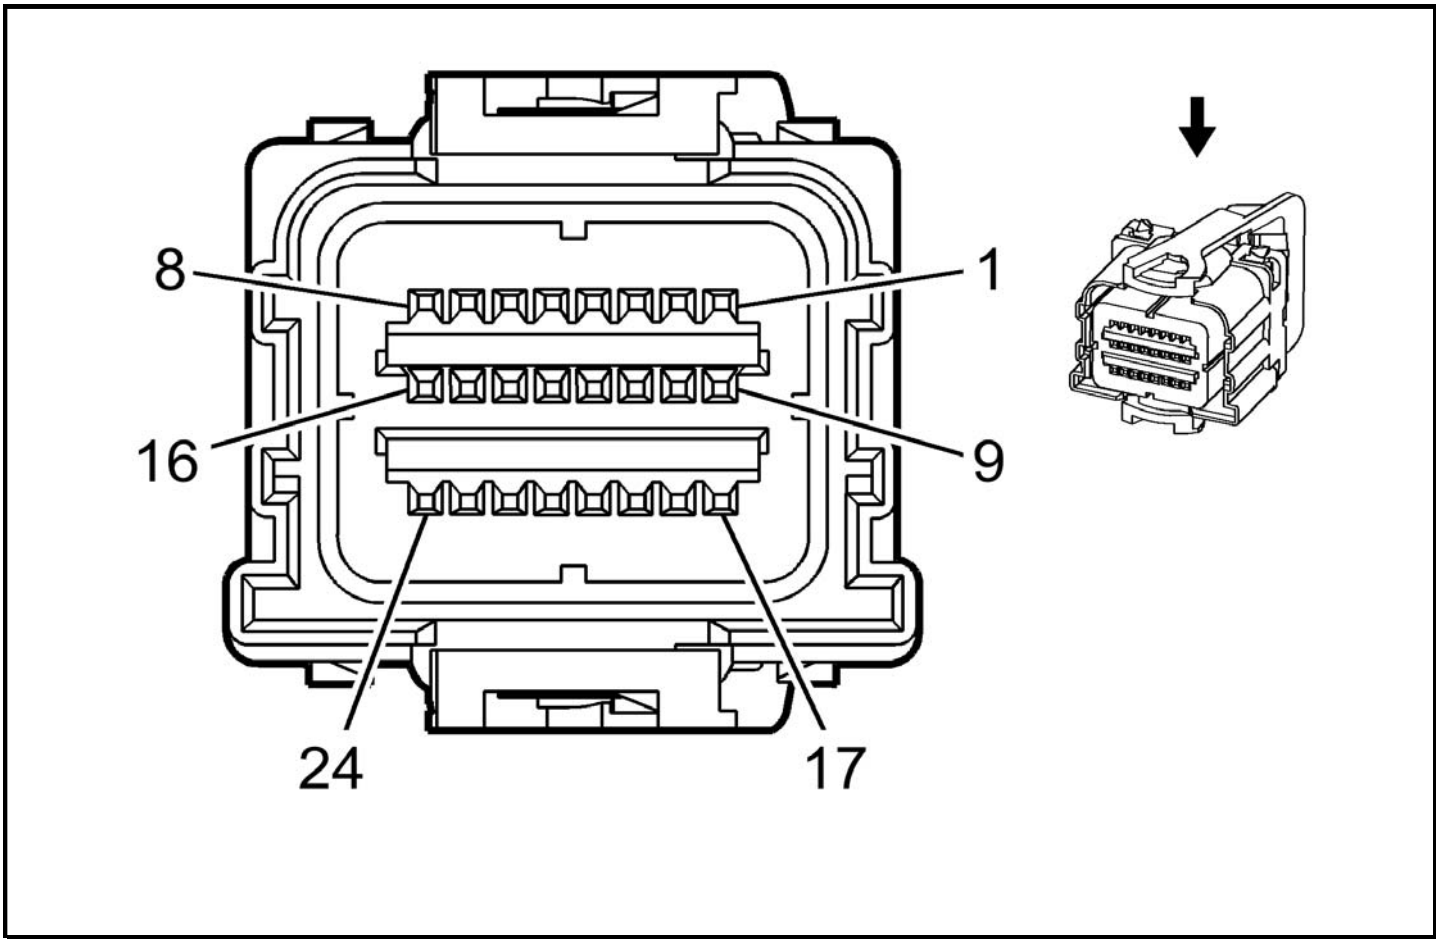
- Terminated Lead: 13575868
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: SHCM-A03T-P025/20
- Core/Insulation Crimp: J/J

Inflatable Restraint I/P Module Indicator

Pin	Wire	Circuit	Function
1	0.35 D-BU	2307	Passenger Air Bag On Indicator Control
2	0.5 BK	1450	Ground
3	0.35 D-GN	2308	Passenger Air Bag Off Indicator Control
4	0.35 PK	1139	Ignition 1 Voltage

Pin	Wire	Circuit	Function
5	0.35 PU	5234	Passenger Seat Belt Indicator Control

INFLATABLE RESTRAINT SENSING AND DIAGNOSTIC MODULE (SDM) X1



Connector Part Information

- Harness Type: Body
- OEM Connector: 13608103
- Service Connector: 13580843
- Description: 24-Way F Kaizen 0.64 Series, Sealed (YE)

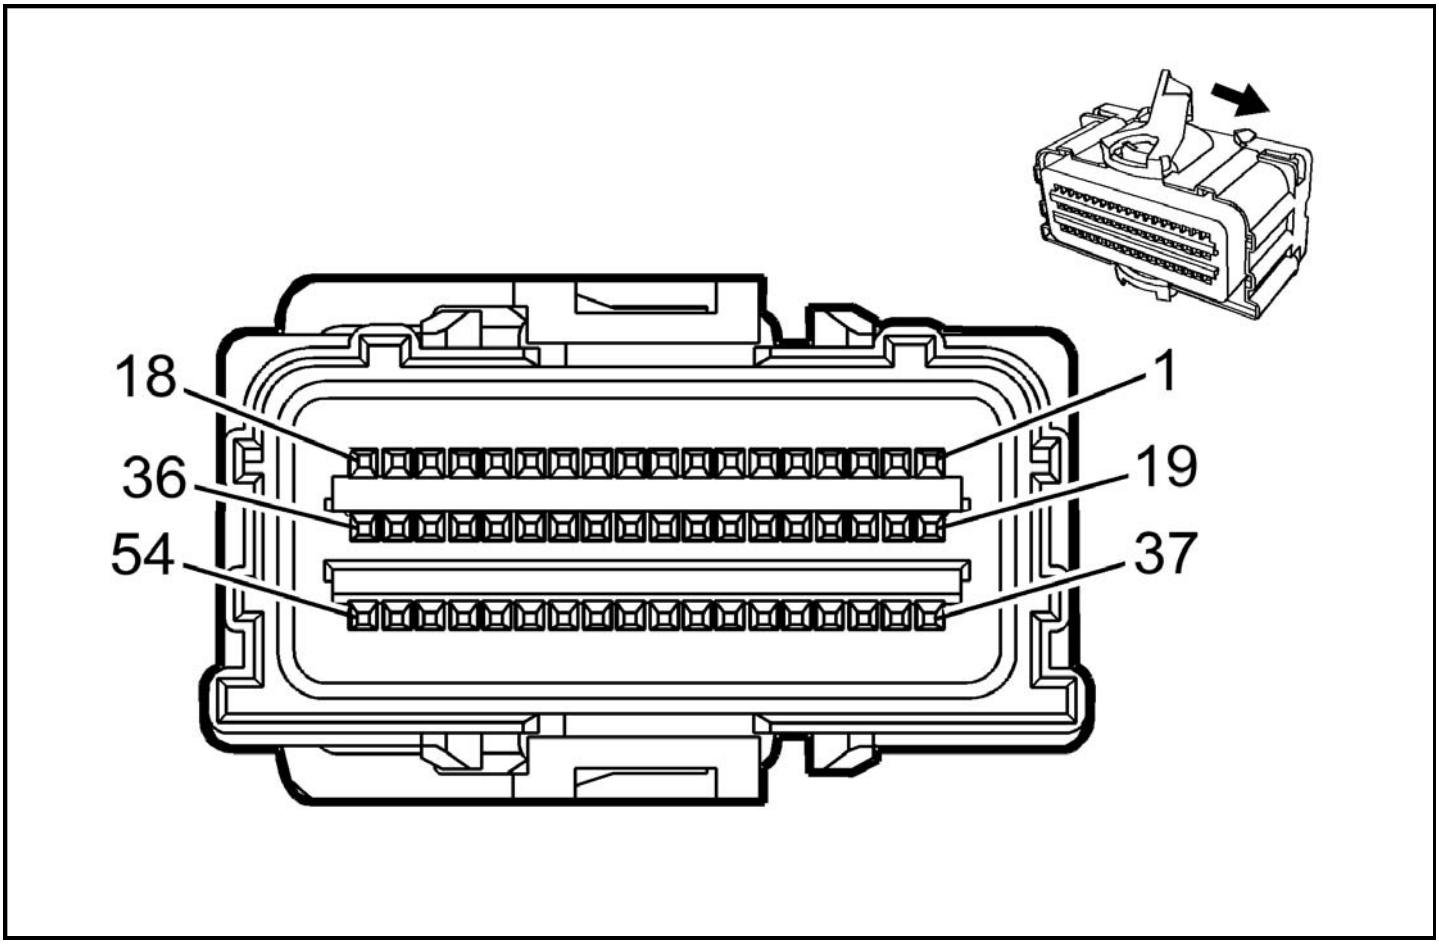
Terminal Part Information

- Terminated Lead: 13575852
- Release Tool: J-38125-215A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: 7116-5231-08//A
- Core/Insulation Crimp: Not Available

Inflatable Restraint Sensing and Diagnostic Module (SDM) X1

Pin	Wire	Circuit	Function
1	0.35 WH	3023	Steering Wheel Module Stage 2 High Control
2	0.35 PK	3022	Steering Wheel Module Stage 2 Low Control
3	0.35 BN	3020	Steering Wheel Module Stage 2 Low Control
4	0.35 TN	3021	Steering Wheel Module Stage 2 High Control
5	0.35 YE	3025	I/P Module Stage 1 High Control
6	0.35 OG	3024	I/P Module Stage 1 Low Control
7	0.35 PU	3026	I/P Module Stage 2 Low Control
8	0.35 GY	3027	I/P Module Stage 2 High Control
9	0.35 RD	1340	Battery Positive Voltage
10-14	-	-	Not Available
15	0.35 D-GN	5060	Low Speed GM LAN Serial Data
16	0.35 D-GN	5060	Low Speed GM LAN Serial Data
17	0.5 PK	1139	Ignition Voltage
18	-	-	Not Available
19	0.5 BK	1751	Ground
20-24	-	-	Not Available

INFLATABLE RESTRAINT SENSING AND DIAGNOSTIC MODULE (SDM) X2



Connector Part Information

- Harness Type: Body
- OEM: 13715984
- Service: 13580845
- Description: 54-Way F 0.64 Series, Sealed (YE)

Terminal Part Information

- Terminated Lead: 13580076
- Release Tool: J-38125-215A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Inflatable Restraint Sensing and Diagnostic Module (SDM) X2

Pin	Wire	Circuit	Function
1-8	-	-	Not Available

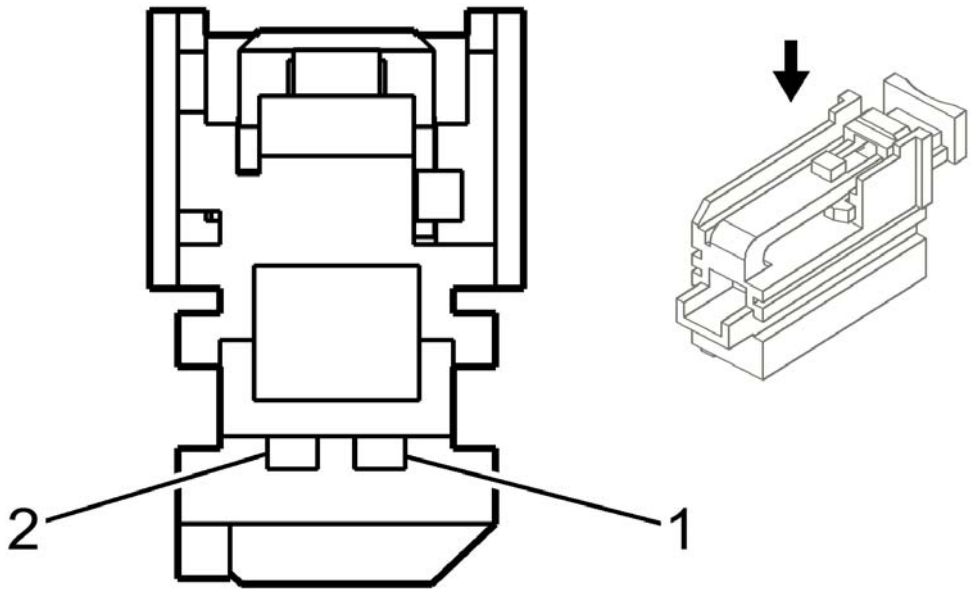
INFLATABLE RESTRAINT SIDE IMPACT MODULE - LEFT



Connector Part Information

- Harness Type: Left Front Seat
- OEM Connector: 13647550
- Service Connector: 19208396
- Description: 2-Way F 0.64 Series Unsealed (YE)

Terminal Part Information

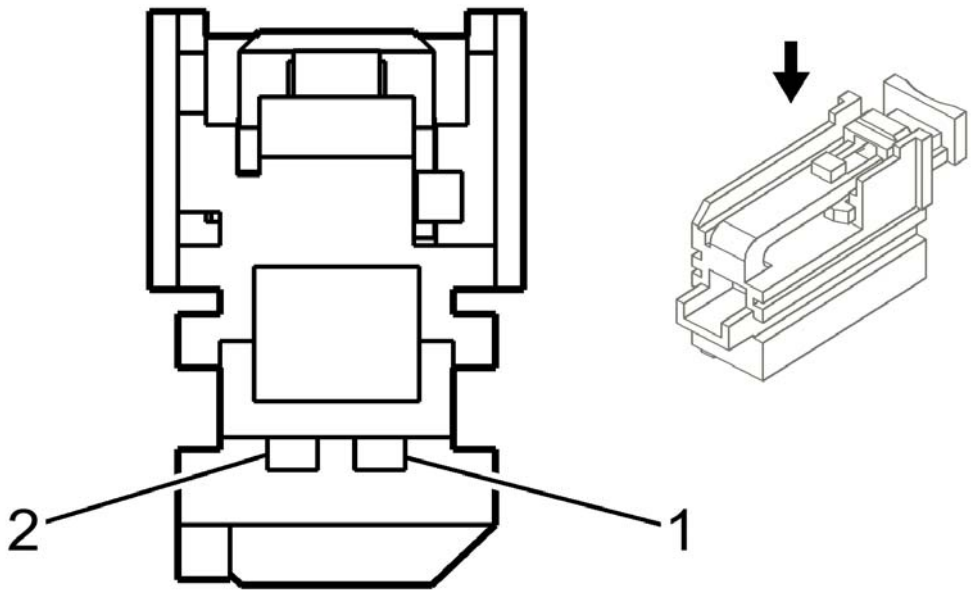
- Terminated Lead: 13575867
- Release Tool: J-38125-215A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: SAIT-A03T-M064/14

- Core/Insulation Crimp: P/P

Inflatable Restraint Side Impact Module - Left

Pin	Wire	Circuit	Function
1	0.5 YE/BK	2138	Left Front Side Impact Module- Low Control
2	0.5 BN	2137	Left Front Side Impact Module- High Control

INFLATABLE RESTRAINT SIDE IMPACT MODULE - RIGHT



Connector Part Information

- Harness Type: Right Front Seat
- OEM Connector: 13647550
- Service Connector: 19208396
- Description: 2-Way F 0.64 Series Unsealed (YE)

Terminal Part Information

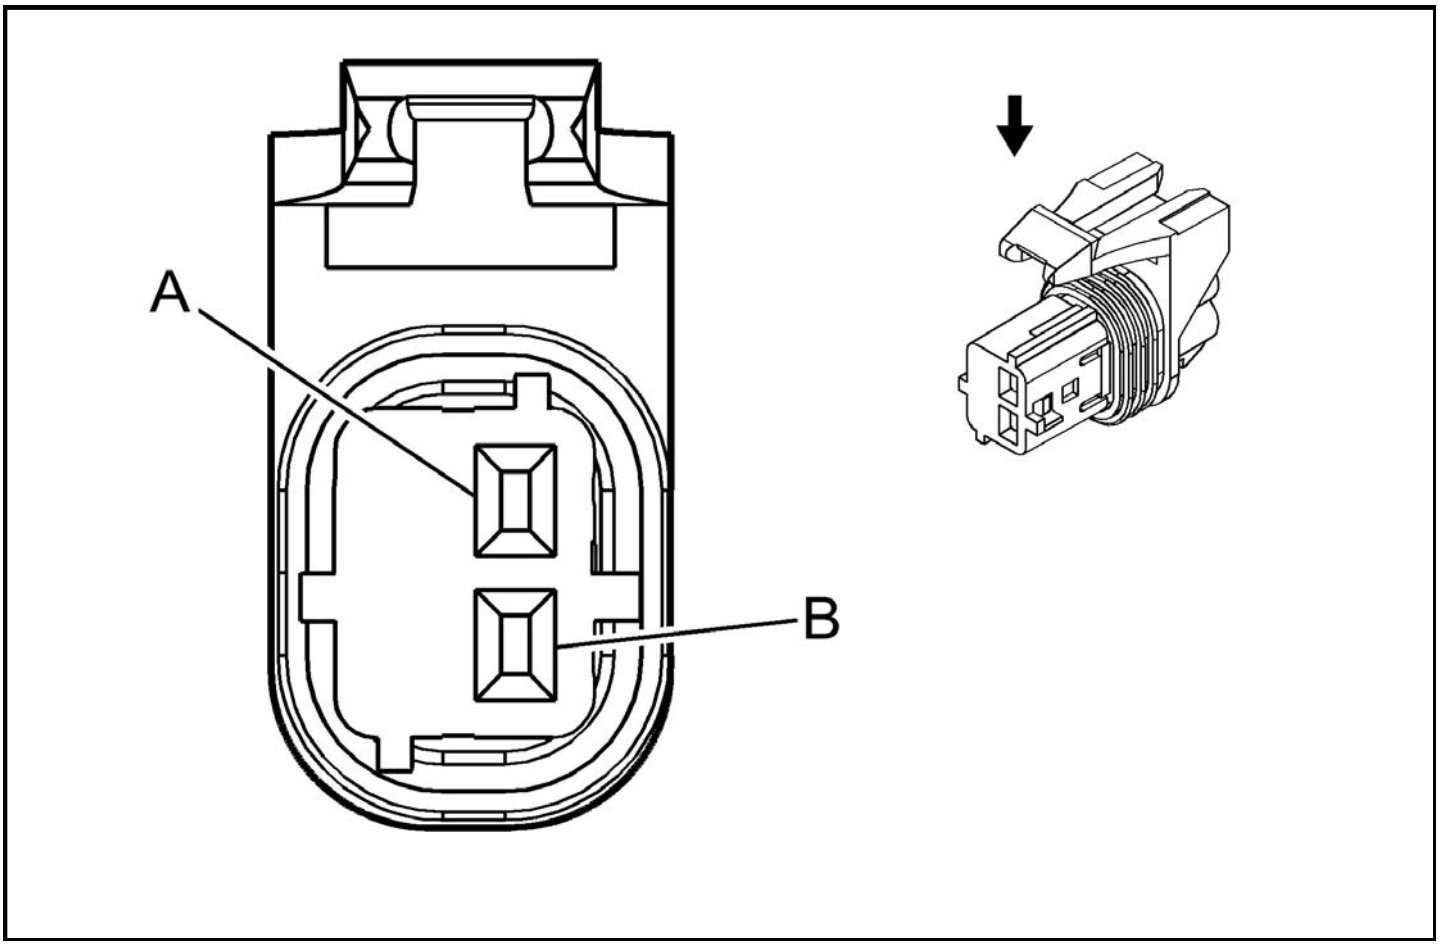
- Terminated Lead: 13575867
- Release Tool: J-38125-215A
- Diagnostic Test Probe: J-35616-64B (L-BU)

- Terminal/Tray: SAIT-A03T-M064/14
- Core/Insulation Crimp: P/P

Inflatable Restraint Side Impact Module - Right

Pin	Wire	Circuit	Function
1	0.5 L-GN	2136	Right Front Side Impact Module- Low Control
2	0.5 TN/WH	2135	Right Front Side Impact Module- High Control

INFLATABLE RESTRAINT SIDE IMPACT SENSOR (SIS) - LEFT



Connector Part Information

- Harness Type: Left Front Door
- OEM Connector: 15356723
- Service Connector: 15306439
- Description: 2-Way F GT 150 Series, Sealed (YE)

Terminal Part Information

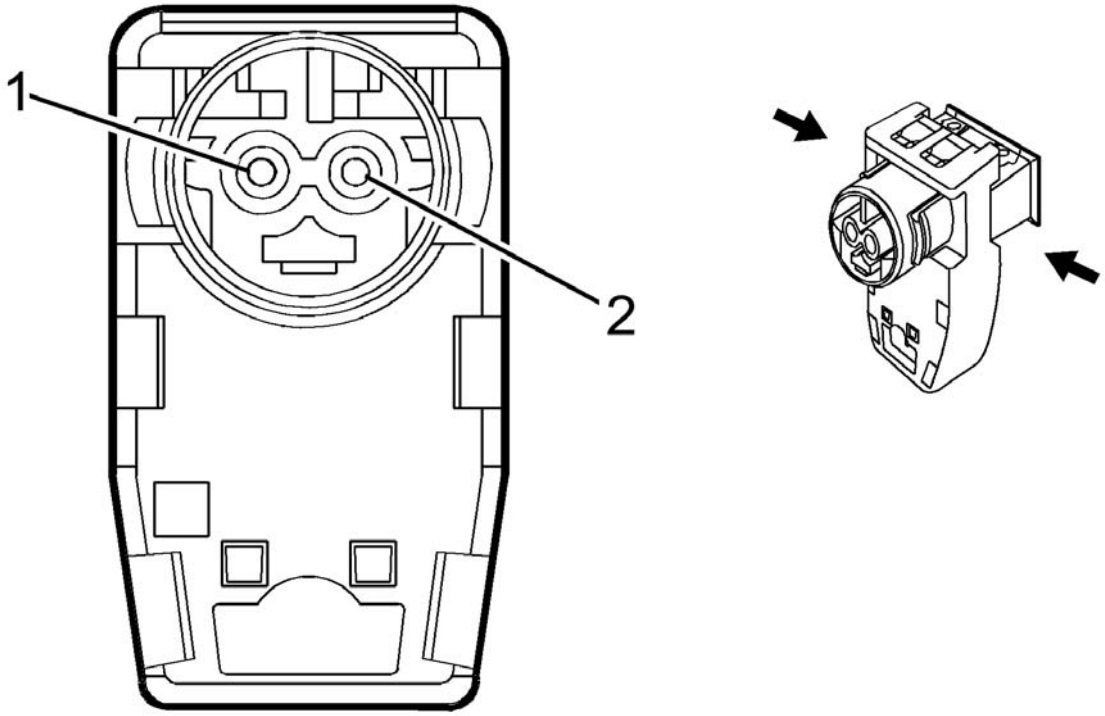
- Terminated Lead: 13327113

- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: 2/1

Inflatable Restraint Side Impact Sensor (SIS) - Left

Pin	Wire	Circuit	Function
A	0.5 WH	2132	Side Impact Sensing Module- Left- Signal
B	0.5 YE	2131	Side Impact Sensing Module- Left- Voltage

INFLATABLE RESTRAINT ROOF RAIL MODULE - LEFT



Connector Part Information

- Harness Type: Body
- OEM Connector: 13849513
- Service Connector: 13584260
- Description: 2-Way F 0.64 GET Series (BK w/ YE cover)

Terminal Part Information

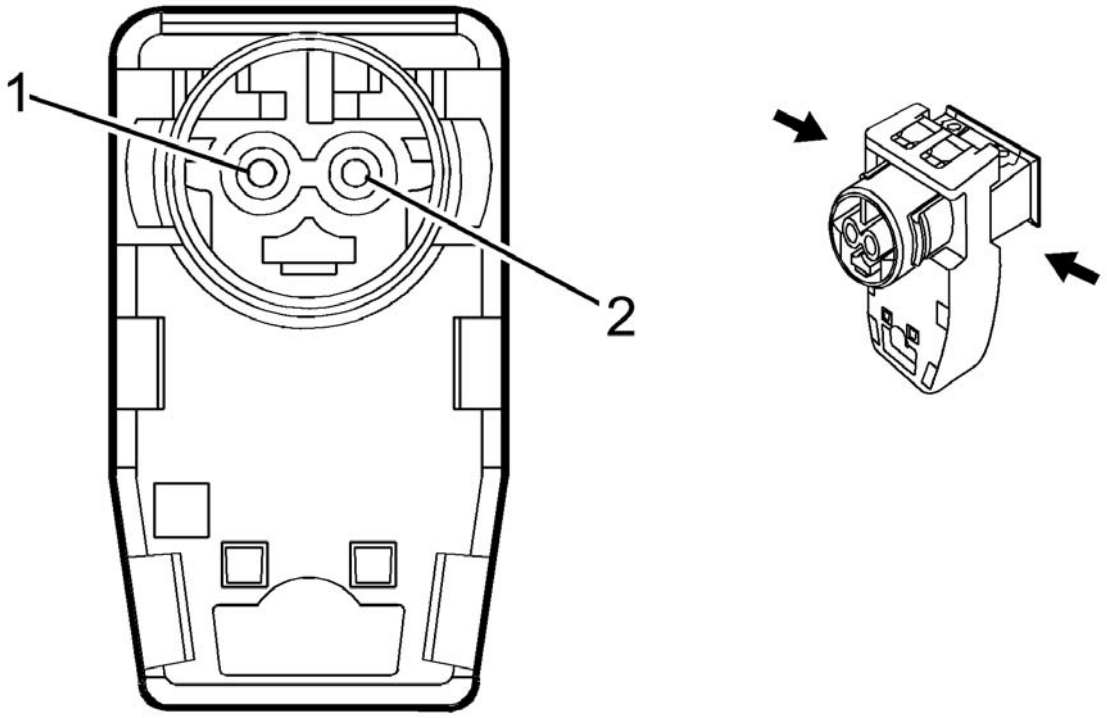
- Terminated Lead: Service by Connector Assembly - 13584260

- Release Tool: Not Available
- Diagnostic Test Probe: Not Available
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Inflatable Restraint Roof Rail Module - Left

Pin	Wire	Circuit	Function
1	0.5 PU/WH	5019	Left Front Head Curtain Module High Control
2	0.5 PK	5020	Left Front Head Curtain Module Low Control

INFLATABLE RESTRAINT ROOF RAIL MODULE - RIGHT



Connector Part Information

- Harness Type: Body
- OEM Connector: 13806185
- Service Connector: 19118723
- Description: 2-Way F 0.64 GET Series (BK w/ YE cover)

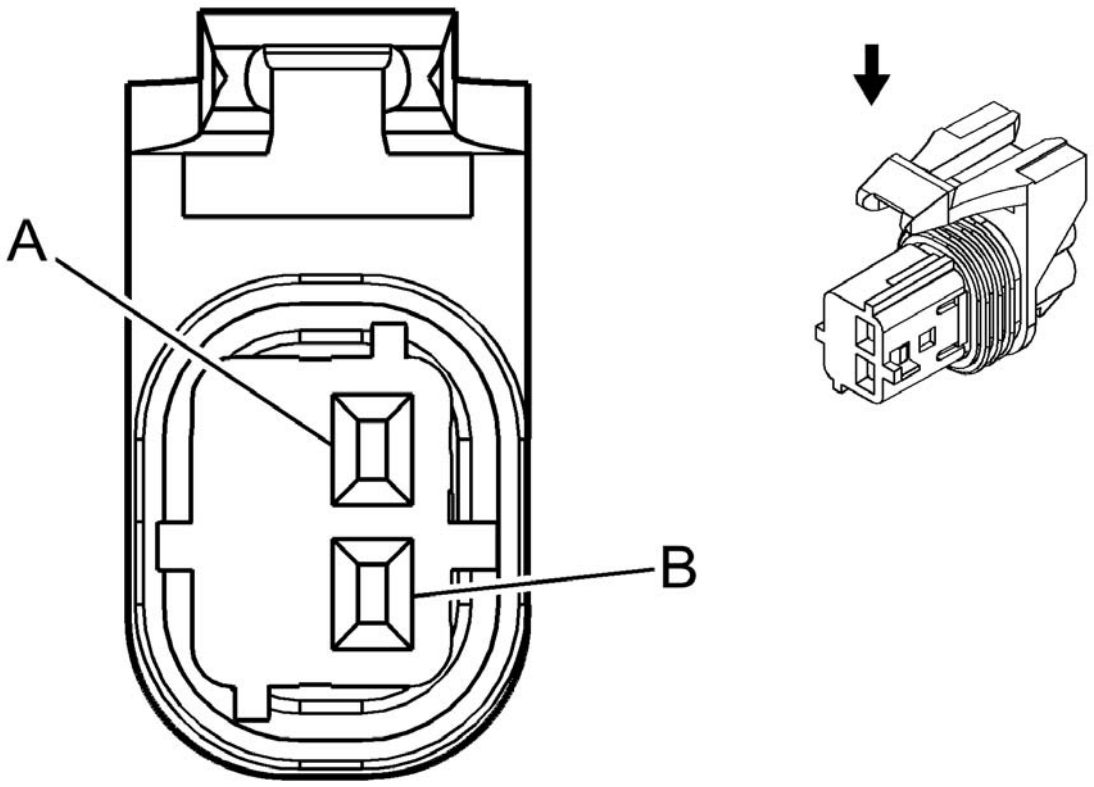
Terminal Part Information

- Terminated Lead: Service by Connector Assembly - 19118723
- Release Tool: Not Available
- Diagnostic Test Probe: Not Available
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Inflatable Restraint Roof Rail Module - Right

Pin	Wire	Circuit	Function
1	0.5 YE/BK	5021	Right Front Head Curtain Module High Control
2	0.5 WH/BK	5022	Right Front Head Curtain Module Low Control

INFLATABLE RESTRAINT SIDE IMPACT SENSOR (SIS) - RIGHT



Connector Part Information

- Harness Type: Right Front Door
- OEM Connector: 15356723

- Service Connector: 15306439
- Description: 2-Way F GT 150 Series, Sealed (YE)

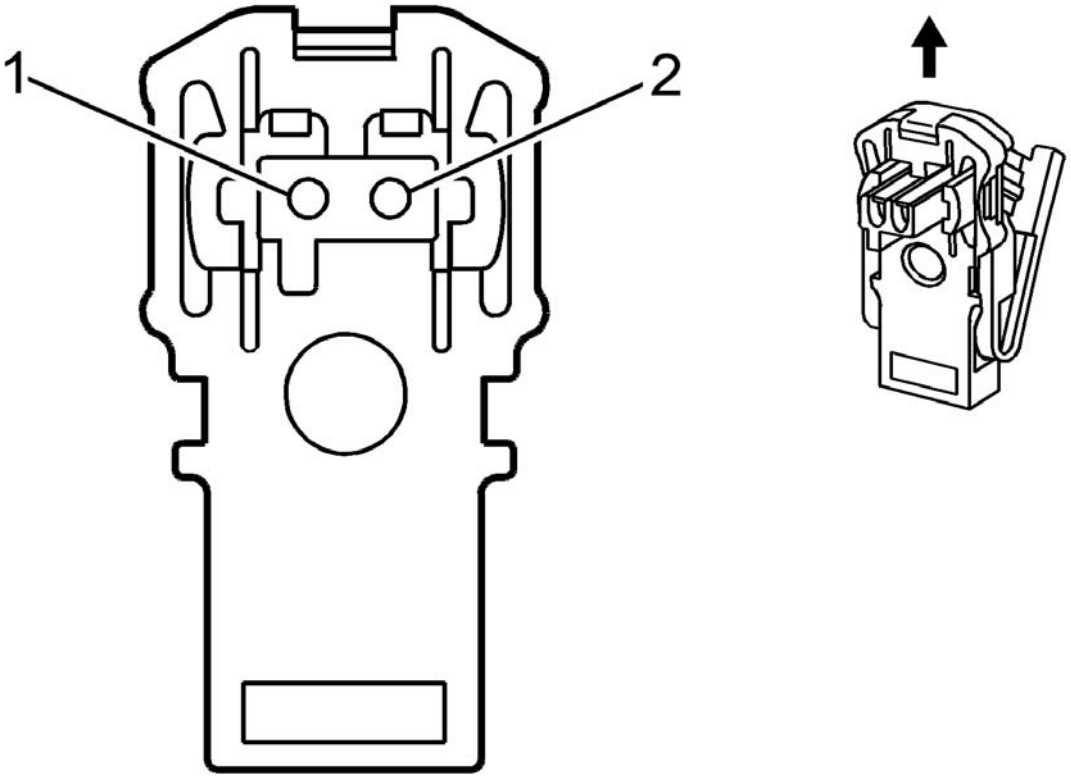
Terminal Part Information

- Terminated Lead: 13327113
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 12191819/8
- Core/Insulation Crimp: 2/1

Inflatable Restraint Side Impact Sensor (SIS) - Right

Pin	Wire	Circuit	Function
A	0.5 D-GN	2134	Side Impact Sensing Module- Right- Signal
B	0.5 TN	2133	Side Impact Sensing Module- Right- Voltage

INFLATABLE RESTRAINT STEERING WHEEL MODULE X1



Connector Part Information

- Harness Type: SIR Coil

- OEM Connector: 54561236
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F AMP (WH with YE Lock)

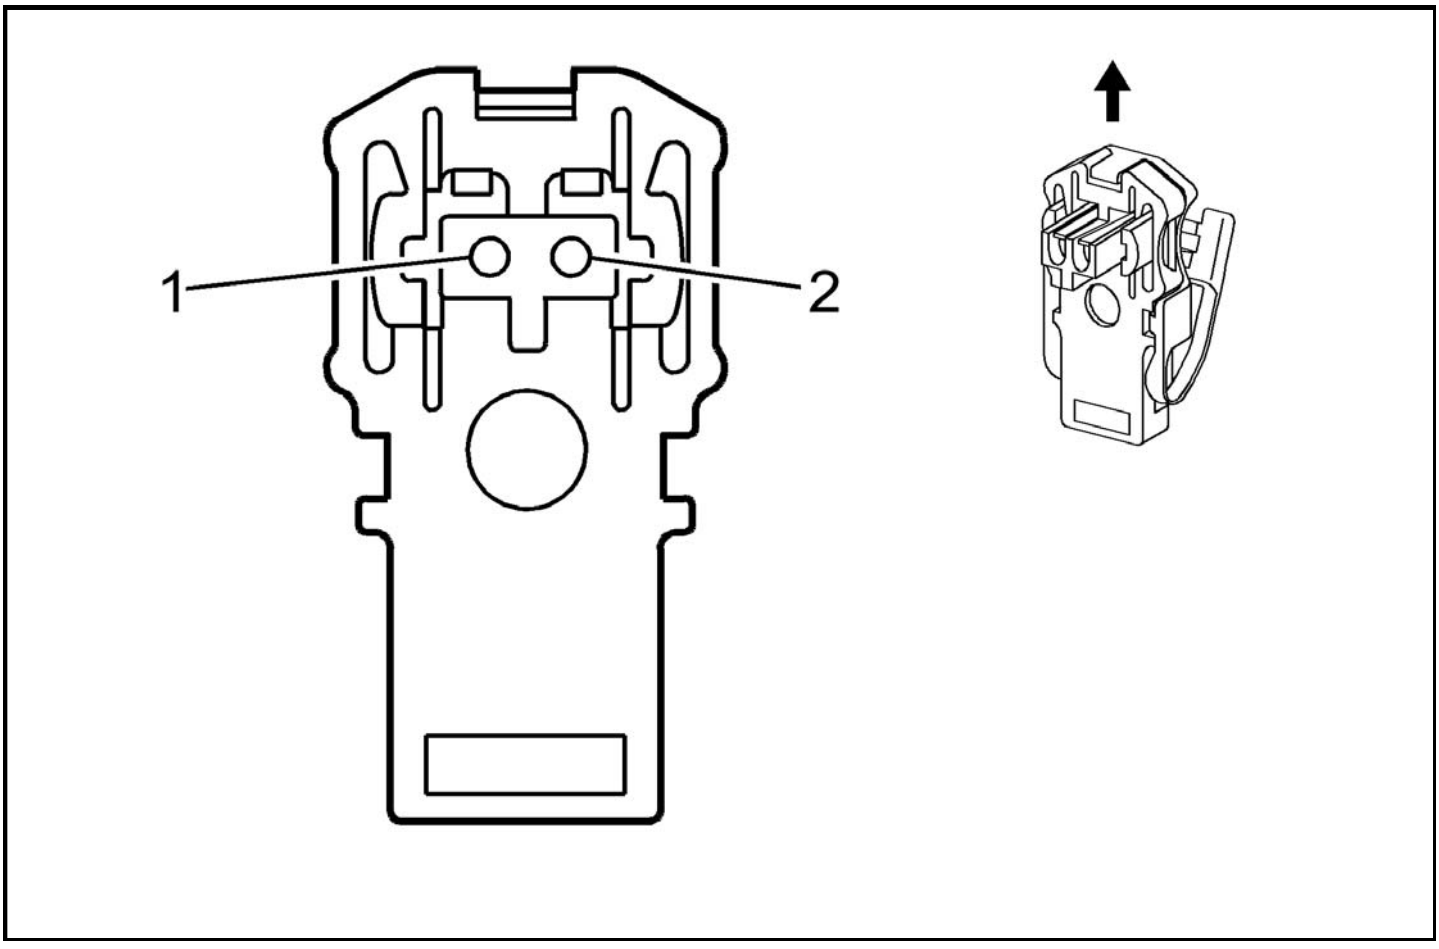
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: Not Available
- Diagnostic Test Probe: Not Available
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Inflatable Restraint Steering Wheel Module X1

Pin	Wire	Circuit	Function
1	0.5 TN	3021	Steering Wheel Module- Stage 1- High Control
2	0.5 BN	3020	Steering Wheel Module- Stage 1- Low Control

INFLATABLE RESTRAINT STEERING WHEEL MODULE X2



Connector Part Information

- Harness Type: SIR Coil
- OEM Connector: 54560222
- Service Connector: 13586139
- Description: 2-Way F AMP (PK with YE Lock)

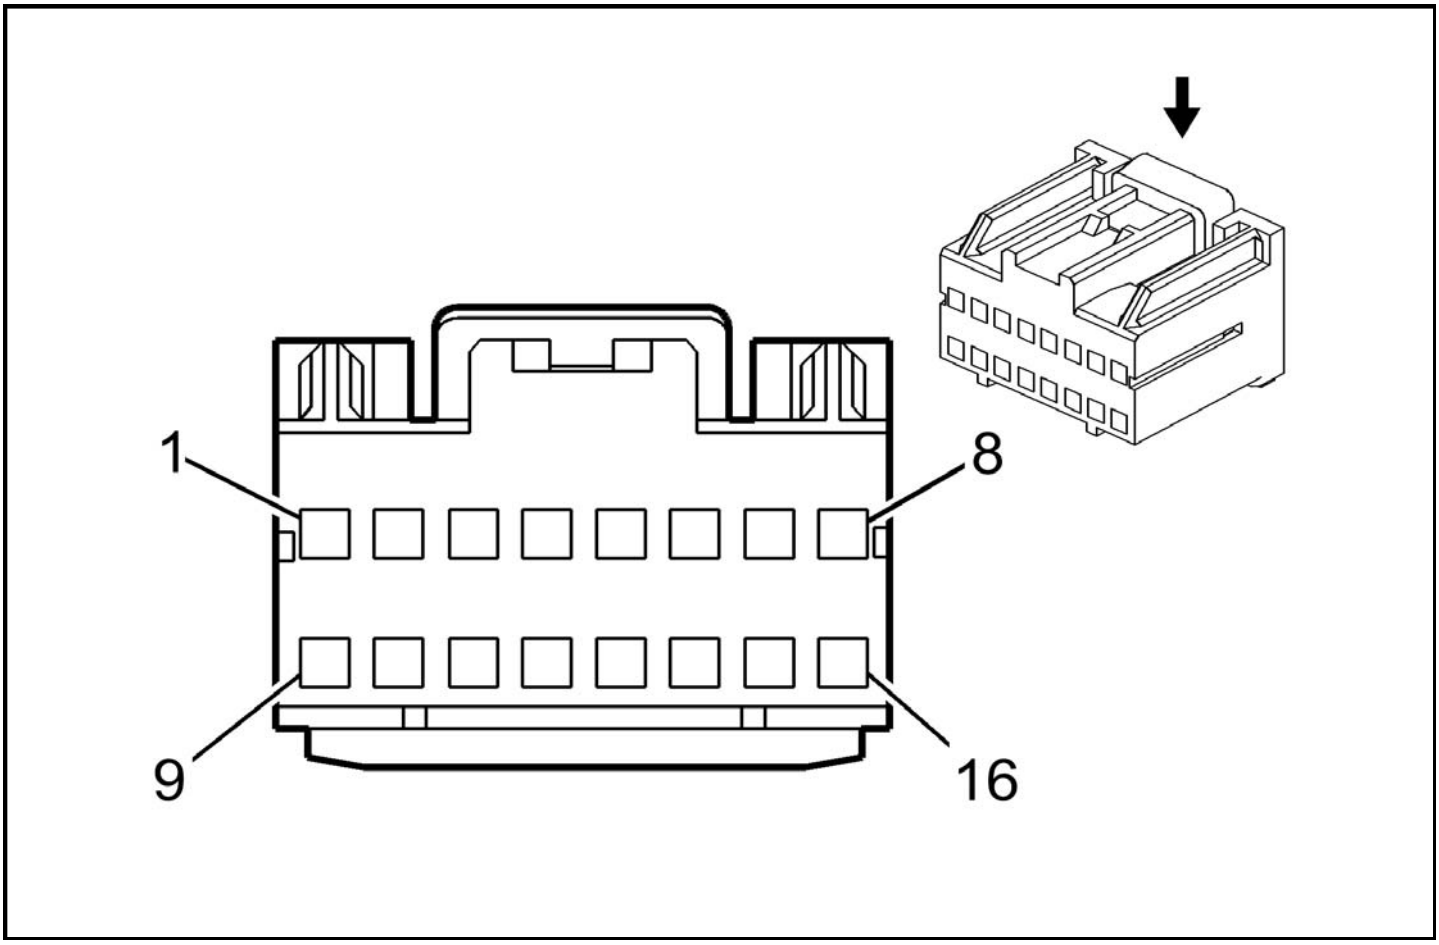
Terminal Part Information

- Terminal/Tray: Service with Pigtail
- Core/Insulation Crimp: Not Available
- Release Tool/Test Probe: Not Available

Inflatable Restraint Steering Wheel Module X2

Pin	Wire	Circuit	Function
1	0.5 WH	3023	Steering Wheel Module- Stage 2- High Control
2	0.5 PK	3022	Steering Wheel Module- Stage 2- Low Control

INSIDE REARVIEW MIRROR (DD6 OR UE1)



Connector Part Information

- Harness Type: Headliner
- OEM Connector: 15441350
- Service Connector: 15306351
- Description: 16-Way F Micro-Pack 100A Series (BK)

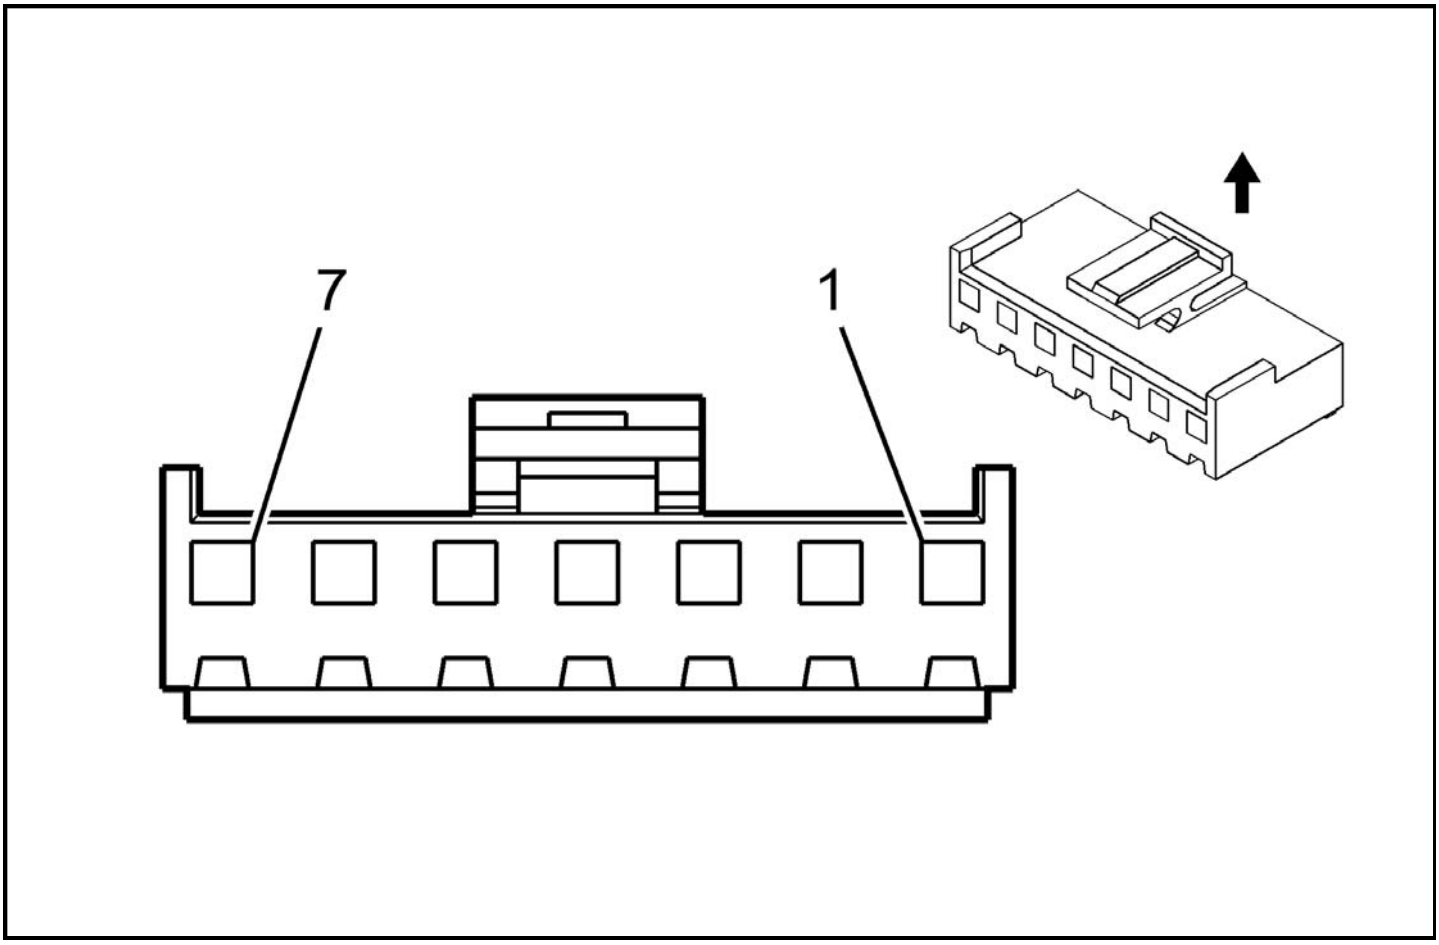
Terminal Part Information

- Terminated Lead: 13575548
- Release Tool: J-38125-559
- Diagnostic Test Probe: J-35616-16 (L-GN)
- Terminal/Tray: 15445905/23
- Core/Insulation Crimp: J/J

Inside Rearview Mirror (DD6 or UE1)

Pin	Wire	Circuit	Function
1-5	-	-	Not Used
6	0.5 OG	1732	Inadvertent Power Courtesy Lamp
7	-	-	Not Used
8	0.5 BK	550	Ground
9	0.5 L-GN	24	Backup Lamp Supply Voltage
10	-	-	Not Used
11	0.35 D-GN/WH	2514	Keypad Signal
12	0.35 L-GN/BK	2515	Keypad Supply Voltage
13	0.5 YE	643	Accessory Voltage
14	0.35 YE/BK	2516	Keypad Green LED Signal
15	0.35 BN/WH	2517	Keypad Red LED Signal
16	-	-	Not Used

INSIDE REARVIEW MIRROR (WITHOUT DD6 OR UE1)



Connector Part Information

- Harness Type: Headliner
- OEM Connector: 12124782
- Service Connector: 15306078
- Description: 7-Way F VH Series (BK)

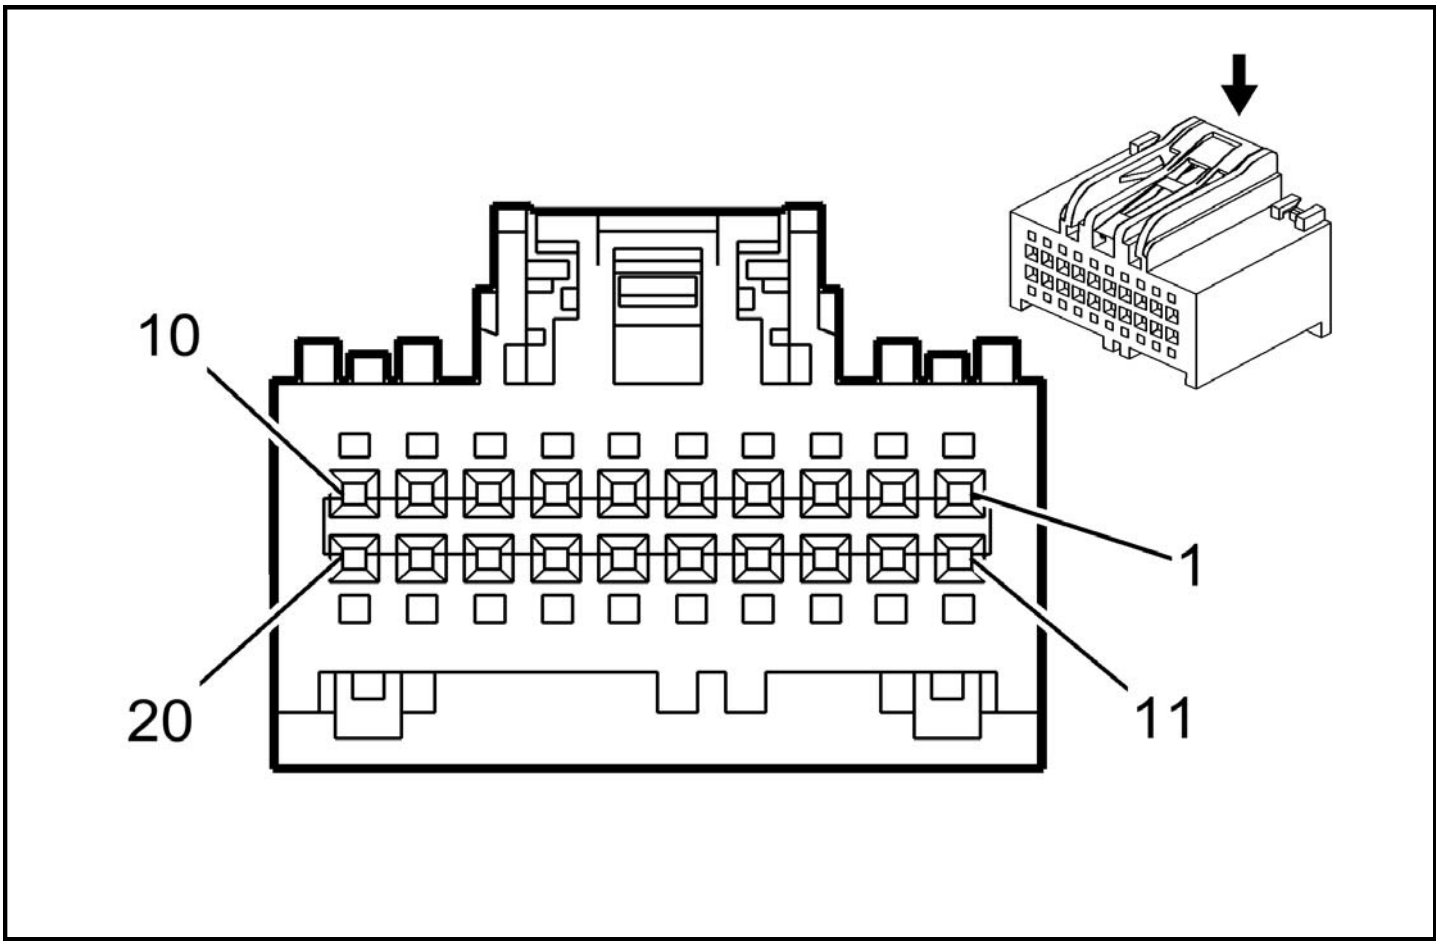
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-18 (BK)
- Terminal/Tray: SVH-21T-P1.1/20
- Core/Insulation Crimp: E/2

Inside Rearview Mirror (without DD6 or UE1)

Pin	Wire	Circuit	Function
1	-	-	Not Used
2	0.5 OG	1732	Inadvertent Power Courtesy Lamp
3-6	-	-	Not Used
7	0.5 BK	550	Ground

INSTRUMENT PANEL CLUSTER (IPC)



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 15489824
- Service Connector: 15126711
- Description: 20-Way F 64 Series (BK)

Terminal Part Information

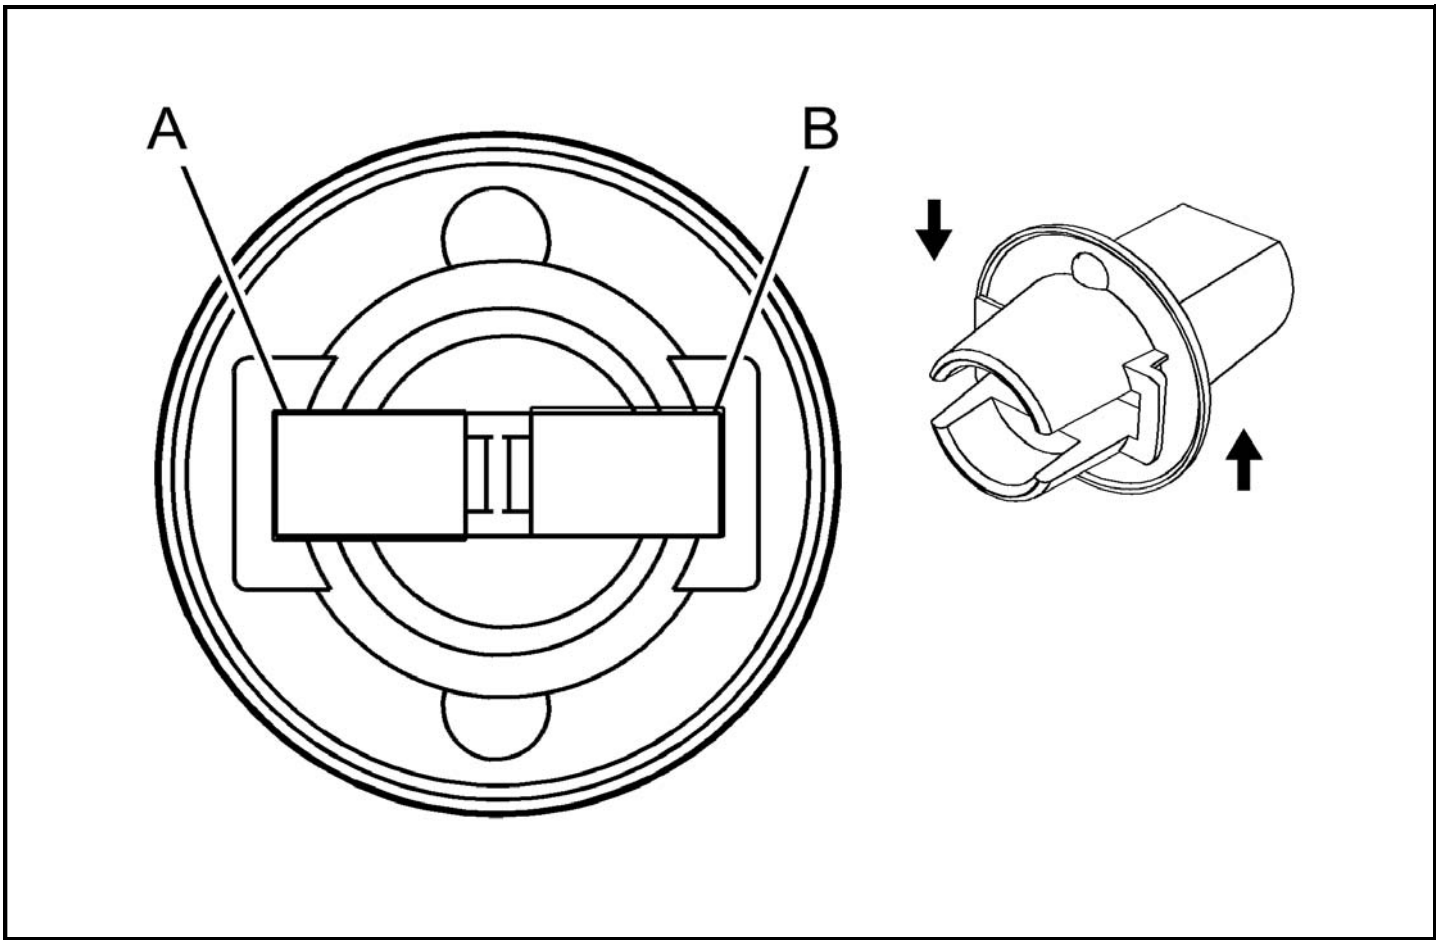
- Terminated Lead: 13575845
- Release Tool: J-38125-215A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: SAIT-A03T-M064/14
- Core/Insulation Crimp: P/P

Instrument Panel Cluster (IPC)

Pin	Wire	Circuit	Function
1	-	-	Not Used
2	0.35 D-GN/BK	5060	Low Speed GMLAN Serial Data

Pin	Wire	Circuit	Function
3	-	-	Not Used
4	0.35 BN/WH	419	MIL Control
5	0.5 BK/WH	1551	Ground
6	0.5 BK	1450	Ground
7	-	-	Not Used
8	0.35 GY	8	Instrument Panel Lamp Supply Voltage
9	-	-	Not Used
10	0.35 RD/WH	1840	Battery Positive Voltage
11	0.35 PU	5234	Passenger Seat Belt Indicator Control
12	0.35 D-BU	2307	Passenger Air Bag On Indicator Control
13	0.35 D-GN	2308	Passenger Air Bag Off Indicator Control
14	0.35 TN	185	Low Washer Fluid Indicator Control
15	0.35 TN/WH	33	Brake Warning Indicator Control
16	0.35 PK	893	DIC Select Menu Switch Signal
17	0.35 D-GN/WH	1358	DIC Switch Signal
18	0.35 BN	897	DIC Switch Low Reference
19	-	-	Not Used
20	0.35 PK	1139	Ignition 1 Voltage

I/P COURTESY LAMP - LEFT



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 12084388
- Service Connector: 12159671
- Description: 2-Way F Lamp Socket Connectors, Bulb Bases, Type W-2 (BK)

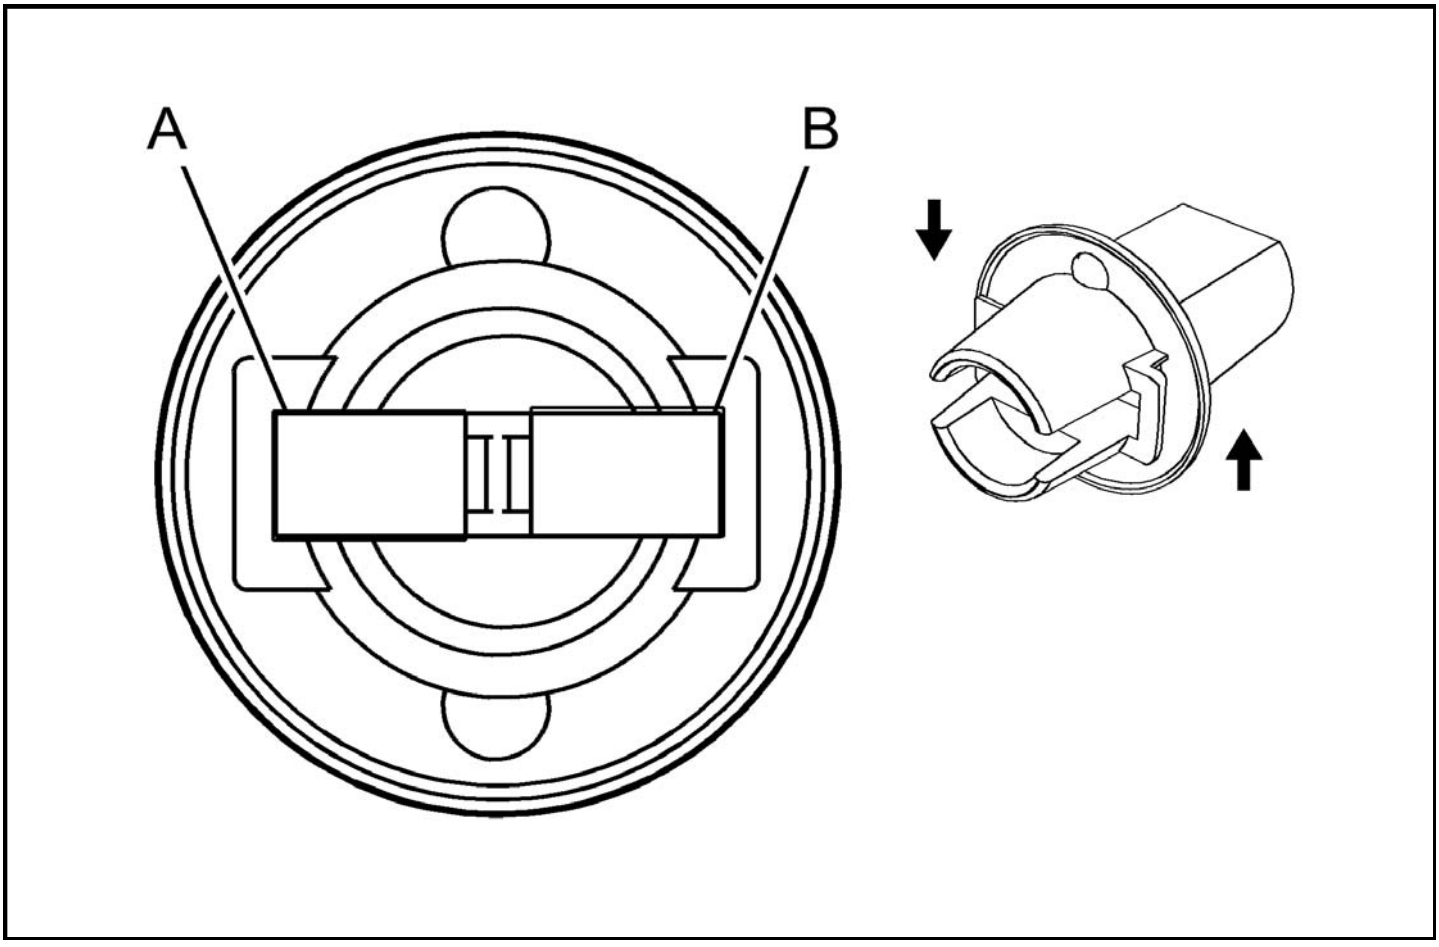
Terminal Part Information

- Terminated Lead: Service with Pigtail
- Terminal/Tray: Service with Pigtail
- Core/Insulation Crimp: Not Available
- Release Tool/Test Probe: Not Available

I/P Courtesy Lamp - Left

Pin	Wire	Circuit	Function
A	0.5 GY/BK	690	Courtesy Lamp Supply Voltage
	0.5 GY/BK	690	Courtesy Lamp Supply Voltage
B	0.35 BK	150	Ground

I/P COURTESY LAMP - RIGHT



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 12084388
- Service Connector: 12159671
- Description: 2-Way F Lamp Socket Connectors, Bulb Bases, Type W-2 (BK)

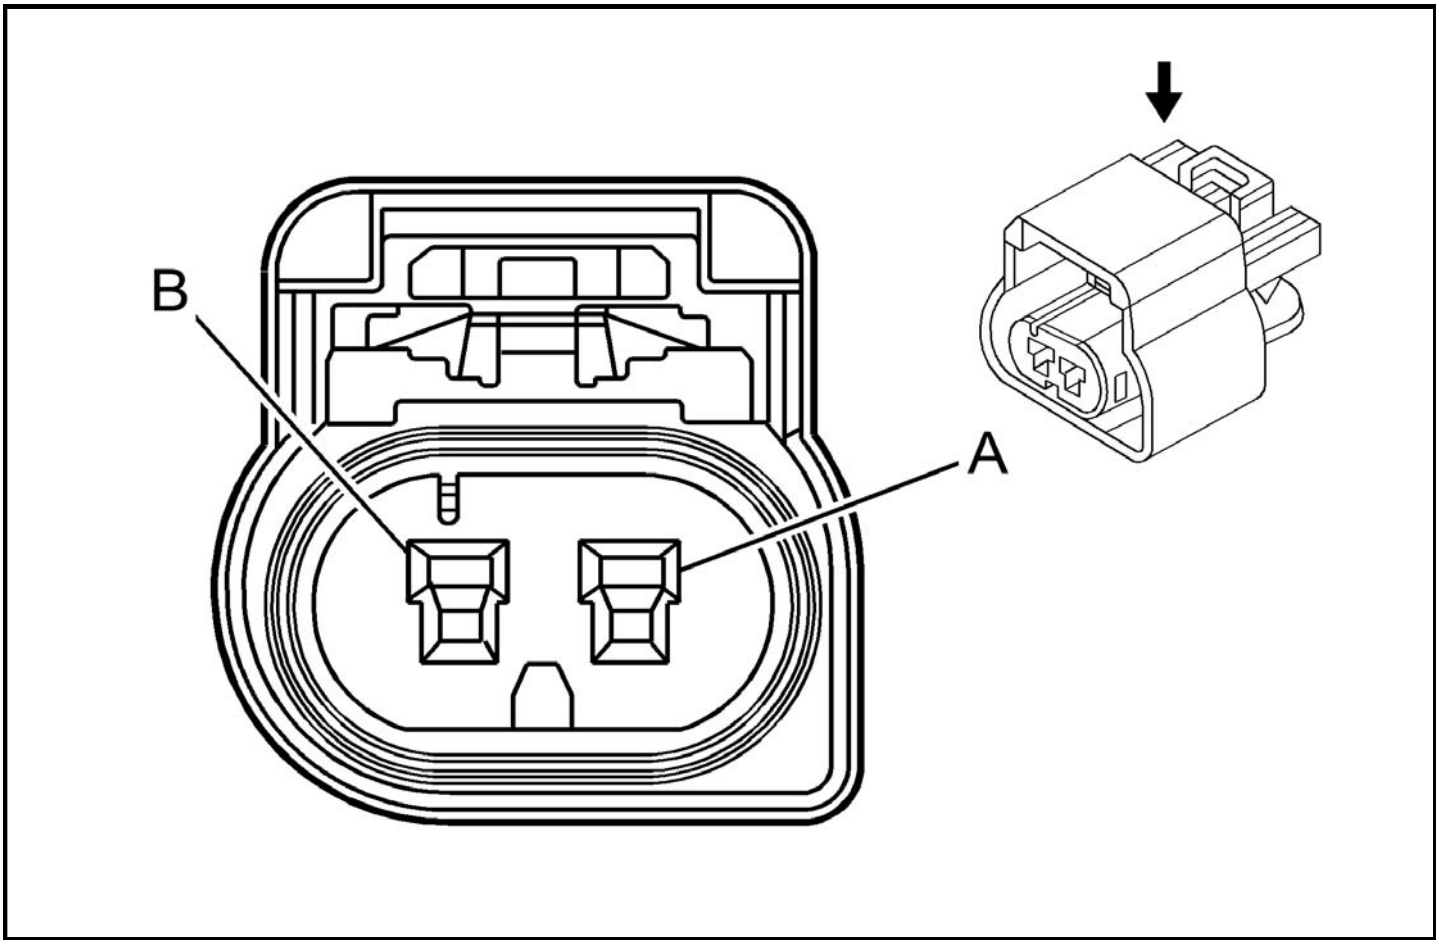
Terminal Part Information

- Terminated Lead: Service with Pigtail
- Terminal/Tray: Service with Pigtail
- Core/Insulation Crimp: Not Available
- Release Tool/Test Probe: Not Available

I/P Courtesy Lamp - Right

Pin	Wire	Circuit	Function
A	0.5 GY/BK	690	Courtesy Lamp Supply Voltage
B	0.35 BK	150	Ground

KNOCK SENSOR (KS) 1



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15374222
- Service Connector: 13580877
- Description: 2-Way F GT 150 Sealed (NA)

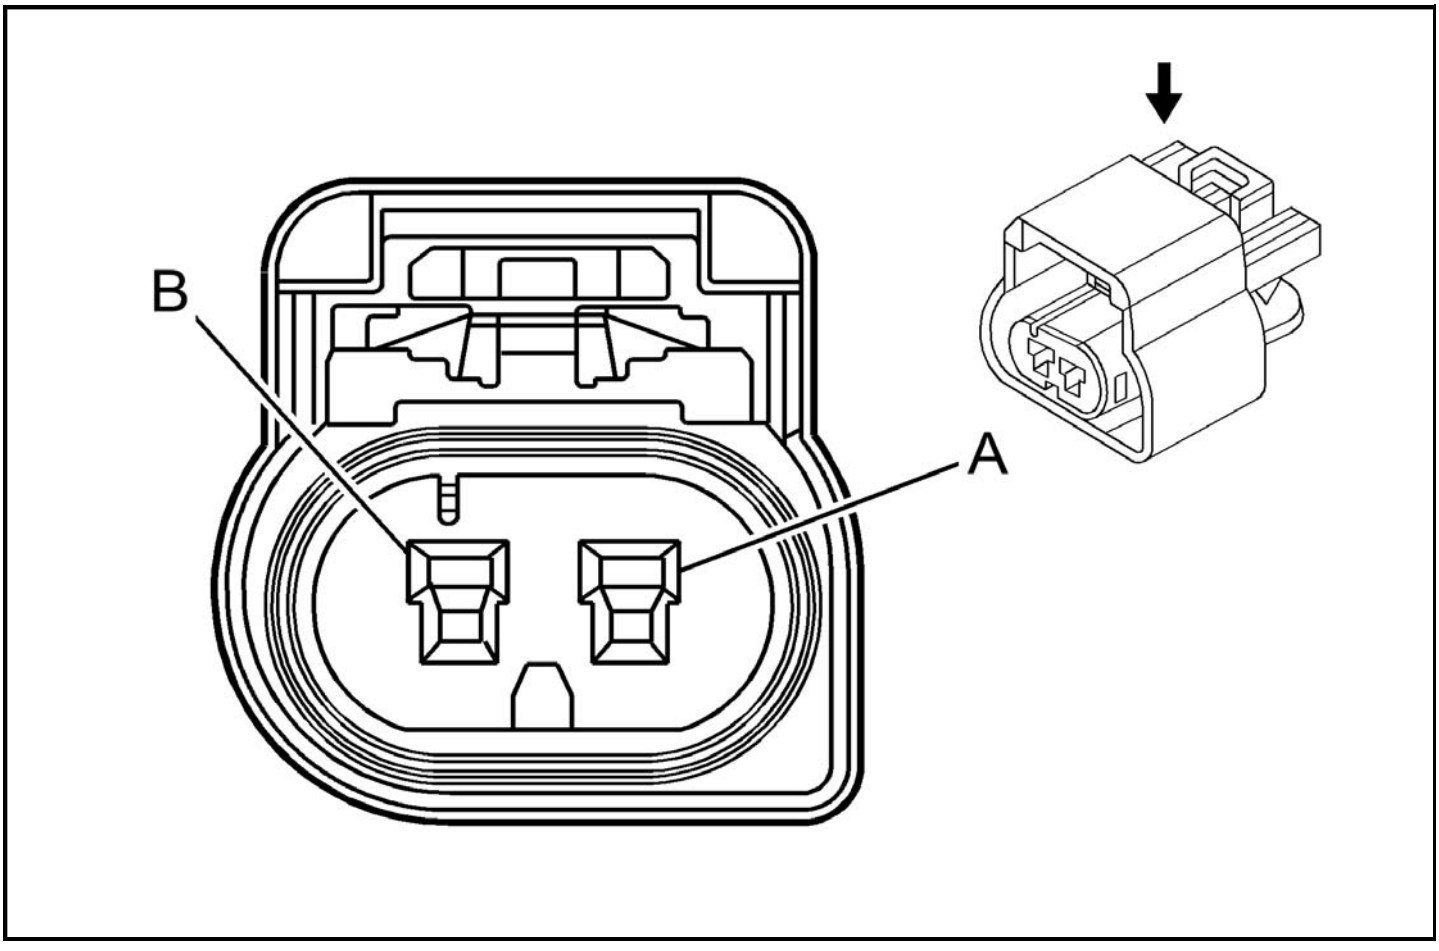
Terminal Part Information

- Terminated Lead: 13575396
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 15326427/5
- Core/Insulation Crimp: E/A

Knock Sensor (KS) 1

Pin	Wire	Circuit	Function
A	0.5 D-BU	496	KS 1 Signal
B	0.5 GY	1716	KS 1 Signal

KNOCK SENSOR (KS) 2



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15374222
- Service Connector: 13580877
- Description: 2-Way F GT 150 Sealed (NA)

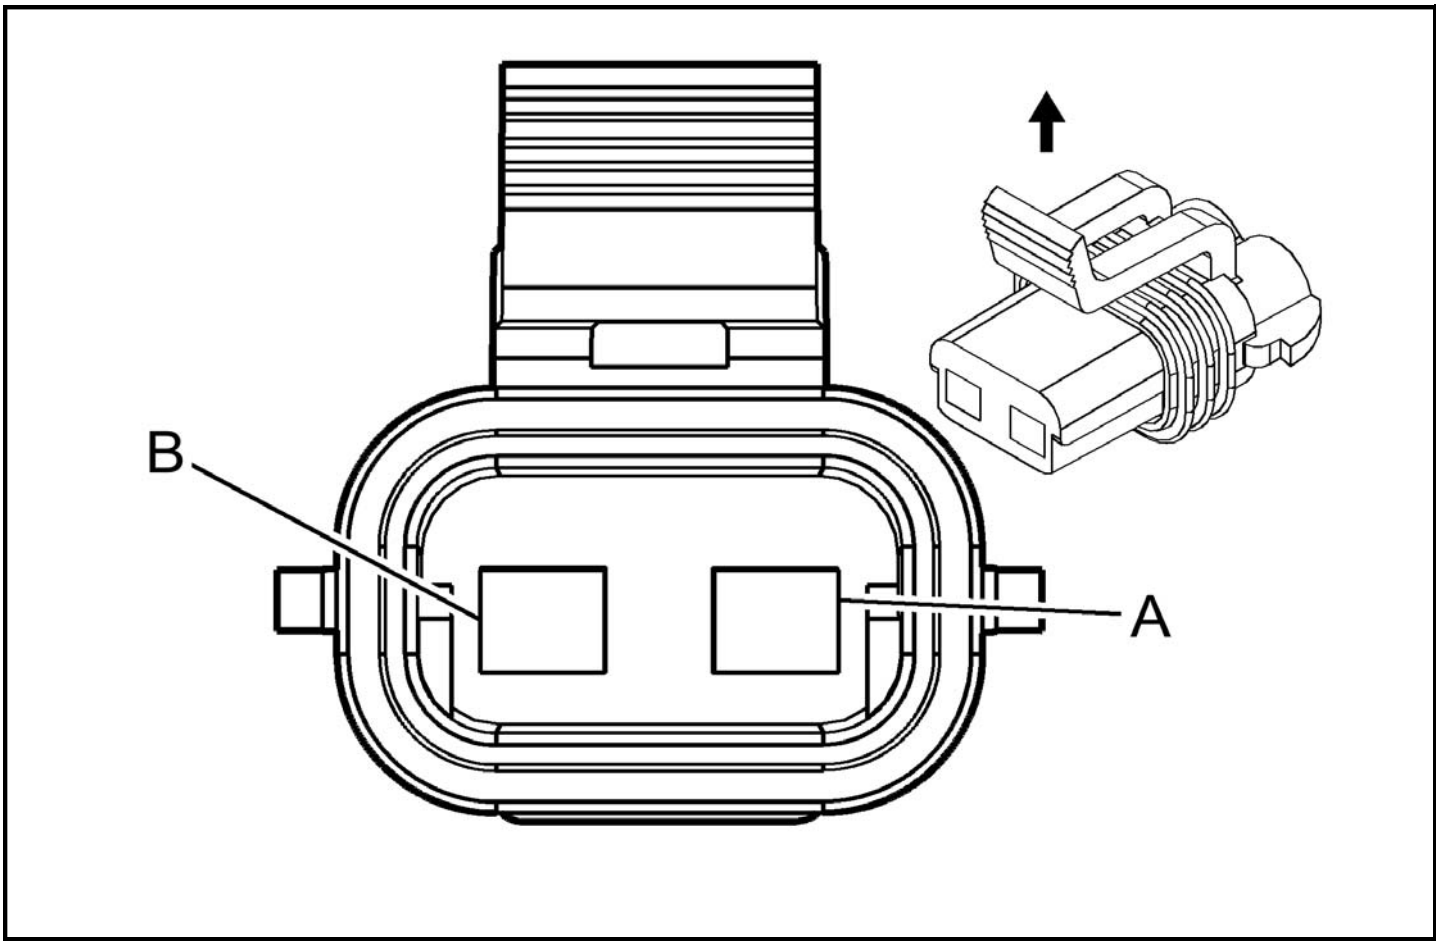
Terminal Part Information

- Terminated Lead: 13575396
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 15326427/5
- Core/Insulation Crimp: E/A

Knock Sensor (KS) 2

Pin	Wire	Circuit	Function
A	0.5 L-BU	1876	KS 2 Signal
B	0.5 GY	2303	KS 2 Signal

LICENSE LAMP



Connector Part Information

- Harness Type: Rear Body
- OEM Connector: 15300027
- Service Connector: 12101855
- Description: 2-Way F Metri-Pack 280 Series, Sealed (BK)

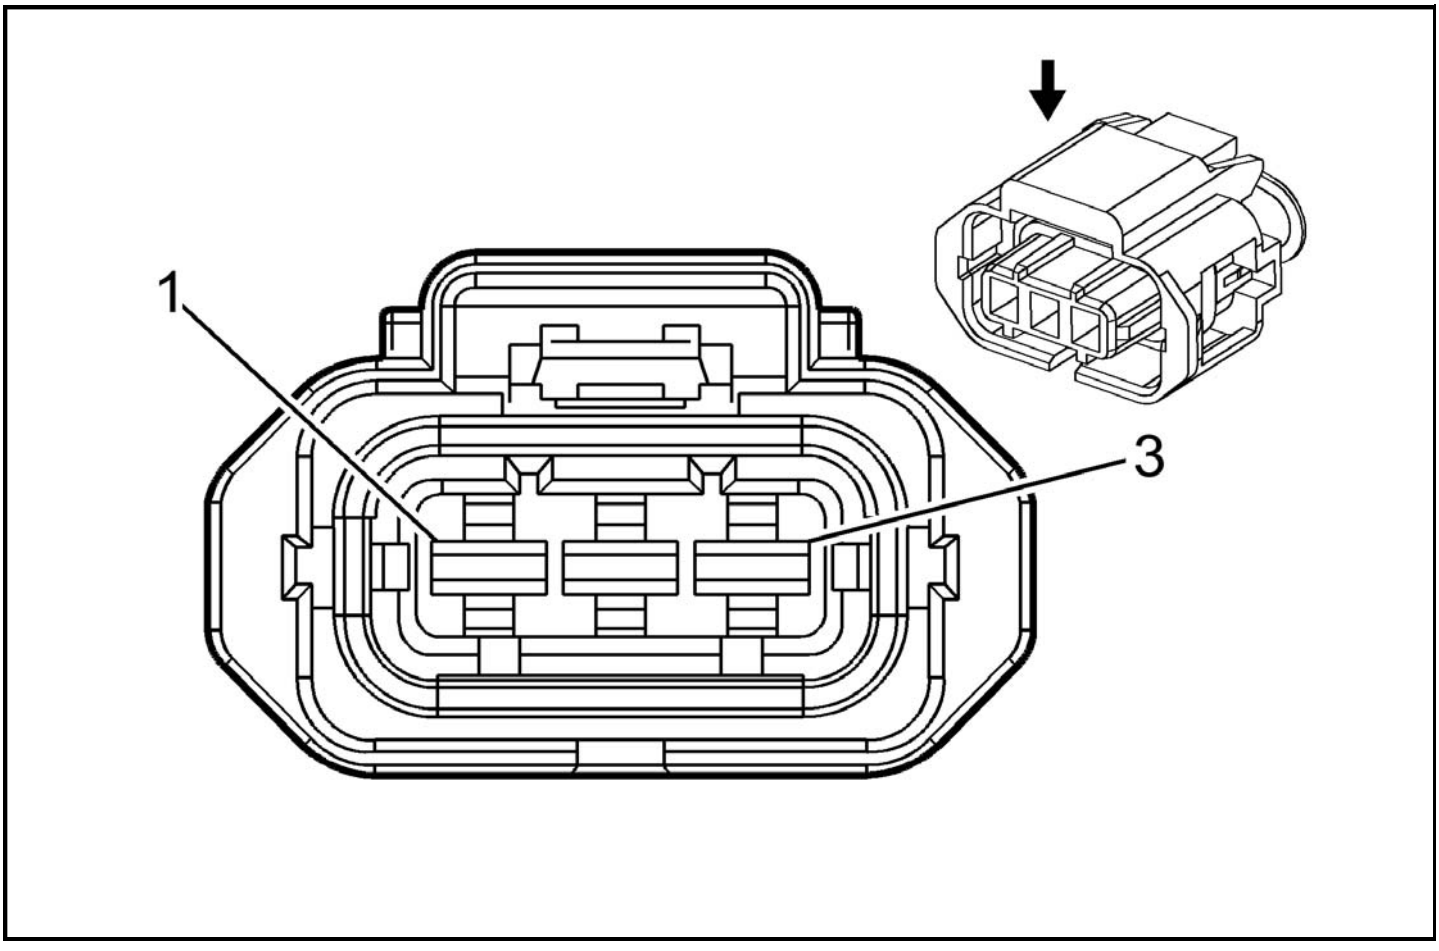
Terminal Part Information

- Terminated Lead: 13575418
- Release Tool: J-38125-11A
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 12077411/2
- Core/Insulation Crimp: 2/5

License Lamp

Pin	Wire	Circuit	Function
A	0.5 BN/WH	309	Right Park Lamp Supply Voltage
B	0.5 BK	850	Ground

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15397338
- Service Connector: 13585845
- Description: 3-Way F 2.8 Timer Series, Sealed (BK)

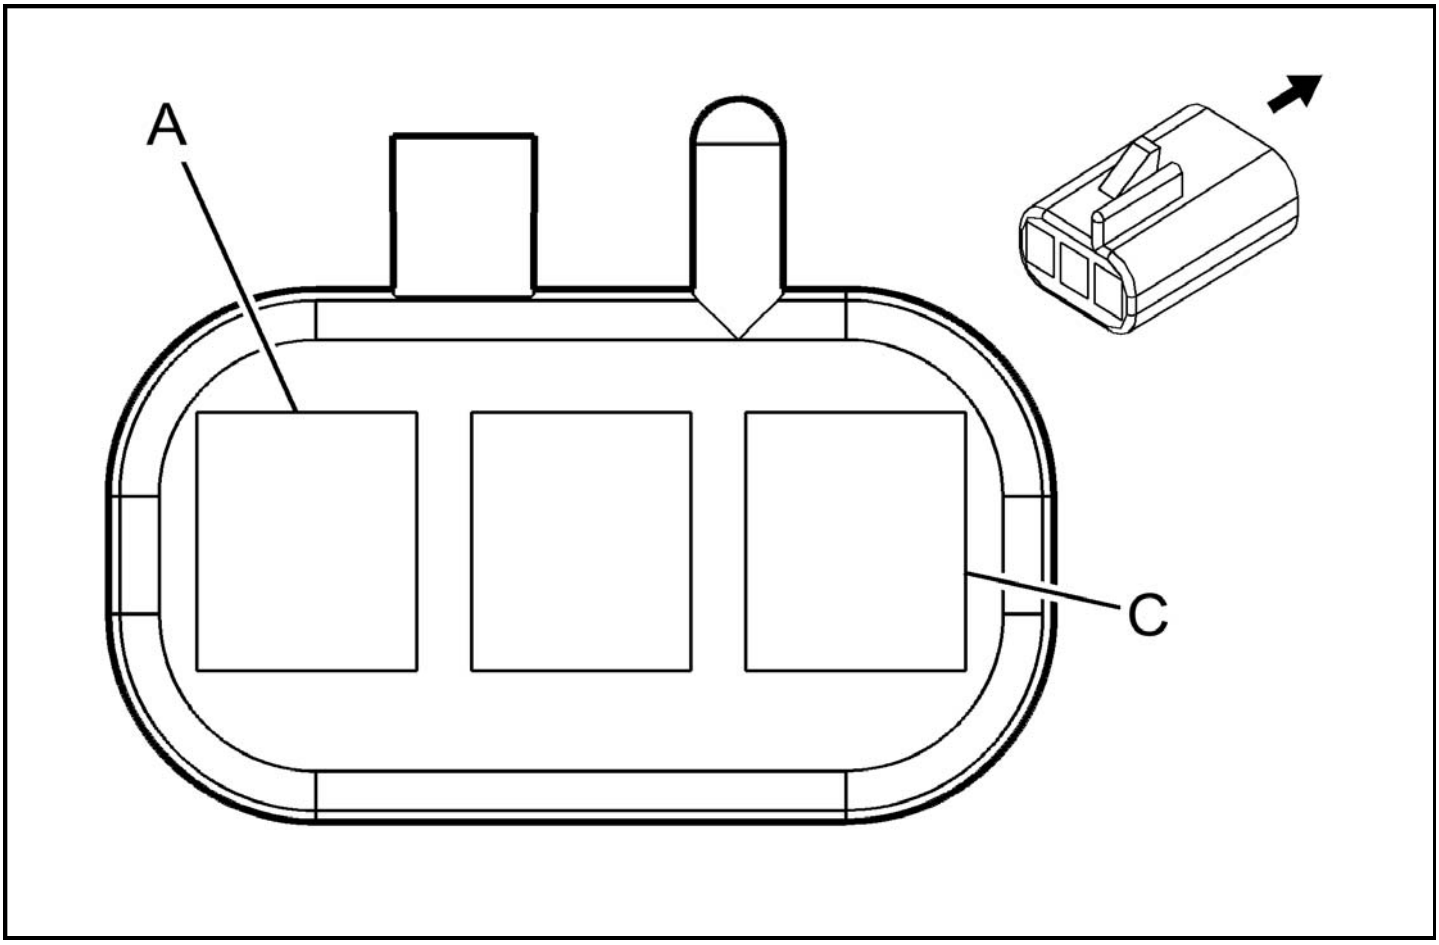
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: Not Available
- Diagnostic Test Probe: Not Available
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Manifold Absolute Pressure (MAP) Sensor

Pin	Wire	Circuit	Function
1	0.5 GY	2704	5-Volt Reference 3
2	0.5 OG/BK	469	Low Reference
3	0.5 L-GN	432	MAP Sensor Signal

MODE ACTUATOR



Connector Part Information

- Harness Type: HVAC
- OEM Connector: 12047781
- Service Connector: 12101864
- Description: 3-Way F Metri-Pack 150 Series (BK)

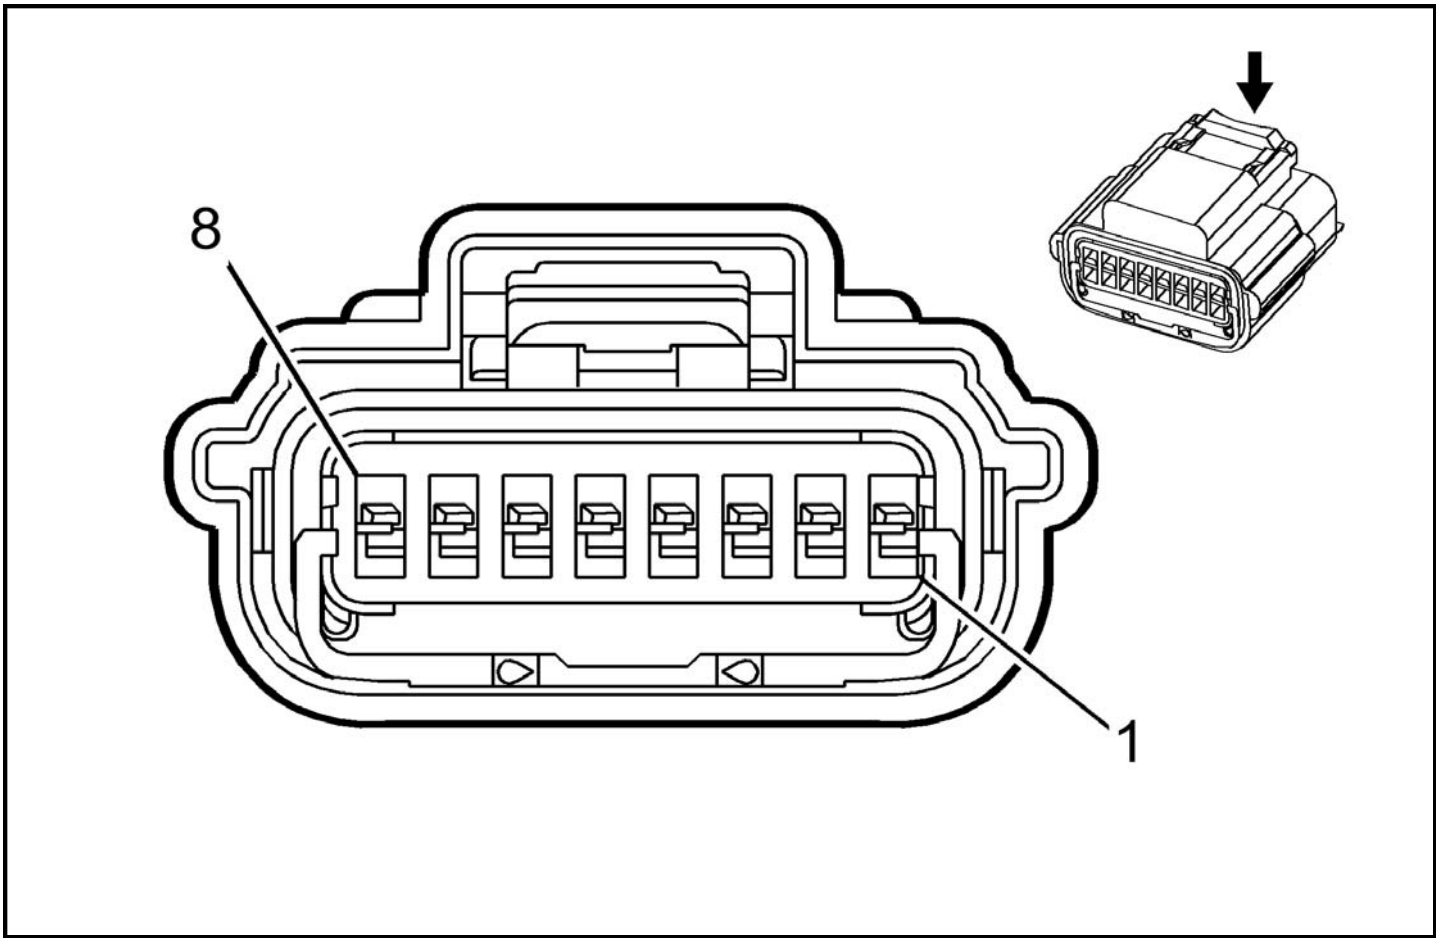
Terminal Part Information

- Terminal/Tray: 12064971/5
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Mode Actuator

Pin	Wire	Circuit	Function
A	0.35 TN	2273	Mode Door Control B
B	-	-	Not Used
C	0.35 L-GN	2275	Mode Door Control A

MULTIFUNCTION INTAKE AIR SENSOR



Connector Part Information

- Harness Type: Engine
- OEM Connector: 13774439
- Service Connector: 13583440
- Description: 8-Way F 064 Series, Sealed (BK)

Terminal Part Information

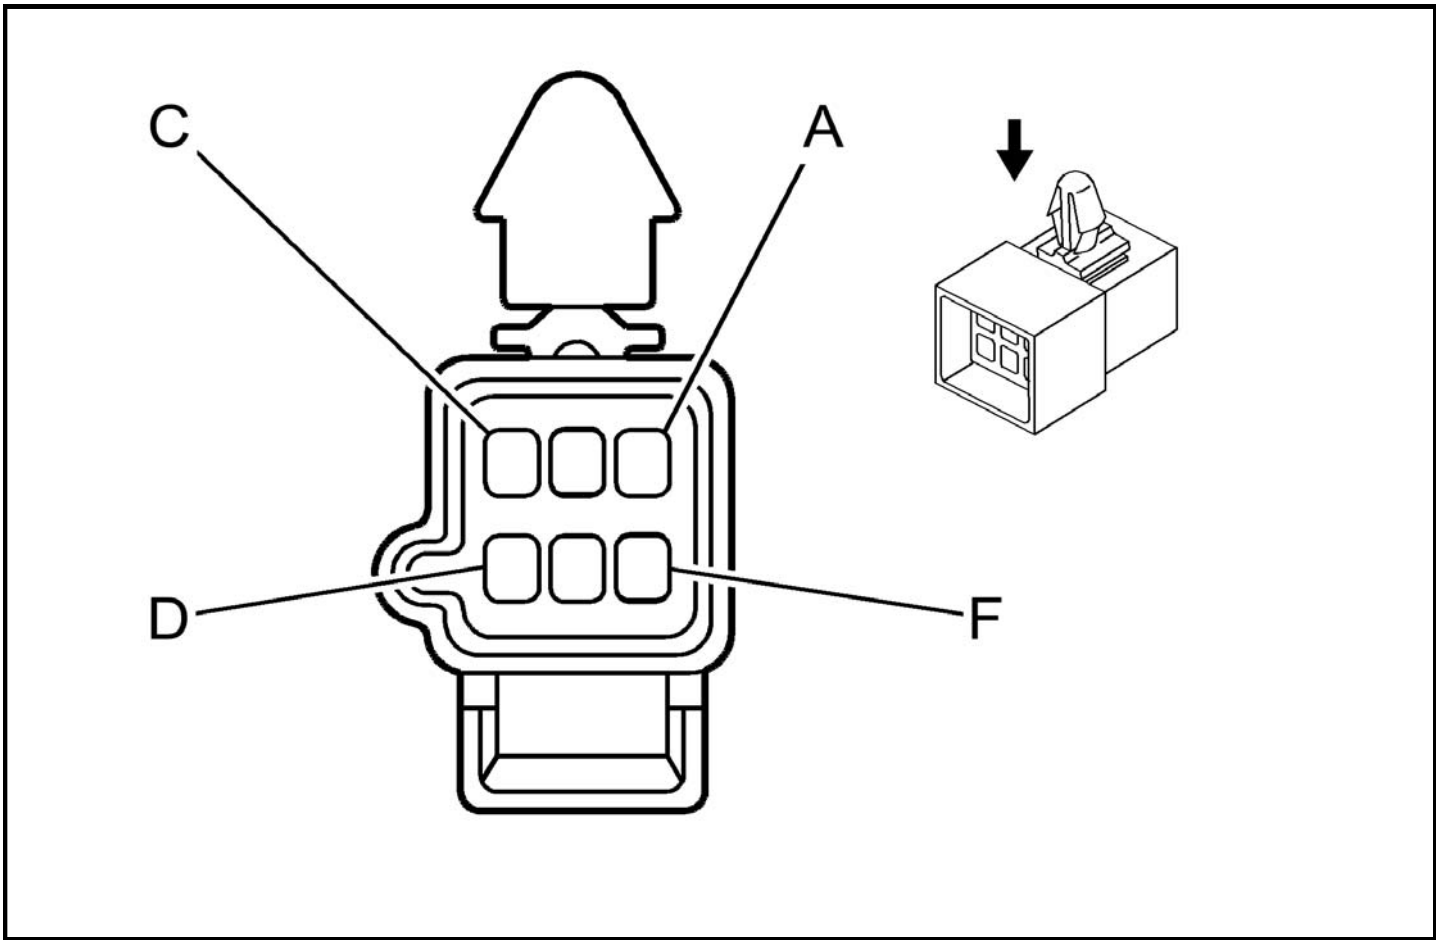
- Terminated Lead: Pins 1-4, 6-8 - 13575864
- Terminated Lead: Pin 5 - 13575865
- Release Tool: J-38125-215A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: SAIT-A03GF-M064/27
- Core/Insulation Crimp: P/P

Multifunction Intake Air Sensor

Pin	Wire	Circuit	Function
1	0.35 L-BU	6289	Induction Air Temperature Sensor Signal
2	0.35 GY	3201	5 Volt Reference 1
3	0.35 TN	2760	Low Reference

Pin	Wire	Circuit	Function
4	0.35 YE/WH	3200	Throttle Inlet Absolute Pressure Sensor Signal
5	0.5 PK/BK	5294	Powertrain Main Relay Fused Supply (5)
6	0.35 YE	492	Mass Air Flow Sensor Signal
7	0.35 BK/WH	451	Ground
8	0.35 PU	4008	Humidity Sensor Signal

OUTSIDE REARVIEW MIRROR - DRIVER



Connector Part Information

- Harness Type: Left Front Door
- OEM Connector: 12065781
- Service Connector: 12101876
- Description: 6-Way M Metri-Pack 150 Series (GY)

Terminal Part Information

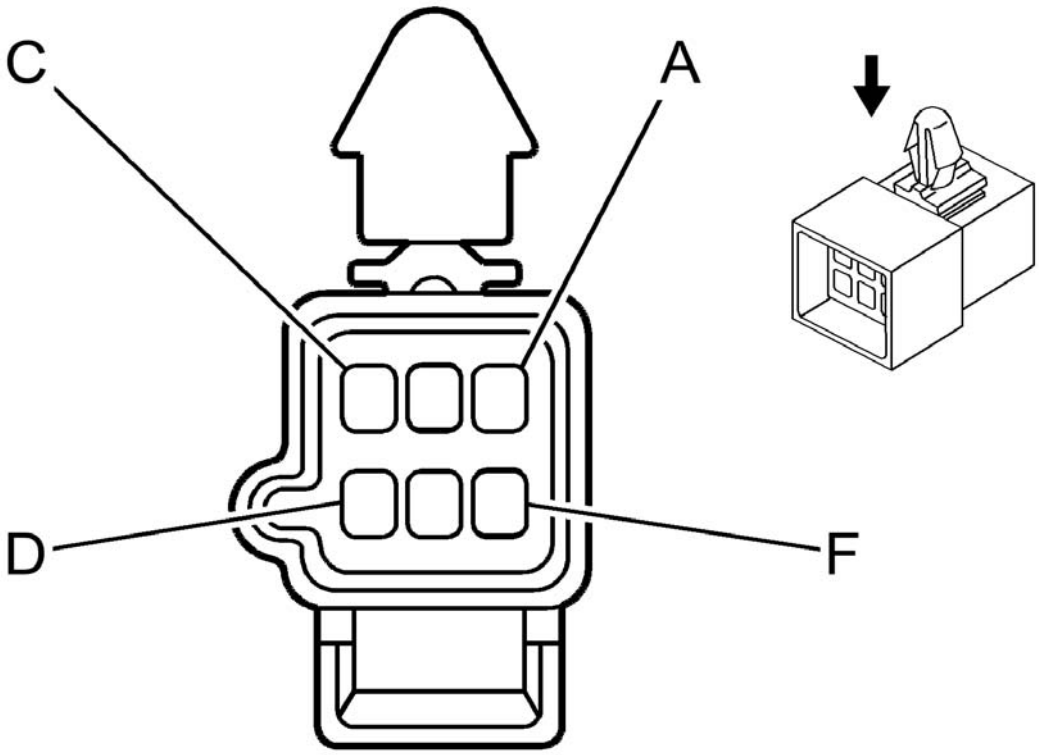
- Terminated Lead: 13575462
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)
- Terminal/Tray: 12047581/2

- Core/Insulation Crimp: E/C

Outside Rearview Mirror - Driver

Pin	Wire	Circuit	Function
A	0.5 WH	81	Driver Mirror Motor Right Control
B	0.5 L-GN	89	Driver Mirror Motor Down Control
C	0.5 TN	329	Driver Mirror Motor Supply Voltage
D	-	-	Not Used
E	0.5 BK	550	Ground
F	0.5 OG	267	Heated Mirror Element Supply Voltage

OUTSIDE REARVIEW MIRROR - PASSENGER



Connector Part Information

- Harness Type: Right Front Door
- OEM Connector: 12065781
- Service Connector: 12101876
- Description: 6-Way M Metri-Pack 150 Series (GY)

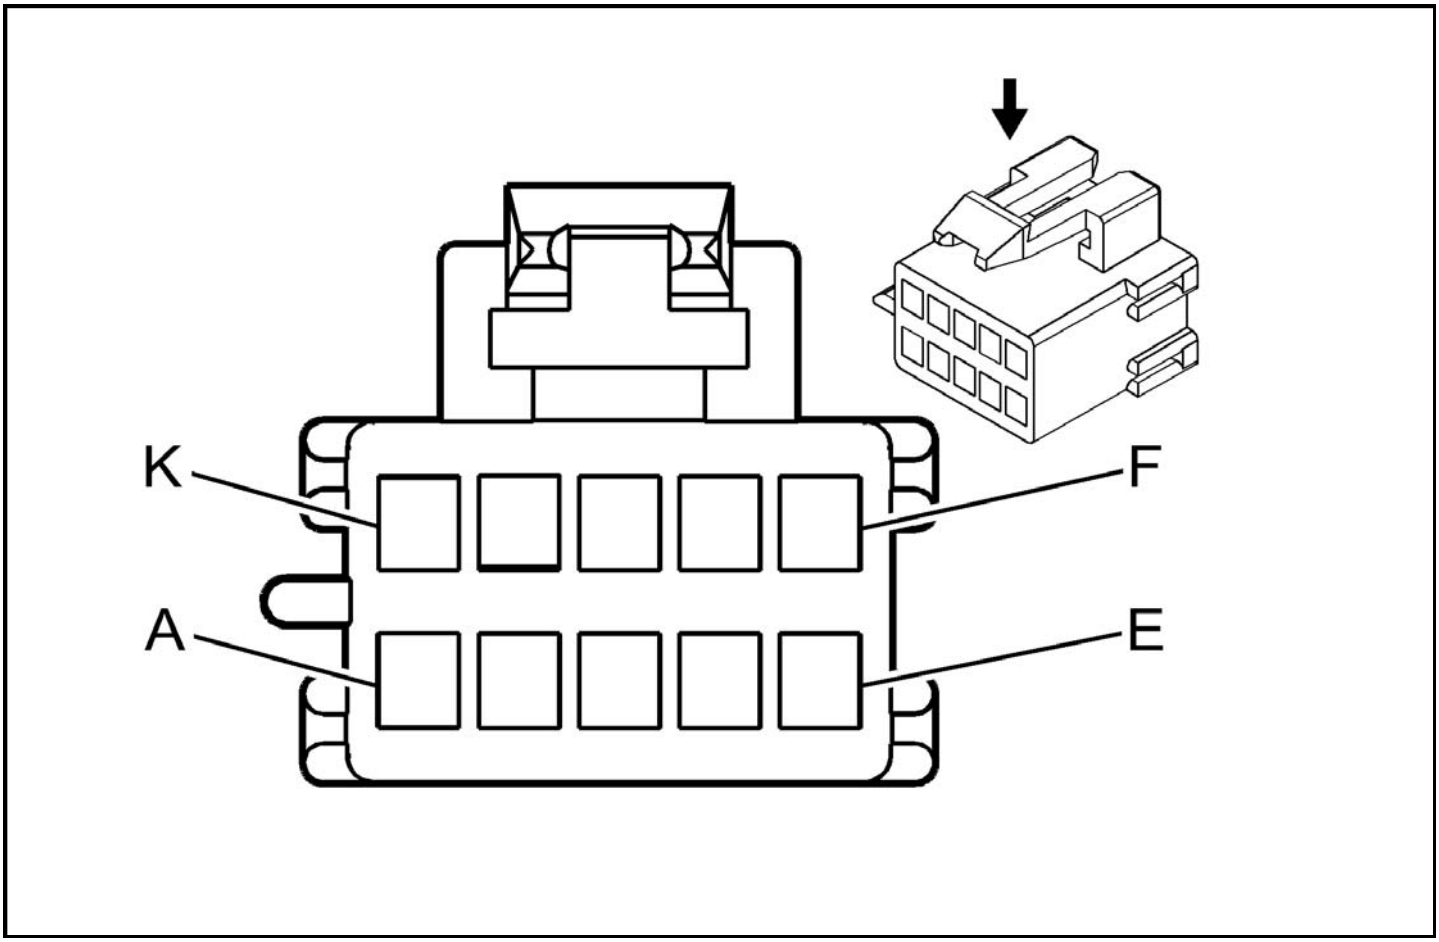
Terminal Part Information

- Terminated Lead: 13575462
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)
- Terminal/Tray: 12047581/2
- Core/Insulation Crimp: E/C

Outside Rearview Mirror - Passenger

Pin	Wire	Circuit	Function
A	0.5 OG/WH	881	Passenger Mirror Motor Right Control
B	0.5 PU/WH	889	Passenger Mirror Motor Down Control
C	0.5 TN/WH	330	Passenger Mirror Motor Supply Voltage
D	-	-	Not Used
E	0.5 BK	750	Ground
F	0.5 OG	267	Heated Mirror Element Supply Voltage

OUTSIDE REARVIEW MIRROR SWITCH



Connector Part Information

- Harness Type: Left Front Door Trim
- OEM Connector: 12064769
- Service Connector: 12101762
- Description: 10-Way F Metri-Pack 150 Series (NA)

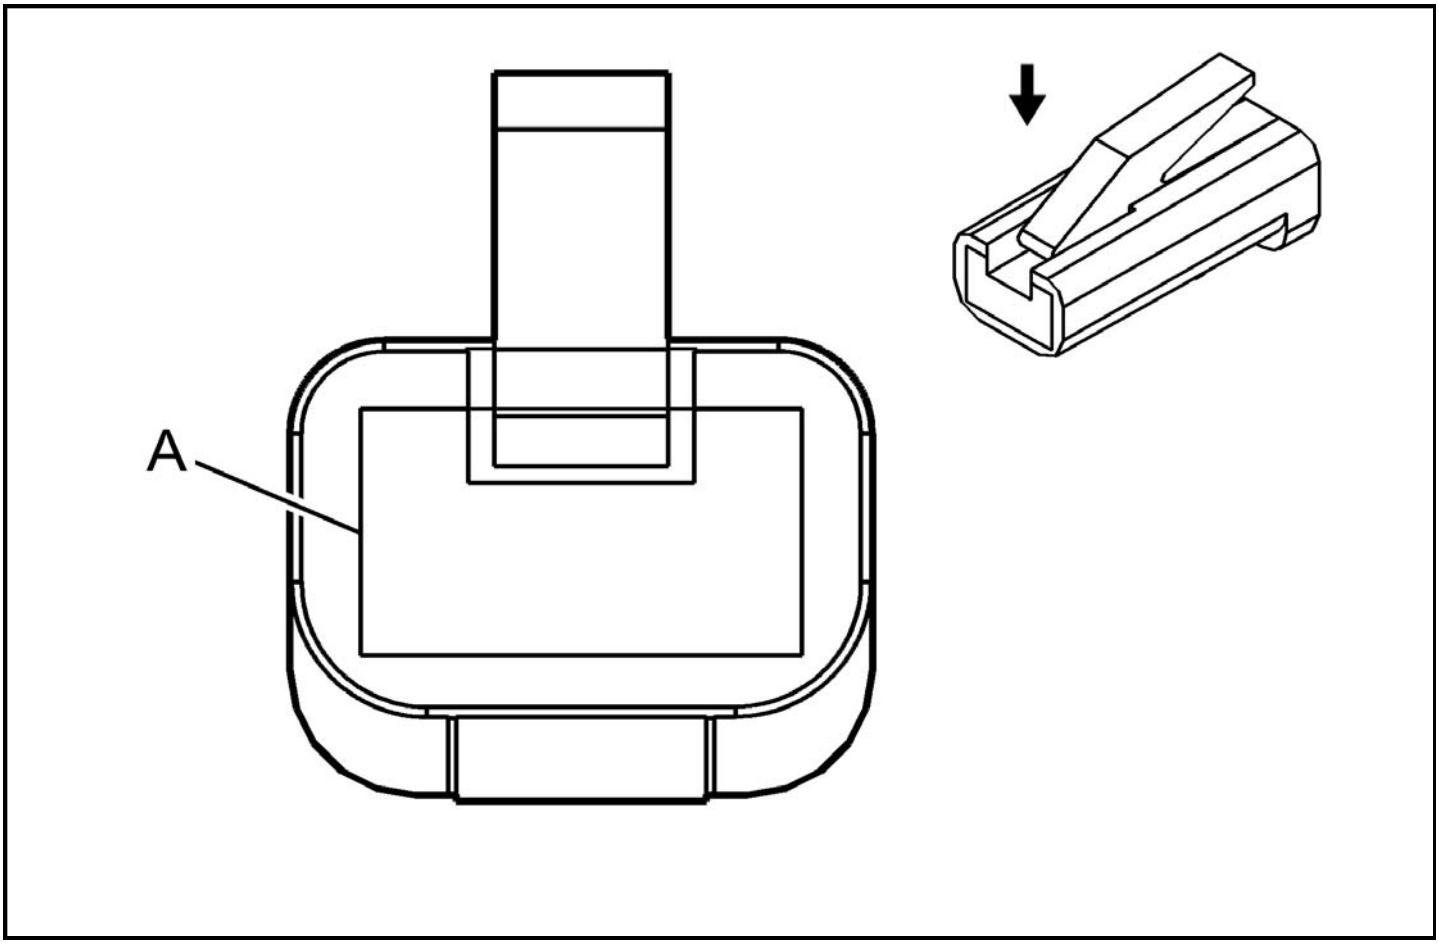
Terminal Part Information

- Terminated Lead: 13575464
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/5
- Core/Insulation Crimp: E/C

Outside Rearview Mirror Switch

Pin	Wire	Circuit	Function
A	-	-	Not Used
B	0.35 BK	550	Ground
C	0.5 WH	330	Passenger Mirror Motor Supply Voltage
D	0.35 WH	81	Driver Mirror Motor Right Control
E	0.35 GY	8	Instrument Panel Lamp Supply Voltage
F	0.35 L-GN	89	Driver Mirror Motor Down Control
G	0.35 RD/WH	840	Battery Positive Voltage
H	0.35 YE	329	Driver Mirror Motor Supply Voltage
J	0.5 OG/WH	881	Passenger Mirror Motor Right Control
K	0.5 PU/WH	889	Passenger Mirror Motor Down Control

PARK BRAKE SWITCH



Connector Part Information

- Harness Type: Body
- OEM Connector: 12004267
- Service Connector: 12102561
- Description: 1-Way F 56 Series Lock Type (BK)

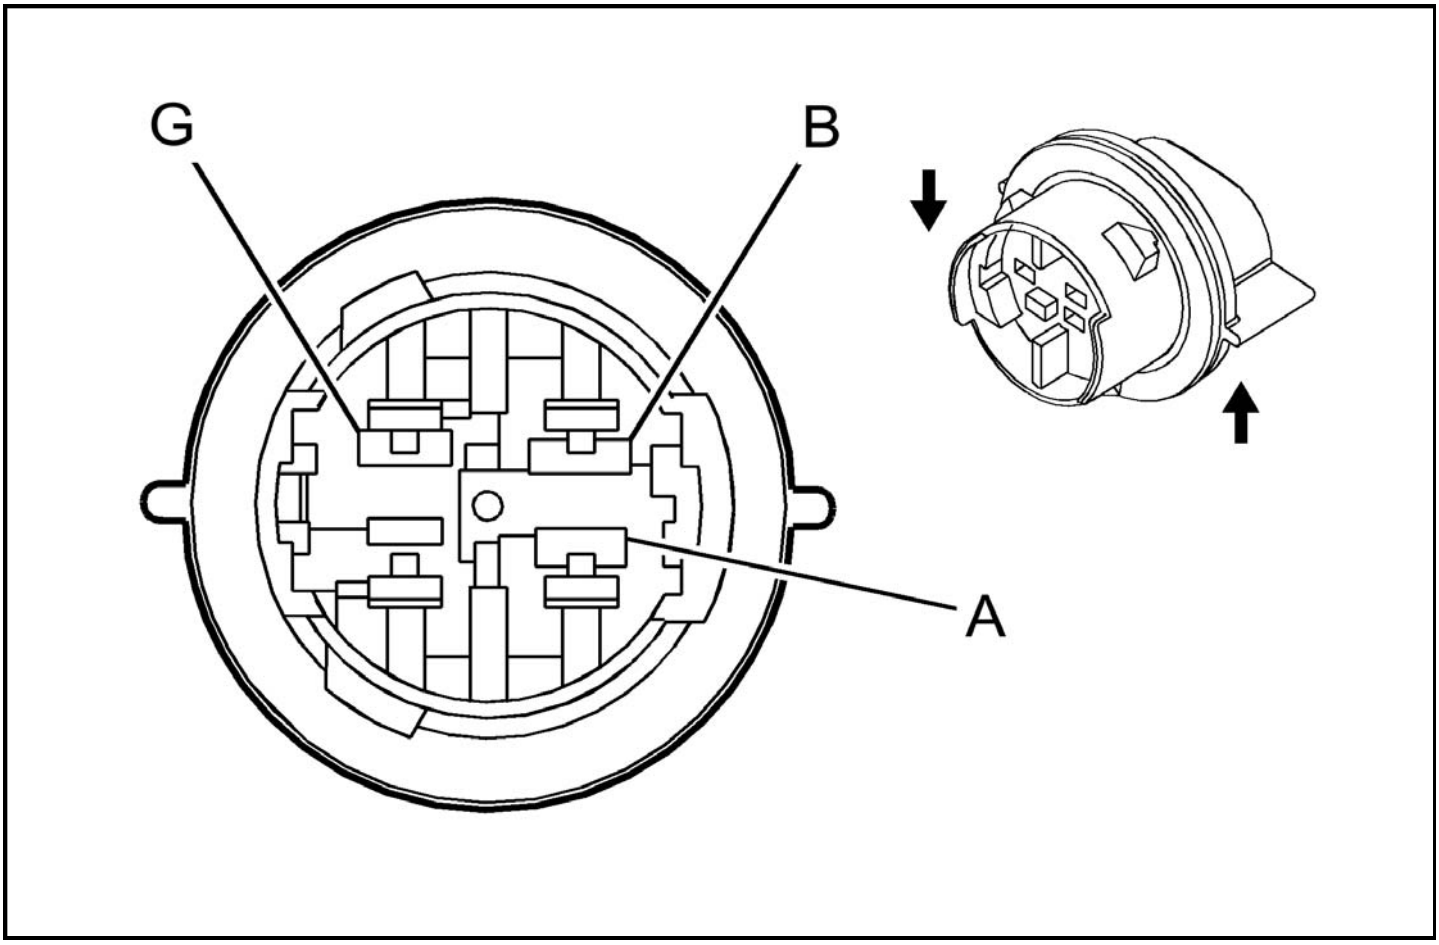
Terminal Part Information

- Terminated Lead: Service by Connector Assembly - 12102561
- Release Tool: J-38125-11A
- Diagnostic Test Probe: J-35616-42 (RD)
- Terminal/Tray: 12124515/1
- Core/Insulation Crimp: C/D

Park Brake Switch

Pin	Wire	Circuit	Function
A	0.5 OG/BK	233	Park Brake Switch Signal

PARK/TURN SIGNAL LAMP - LEFT



Connector Part Information

- Harness Type: Left Front Headlamp Assembly
- OEM Connector: 16530873
- Service Connector: Service by Harness - See Part Catalog
- Description: 3-Way F Lamp Socket (WH)

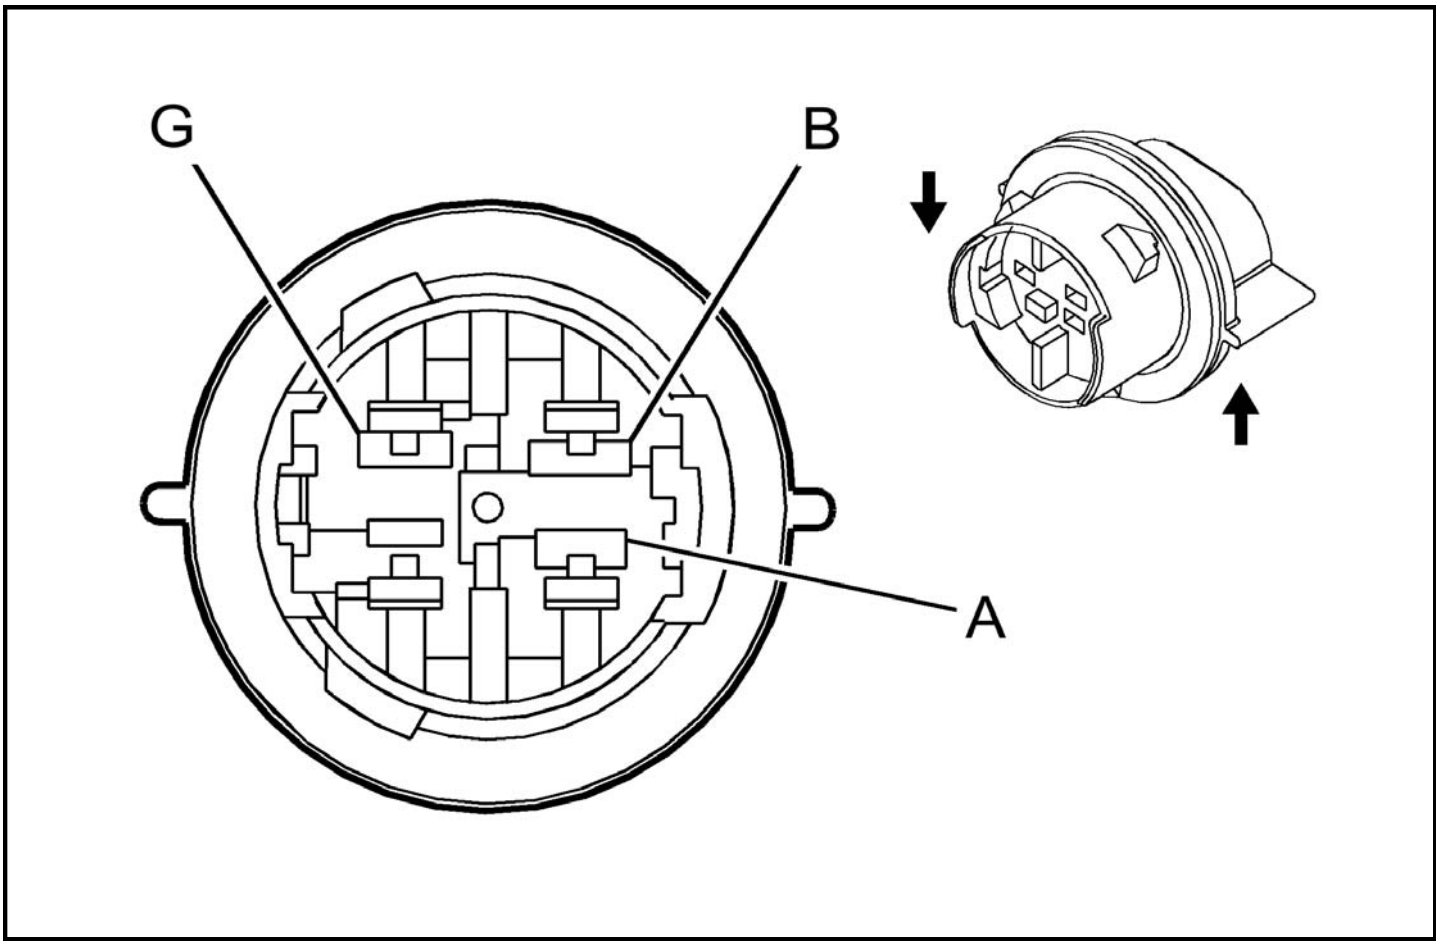
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: Not Available
- Diagnostic Test Probe: Not Available
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Park/Turn Signal Lamp - Left

Pin	Wire	Circuit	Function
A	0.8 YE	1314	Left Front Turn Signal Lamp Supply Voltage
B	0.8 RD	709	Left Park Lamp Supply Voltage
G	0.8 BK	1350	Ground

PARK/TURN SIGNAL LAMP - RIGHT



Connector Part Information

- Harness Type: Right Front Headlamp Assembly
- OEM Connector: 16530873
- Service Connector: Service by Harness - See Part Catalog
- Description: 3-Way F Lamp Socket (WH)

Terminal Part Information

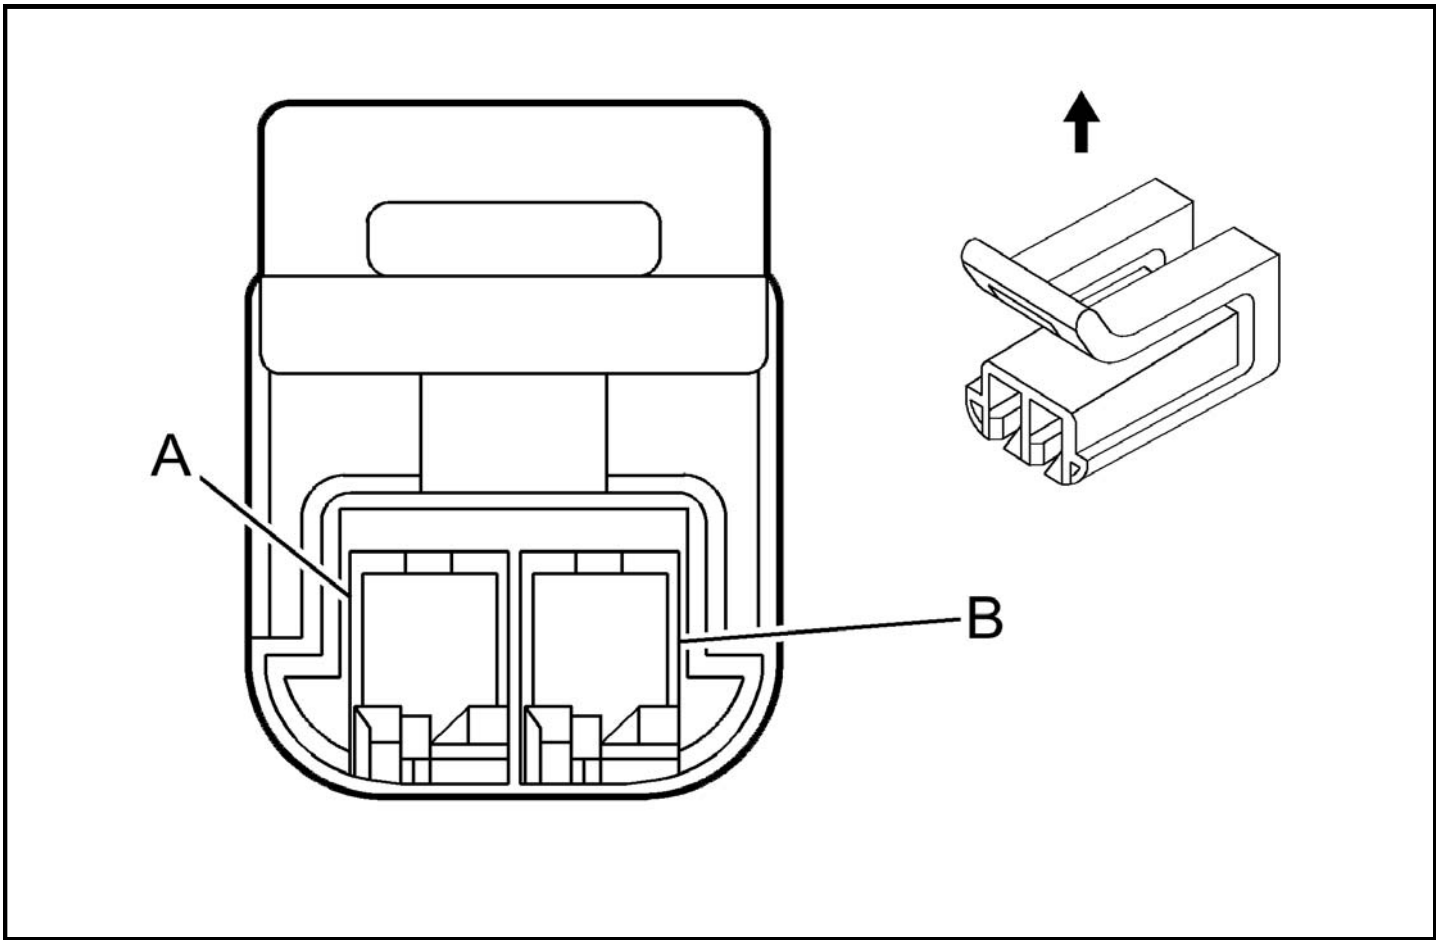
- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: Not Available
- Diagnostic Test Probe: Not Available
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Park/Turn Signal Lamp - Right

Pin	Wire	Circuit	Function
A	0.8 YE	1315	Right Front Turn Signal Lamp Supply Voltage
B	0.8 RD	309	Right Park Lamp Supply Voltage

Pin	Wire	Circuit	Function
G	0.8 BK	1250	Ground

PRESSURE CONTROL (PC) SOLENOID VALVE



Connector Part Information

- Harness Type: Transmission
- OEM Connector: 15466861
- Service Connector: Service by Harness- See Part Catalog
- Description: 2-Way F Metri-Pack 150.2 Series (GY)

Terminal Part Information

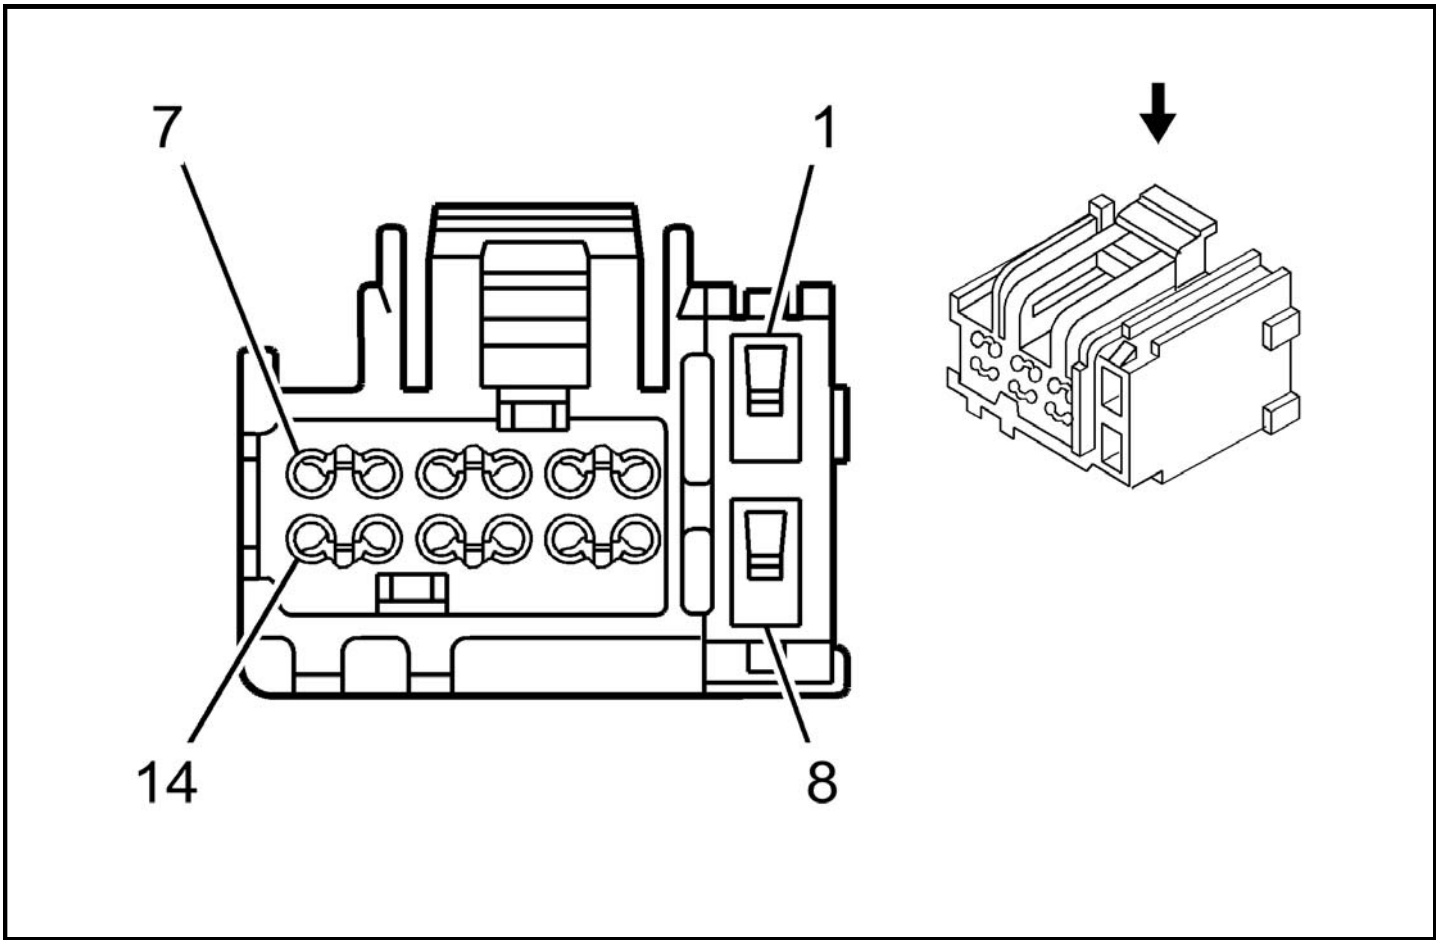
- Terminal/Tray: 12124075/5
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 12180559-1/J-35616-14 (GN)

Pressure Control (PC) Solenoid Valve

Pin	Wire	Circuit	Function
A	0.5 PU	1228	PC Solenoid Valve High Control

Pin	Wire	Circuit	Function
B	0.5 L-BU	1229	PC Solenoid Valve Low Control

RADIO X1



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 15488568
- Service Connector: 88988743
- Description: 14-Way F GT 150 Micro 64 Series (BK)

Terminal Part Information

- Pins: 1, 8
- Terminated Lead: 13575735
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 12191812/19
- Core/Insulation Crimp: C/A
- Pins: 2-6, 9-14

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-21
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: 15359541/4
- Core/Insulation Crimp: M/M

Radio X1

Pin	Wire	Circuit	Function
1	1 RD/WH	2040	Battery Positive Voltage
2	0.8 TN	201	Left Front Speaker Output (+) (UW6, 9C1, 9C3)

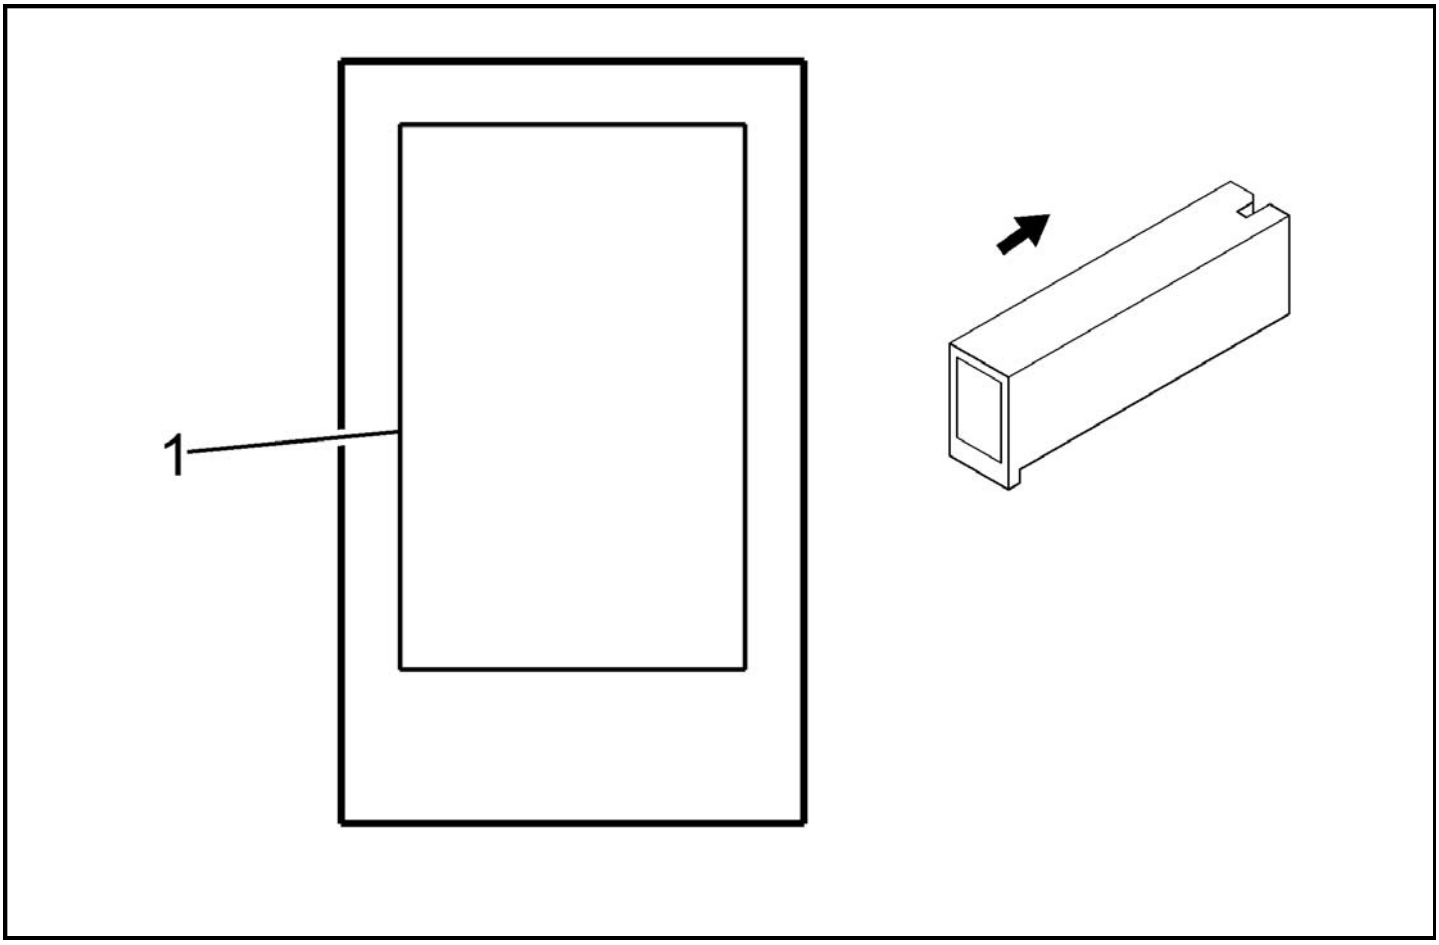
RADIO ANTENNA MODULE



Connector Part Information

- Harness Type: Body
- OEM Connector: 15368970
- Service Connector: 89046641
- Description: 1-Way F Positive Lock 187 Series (BK)

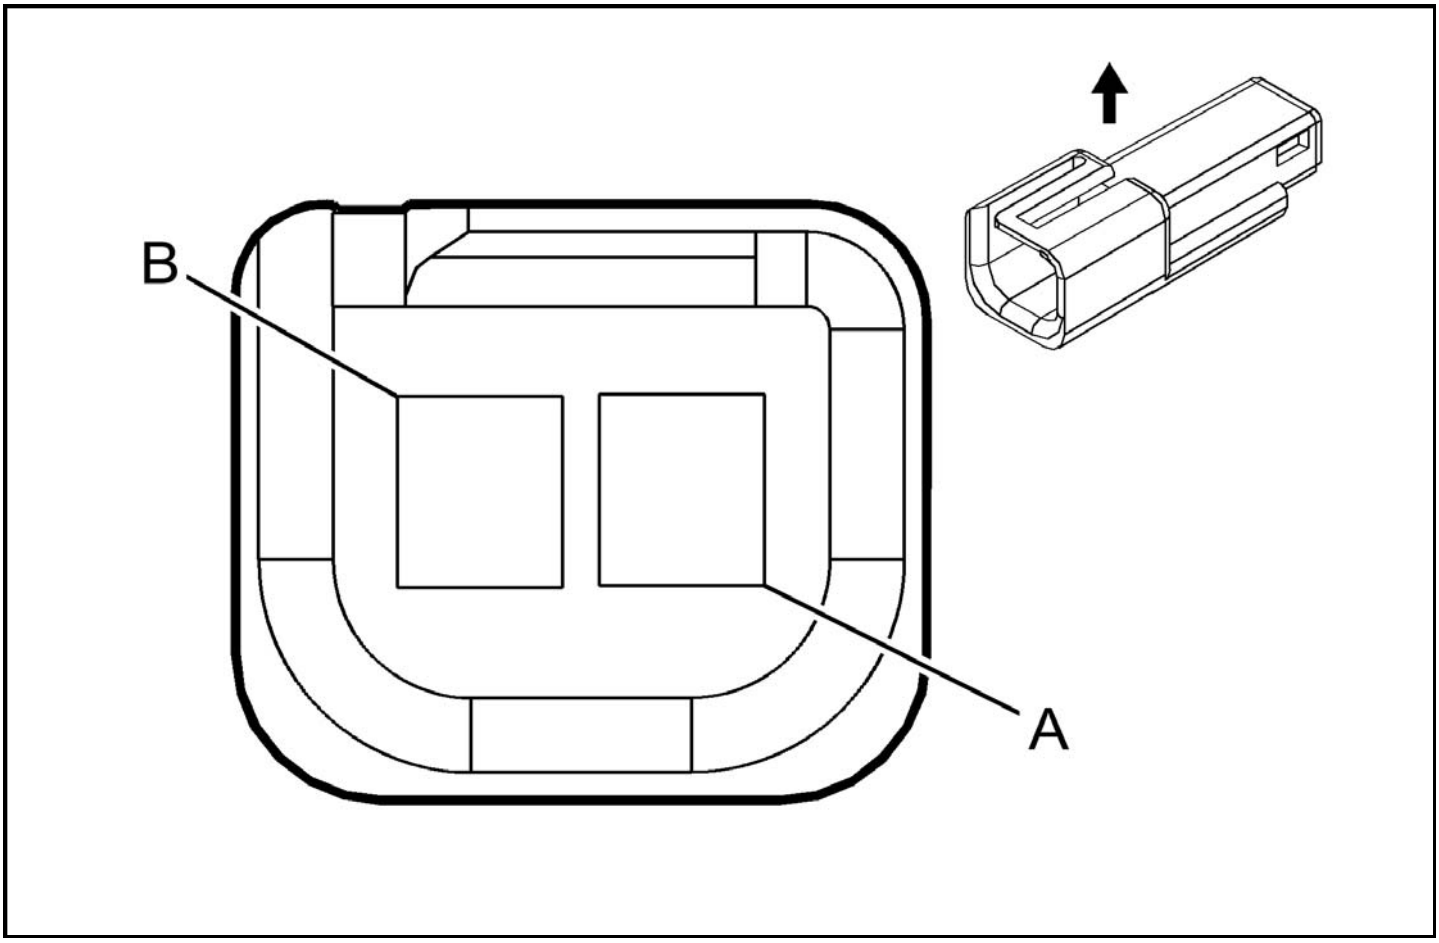
Terminal Part Information

- Terminated Lead: Service by Connector Assembly - 89046641
- Release Tool: J-38125-218
- Diagnostic Test Probe: J-35616-40 (BU)
- Terminal/Tray: 170325-1/24
- Core/Insulation Crimp: E/A

Radio Antenna Module

Pin	Wire	Circuit	Function
1	0.5 PK	5165	Antenna 14V Switched Supply Voltage

READING LAMP - AUXILIARY (6C7)



Connector Part Information

- Harness Type: Headliner
- OEM Connector: 12047663
- Service Connector: 13584278
- Description: 2-Way M Metri-Pack 150 Series (BK)

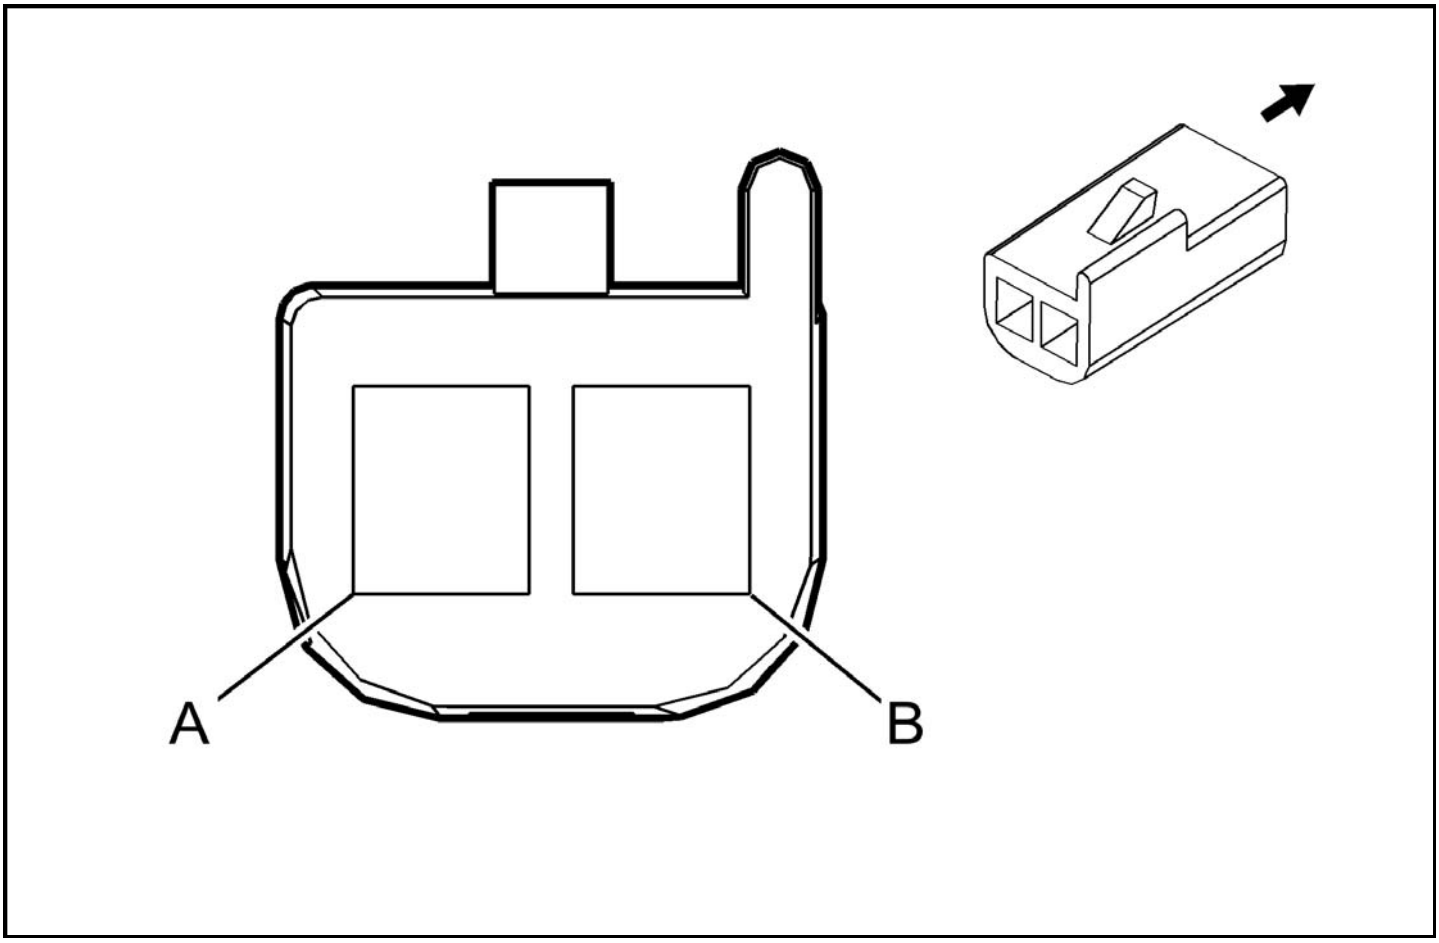
Terminal Part Information

- Terminated Lead: 13575462
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)
- Terminal/Tray: 12047581/2
- Core/Insulation Crimp: E/C

Reading Lamp - Auxiliary (6C7)

Pin	Wire	Circuit	Function
A	0.5 OG	1732	Inadvertent Power Courtesy Lamp
B	0.5 BK	550	Ground

REAR COMPARTMENT COURTESY LAMP



Connector Part Information

- Harness Type: Body
- OEM Connector: 12047662
- Service Connector: 12085535
- Description: 2-Way F Metri-Pack 150 Series (BK)

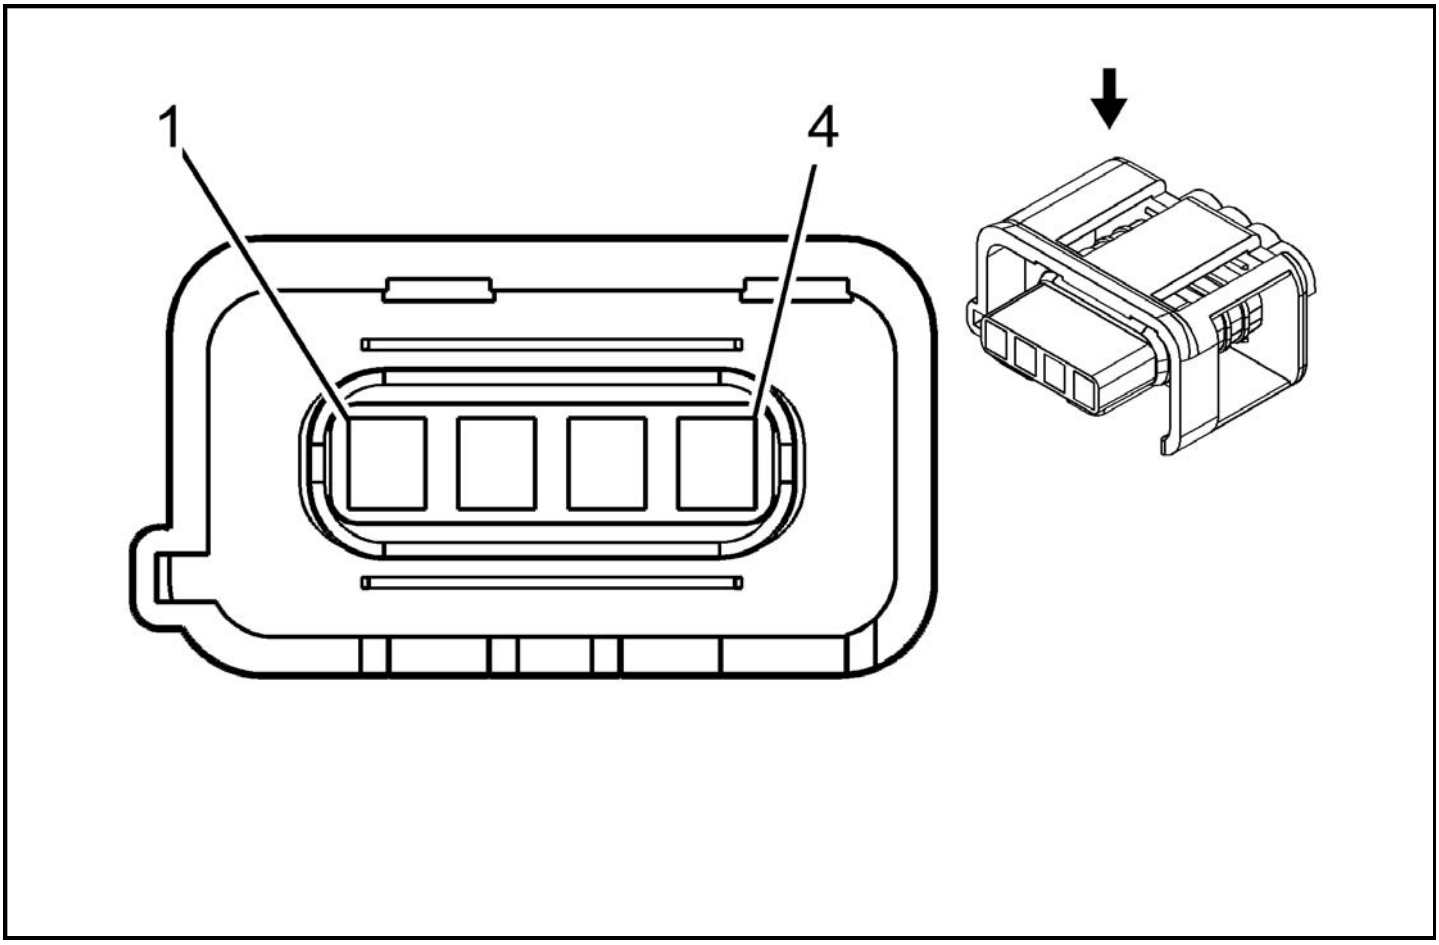
Terminal Part Information

- Terminated Lead: 13575464
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/5
- Core/Insulation Crimp: E/C

Rear Compartment Courtesy Lamp

Pin	Wire	Circuit	Function
A	0.8 BK	1732	Inadvertent Power Courtesy Lamp
B	0.5 BK	737	Rear Compartment Lamp Control

REAR COMPARTMENT LID LATCH



Connector Part Information

- Harness Type: Body
- OEM Connector: 15489982
- Service Connector: 88988815
- Description: 4-Way F Micro Timer Series, Sealed (BK)

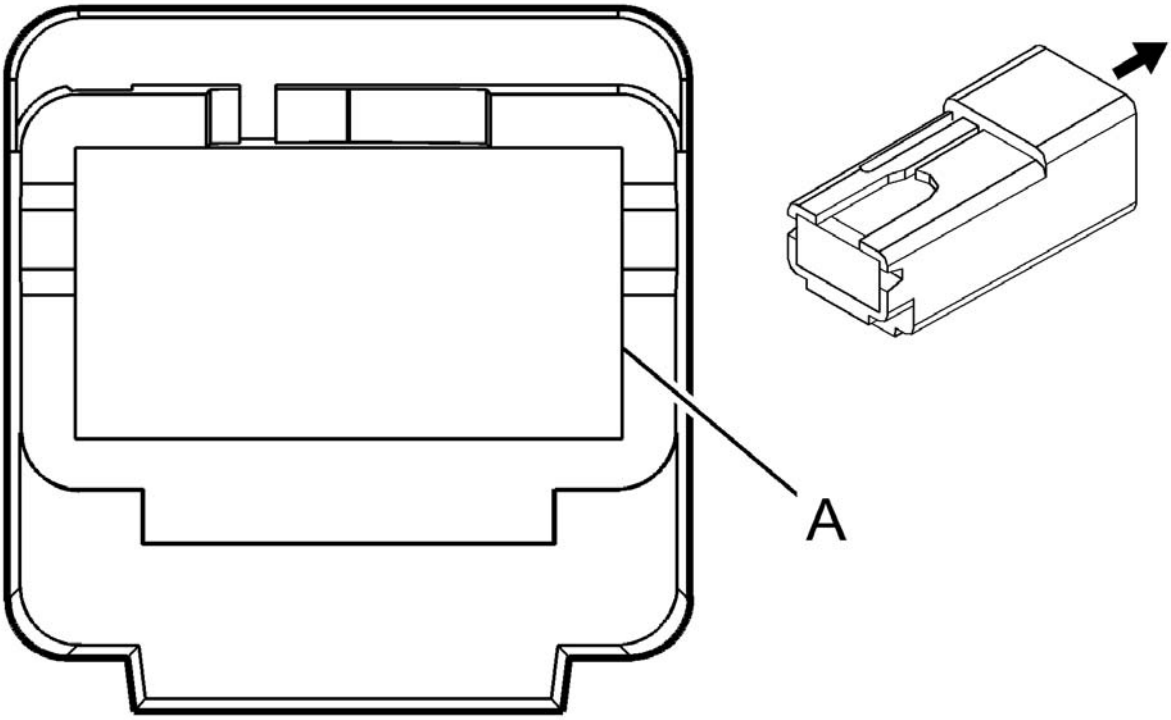
Terminal Part Information

- Terminated Lead: 13575359
- Release Tool: J-38125-560
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 964274-2/16
- Core/Insulation Crimp: E/1

Rear Compartment Lid Latch

Pin	Wire	Circuit	Function
1	0.5 BK	737	Rear Compartment Lamp Control
2	0.5 OG/BK	744	Rear Compartment Lid Ajar Switch Signal
3	0.5 BK	750	Ground
4	0.5 TN/WH	56	Trunk Release Motor Control

REAR WINDOW DEFOGGER GRID X1



Connector Part Information

- Harness Type: Headliner
- OEM Connector: 12092133
- Service Connector: 13580869
- Description: 1-Way F Metri-Pack 630 Series Self Lock (BK)

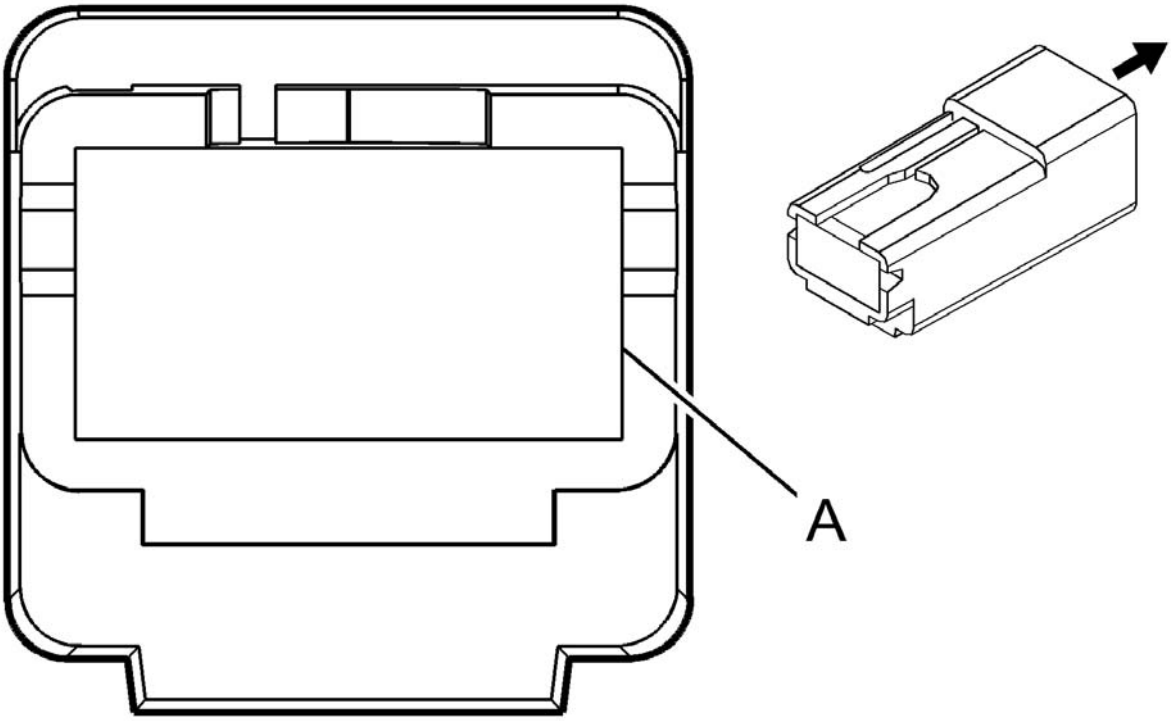
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-11A
- Diagnostic Test Probe: J-35616-42 (RD)
- Terminal/Tray: 12034110/18
- Core/Insulation Crimp: F/G

Rear Window Defogger Grid X1

Pin	Wire	Circuit	Function
A	3 BK	293	Rear Defog Element Supply Voltage

REAR WINDOW DEFOGGER GRID X2



Connector Part Information

- Harness Type: Body
- OEM Connector: 12092133
- Service Connector: 13580869
- Description: 1-Way F Metri-Pack 630 Series Self Lock (BK)

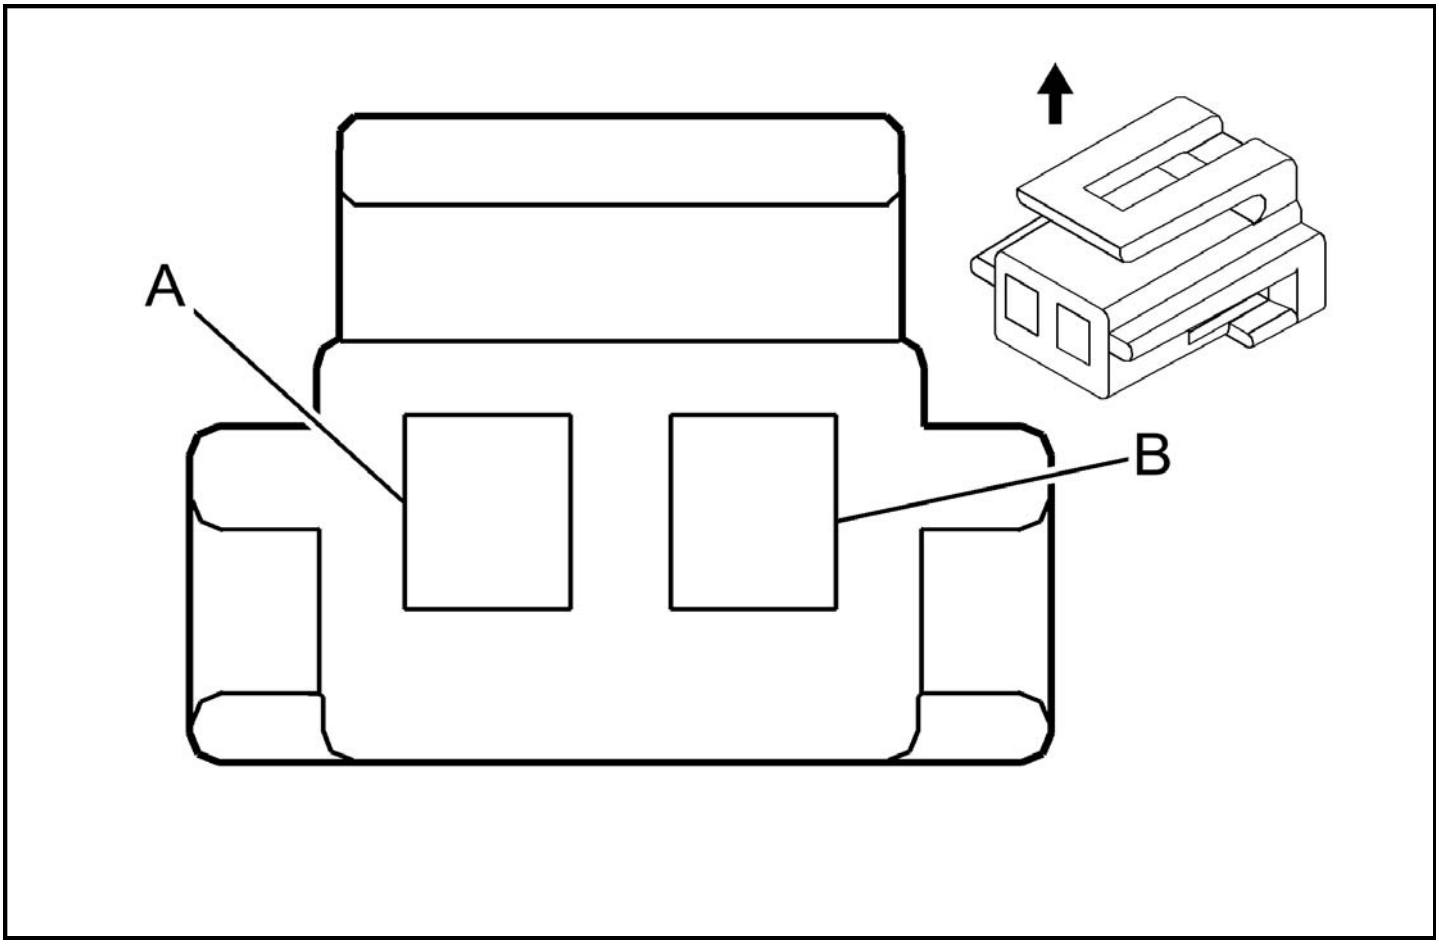
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-11A
- Diagnostic Test Probe: J-35616-42 (RD)
- Terminal/Tray: 12034110/18
- Core/Insulation Crimp: F/G

Rear Window Defogger Grid X2

Pin	Wire	Circuit	Function
A	5 BK	1150	Ground

RECIRCULATION ACTUATOR



Connector Part Information

- Harness Type: HVAC
- OEM Connector: 12059110
- Service Connector: 88953271
- Description: 2-Way F Metri-Pack 150 Series (BK)

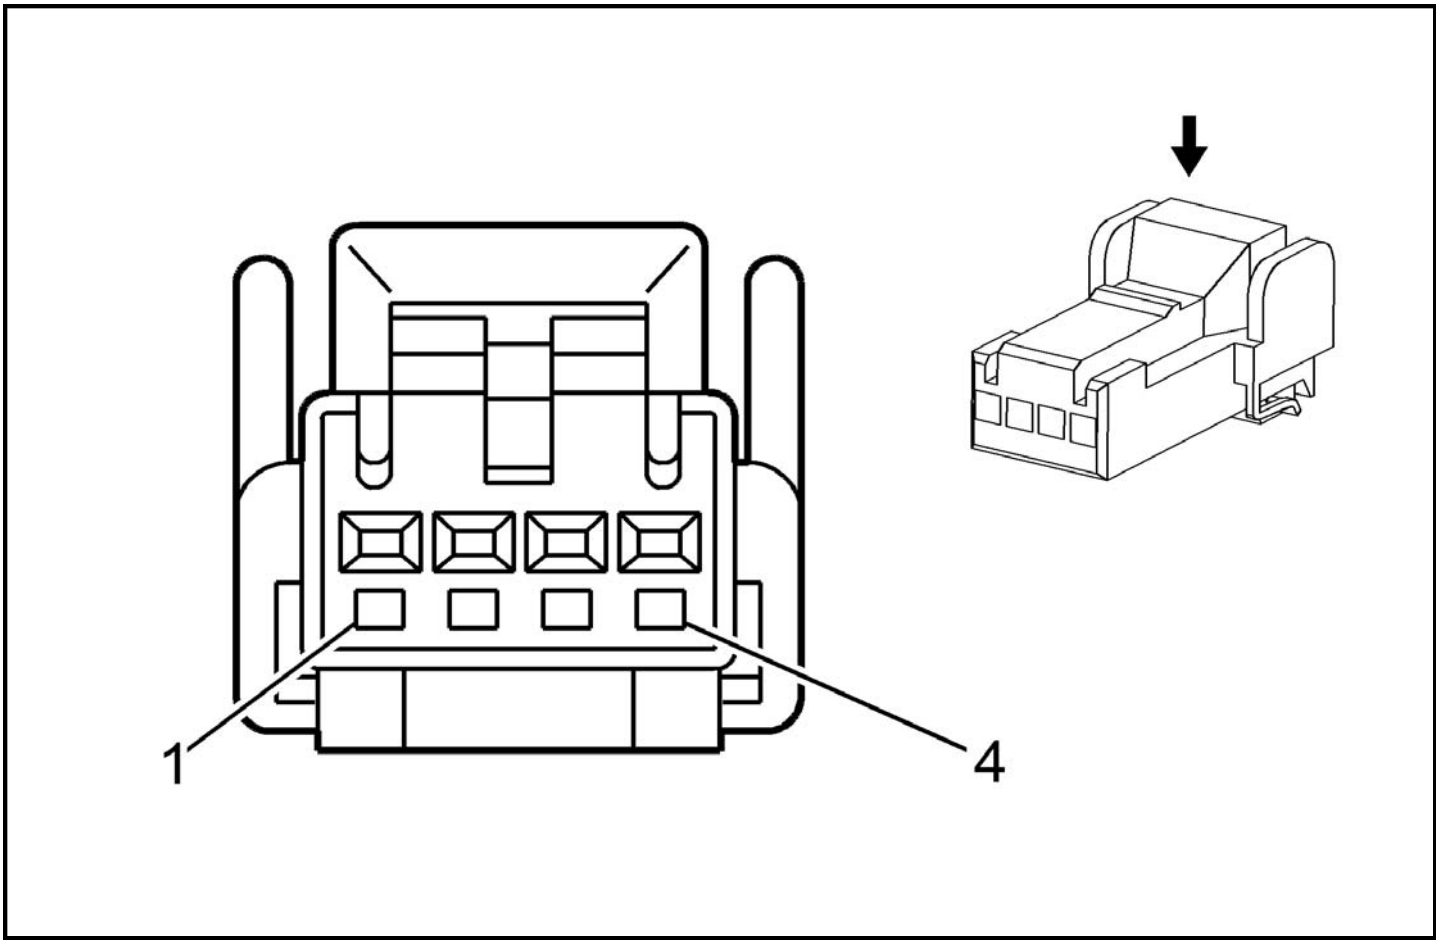
Terminal Part Information

- Terminal/Tray: 12064971/5
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Recirculation Actuator

Pin	Wire	Circuit	Function
A	0.35 L-GN/BK	1647	Recirculation Door Control B
B	0.35 PK/WH	1648	Recirculation Door Control A

REMOTE CONTROL DOOR LOCK RECEIVER (RCDLR)



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 15462684
- Service Connector: 13585474
- Description: 4-Way F ILAG5 Series (GN)

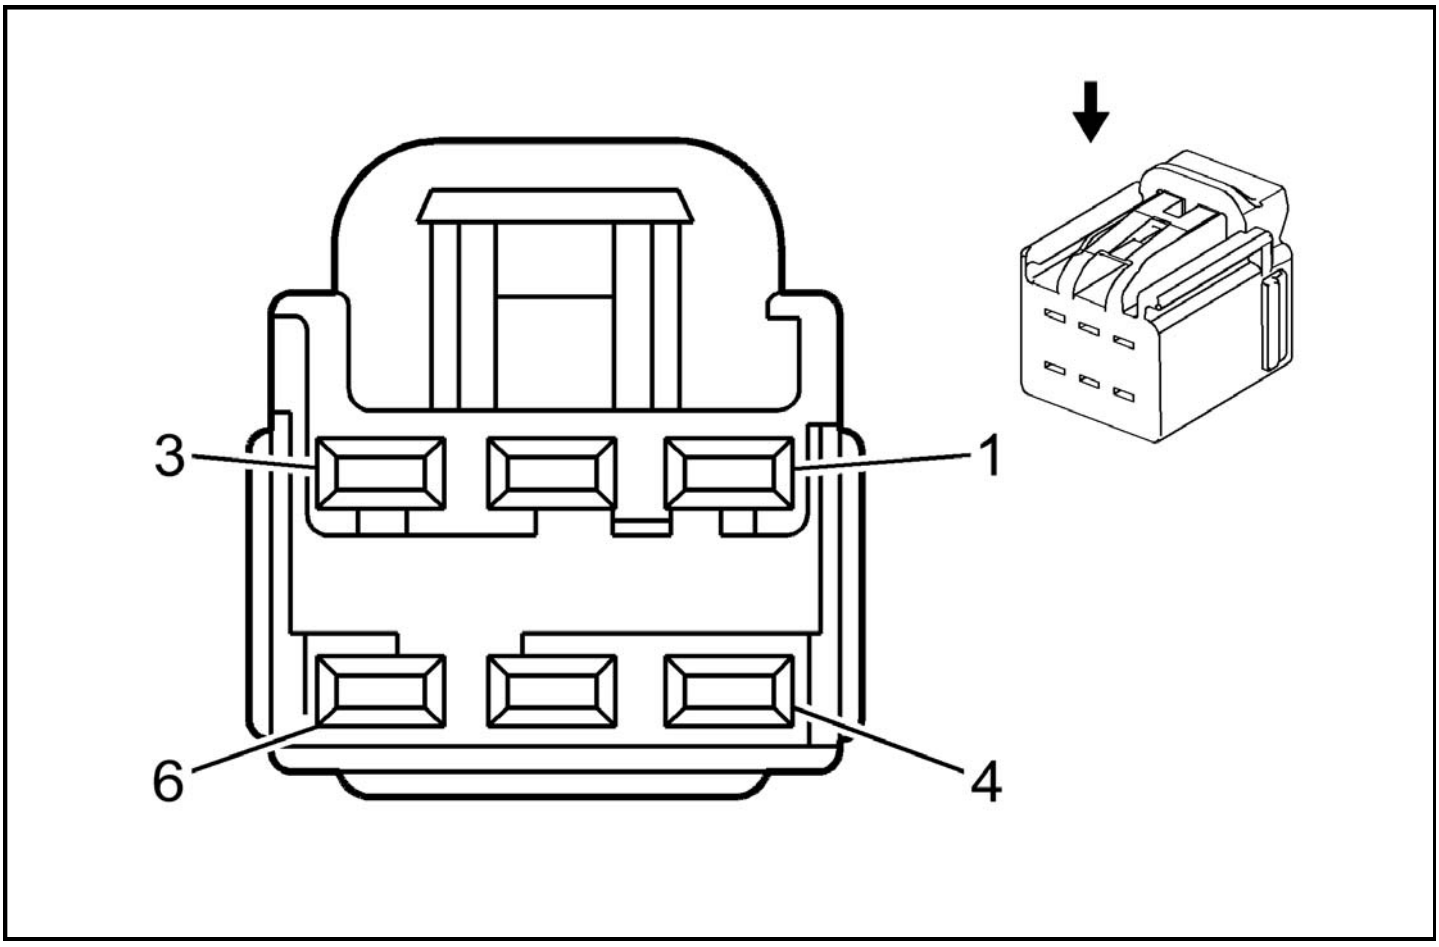
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-211
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: IL-AG5-C1-5000/20
- Core/Insulation Crimp: J/J

Remote Control Door Lock Receiver (RCDLR)

Pin	Wire	Circuit	Function
1	0.35 RD/WH	1840	Battery Positive Voltage
2	0.35 D-GN/RD	5060	Low Speed GMLAN Serial Data
3	-	-	Not Used
4	0.5 BK/WH	1551	Ground

SEAT ADJUSTER MOTOR ASSEMBLY - DRIVER (AG1, AH5)



Connector Part Information

- Harness Type: Left Front Seat
- OEM Connector: 10847014
- Service Connector: 19153175
- Description: 6-Way F Kaizen YESC Series (L-GY)

Terminal Part Information

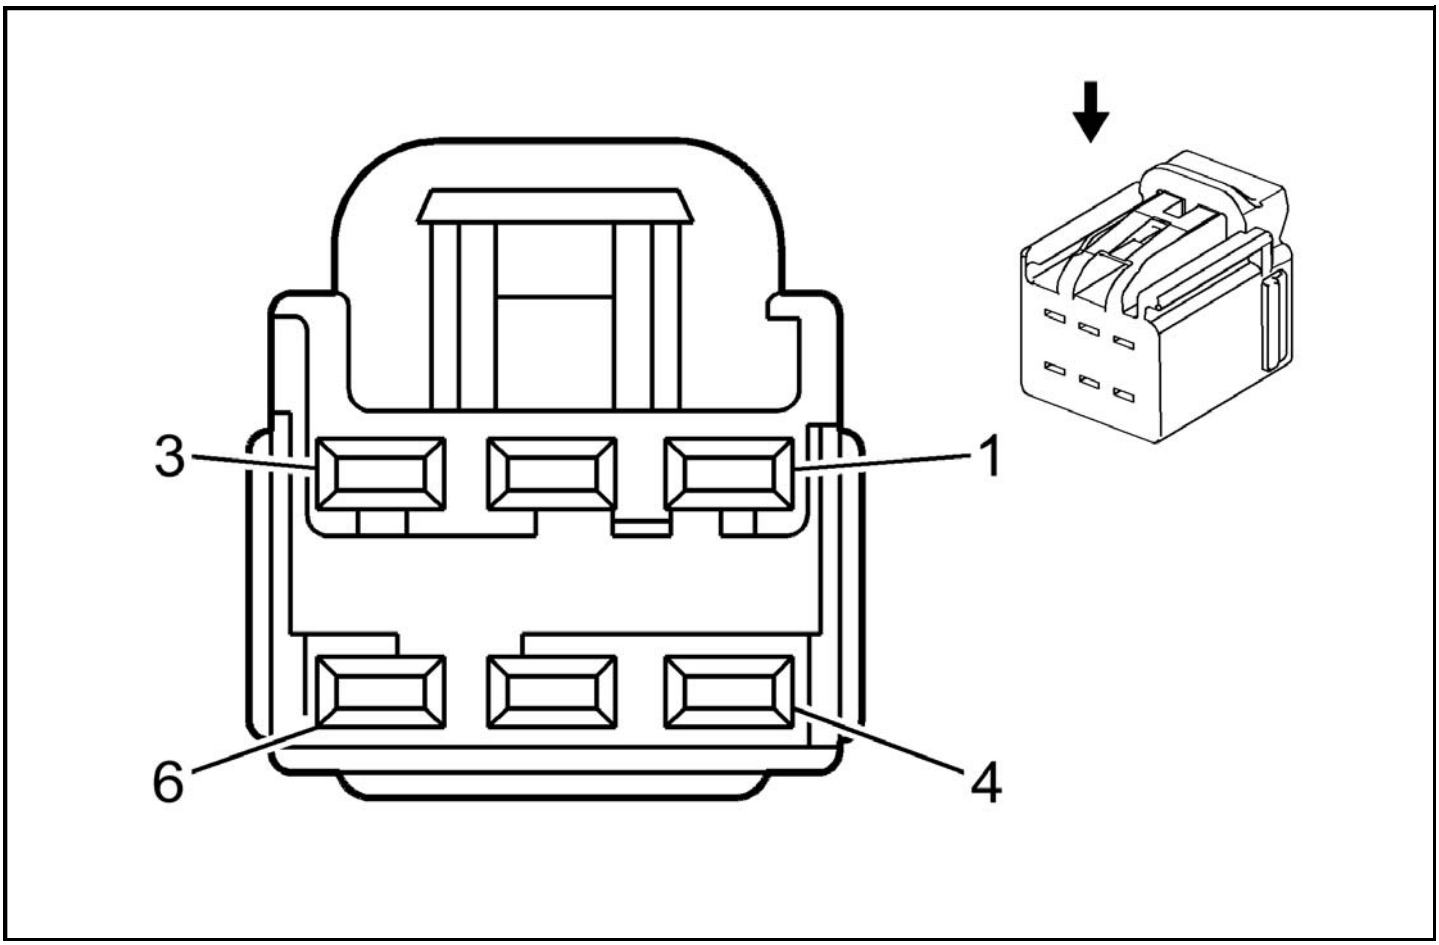
- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-11A
- Diagnostic Test Probe: J-35616-35 (VT)
- Terminal/Tray: 7116-4112-02/9
- Core/Insulation Crimp: C/D

Seat Adjuster Motor Assembly - Driver (AG1, AH5)

Pin	Wire	Circuit	Function
1	3 YE	282	Driver Seat Rear Vertical Motor Up Control
2	3 D-GN	286	Driver Seat Front Vertical Motor Up Control

Pin	Wire	Circuit	Function
3	3 TN	285	Driver Seat Horizontal Motor Forward Control
4	3 L-BU	283	Driver Seat Rear Vertical Motor Down Control
5	3 D-BU	287	Driver Seat Front Vertical Motor Down Control
6	3 L-GN	284	Driver Seat Horizontal Motor Rearward Control

SEAT ADJUSTER MOTOR ASSEMBLY - PASSENGER (AG2)



Connector Part Information

- Harness Type: Passenger Seat Harness
- OEM Connector: 10847014
- Service Connector: 19153175
- Description: 6-Way F Kaizen YESC Series (L-GY)

Terminal Part Information

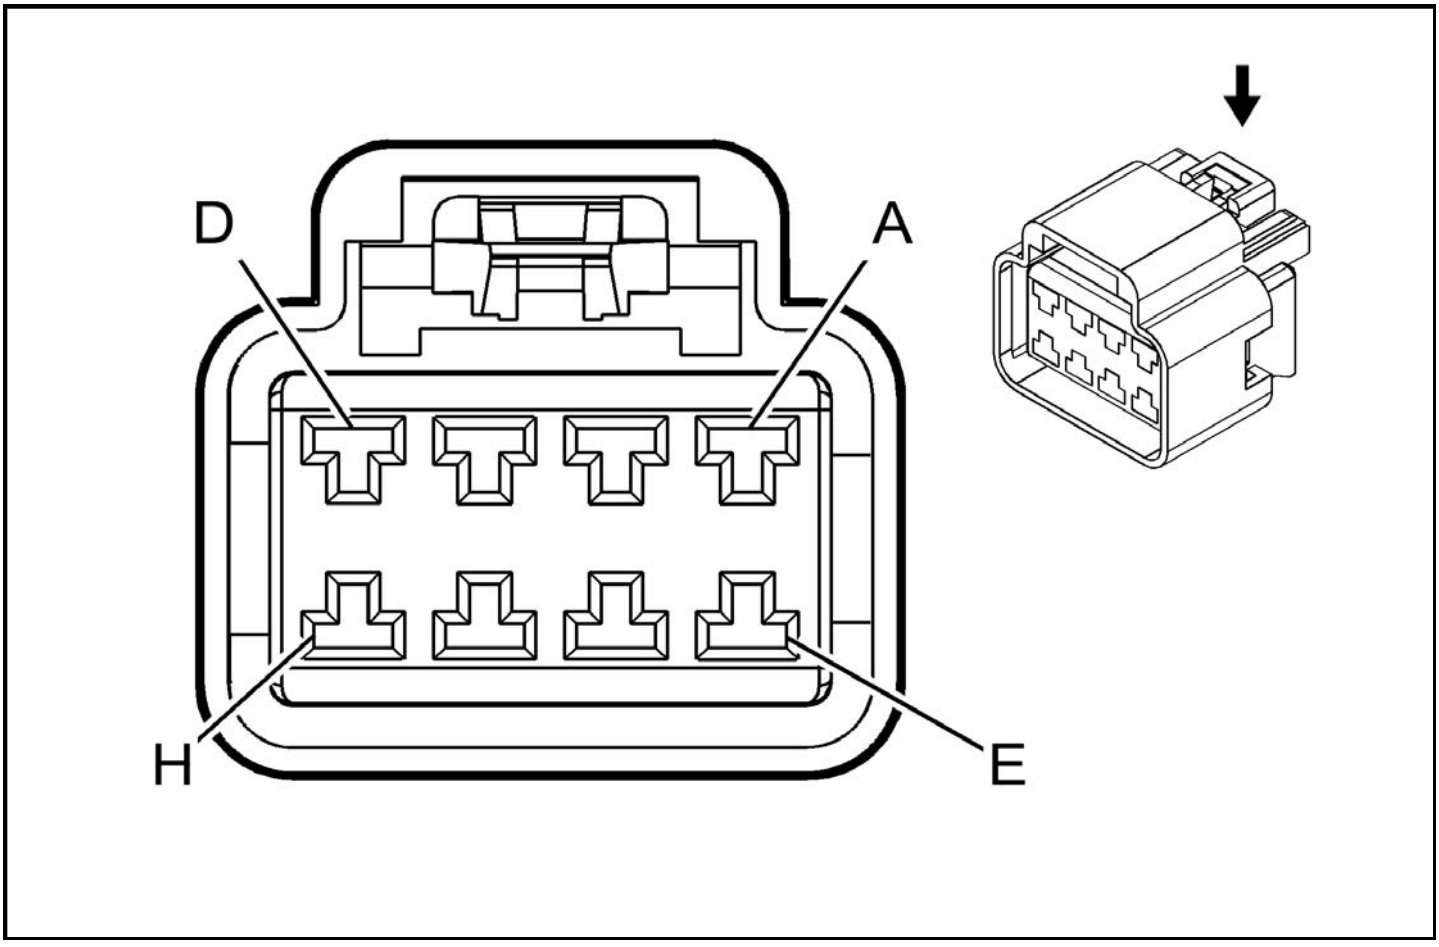
- Terminated Lead: Service by Harness- See Part Catalog

- Release Tool: J-38125-11A
- Diagnostic Test Probe: J-35616-35 (VT)
- Terminal/Tray: 7116-4112-02/9
- Core/Insulation Crimp: C/D

Seat Adjuster Motor Assembly - Passenger (AG2)

Pin	Wire	Circuit	Function
1	3 YE	282	Passenger Seat Rear Vertical Motor Up Control
2	3 D-GN	286	Passenger Seat Front Vertical Motor Up Control
3	3 TN	285	Passenger Seat Horizontal Motor Forward Control
4	3 L-BU	283	Passenger Seat Rear Vertical Motor Down Control
5	3 D-BU	287	Passenger Seat Front Vertical Motor Down Control
6	3 L-GN	284	Passenger Seat Horizontal Motor Rearward Control

SEAT ADJUSTER SWITCH - DRIVER (AG1)



Connector Part Information

- Harness Type: Left Front Seat
- OEM Connector: 15459914
- Service Connector: 19153751
- Description: 8-Way F GT 280 Series (BK)

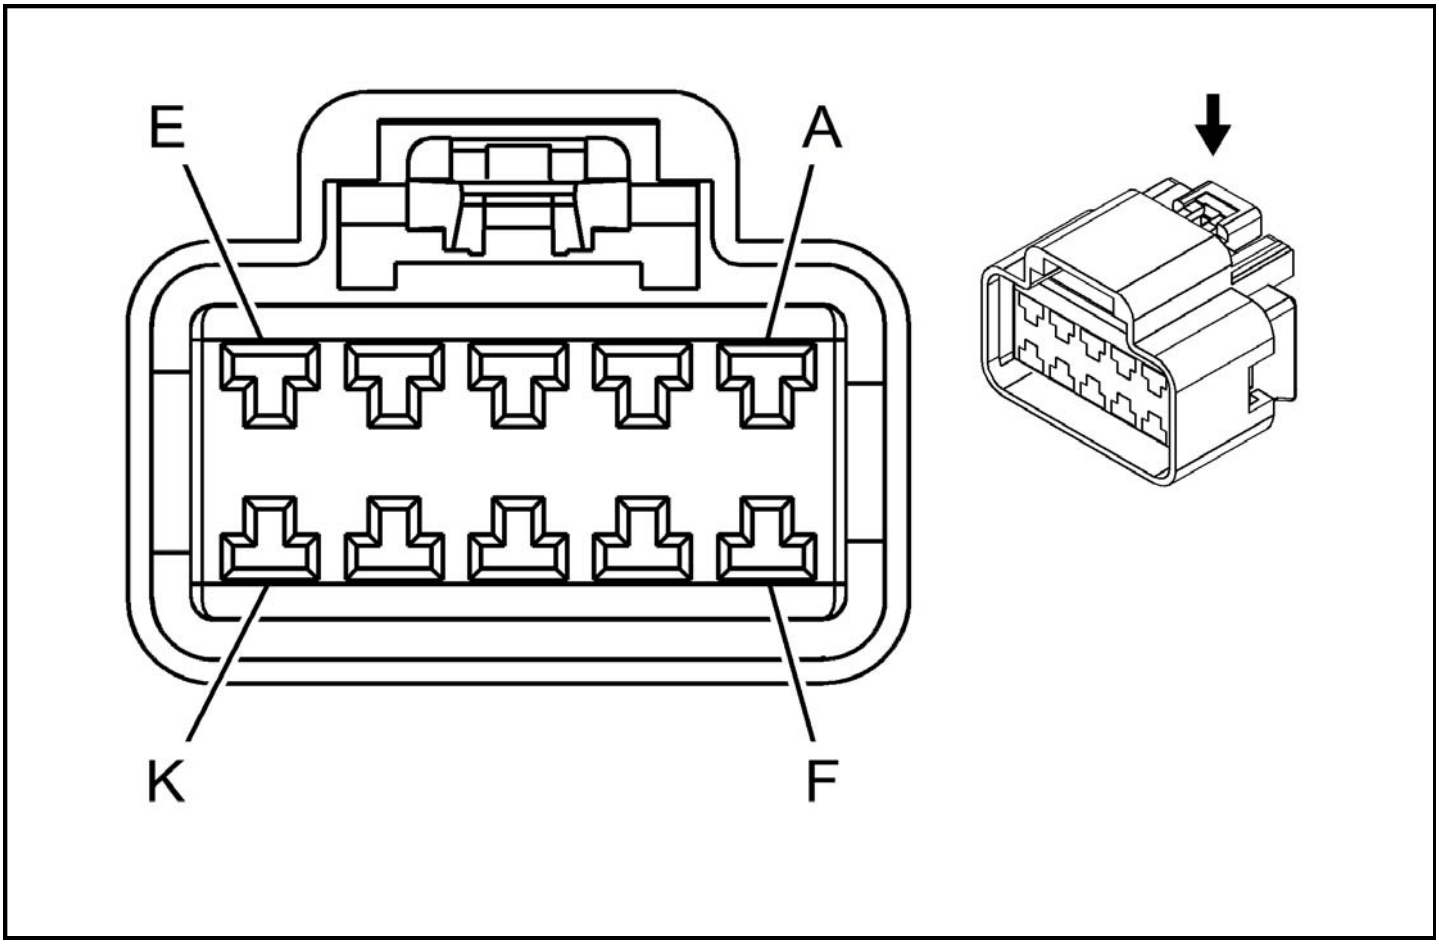
Terminal Part Information

- Terminated Lead: 13575756
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 15304713/19
- Core/Insulation Crimp: F/D

Seat Adjuster Switch - Driver (AG1)

Pin	Wire	Circuit	Function
A	3 D-GN	286	Driver Seat Front Vertical Motor Up Control
B	3 BK	550	Ground
C	3 TN	285	Driver Seat Horizontal Motor Forward Control
D	3 RD/WH	1140	Battery Positive Voltage
E	3 YE	282	Driver Seat Rear Vertical Motor Up Control
F	3 L-GN	284	Driver Seat Horizontal Motor Rearward Control
G	3 L-BU	283	Driver Seat Rear Vertical Motor Down Control
H	3 D-BU	287	Driver Seat Front Vertical Motor Down Control

SEAT ADJUSTER SWITCH - DRIVER (AH5)



Connector Part Information

- Harness Type: Left Front Seat
- OEM Connector: 15326931
- Service Connector: 15306309
- Description: 10-Way F GT 280 Series (BK)

Terminal Part Information

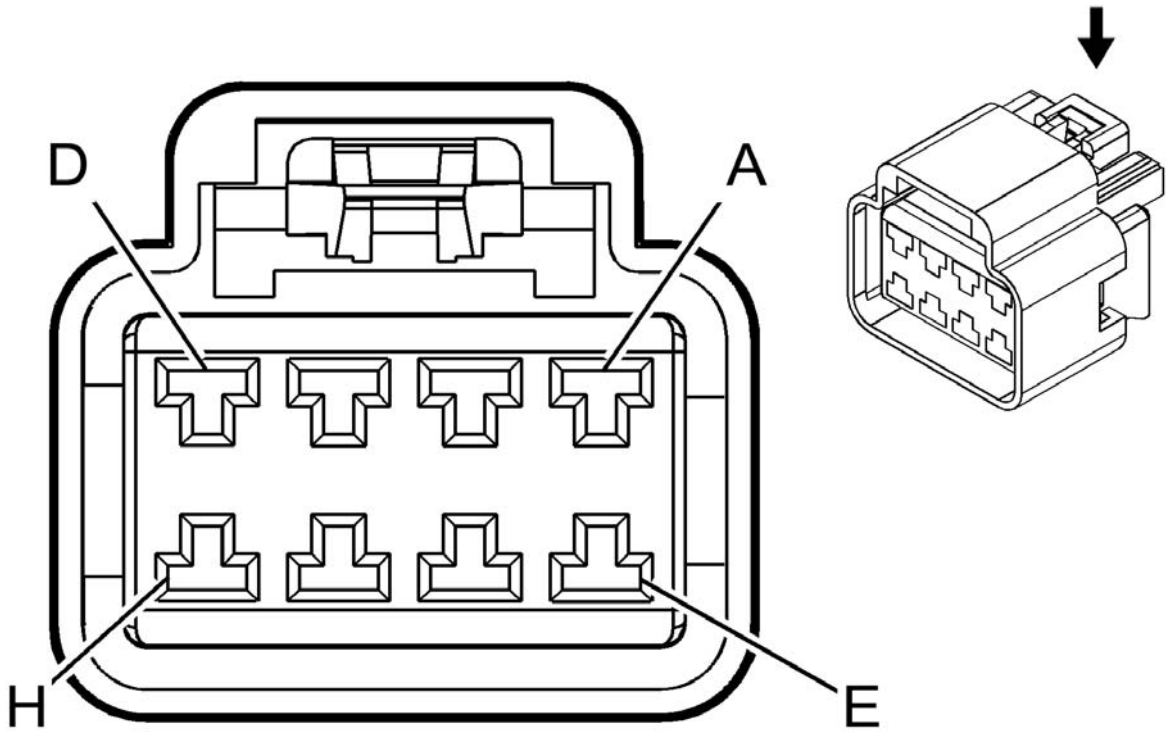
- Terminated Lead: 13575753
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 15304711/8
- Core/Insulation Crimp: E/A

Seat Adjuster Switch - Driver (AH5)

Pin	Wire	Circuit	Function
A	3 D-GN	286	Driver Seat Front Vertical Motor Up Control
B	3 BK	550	Ground
C	3 L-GN	284	Driver Seat Horizontal Motor Rearward Control

Pin	Wire	Circuit	Function
D	3 TN	285	Driver Seat Horizontal Motor Forward Control
E	3 RD/WH	1140	Battery Positive Voltage
F	3 YE	282	Driver Seat Rear Vertical Motor Up Control
G	3 D-BU	77	Driver Seat Recline Motor Rearward Control
H	3 D-GN	76	Driver Seat Recline Motor Forward Control
J	3 L-BU	283	Driver Seat Rear Vertical Motor Down Control
K	3 D-BU	287	Driver Seat Front Vertical Motor Down Control

SEAT ADJUSTER SWITCH - PASSENGER (AG2)



Connector Part Information

- Harness Type: Right Front Seat
- OEM Connector: 15459914
- Service Connector: 19153751
- Description: 8-Way F GT 280 Series (BK)

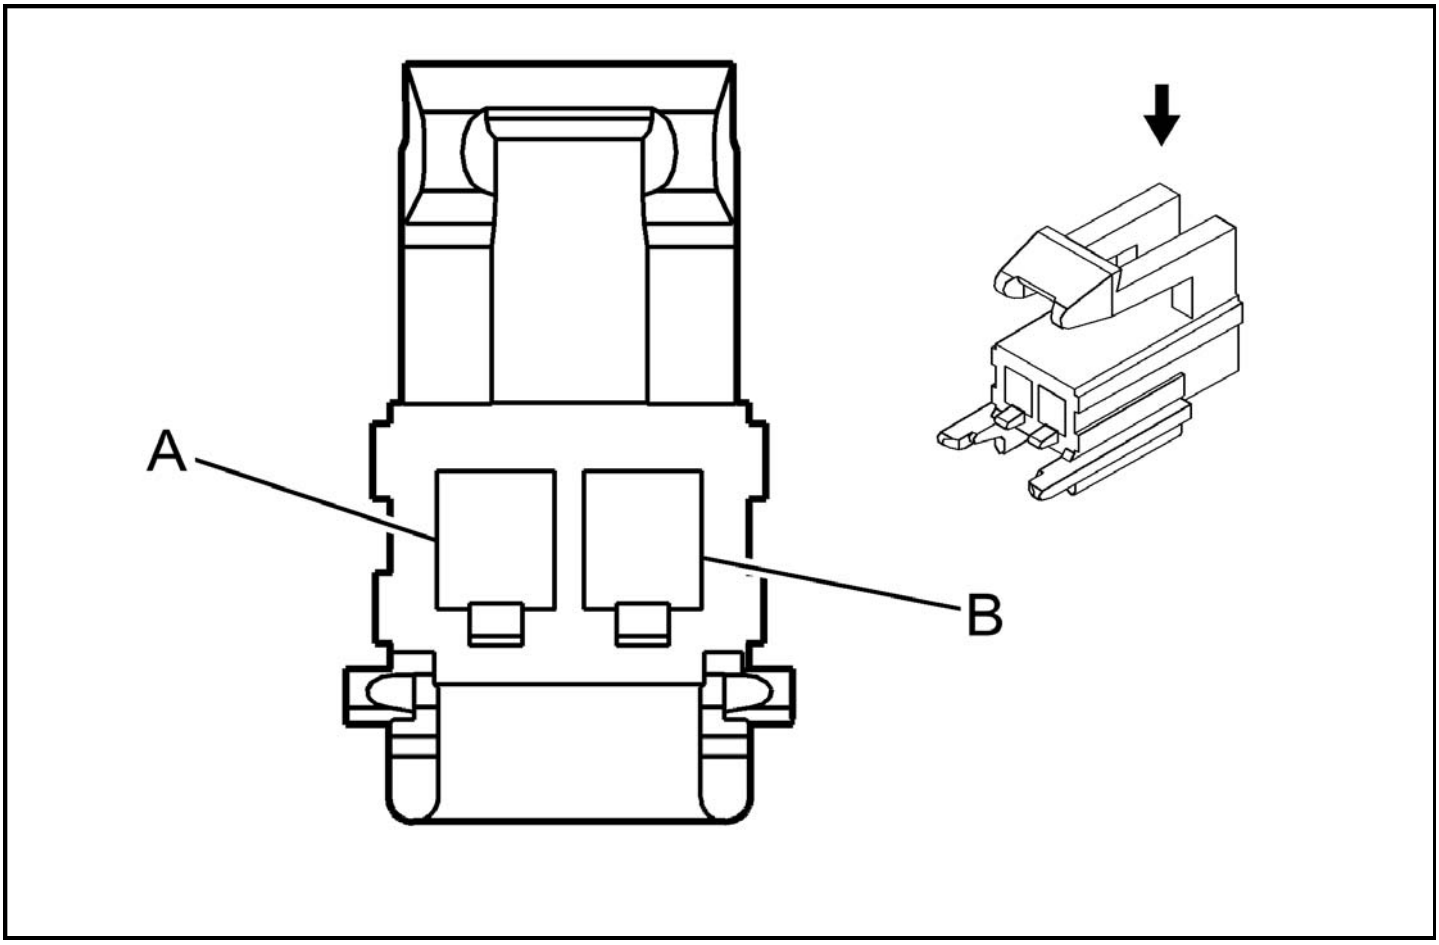
Terminal Part Information

- Terminated Lead: 13575756
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 15304713/19
- Core/Insulation Crimp: F/D

Seat Adjuster Switch - Passenger (AG2)

Pin	Wire	Circuit	Function
A	3 D-BU	287	Passenger Seat Front Vertical Motor Down Control
B	3 BK	750	Ground
C	3 TN	285	Passenger Seat Horizontal Motor Forward Control
D	3 RD/WH	1140	Battery Positive Voltage
E	3 L-BU	283	Passenger Seat Rear Vertical Motor Down Control
F	3 L-GN	284	Passenger Seat Horizontal Motor Rearward Control
G	3 YE	282	Passenger Seat Rear Vertical Motor Up Control
H	3 D-GN	286	Passenger Seat Front Vertical Motor Up Control

SEAT BELT RETRACTOR PRETENSIONER - DRIVER



Connector Part Information

- Harness Type: Body
- OEM Connector: 12110505
- Service Connector: 15306044
- Description: 2-Way F Metri-Pack 150 Series (YE)

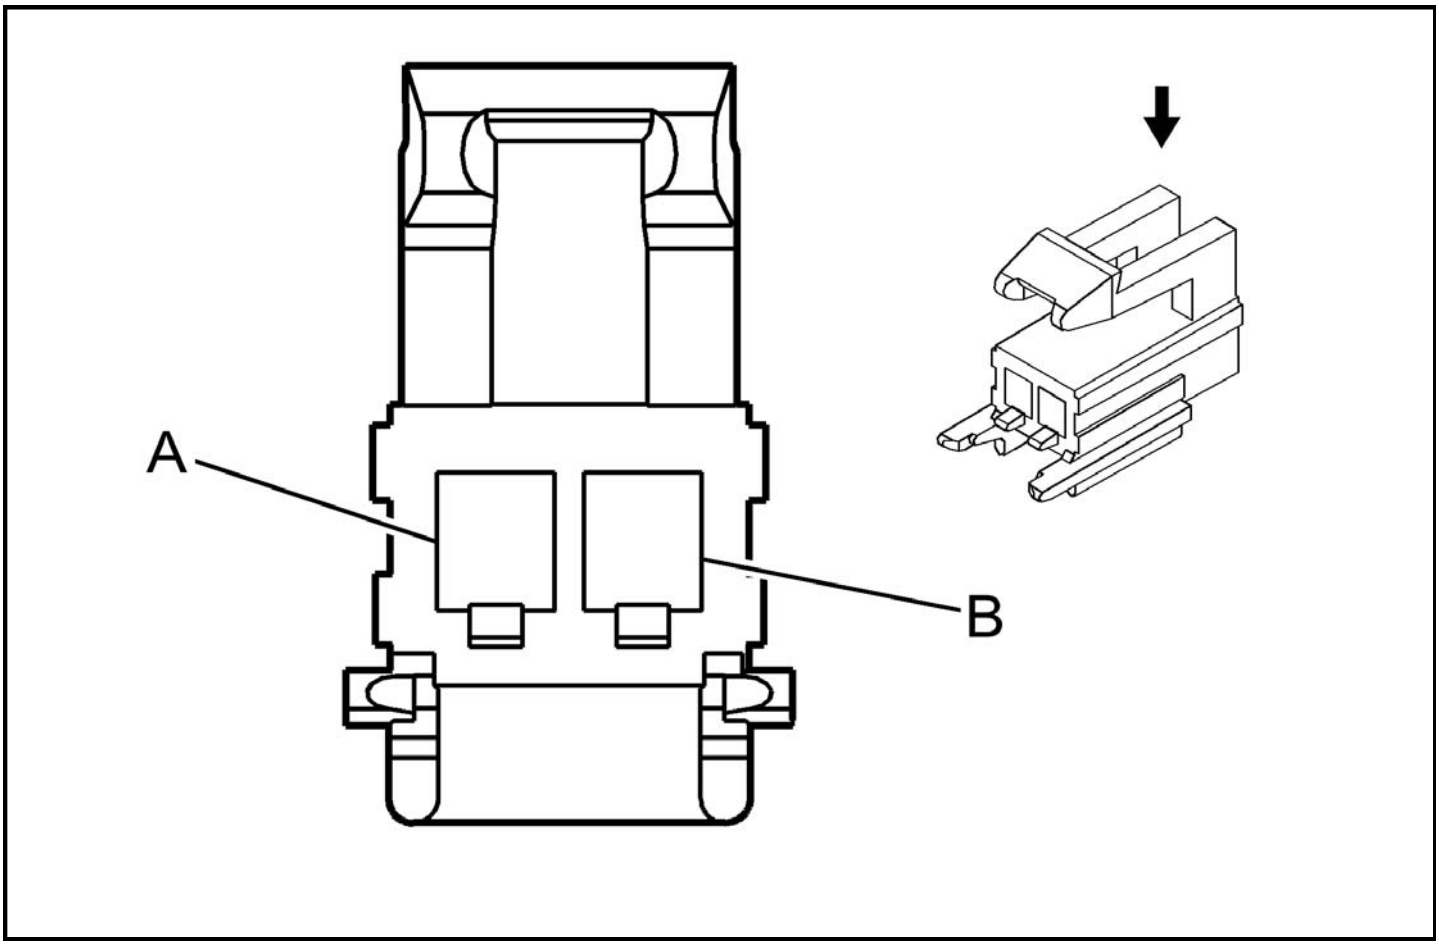
Terminal Part Information

- Terminated Lead: 13575464
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/5
- Core/Insulation Crimp: E/C

Seat Belt Retractor Pretensioner - Driver

Pin	Wire	Circuit	Function
A	0.35 TN/WH	2118	Seat Belt Retractor Pretensioner- Driver- High Control
B	0.35 OG/BK	2119	Seat Belt Retractor Pretensioner- Driver- Low Control

SEAT BELT RETRACTOR PRETENSIONER - PASSENGER



Connector Part Information

- Harness Type: Body
- OEM Connector: 12110505
- Service Connector: 15306044
- Description: 2-Way F Metri-Pack 150 Series (YE)

Terminal Part Information

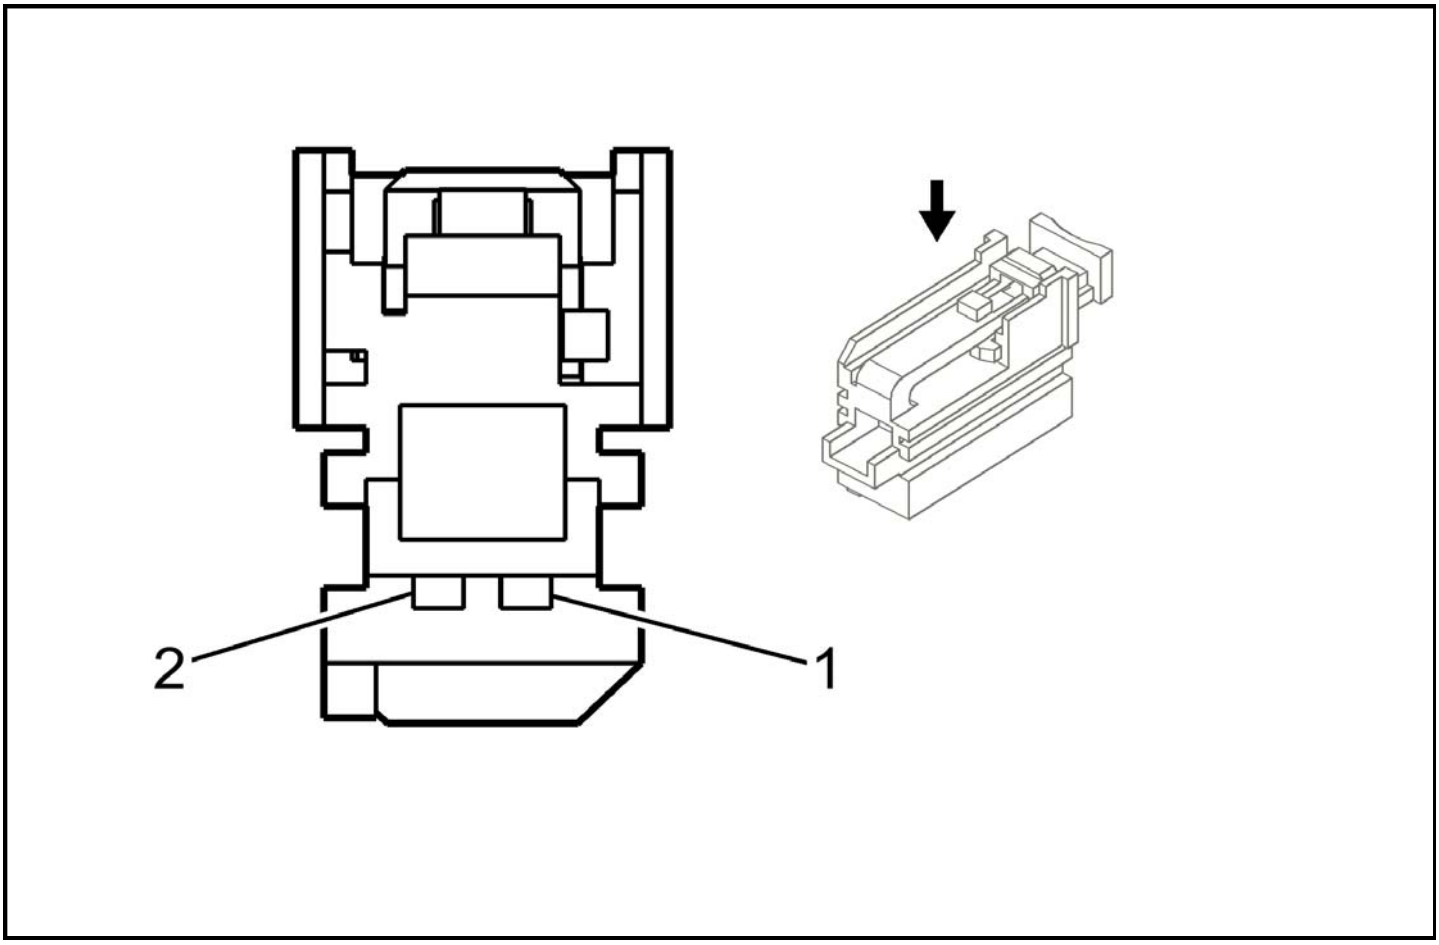
- Terminated Lead: 13575464
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/5
- Core/Insulation Crimp: E/C

Seat Belt Retractor Pretensioner - Passenger

Pin	Wire	Circuit	Function
A	0.35 L-GN	2116	Seat Belt Retractor Pretensioner - Passenger - High Control

Pin	Wire	Circuit	Function
B	0.35 OG	2117	Seat Belt Retractor Pretensioner - Passenger - Low Control

SEAT BELT PRETENSIONER - DRIVER



Connector Part Information

- Harness Type: Left Front Seat
- OEM Connector: 13676743
- Service Connector: Service by Harness- See Part Catalog
- Description: 2-Way F 0.64 Series (YE)

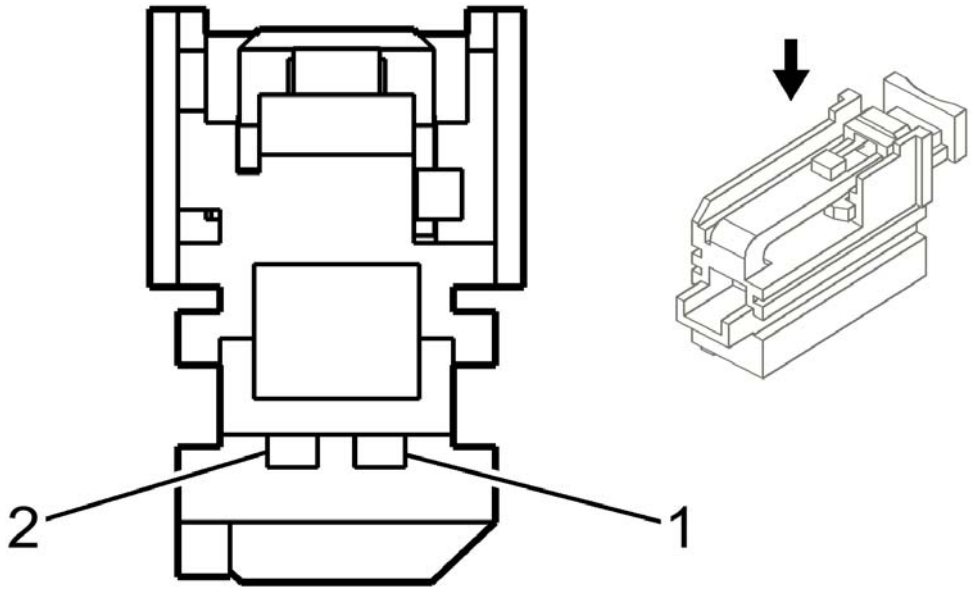
Terminal Part Information

- Terminated Lead: 13575867
- Release Tool: J-38125-215A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: SAIT-A03T-M064/14
- Core/Insulation Crimp: P/P

Seat Belt Pretensioner - Driver

Pin	Wire	Circuit	Function
1	0.5 WH	3064	Seat Belt Pretensioner- Driver- High Control
2	0.5 YE/BK	3065	Seat Belt Pretensioner- Driver- Low Control

SEAT BELT PRETENSIONER - PASSENGER



Connector Part Information

- Harness Type: Right Front Seat
- OEM Connector: 13676743
- Service Connector: Service by Harness- See Part Catalog
- Description: 2-Way F 0.64 Series (YE)

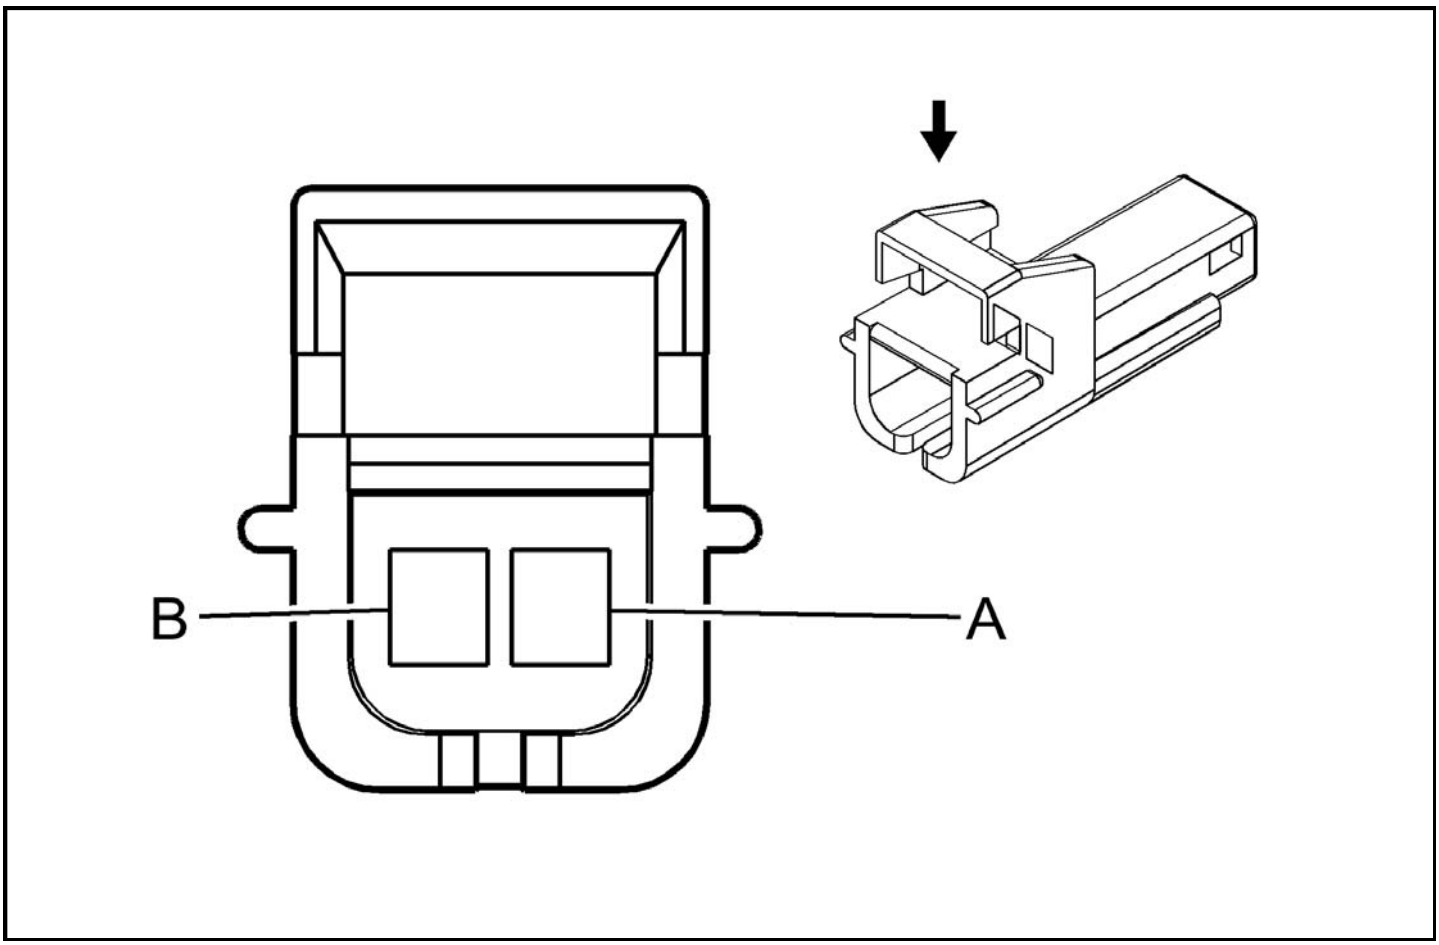
Terminal Part Information

- Terminated Lead: 13575867
- Release Tool: J-38125-215A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: SAIT-A03T-M064/14
- Core/Insulation Crimp: P/P

Seat Belt Pretensioner - Passenger

Pin	Wire	Circuit	Function
1	0.5 TN	3062	Seat Belt Pretensioner- Passenger- High Control
2	0.5 L-BU/BK	3063	Seat Belt Pretensioner- Passenger- Low Control

SEAT BELT SWITCH - DRIVER



Connector Part Information

- Harness Type: Left Front Seat
- OEM Connector: 12124451
- Service Connector: 12117275
- Description: 2-Way M Metri-Pack 150 Series (BK)

Terminal Part Information

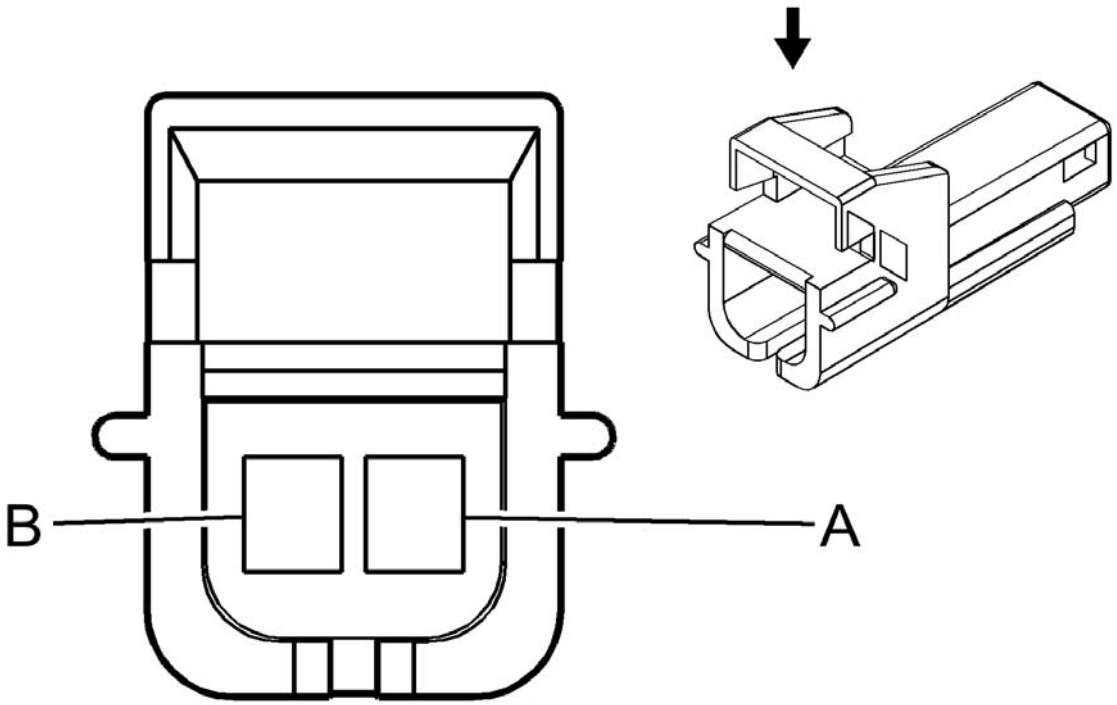
- Terminated Lead: 13575462
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)
- Terminal/Tray: 12047581/2

- Core/Insulation Crimp: E/C

Seat Belt Switch - Driver

Pin	Wire	Circuit	Function
A	0.35 D-GN	5016	Seat Belt Switch- Left- Signal
B	0.35 PK	5057	Low Reference

SEAT BELT SWITCH - PASSENGER



Connector Part Information

- Harness Type: Right Front Seat
- OEM Connector: 12124451
- Service Connector: 12117275
- Description: 2-Way M Metri-Pack 150 Series (BK)

Terminal Part Information

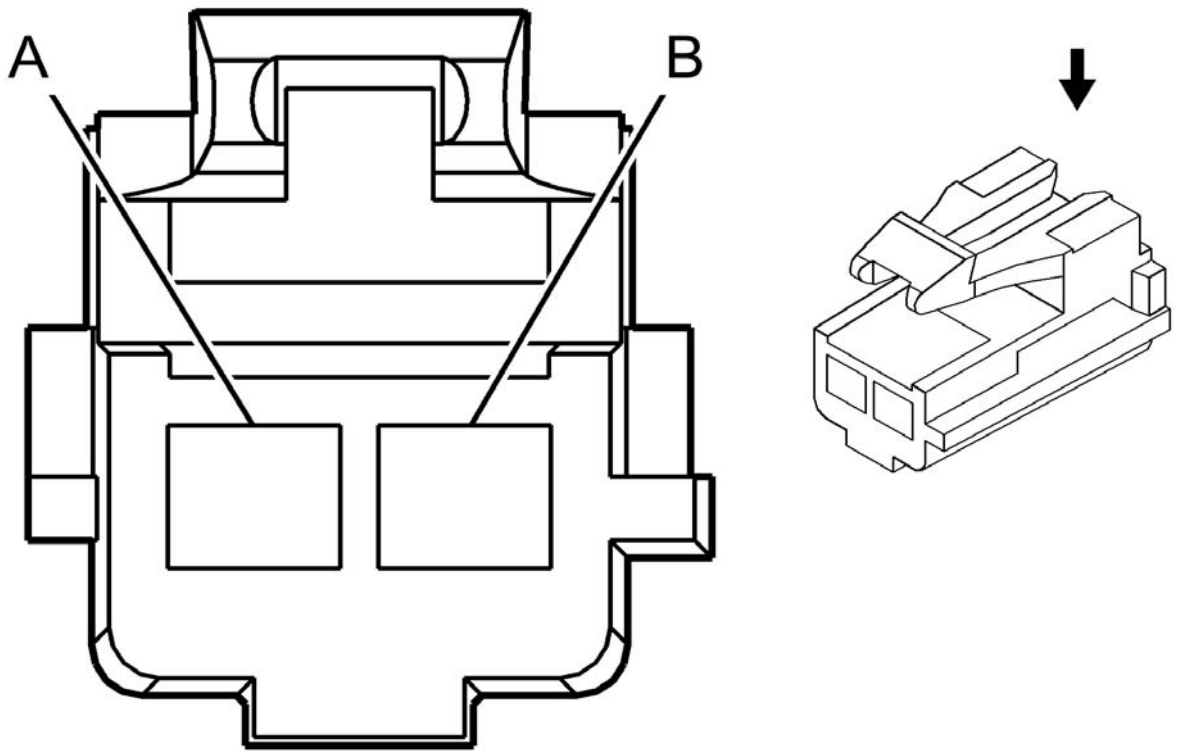
- Terminated Lead: 13575462
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)

- Terminal/Tray: 12047581/2
- Core/Insulation Crimp: E/C

Seat Belt Switch - Passenger

Pin	Wire	Circuit	Function
A	0.35 OG	1362	Seat Belt Switch- Right- Signal
B	0.35 PK	5057	Low Reference

SEAT RECLINE MOTOR - DRIVER (AH5)



Connector Part Information

- Harness Type: Left Front Seat
- OEM Connector: 12129081
- Service Connector: 12129081
- Description: 2-Way F Metri-Pack 280 Series, Flexlock (BK)

Terminal Part Information

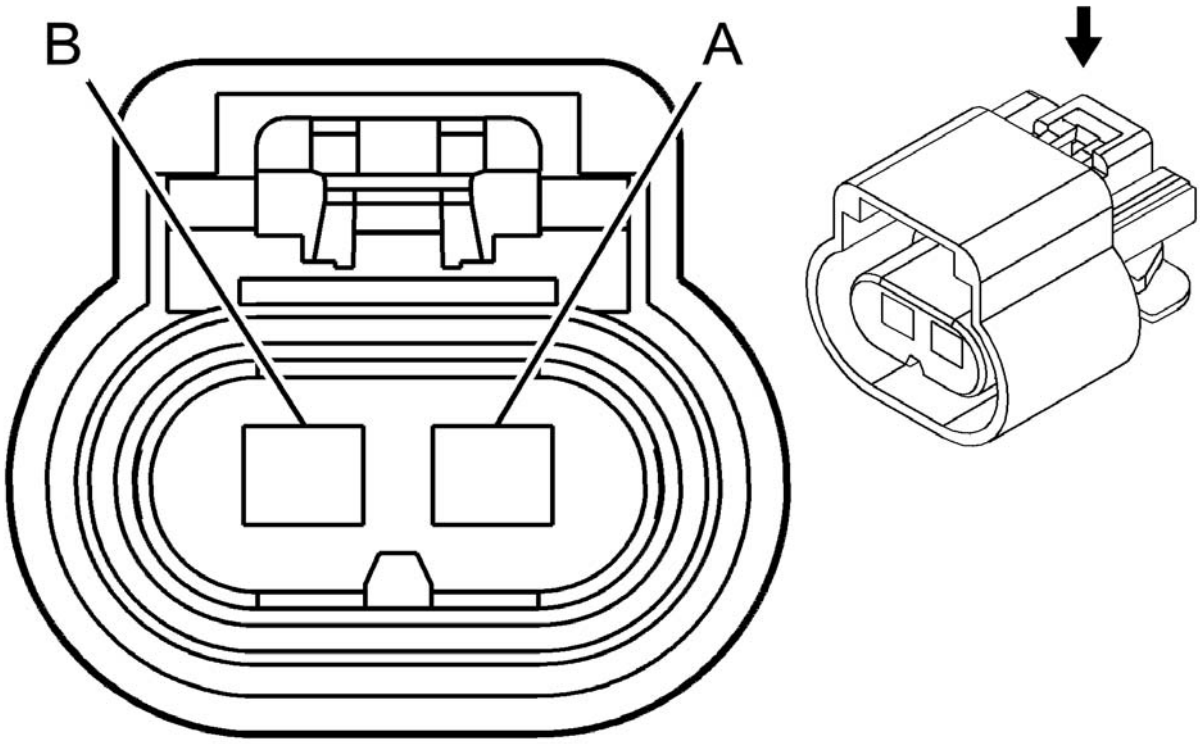
- Terminal/Tray: 12110842/4
- Core/Insulation Crimp: F/G

- Release Tool/Test Probe: 15315247/J-35616-4A (PU)

Seat Recline Motor - Driver (AH5)

Pin	Wire	Circuit	Function
A	3 D-GN	76	Driver Seat Recline Motor Forward Control
B	3 D-BU	77	Driver Seat Recline Motor Rearward Control

SECONDARY AIR INJECTION (AIR) PUMP (NU5/NU6)



Connector Part Information

- Harness Type: Engine
- OEM Connector: 13518845
- Service Connector: 88988942
- Description: 2-Way F GT 280 Series, Sealed (BK)

Terminal Part Information

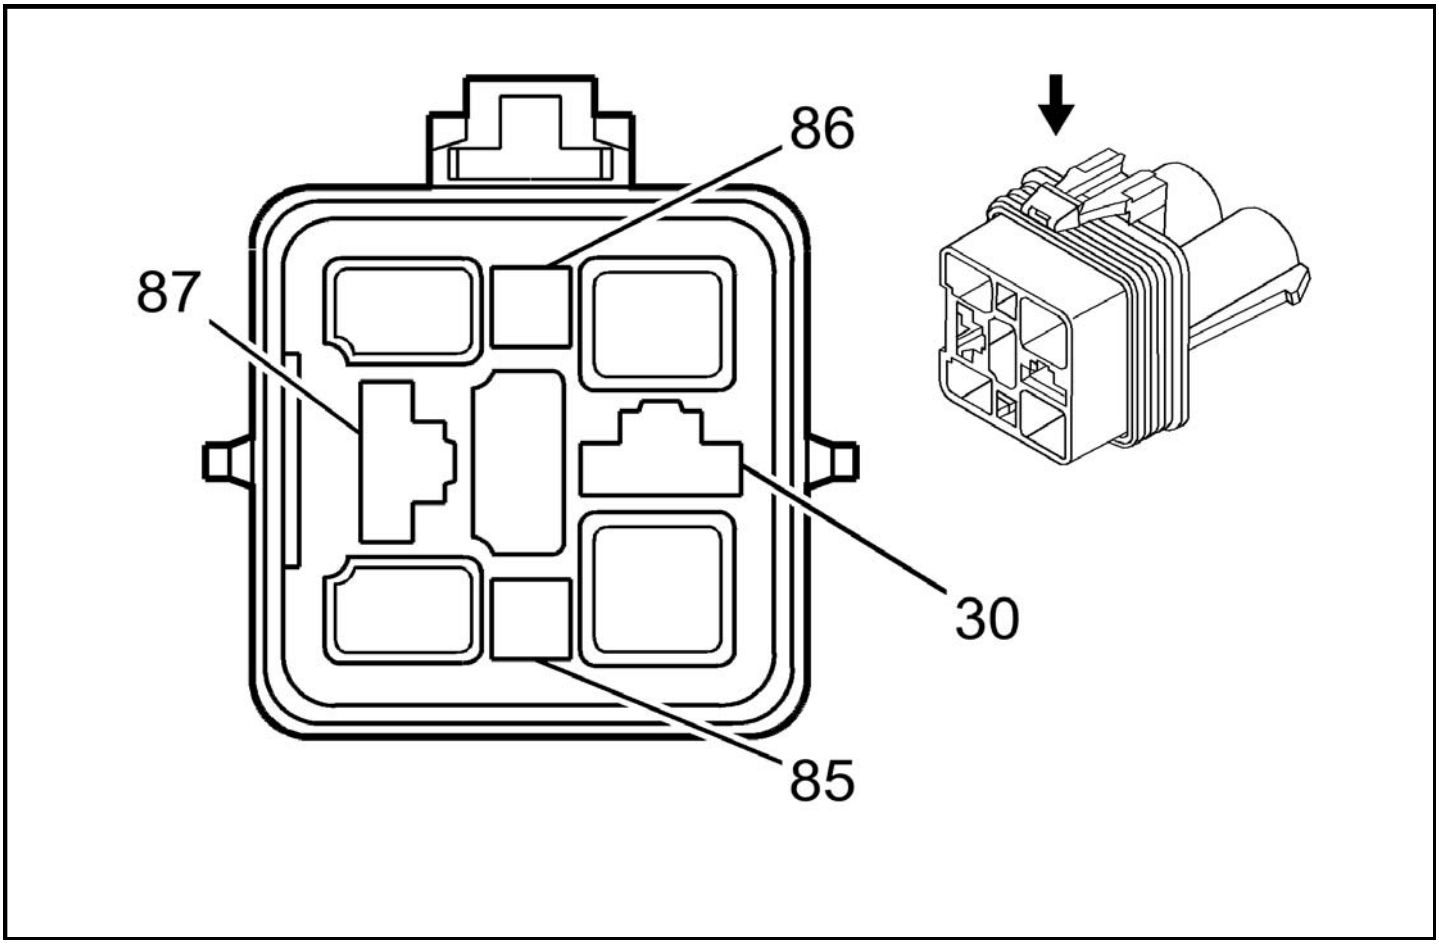
- Terminated Lead: 13575402
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)

- Terminal/Tray: 15392777/23
- Core/Insulation Crimp: B/5

Secondary Air Injection (AIR) Pump (NU5/NU6)

Pin	Wire	Circuit	Function
A	5 OG	78	AIR Pump Supply Voltage
B	5 BK	350	Ground

SECONDARY AIR INJECTION (AIR) PUMP RELAY (NU5/NU6)



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15336745
- Service Connector: 15306331
- Description: 4-Way F GR 280 Series, Metri-Pack 800 Series, Sealed (GY)

Terminal Part Information

- Pins: 30, 87
- Terminated Lead: Service by Harness- See Part Catalog

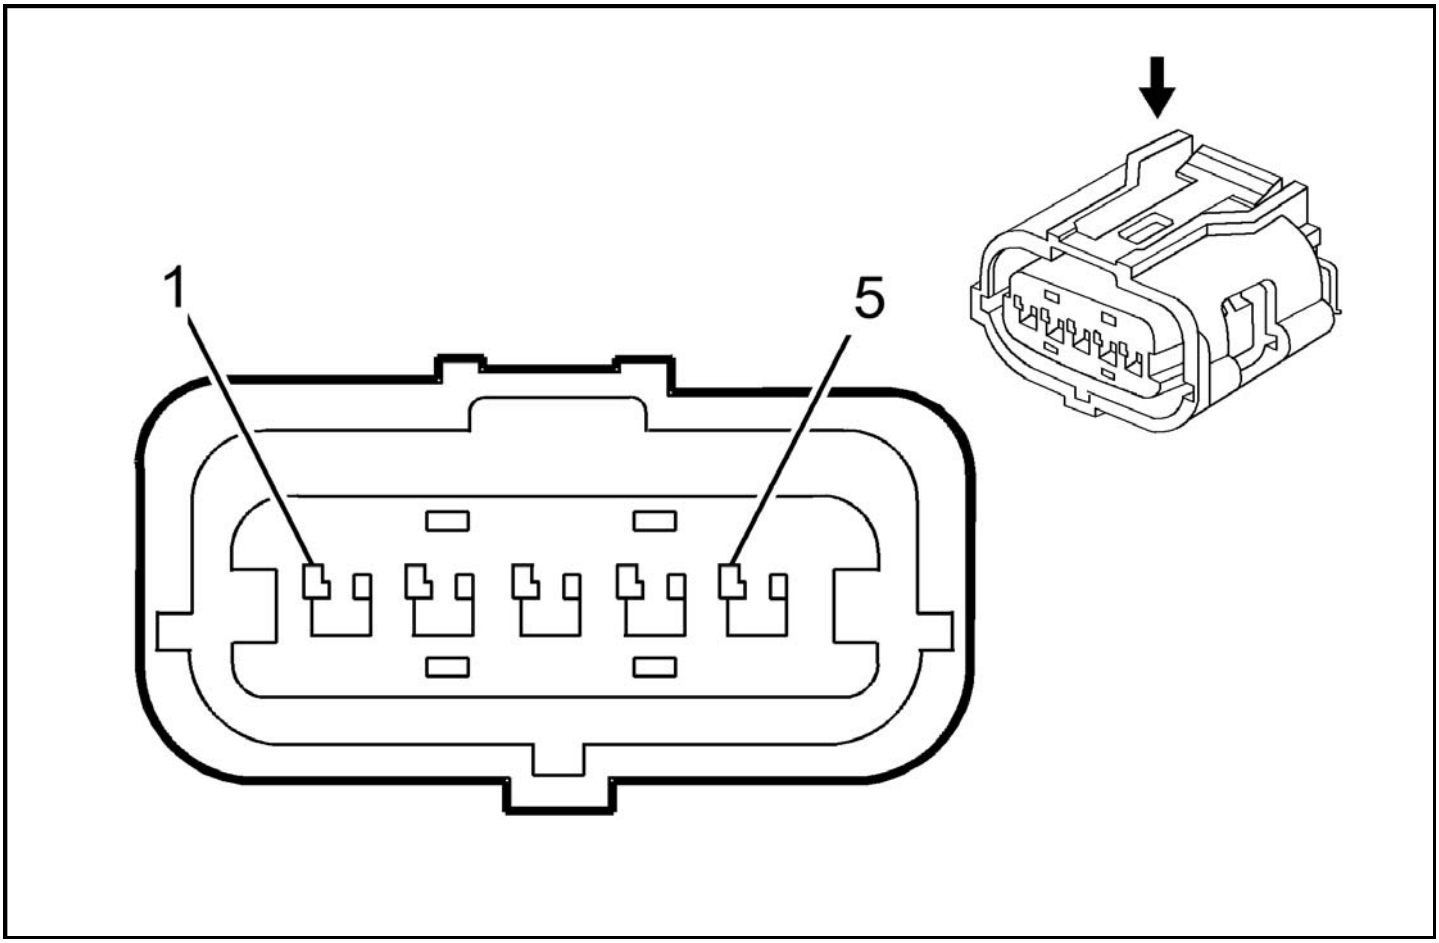
- Release Tool: J-38125-558
- Diagnostic Test Probe: J-35616-44 (YE)
- Terminal/Tray: 15336748/20
- Core/Insulation Crimp: G/F/3

- Pins: 85, 86
- Terminated Lead: 13575406
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 15304719/19
- Core/Insulation Crimp: E/5

Secondary Air Injection (AIR) Pump Relay (NU5/NU6)

Pin	Wire	Circuit	Function
30	5 RD/BK	742	Battery Positive Voltage
85	0.5 PK/BK	5294	Ignition 1 Voltage
86	0.35 BN	436	AIR Pump Relay Control
87	5 OG	78	AIR Pump Supply Voltage

SECONDARY AIR INJECTION (AIR) PUMP SOLENOID BANK 1 (NU5/NU6)



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15443141
- Service Connector: 19151506
- Description: 5-Way F TS Series, Sealed (BK)

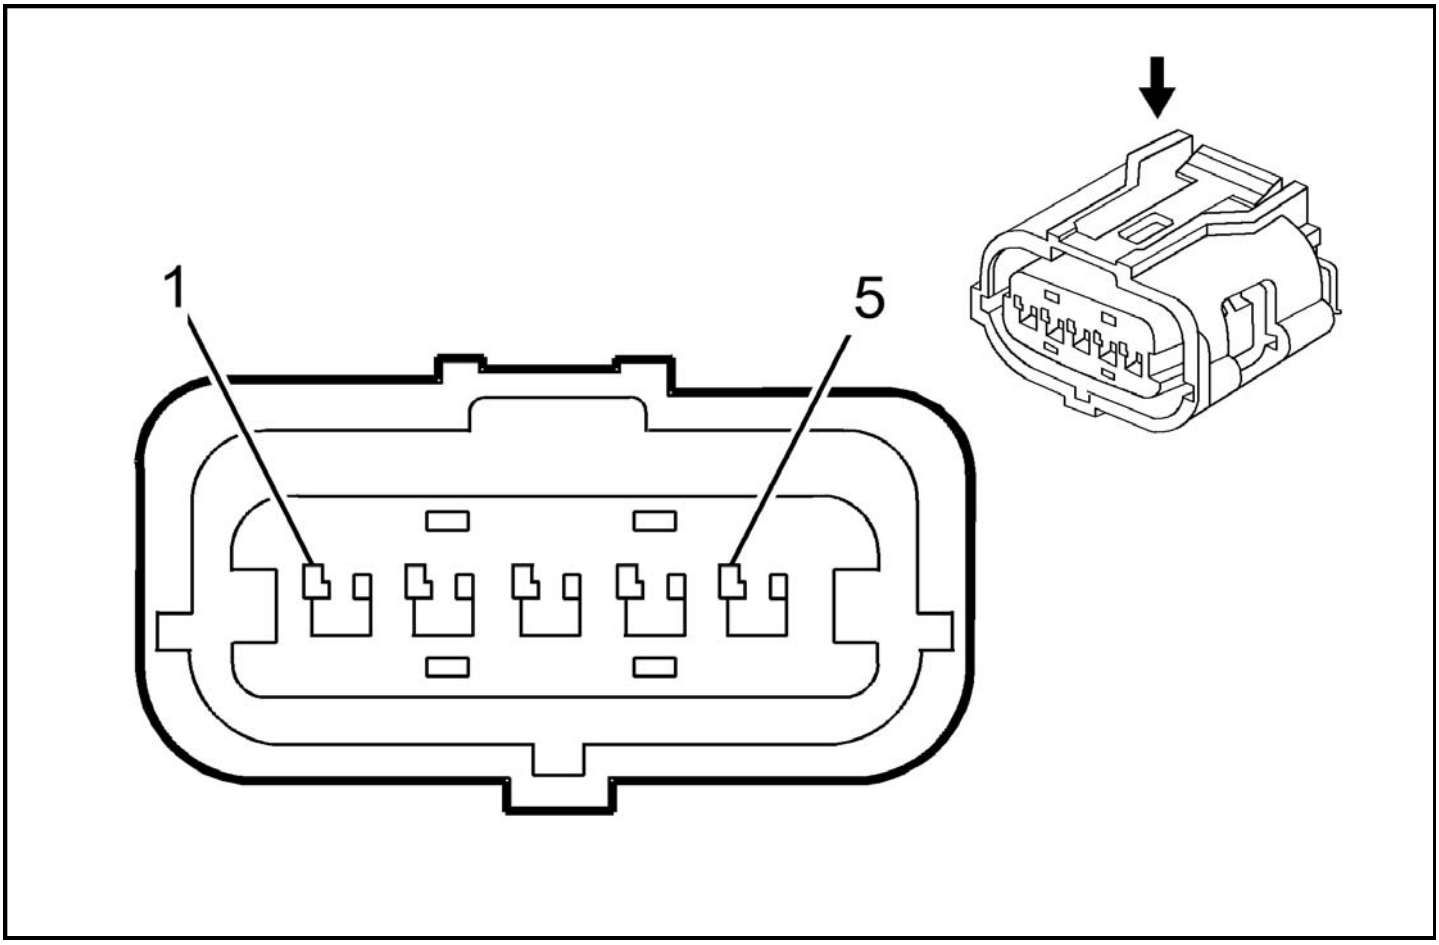
Terminal Part Information

- Terminated Lead: Service by Connector Assembly - 19151506
- Release Tool: Not Available
- Diagnostic Test Probe: Not Available
- Terminal/Tray: Not Available
- Core/Insulation Crimp : Not Available

Secondary Air Injection (AIR) Pump Solenoid Bank 1 (NU5/NU6)

Pin	Wire	Circuit	Function
1	0.5 WH	6452	Air Injection Reaction Pump Sensor Supply Voltage
2	0.5 BN/WH	6331	Air Injection Reaction Pump Pressure Sensor Signal
3	0.5 D-BU/WH	6785	Air Injection Reaction Control Valve #1 Low Reference
4	0.5 BK/WH	451	Signal Ground
5	PK/BK	415	Air Injection Reaction Solenoid Supply Voltage

SECONDARY AIR INJECTION (AIR) PUMP SOLENOID BANK 2 (NU5/NU6)



Connector Part Information

- Harness Type: Engine
- OEM Connector: 15443141
- Service Connector: 19151506
- Description:5-Way F TS Series, Sealed (BK)

Terminal Part Information

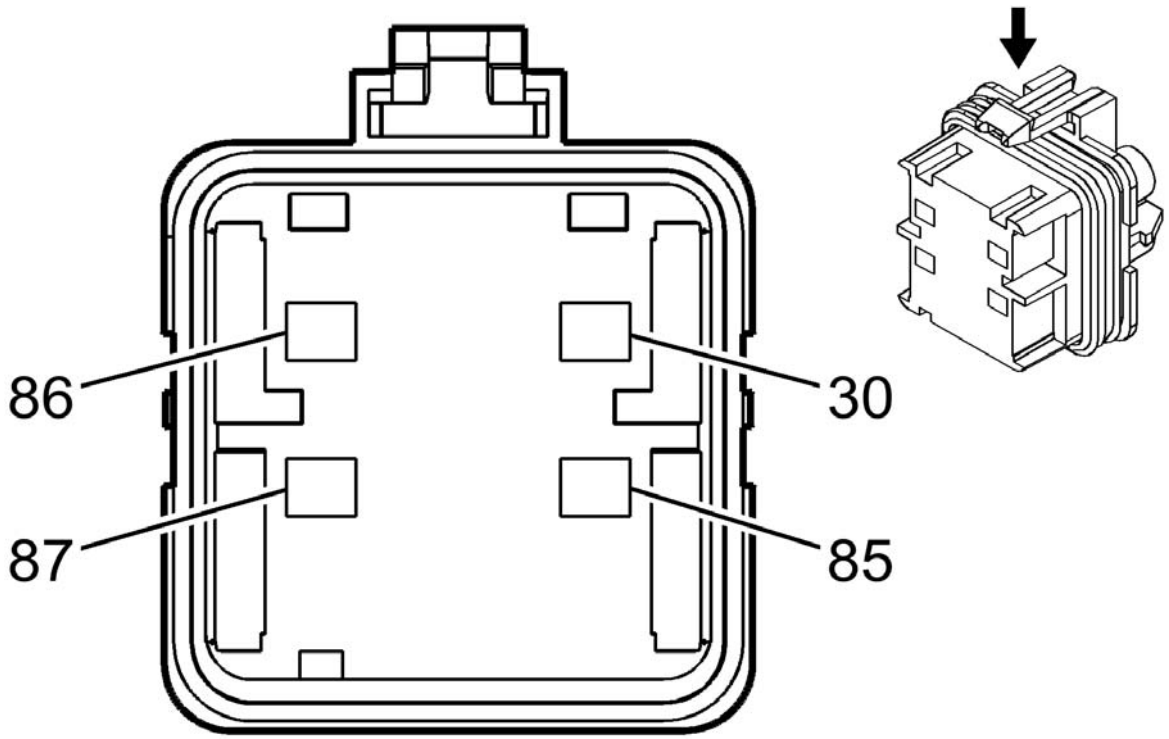
- Terminated Lead: Not Available
- Release Tool: Not Available
- Diagnostic Test Probe: Not Available
- Terminal/Tray : Not Available
- Core/Insulation Crimp: Not Available

Secondary Air Injection (AIR) Pump Solenoid Bank 2 (NU5/NU6)

Pin	Wire	Circuit	Function
1	0.5 L-BU	6456	Air Injection Reaction Pump Sensor #2 Supply Voltage
2	0.5 L-BU/BK	6455	Air Injection Reaction Pump Sensor #2 Signal

Pin	Wire	Circuit	Function
3	0.5 BN	6454	Air Injection Reaction Pump Sensor #2 Ground
4	0.5 BK/WH	451	Signal Ground
5	PK/BK	415	Air Injection Reaction Solenoid Supply Voltage

SECONDARY AIR INJECTION (AIR) PUMP SOLENOID RELAY (NU5/NU6)



Connector Part Information

- Harness Type: Engine
- OEM Connector: 12129716
- Service Connector: 13580863
- Description: 4-Way F Metri-Pack 280 Series, Flexlock (GY)

Terminal Part Information

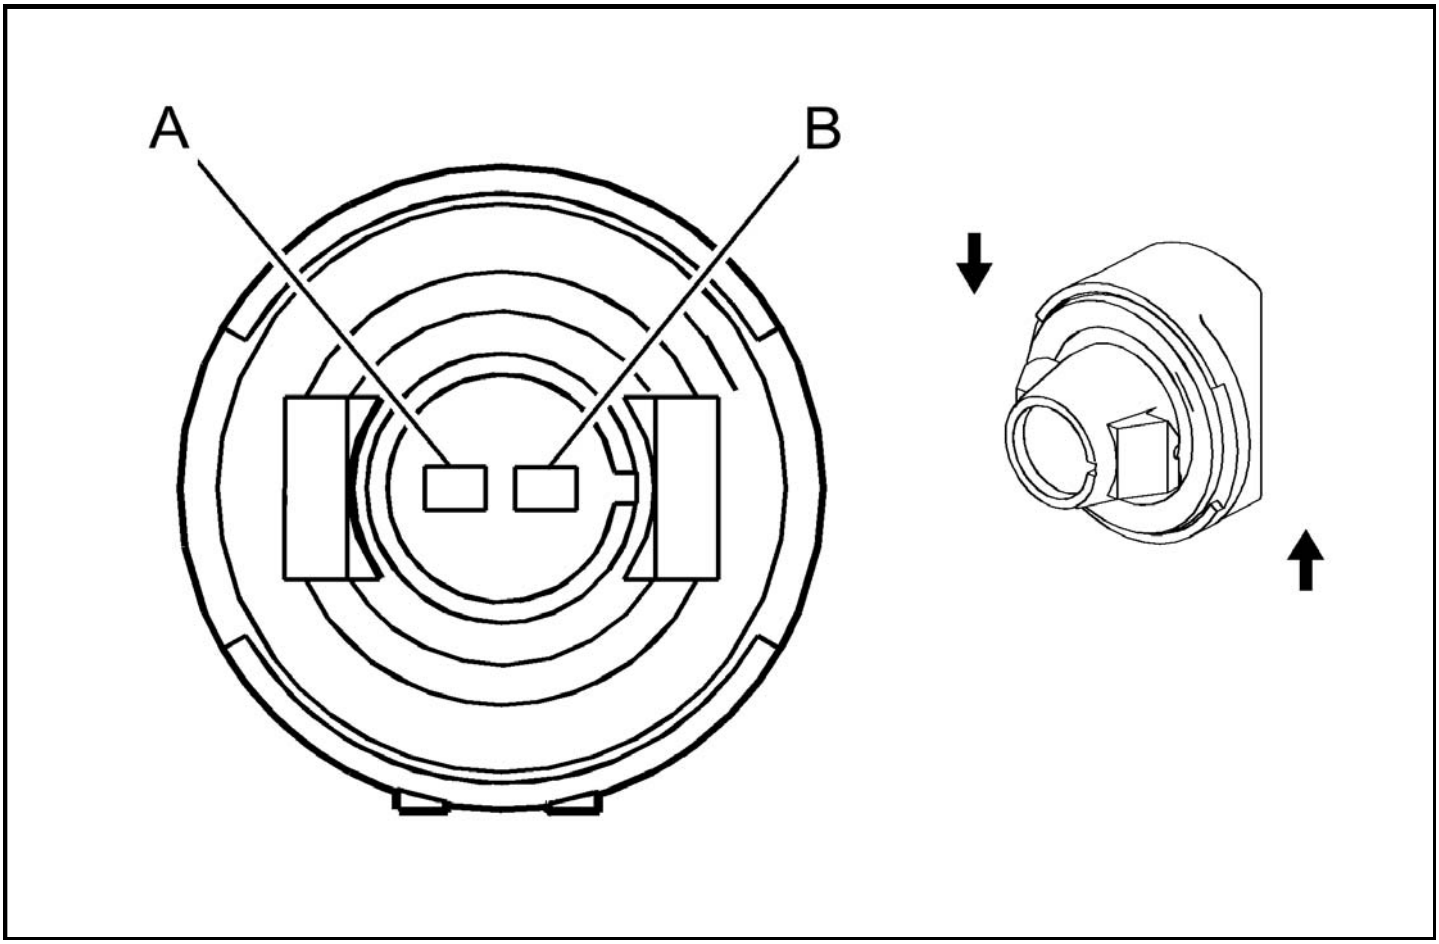
- Terminated Lead: Service by Connector Assembly - 13580863
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 12110847/4

- Core/Insulation Crimp: E/5

Secondary Air Injection (AIR) Pump Solenoid Relay (NU5/NU6)

Pin	Wire	Circuit	Function
30	0.5 RD/WH	2140	Battery Positive Voltage
85	0.35 PK/BK	429	AIR Solenoid Control
86	0.5 PK/BK	5294	Ignition 1 Voltage
87	0.5 PU	421	AIR Solenoid Supply Voltage

SIDE MARKER LAMP - LEFT FRONT



Connector Part Information

- Harness Type: Left Front Headlamp Assembly
- OEM Connector: 16530674
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F Socket (GY)

Terminal Part Information

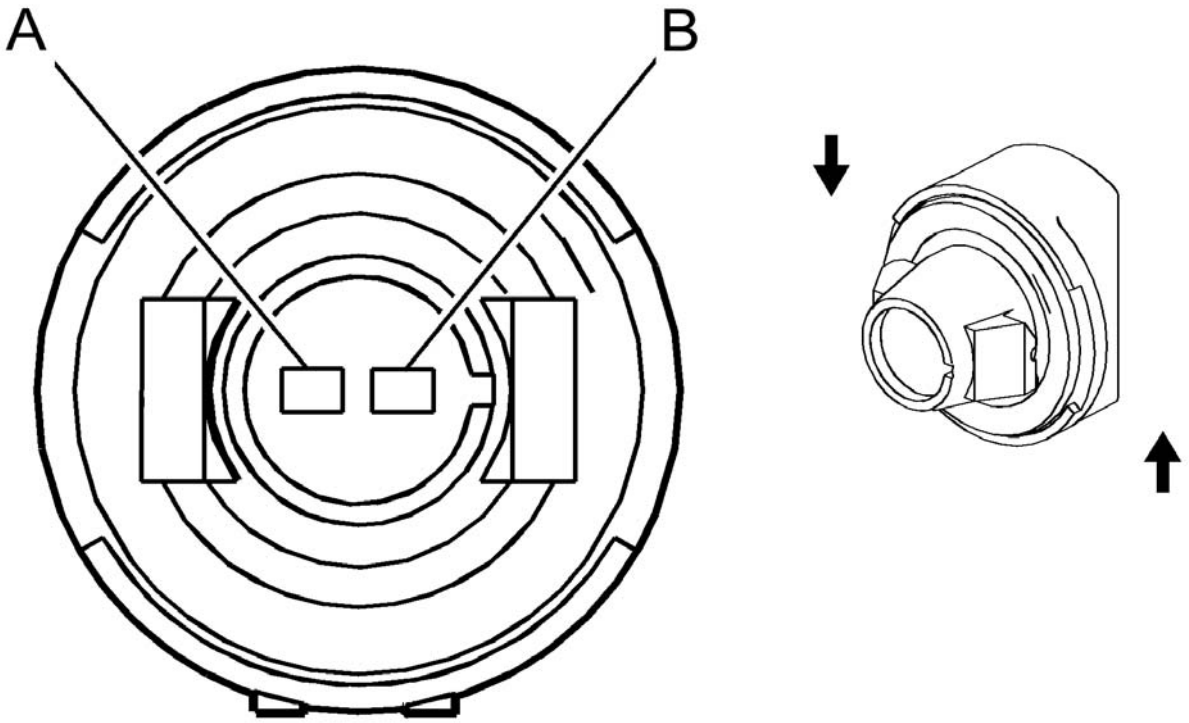
- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: Not Available

- Diagnostic Test Probe: Not Available
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Side Marker Lamp - Left Front

Pin	Wire	Circuit	Function
A	0.8 RD	709	Left Park Lamp Supply Voltage
	0.8 RD	709	Left Park Lamp Supply Voltage
B	0.8 BK	1350	Ground

SIDE MARKER LAMP - RIGHT FRONT



Connector Part Information

- Harness Type: Right Front Headlamp Assembly
- OEM Connector: 16530674
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F Socket (GY)

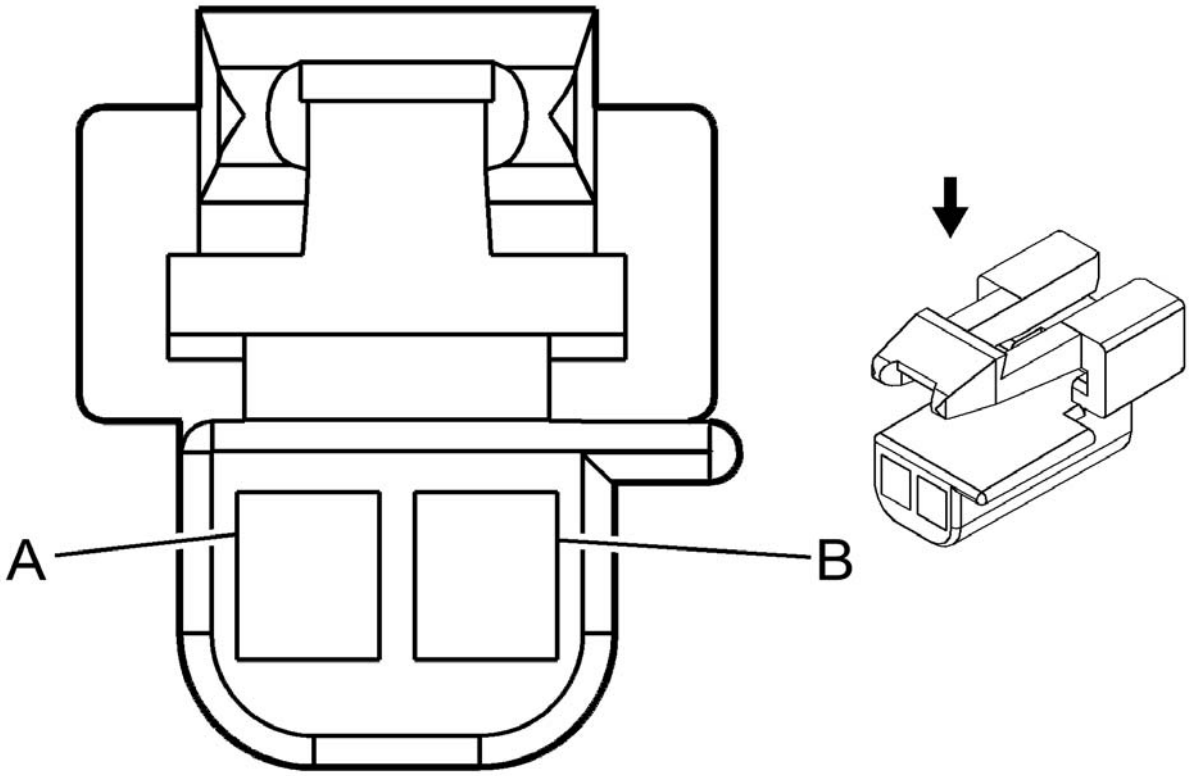
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: Not Available
- Diagnostic Test Probe: Not Available
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Side Marker Lamp - Right Front

Pin	Wire	Circuit	Function
A	0.8 RD	309	Right Park Lamp Supply Voltage
	0.8 RD	309	Right Park Lamp Supply Voltage
B	0.8 BK	1250	Ground

SPEAKER - LEFT FRONT



Connector Part Information

- Harness Type: Left Front Door
- OEM Connector: 12064867
- Service Connector: 88987981
- Description: 2-Way F Metri-Pack 150 Series (NA)

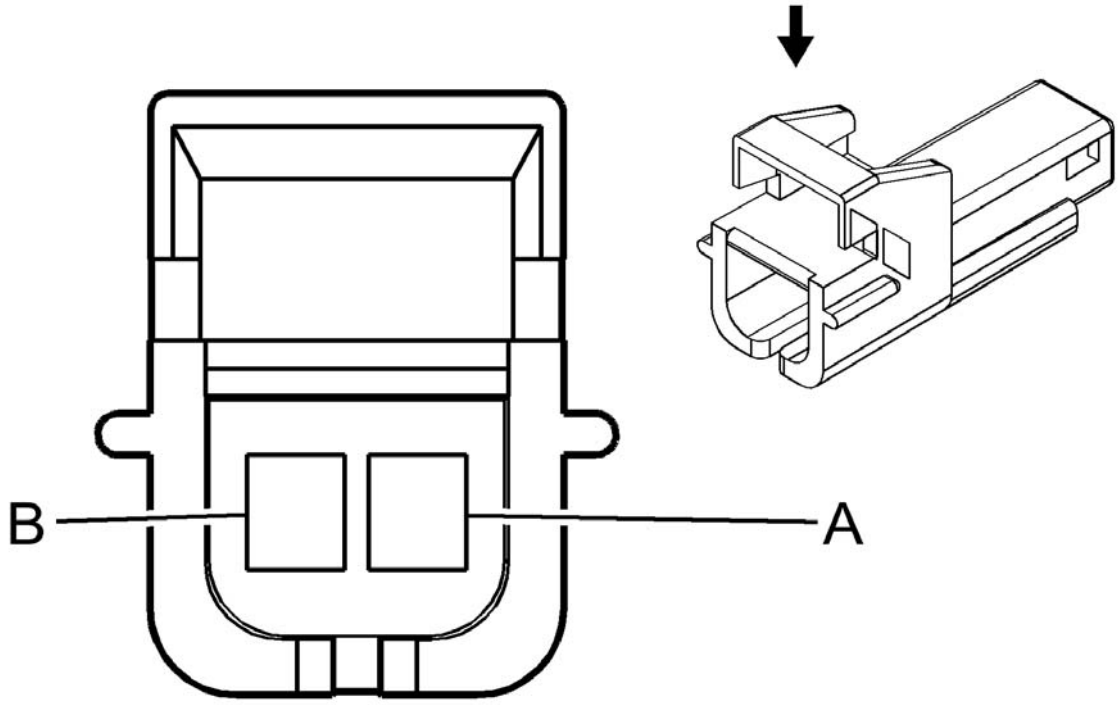
Terminal Part Information

- Terminated Lead: 13575464
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/5
- Core/Insulation Crimp: E/C

Speaker - Left Front

Pin	Wire	Circuit	Function
A	0.5 GY	118	Left Front Speaker Output (-)
B	0.5TN	201	Left Front Speaker Output (+)

SPEAKER - LEFT FRONT TWEETER



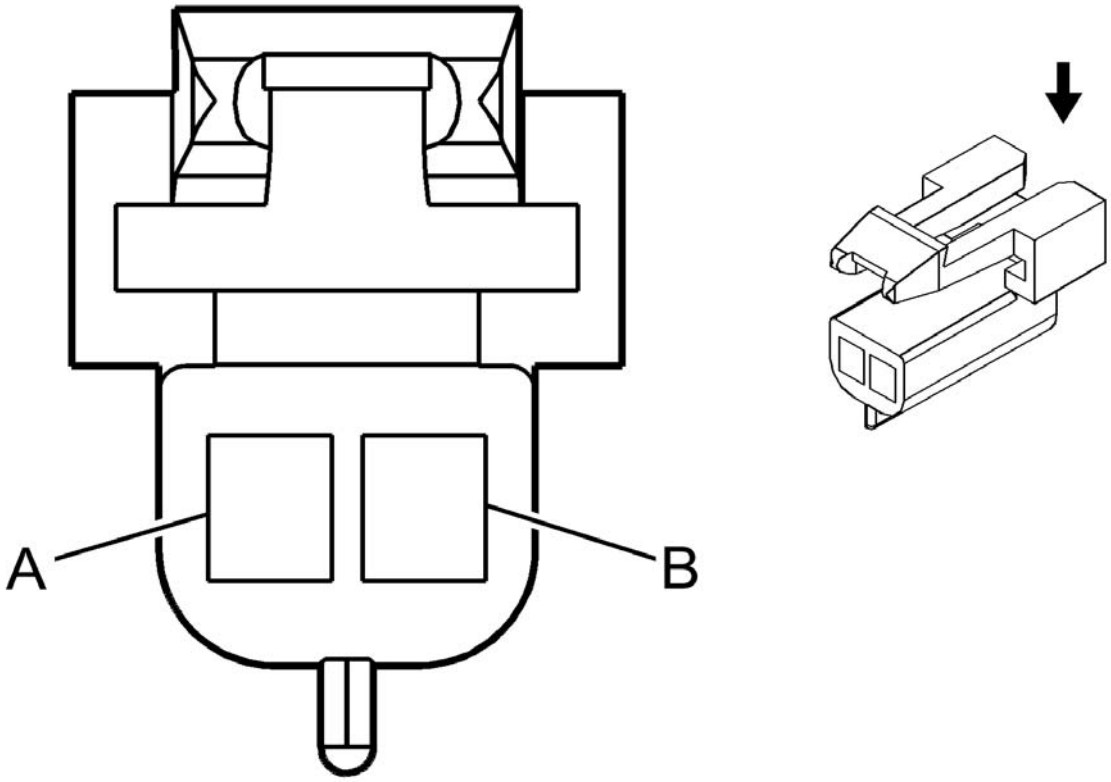
Connector Part Information

- Harness Type: Body
- OEM Connector: 15393225
- Service Connector: 12117275
- Description: 2-Way F (BK)

Speaker - Left Front Tweeter

Pin	Wire	Circuit	Function
A	0.8 GY	118	Left Front Speaker Output (-) (UW6)
	0.8 YE	1956	Left Front Speaker Output (-) (UQ3)
B	0.8 TN	201	Left Front Speaker Output (+) (UW6)
	0.8 TN	1856	Left Front Speaker Output (+) (UQ3)

SPEAKER - LEFT REAR (UW6)



Connector Part Information

- Harness Type: Body
- OEM Connector: 12052832
- Service Connector: 13583033
- Description: 2-Way F Metri-Pack 150 Series (BK)

Terminal Part Information

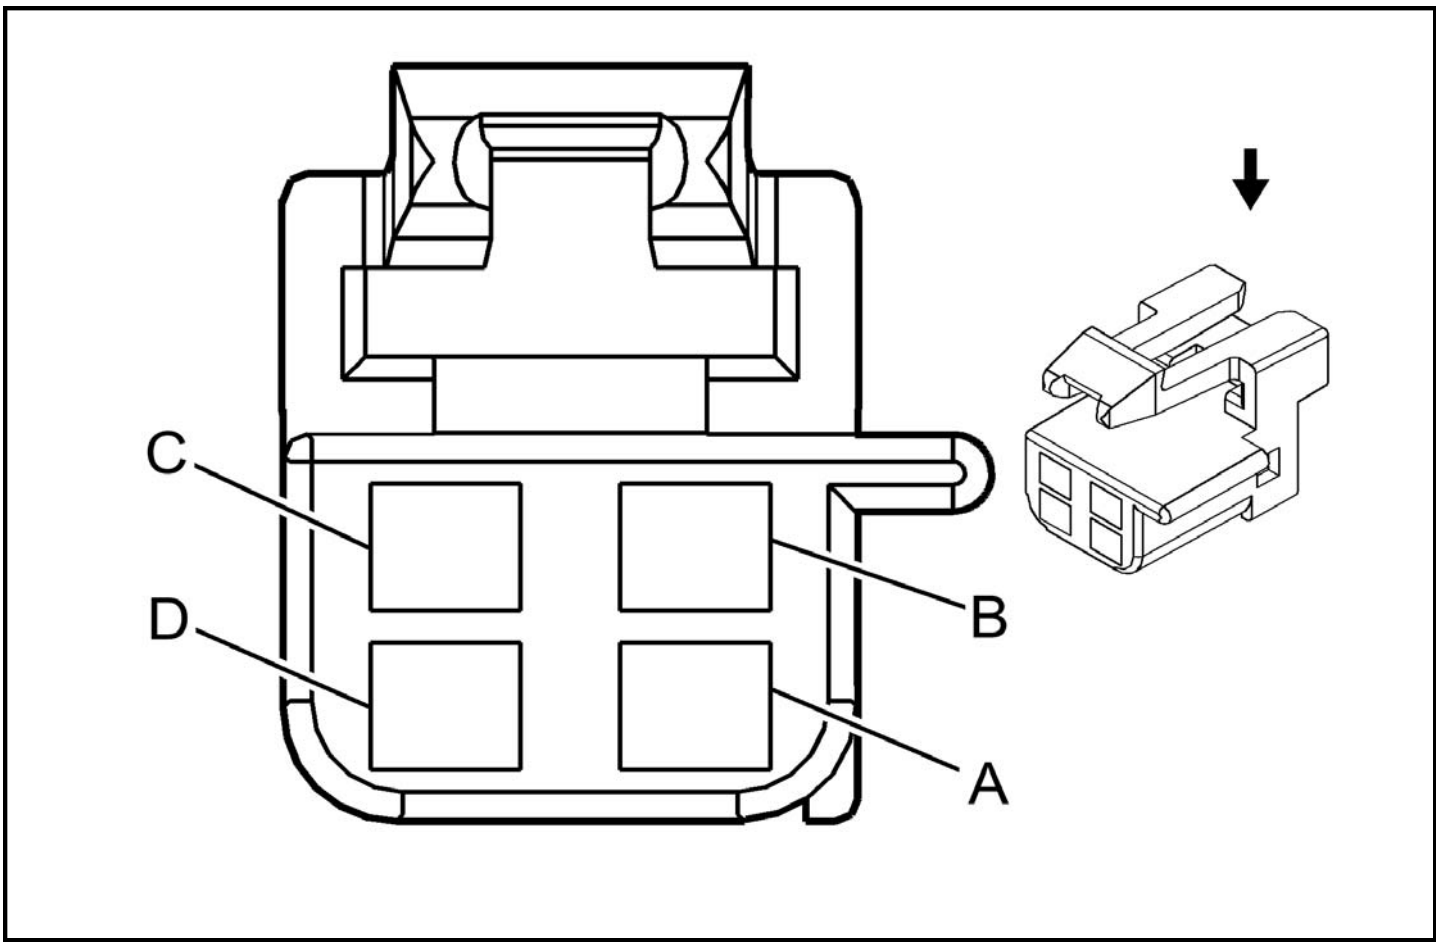
- Terminated Lead: 13575464
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/2

- Core/Insulation Crimp: E/A

Speaker - Left Rear (UW6)

Pin	Wire	Circuit	Function
A	0.8 YE	116	Left Rear Speaker Output (-)
B	0.8 BN	199	Left Rear Speaker Output (+)

SPEAKER - LEFT REAR (UQ3)



Connector Part Information

- Harness Type: Body
- OEM Connector: 12064760
- Service Connector: 13584477
- Description: 4-Way F Metri-Pack 150 Series (BK)

Terminal Part Information

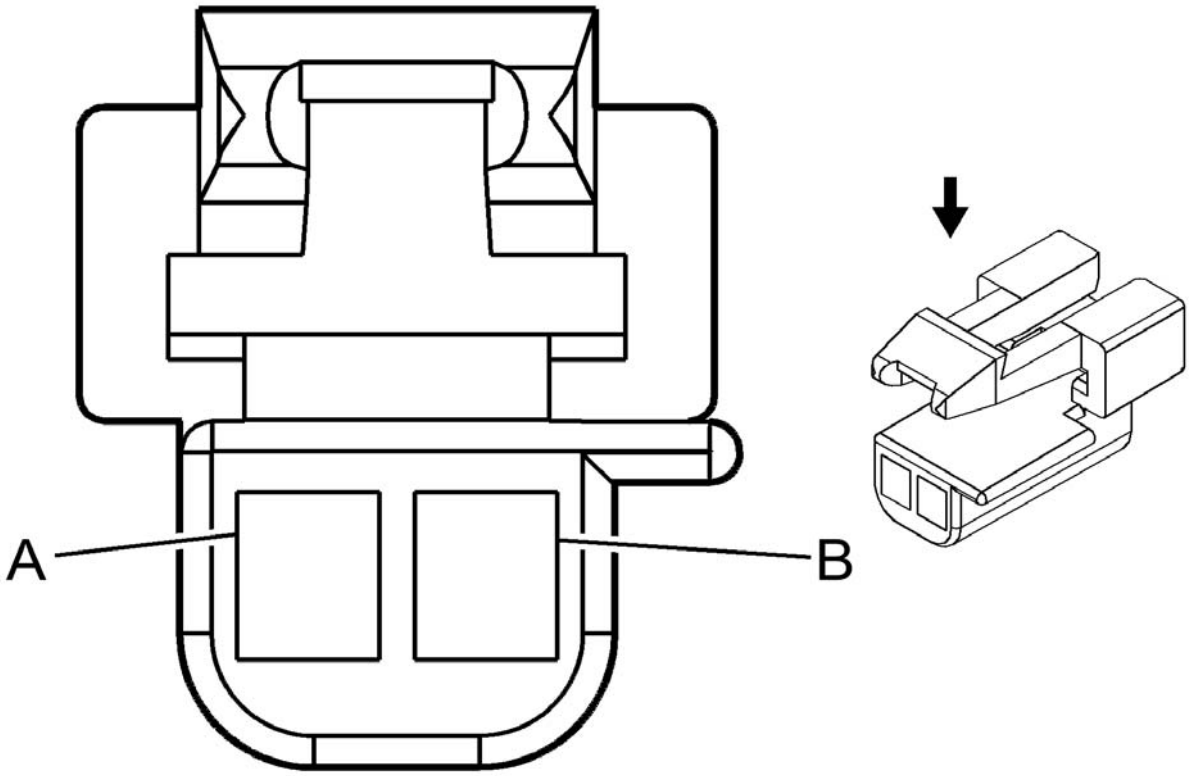
- Terminated Lead: 13575464
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)

- Terminal/Tray: 15326030/2
- Core/Insulation Crimp: E/A

Speaker - Left Rear (UQ3)

Pin	Wire	Circuit	Function
A	0.8 YE	116	Left Rear Speaker Output (-)
B	0.8 BN	199	Left Rear Speaker Output (+)
C	0.8 D-BU/WH	346	Left Subwoofer Speaker Output (+)
D	0.8 L-GN/BK	1794	Left Subwoofer Speaker Output (-)

SPEAKER - RIGHT FRONT



Connector Part Information

- Harness Type: Right Front Door
- OEM Connector: 12064867
- Service Connector: 88987981
- Description: 2-Way F Metri-Pack 150 Series (NA)

Terminal Part Information

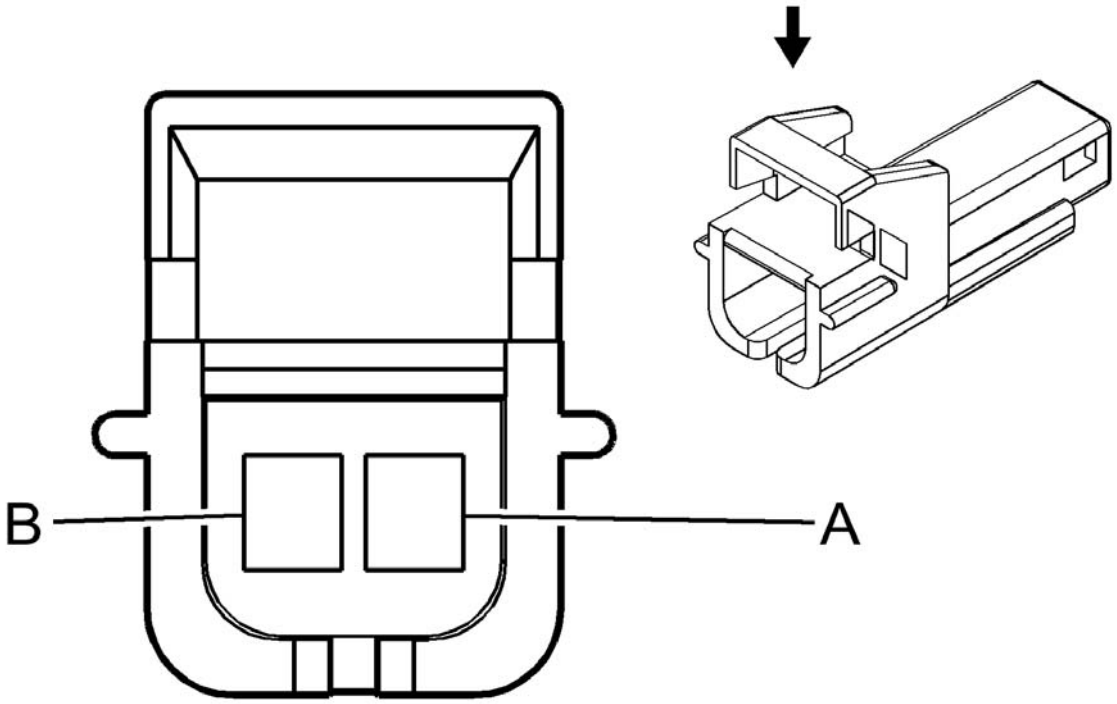
- Terminated Lead: 13575464

- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/5
- Core/Insulation Crimp: E/C

Speaker - Right Front

Pin	Wire	Circuit	Function
A	0.5 D-GN	117	Right Front Speaker Output (-)
B	0.5 L-GN	200	Right Front Speaker Output (+)

SPEAKER - RIGHT FRONT TWEETER



Connector Part Information

- Harness Type: Body
- OEM Connector: 15393225
- Service Connector: 12117275
- Description: 2-Way F (BK)

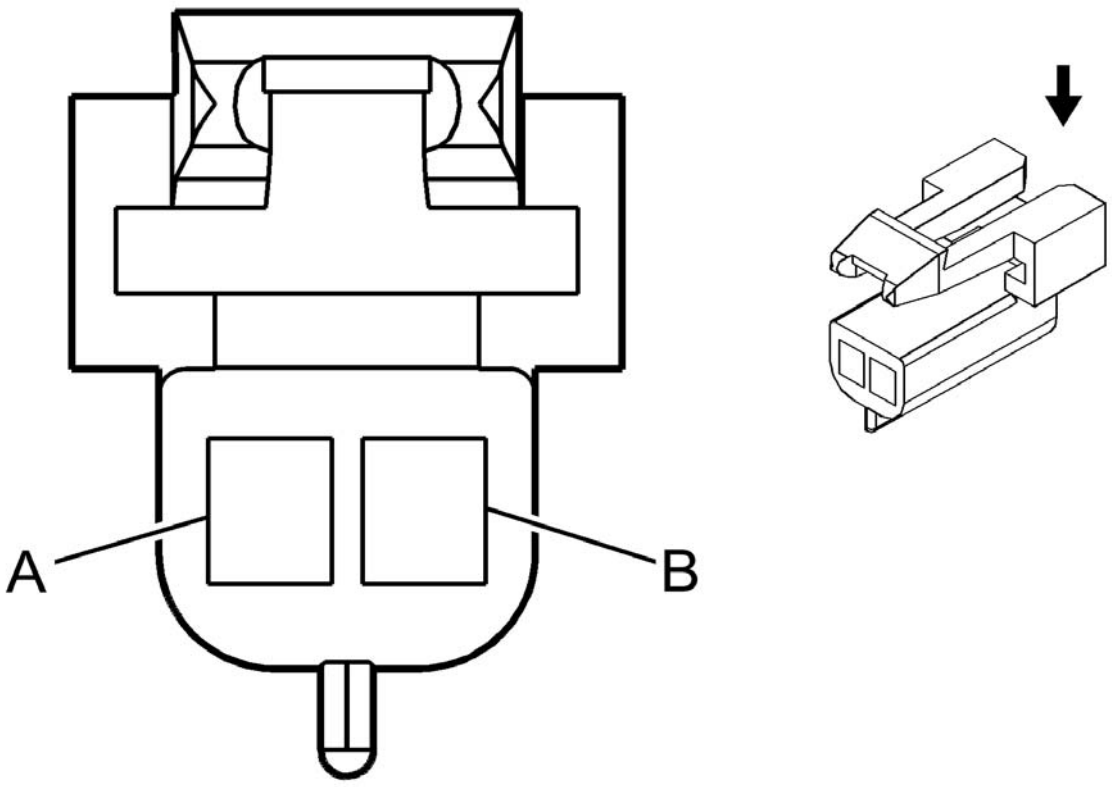
Terminal Part Information

- Terminated Lead: 13505668
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)
- Terminal/Tray: 12047581/2
- Core/Insulation Crimp: E/A

Speaker - Right Front Tweeter

Pin	Wire	Circuit	Function
A	0.8 D-GN	117	Right Front Speaker Output (-) (UW6)
	0.8 PU	1952	Right Front Speaker Output (-) (UQ3)
B	0.8 L-GN	200	Right Front Speaker Output (+) (UW6)
	0.8 L-GN	1852	Right Front Speaker Output (+) (UQ3)

SPEAKER - RIGHT REAR (UW6)



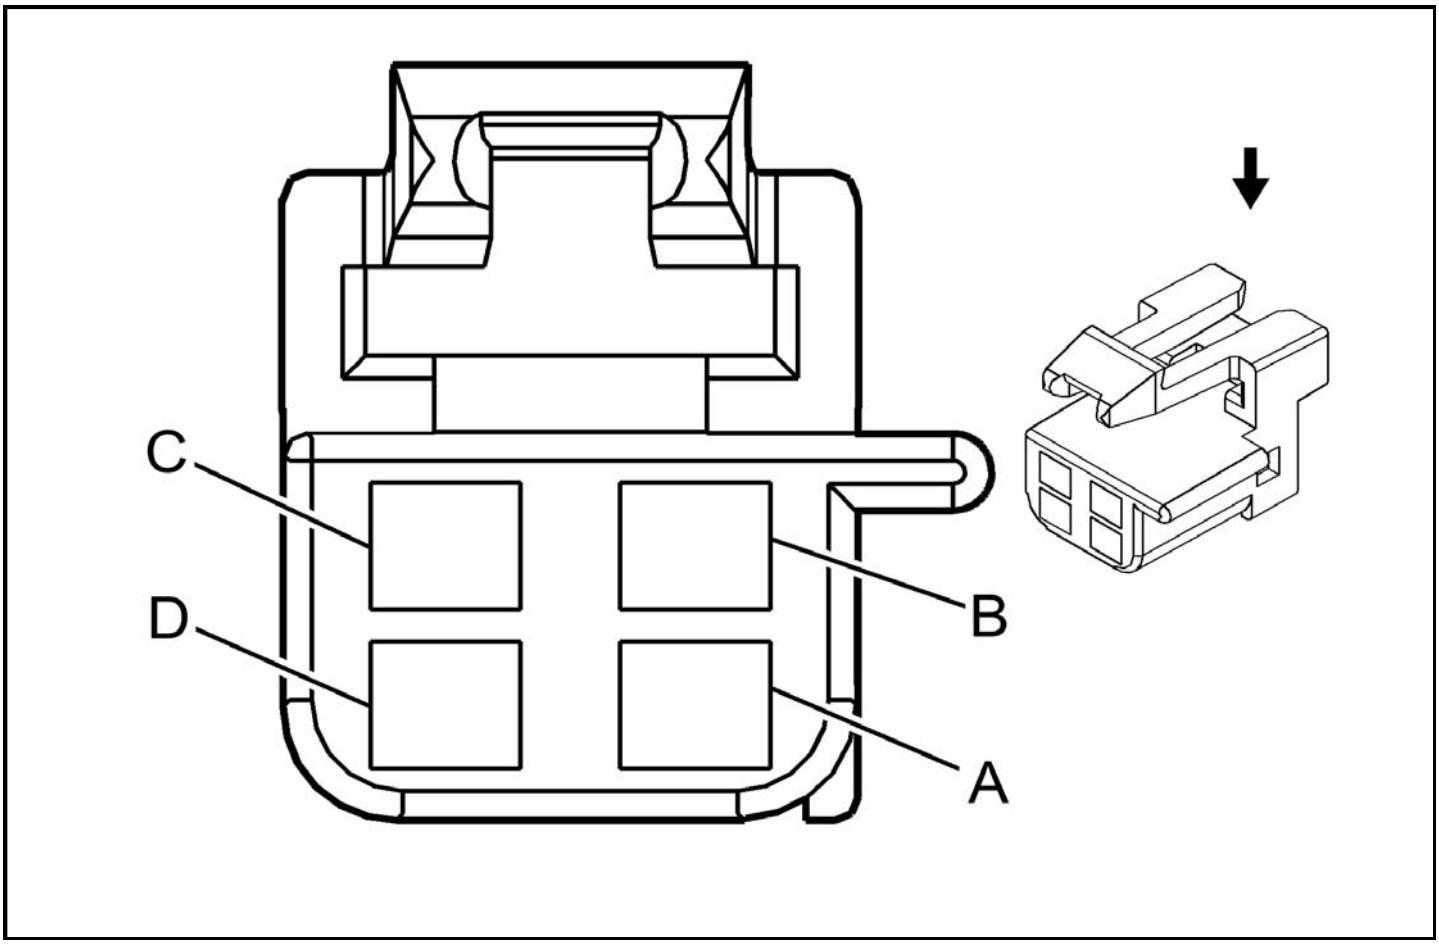
Connector Part Information

- Harness Type: Body
- OEM Connector: 12052832
- Service Connector: 13583033
- Description: 2-Way F Metri-Pack 150 Series (BK)

Speaker - Right Rear (UW6)

Pin	Wire	Circuit	Function
A	0.8 L-BU	115	Right Rear Speaker Output (-)
B	0.8 D-BU	46	Right Rear Speaker Output (+)

SPEAKER - RIGHT REAR (UQ3)



Connector Part Information

- Harness Type: Body
- OEM Connector: 12064760
- Service Connector: 13584477
- Description: 4-Way F Metri-Pack 150 Series (BK)

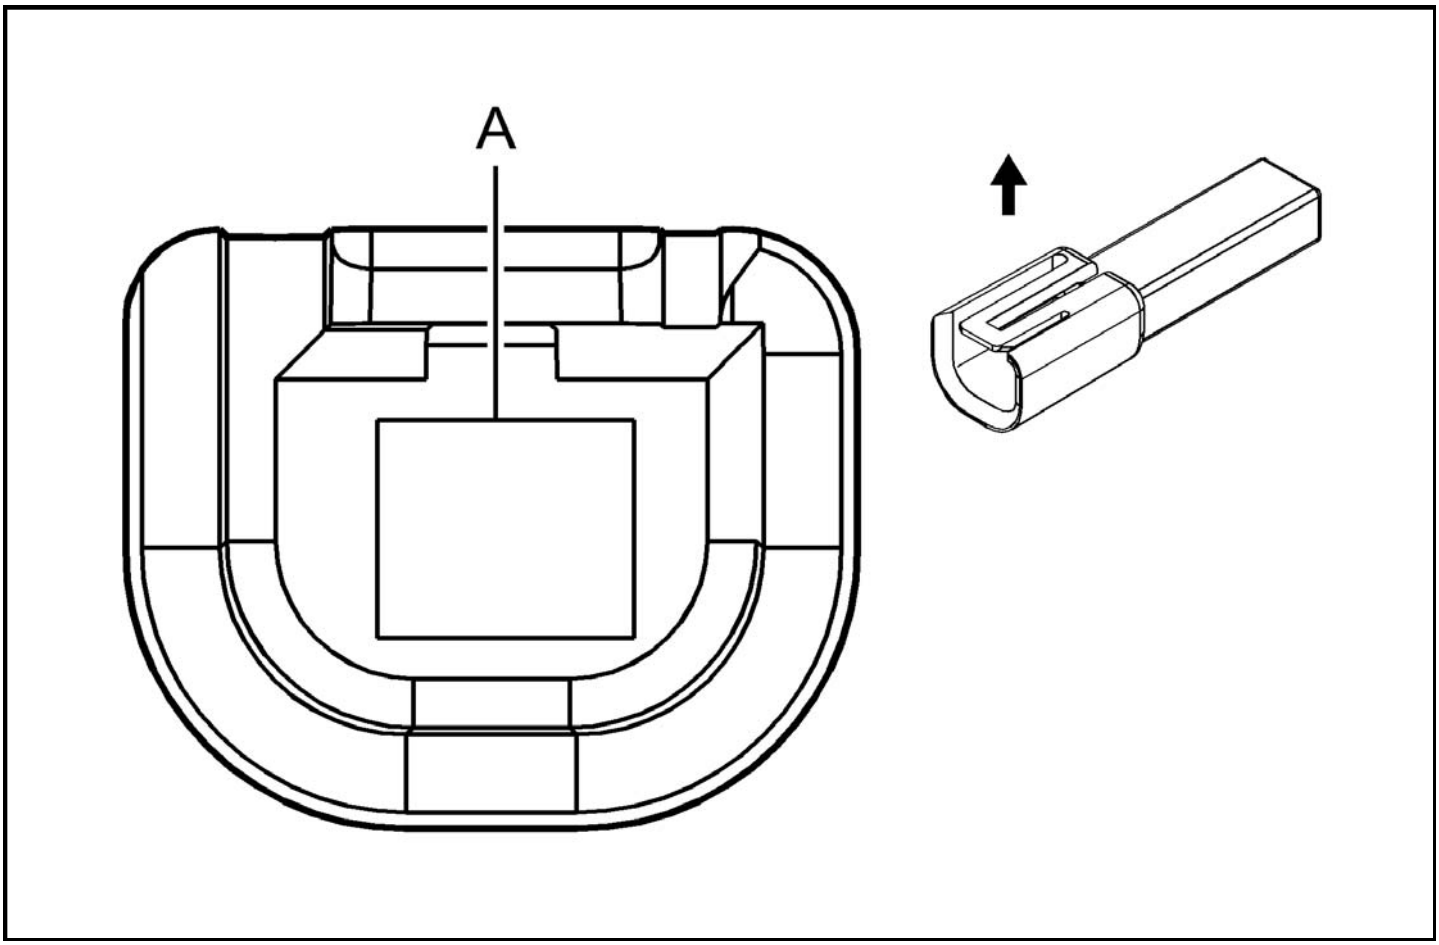
Terminal Part Information

- Terminated Lead: 13575464
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/2
- Core/Insulation Crimp: E/A

Speaker - Right Rear (UQ3)

Pin	Wire	Circuit	Function
A	0.8 L-BU	115	Right Rear Speaker Output (-)
B	0.8 D-BU	46	Right Rear Speaker Output (+)
C	0.8 D-GN	1795	Right Subwoofer Speaker Output (+)
D	0.8 L-BU/BK	315	Right Subwoofer Speaker Output (-)

SPOT LAMP - LEFT (7X6, 7X7)



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 12047683
- Service Connector: 12101828
- Description: 1-Way M Metri-Pack 150 Series (BK)

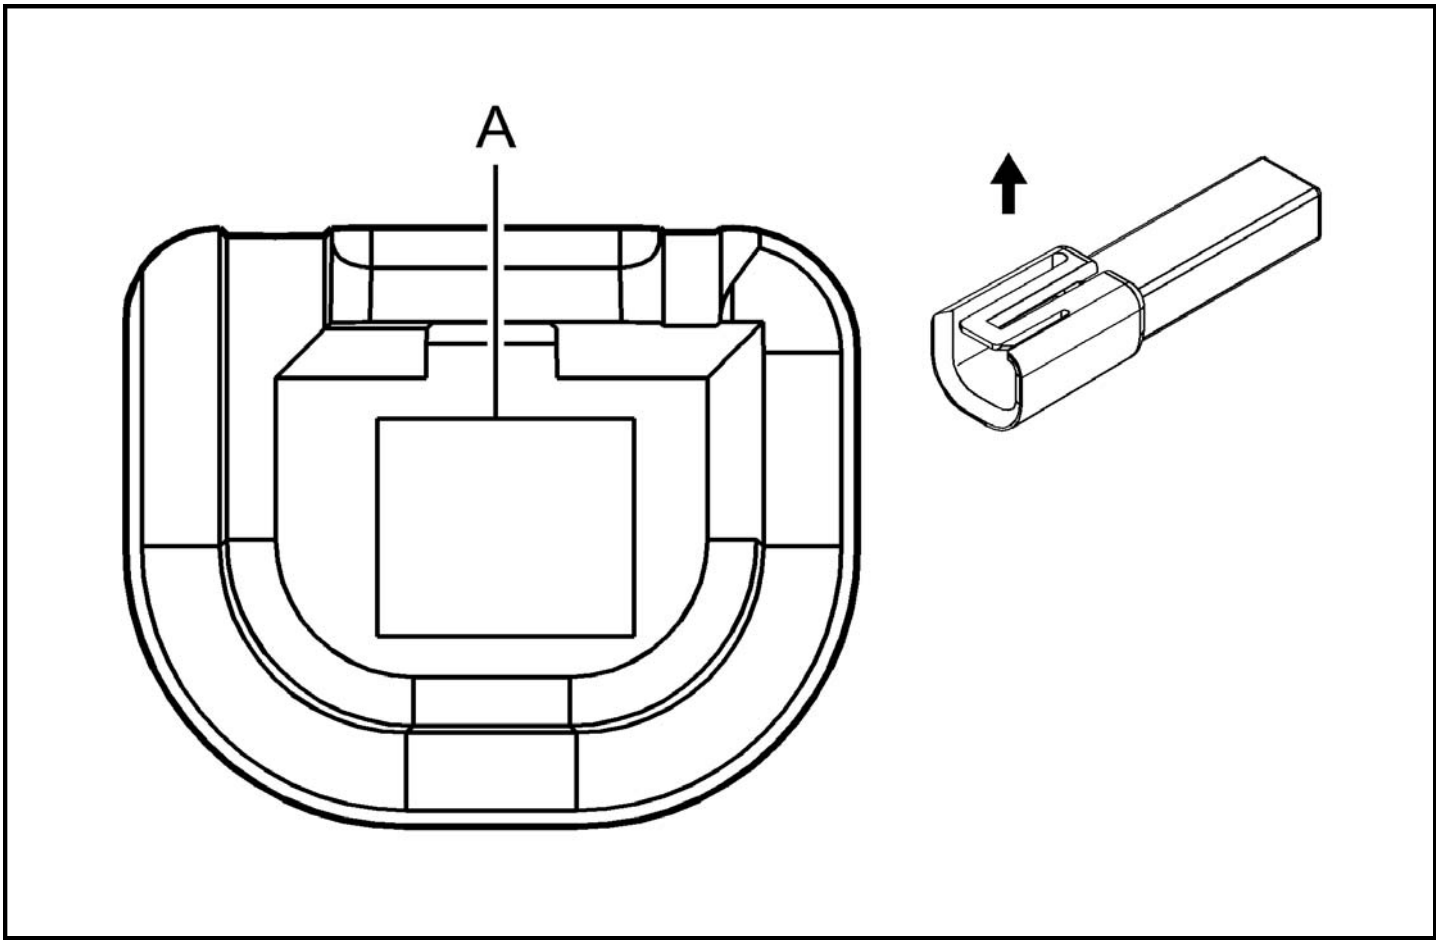
Terminal Part Information

- Terminal/Tray: 12047581/2
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 12094429/J-35616-3 (GY)

Spot Lamp - Left (7X6, 7X7)

Pin	Wire	Circuit	Function
A	0.5 RD/WH	2640	Battery Positive Voltage

SPOT LAMP - RIGHT (7X7)



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 12047683
- Service Connector: 12101828
- Description: 1-Way M Metri-Pack 150 Series (BK)

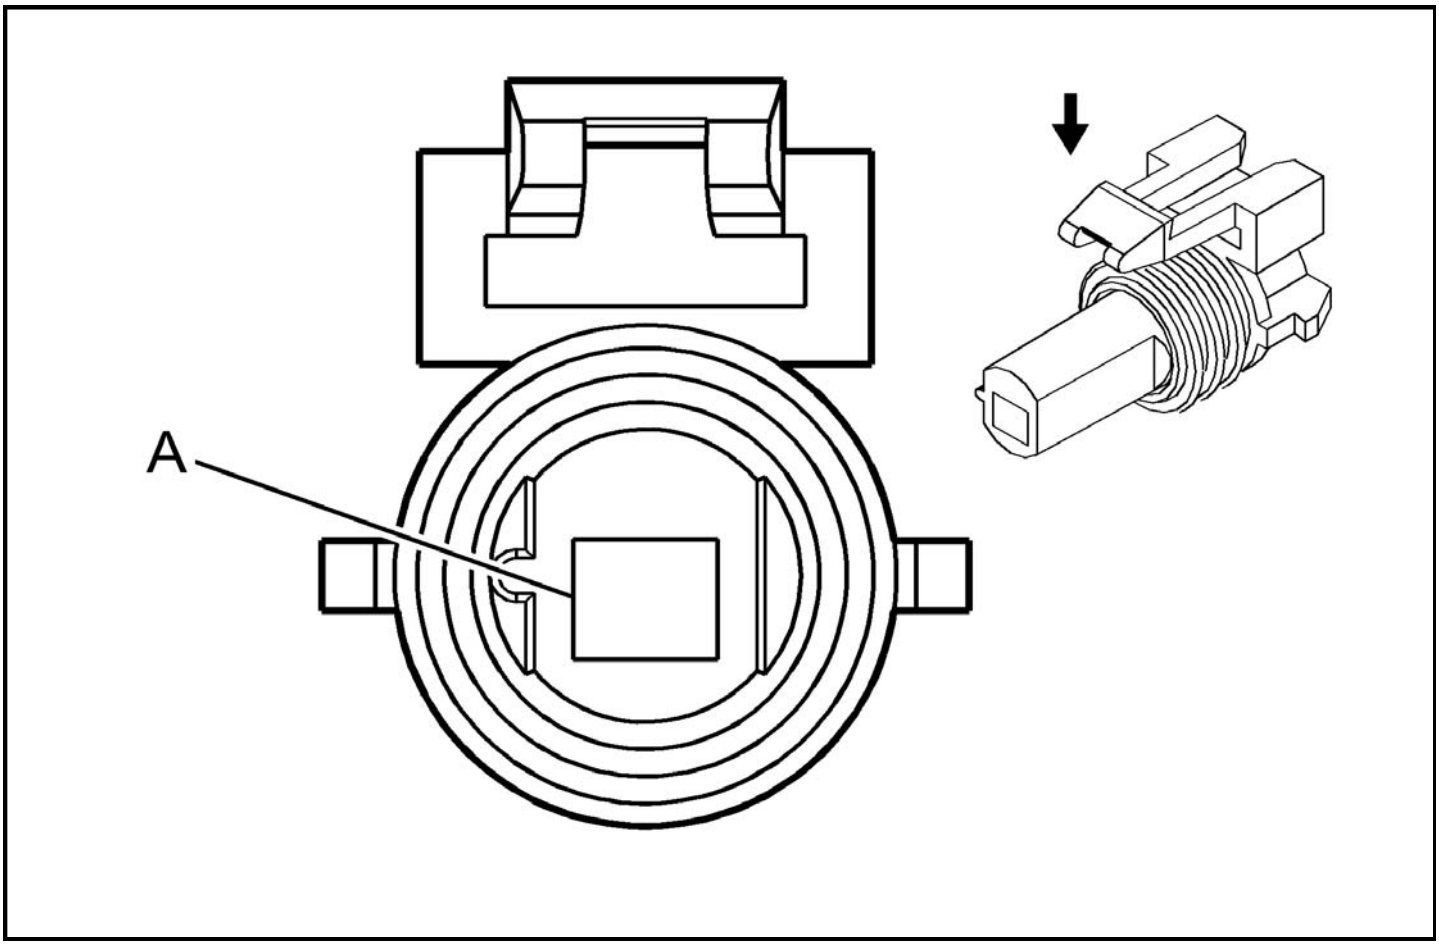
Terminal Part Information

- Terminal/Tray: 12047581/2
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 12094429/J-35616-3 (GY)

Spot Lamp - Right (7X7)

Pin	Wire	Circuit	Function
A	0.5 RD/WH	2740	Battery Positive Voltage

STARTER X2



Connector Part Information

- Harness Type: Engine
- OEM Connector: 12089916
- Service Connector: 13584479
- Description: 1-Way F Metri-Pack 280 Series, Sealed (BK)

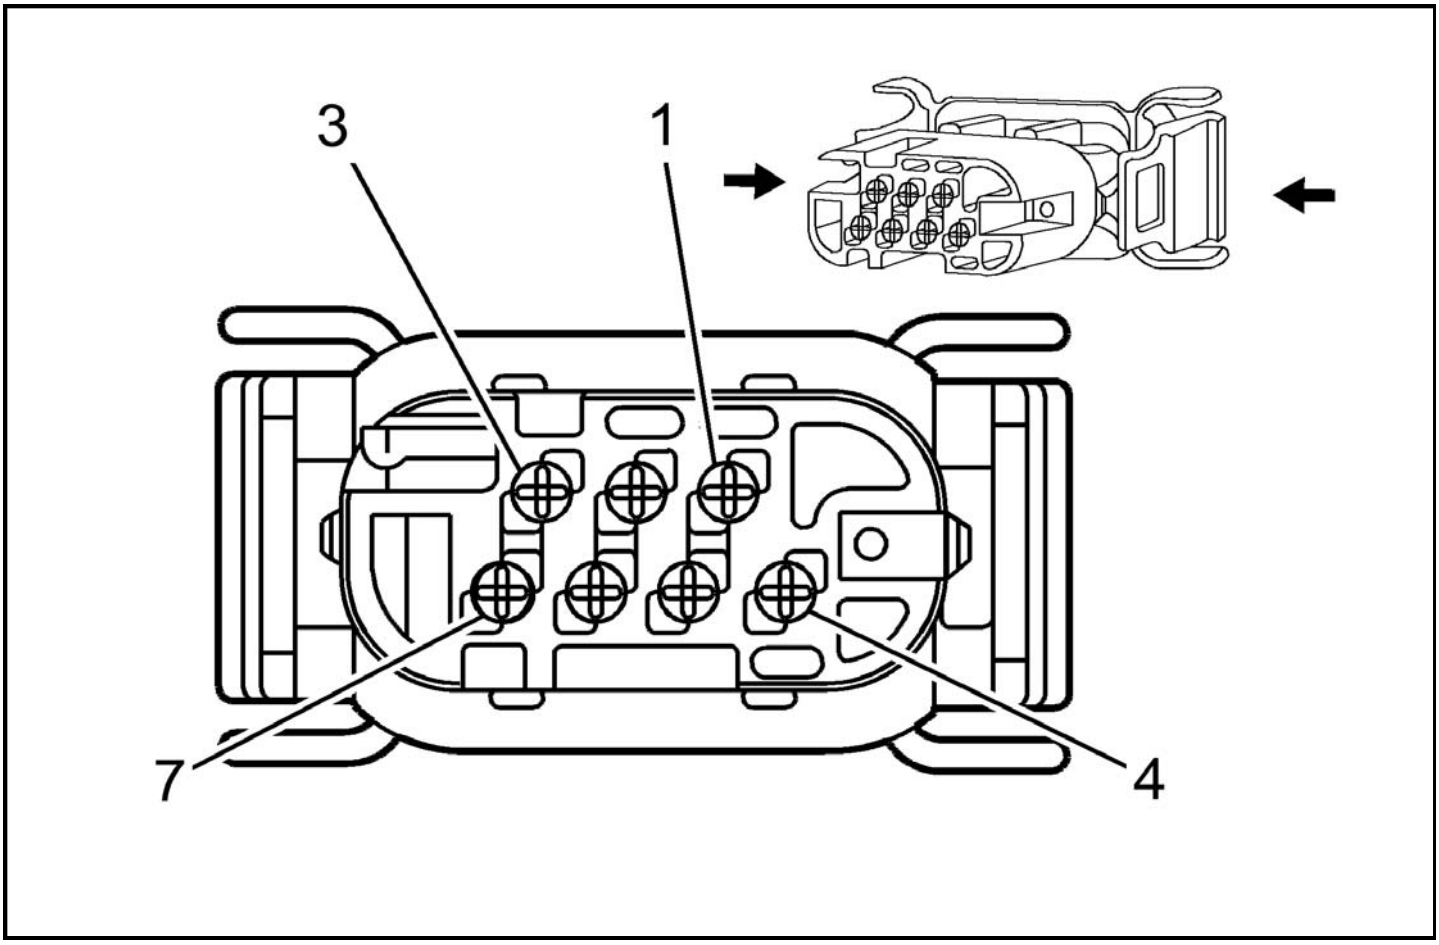
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-11A
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 12077413/4
- Core/Insulation Crimp: F/5

Starter X2

Pin	Wire	Circuit	Function
A	3 PU	6	Starter Solenoid Crank Voltage

STEERING ANGLE SENSOR



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 15324351
- Service Connector: 88987967
- Description: 7-Way F 0.6 Series (BK)

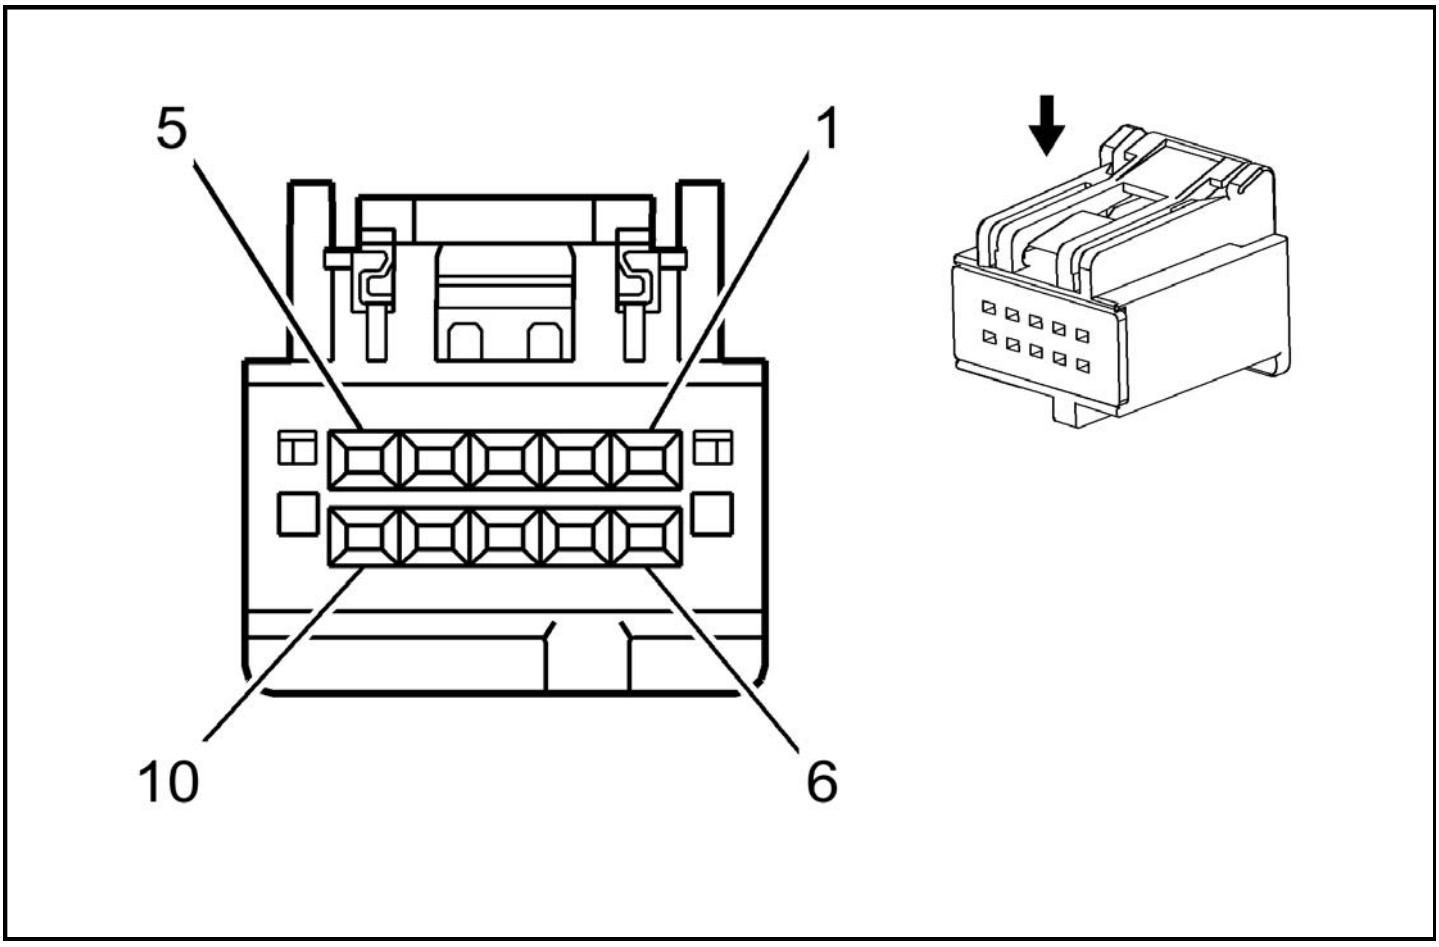
Terminal Part Information

- Terminal/Tray: 1928498014/17
- Core/Insulation Crimp: N/N
- Release Tool/Test Probe: J-38125-560/J-35616-64B (L-BU)

Steering Angle Sensor

Pin	Wire	Circuit	Function
1	0.35 BK/WH	1551	Ground
2	0.35 WH	1056	Steering Wheel Position Sensor 12V Reference Voltage
3	0.35 TN	6433	CAN Bus High Serial Data
4	0.35 L-GN	6432	CAN Bus Low Serial Data
5-7	-	-	Not Used

STEERING WHEEL CONTROL SWITCH - LEFT



Connector Part Information

- Harness Type: Steering Wheel
- OEM Connector: 30700-1100
- Service Connector: Service by Harness - See Part Catalog
- Description: 10-Way F H-DAC 64 Series (GY)

Terminal Part Information

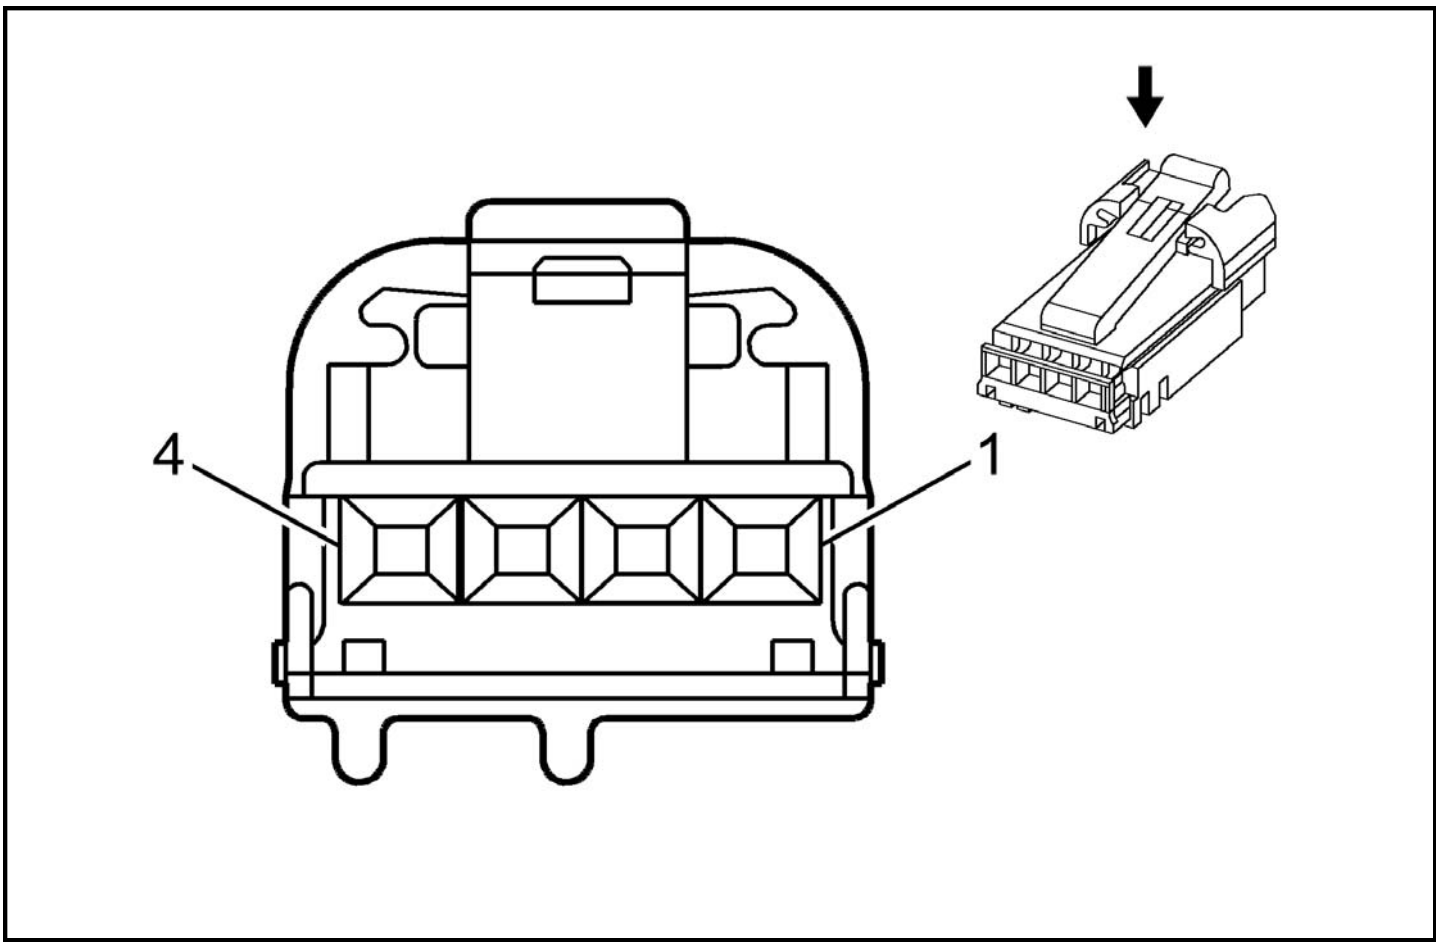
- Terminated Lead: Service by Harness - See Part Catalog
- Release Tool: Not Available
- Diagnostic Test Probe: Not Available
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Steering Wheel Control Switch - Left

Pin	Wire	Circuit	Function
1	0.35 PU	1375	Steering Wheel Control Supply Voltage

Pin	Wire	Circuit	Function
2	-	-	Not Used
3	0.35 GY	1884	Cruise Control Switch Signal
4-5	-	-	Not Used
6	0.35 PU/WH	7005	LED Dimming Supply
7	-	-	Not Used
8	0.35 BK	1450	Ground
9	0.35 D-GN/WH	7158	Cruise Control Indicator Dimming Signal
10	-	-	Not Used

STEERING WHEEL CONTROL SWITCH - RIGHT (UK3)



Connector Part Information

- Harness Type: Steering Wheel
- OEM Connector: 31068-1010
- Service Connector: 19153195
- Description: 4-Way F H-DAC 64 Series (BK)

Terminal Part Information

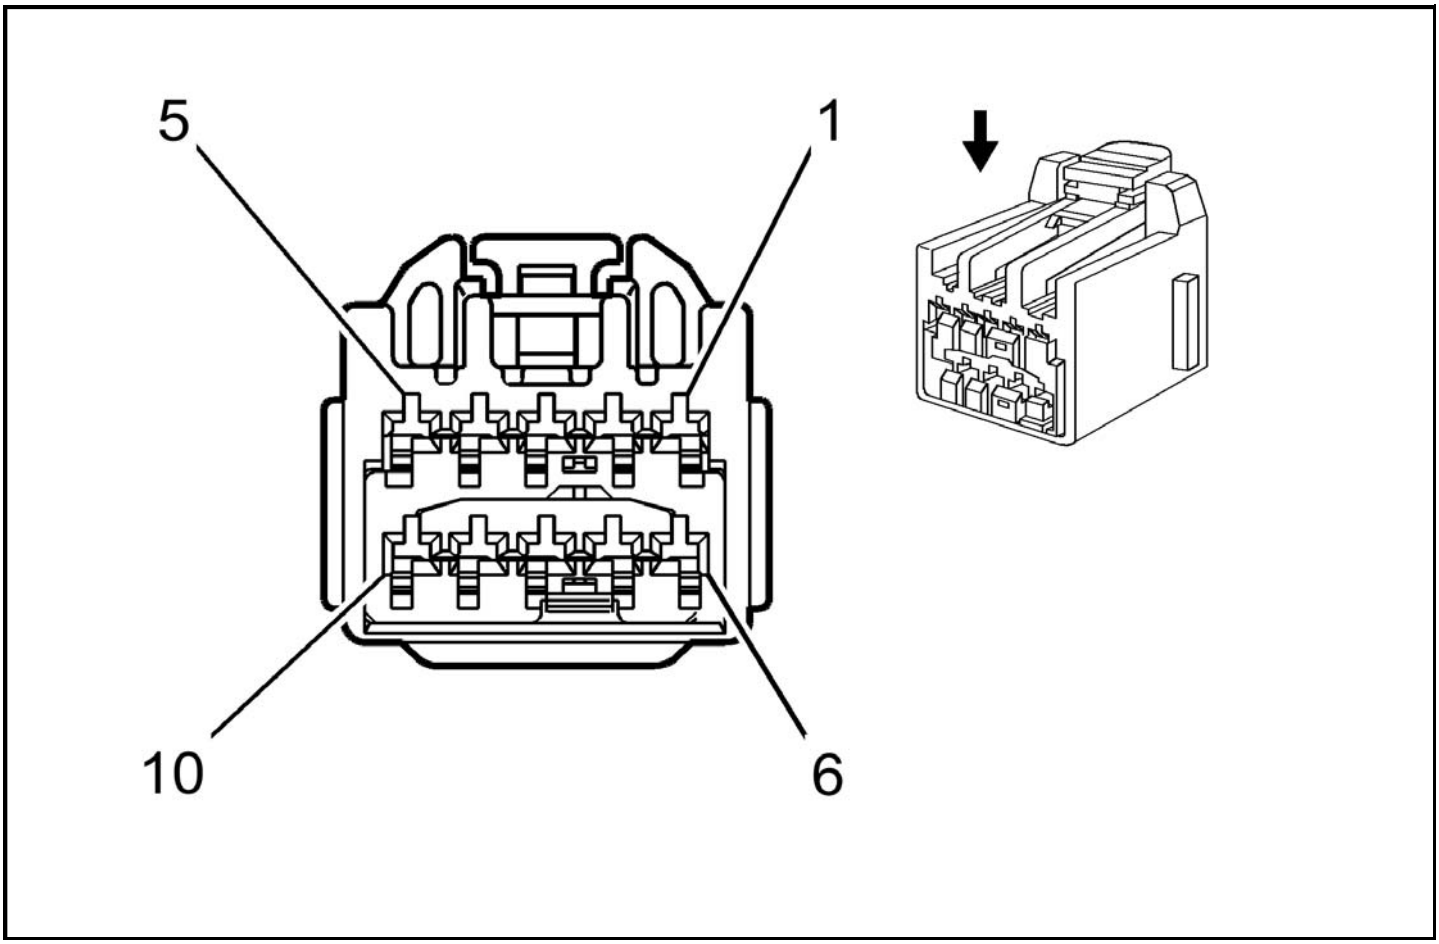
- Terminated Lead: Service by Harness- See Part Catalog

- Release Tool: Not Available
- Diagnostic Test Probe: Not Available
- Terminal/Tray: Not Available
- Core/Insulation Crimp: Not Available

Steering Wheel Control Switch - Right (UK3)

Pin	Wire	Circuit	Function
1	0.35 BK	1450	Ground
2	0.35 PU/WH	7005	LED Dimming Supply
3	0.35 PU	1375	Steering Wheel Control Supply Voltage
4	0.35 D-BU	1796	Steering Wheel Controls Signal

SUNROOF CONTROL MODULE (CF5)



Connector Part Information

- Harness Type: Sunroof
- OEM Connector: 7283-5909-40
- Service Connector: Service by Harness - See Part Catalog
- Description: 10-Way F 1.5 Series (L-GY)

Terminal Part Information

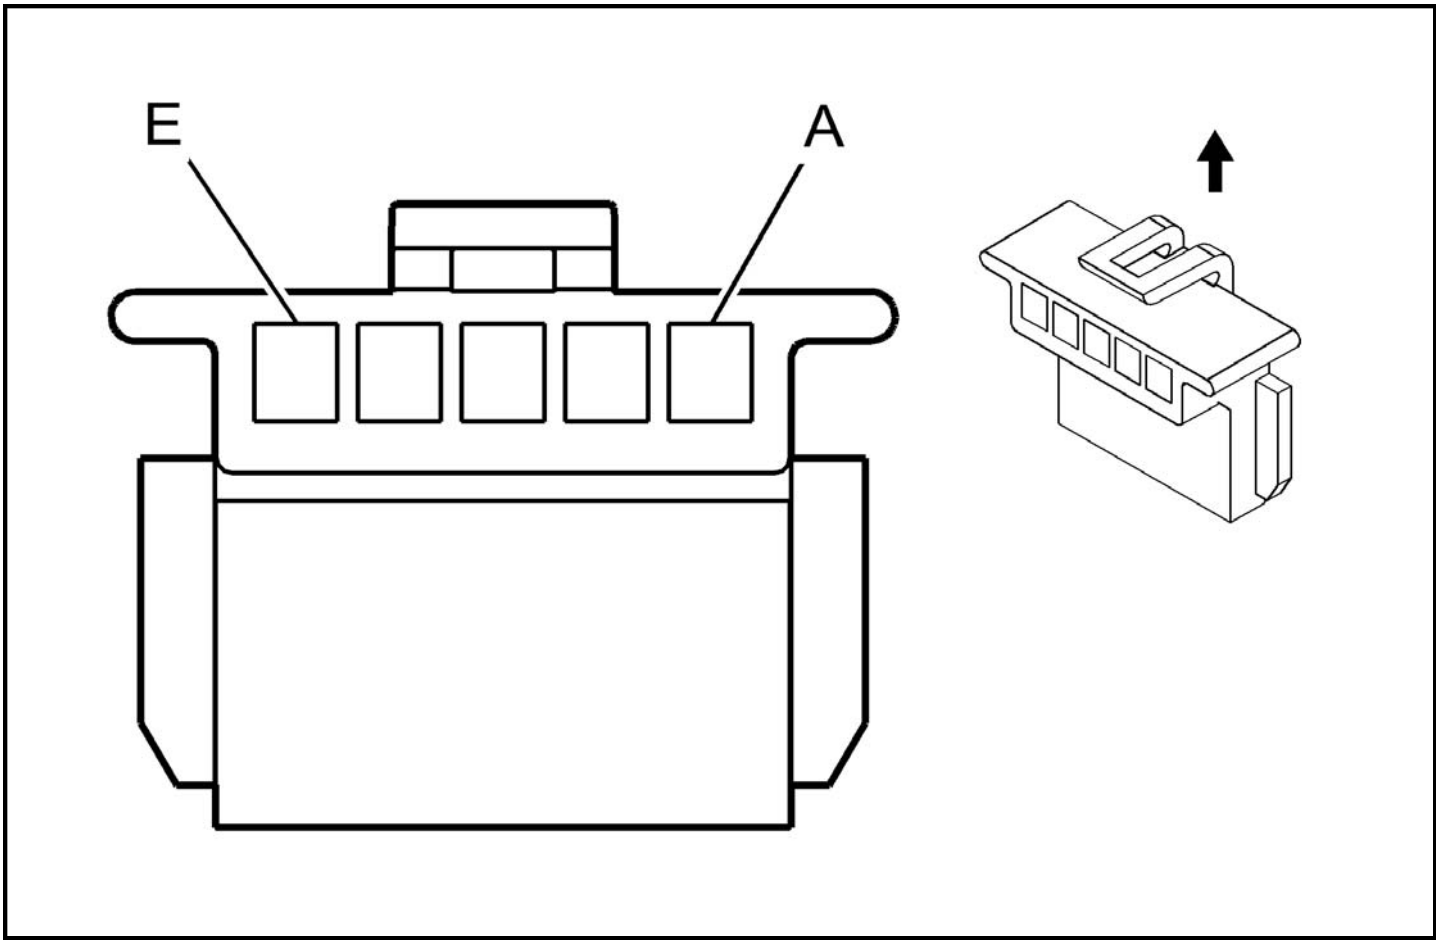
- Pins: 1, 6
- Terminal/Tray: 7116-4101-08/9
- Core/Insulation Crimp: E/A
- Release Tool/Test Probe: 12094430/J-35616-2A (GY)

- Pins: 2, 3, 5, 10
- Terminal/Tray: 7116-4100-08/9
- Core/Insulation Crimp: E/C
- Release Tool/Test Probe: 12094430/J-35616-2A (GY)

Sunroof Control Module (CF5)

Pin	Wire	Circuit	Function
1	1 BK	550	Ground
2	0.5 D-BU	128	Sunroof Switch Low Reference
3	0.5 YE	643	Accessory Voltage
4	-	-	Not Used
5	0.5 BN	100	Sunroof Switch Open Signal
6	1 RD/WH	3440	Battery Positive Voltage
7-9	-	-	Not Used
10	0.5 OG	110	Sunroof Switch Close Signal

SUNROOF SWITCH (CF5)



Connector Part Information

- Harness Type: Headliner
- OEM Connector: 12124997
- Service Connector: 12167130
- Description: 5-Way F Metri-Pack 150 Series (BK)

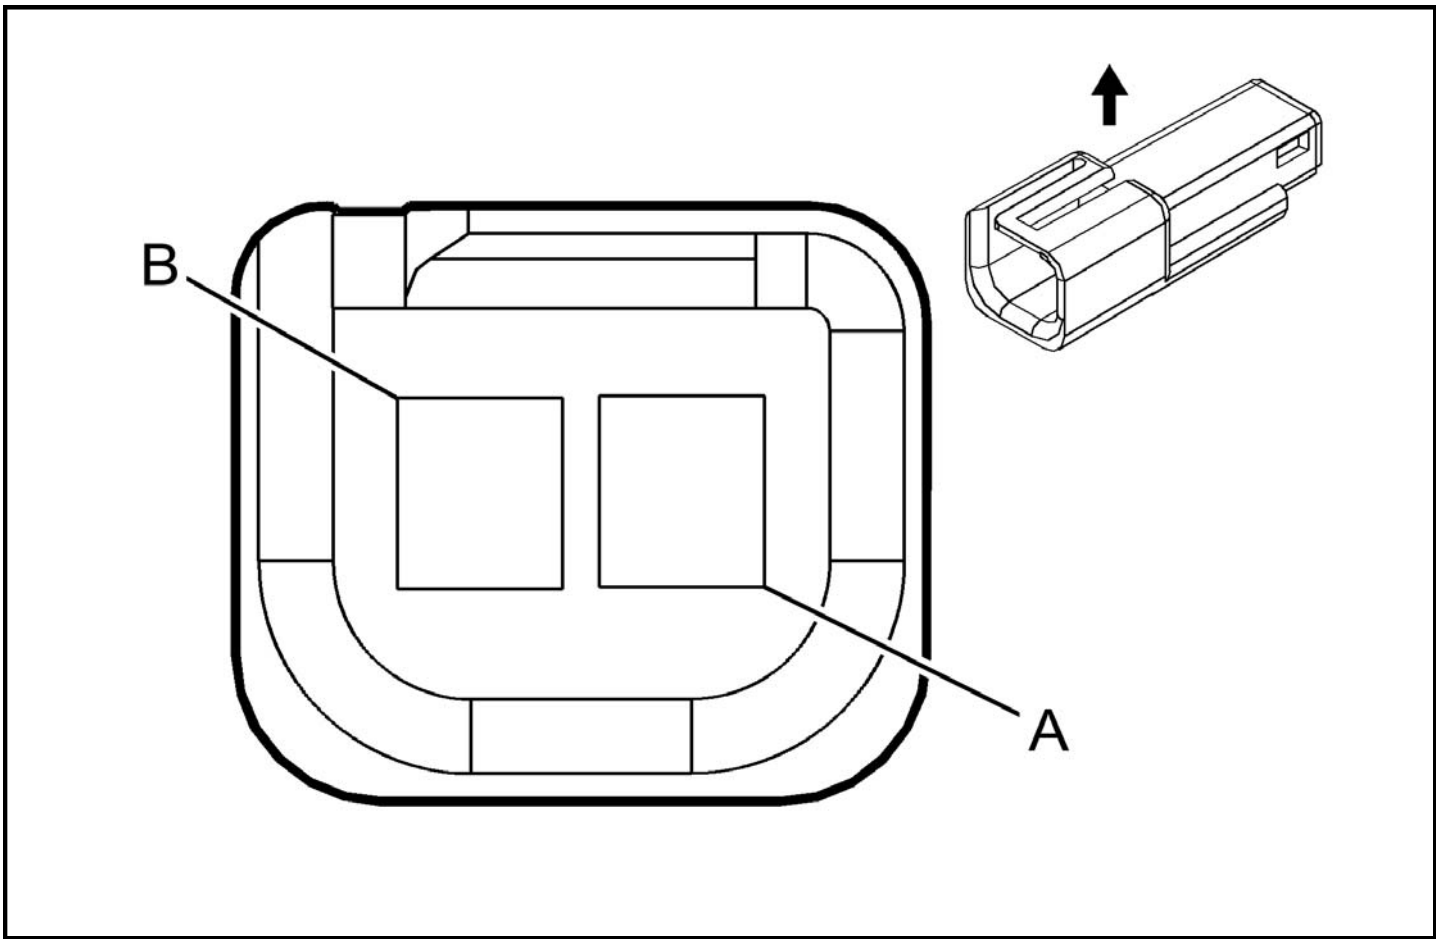
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 12103359/18
- Core/Insulation Crimp: E/C

Sunroof Switch (CF5)

Pin	Wire	Circuit	Function
A-B	-	-	Not Used
C	0.35 D-BU	128	Sunroof Switch Low Reference
D	0.35 BN	100	Sunroof Switch Open Signal
E	0.35 OG	110	Sunroof Switch Close Signal

SUNSHADE - LEFT (DH6)



Connector Part Information

- Harness Type: Headliner
- OEM Connector: 12047663
- Service Connector: 13584278
- Description: 2-Way M Metri-Pack 150 Series (BK)

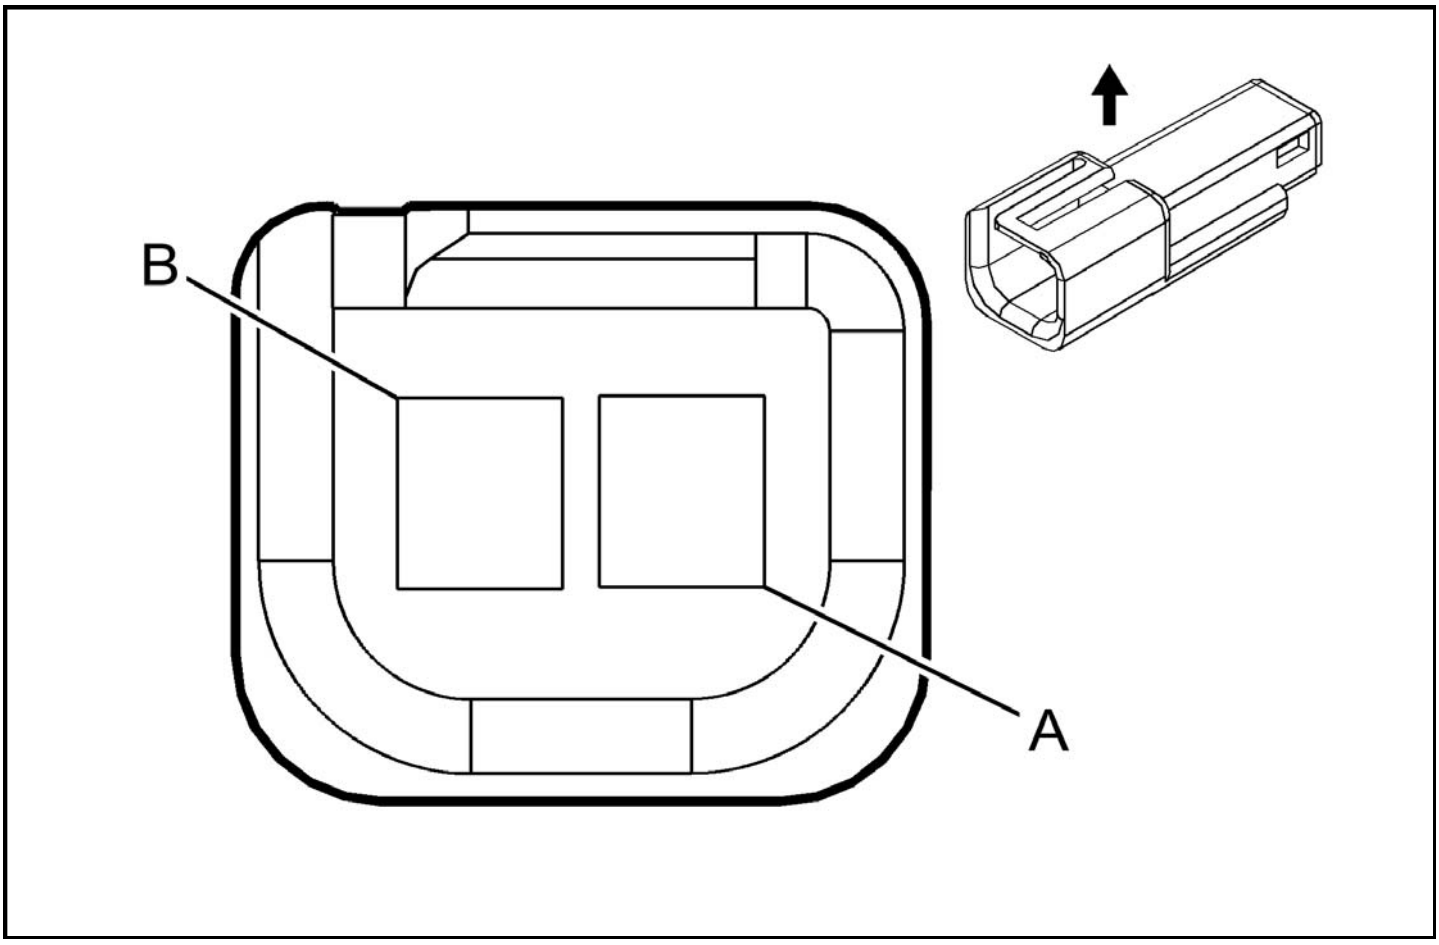
Terminal Part Information

- Terminated Lead: 13575462
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)
- Terminal/Tray: 12047581/2
- Core/Insulation Crimp: E/C

Sunshade - Left (DH6)

Pin	Wire	Circuit	Function
A	0.5 OG	1732	Inadvertent Power Courtesy Lamp
B	0.5 BK	550	Ground

SUNSHADE - RIGHT (DH6)



Connector Part Information

- Harness Type: Headliner
- OEM Connector: 12047663
- Service Connector: 13584278
- Description: 2-Way M Metri-Pack 150 Series (BK)

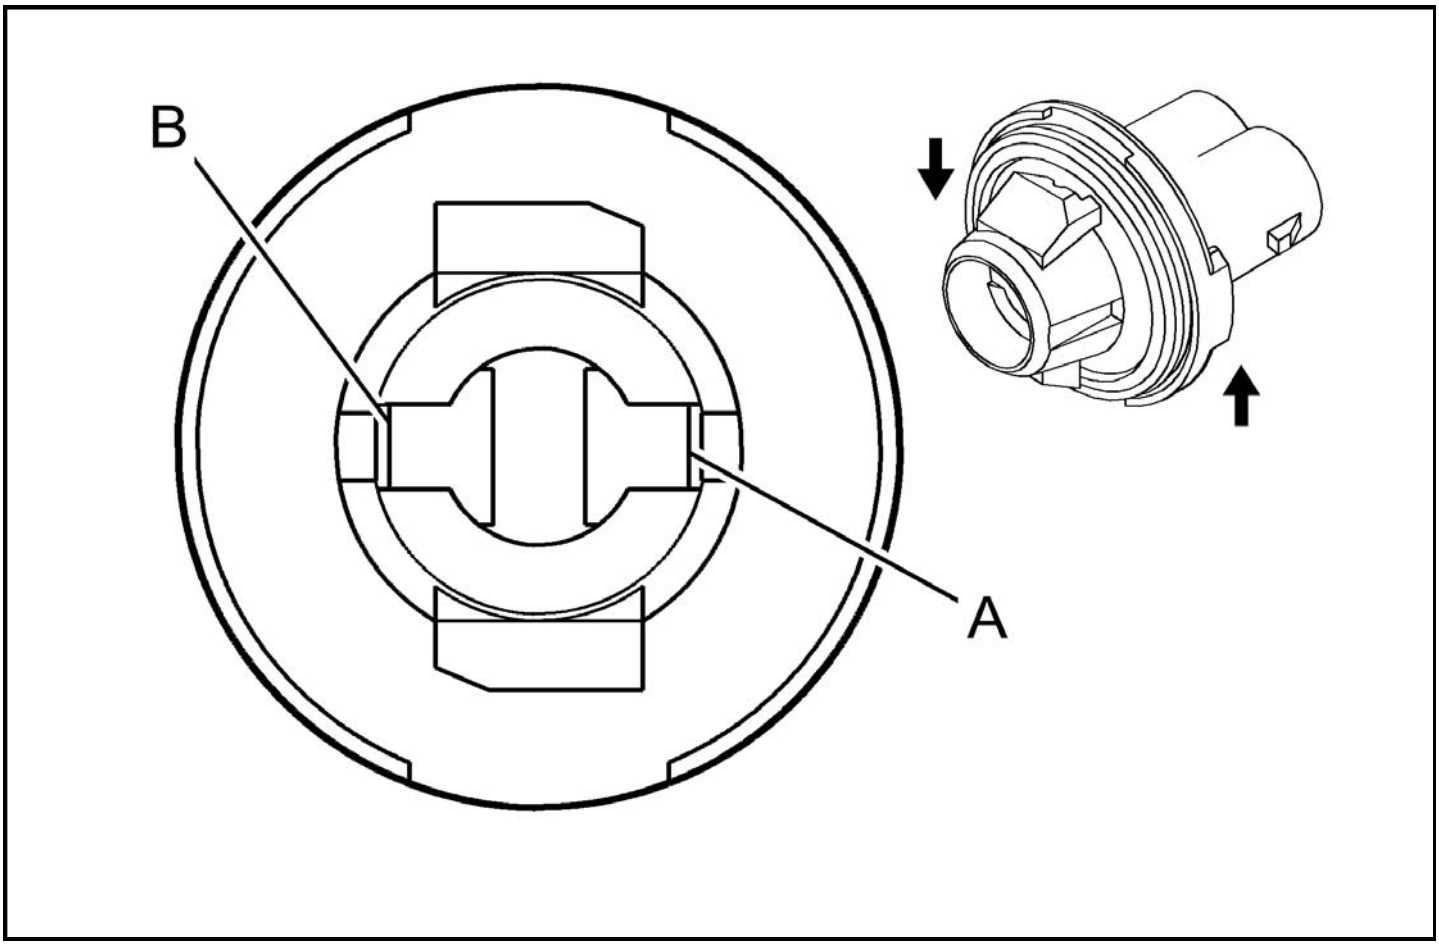
Terminal Part Information

- Terminated Lead: 13575462
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-3 (GY)
- Terminal/Tray: 12047581/2
- Core/Insulation Crimp: E/C

Sunshade - Right (DH6)

Pin	Wire	Circuit	Function
A	0.5 OG	1732	Inadvertent Power Courtesy Lamp
B	0.5 BK	550	Ground

TAIL LAMP - LEFT



Connector Part Information

- Harness Type: Left Tail Lamp
- OEM Connector: 15324946
- Service Connector: 88986416
- Description: 2-Way F Lamp Socket Wedge Base W2 (D-GY)

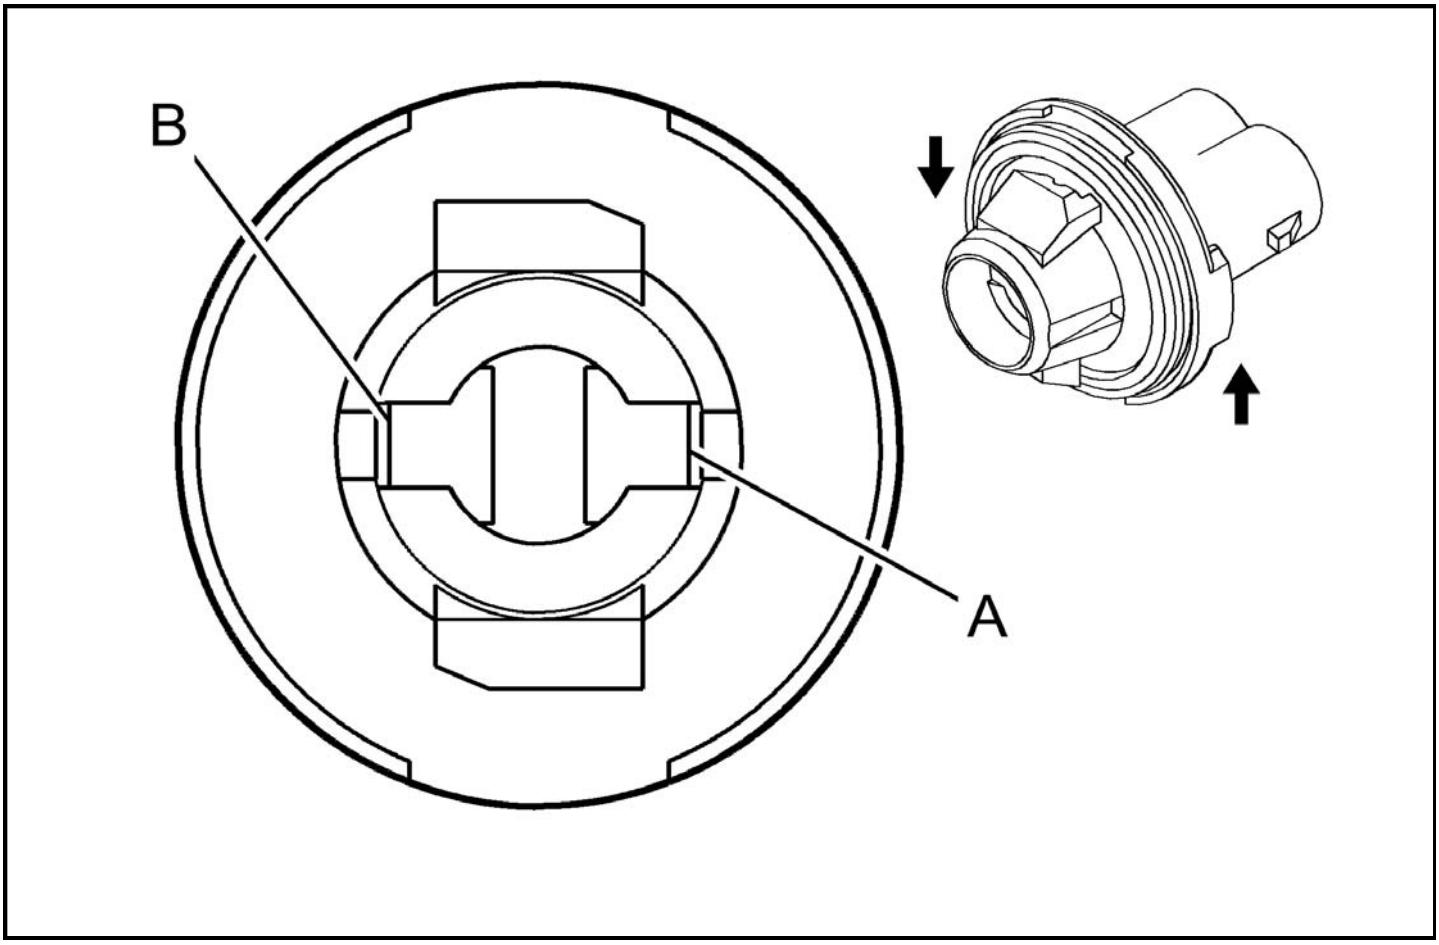
Terminal Part Information

- Terminal/Tray: 12124471/5
- Core/Insulation Crimp: 2/3
- Release Tool/Test Probe: 12094430/ Not Available

Tail Lamp - Left

Pin	Wire	Circuit	Function
A	0.5 L-GN	709	Left Park Lamp Supply Voltage
B	0.5 BK	750	Ground

TAIL LAMP - RIGHT



Connector Part Information

- Harness Type: Right Tail Lamp
- OEM Connector: 15324946
- Service Connector: 88986416
- Description: 2-Way F Lamp Socket Wedge Base W2 (D-GY)

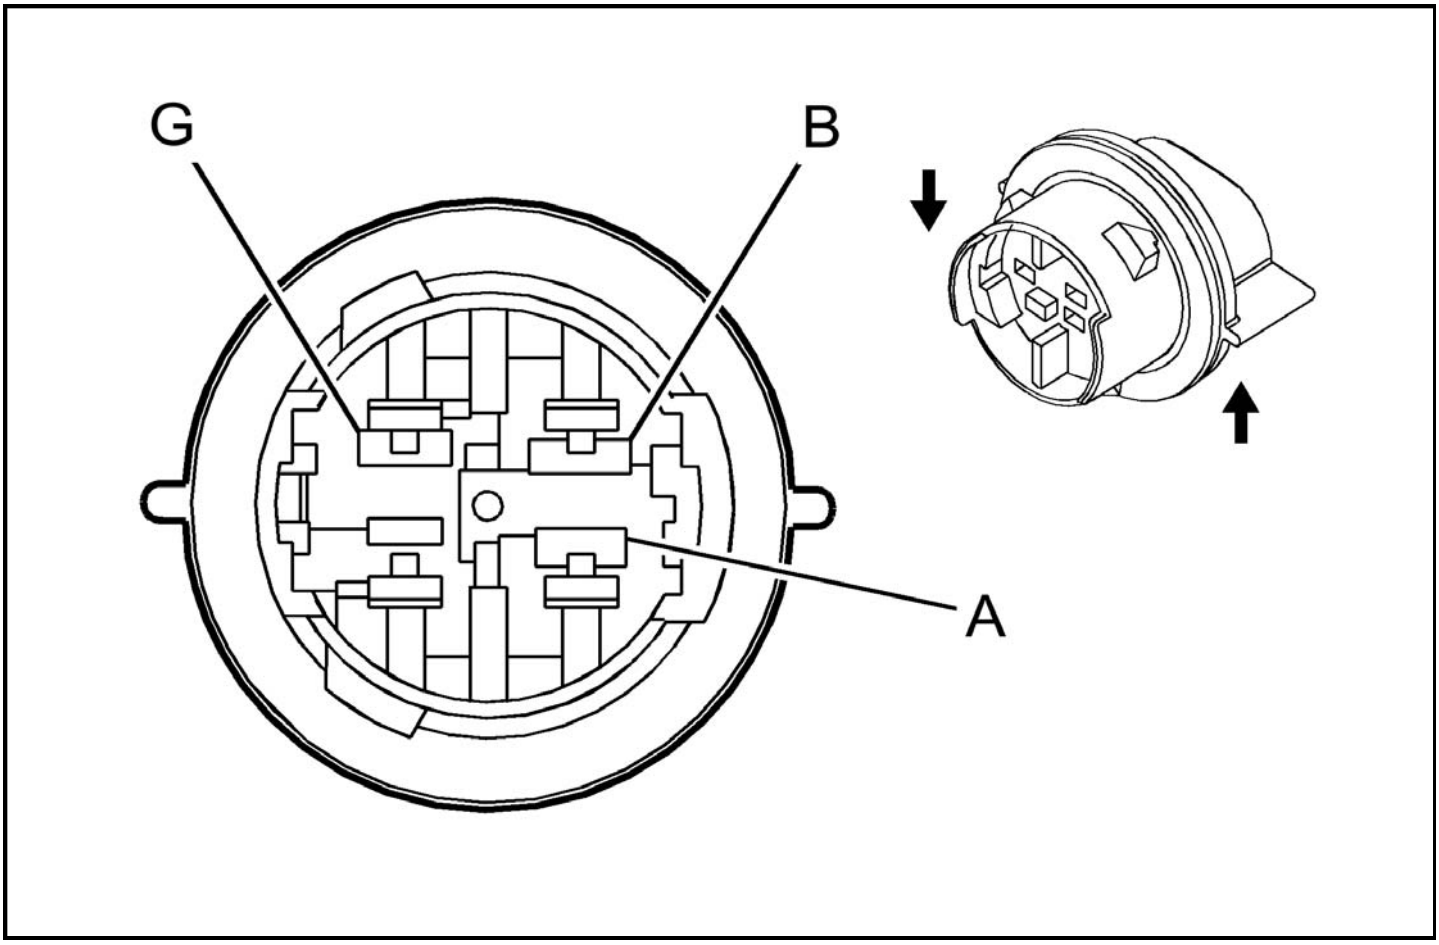
Terminal Part Information

- Terminal/Tray: 12124471/5
- Core/Insulation Crimp: 2/3
- Release Tool/Test Probe: 12094430/ Not Available

Tail Lamp - Right

Pin	Wire	Circuit	Function
A	0.5 L-GN	309	Left Park Lamp Supply Voltage
B	0.5 BK	750	Ground

TAIL/STOP AND TURN SIGNAL LAMP - LEFT



Connector Part Information

- Harness Type: Left Tail Lamp
- OEM Connector: 16530873
- Service Connector: Service by Harness - See Part Catalog
- Description: 3-Way F Lamp Socket Wedge Base W3 Right angle (NA)

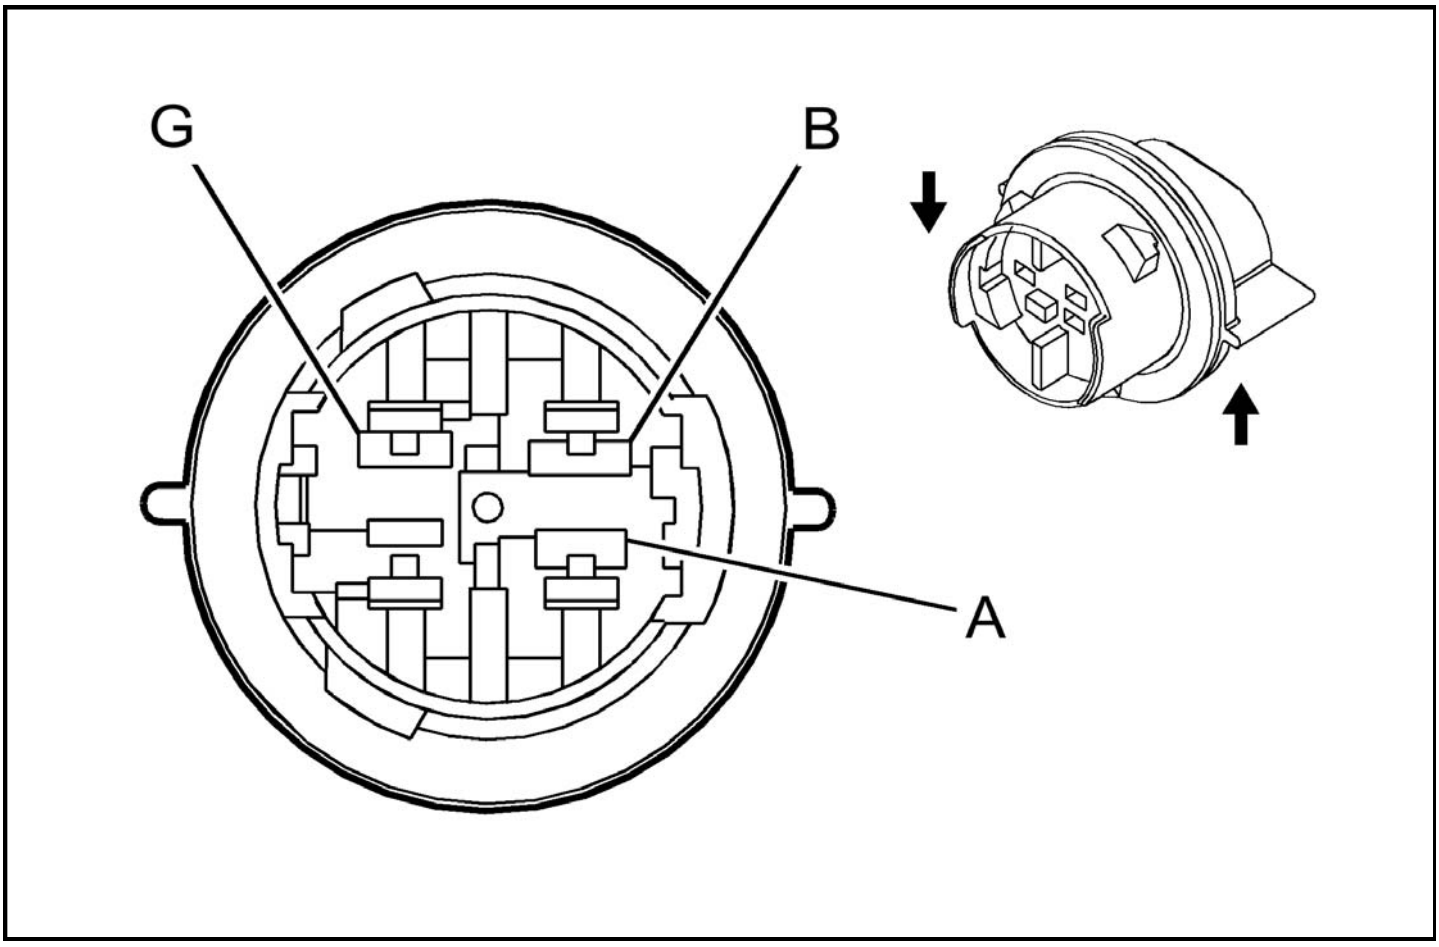
Terminal Part Information

- Terminal/Tray: 12066638/5
- Core/Insulation Crimp: 2/5
- Release Tool/Test Probe: 12180559-1/J-35616-4A (PU)

Tail/Stop and Turn Signal Lamp - Left

Pin	Wire	Circuit	Function
A	0.5 YE	18	Left Rear Stop/Turn Lamp Supply Voltage
B	0.5 L-GN	709	Left Park Lamp Supply Voltage
	0.5 L-GN	709	Left Park Lamp Supply Voltage
G	0.5 BK	750	Ground
	0.5 BK	750	Ground

TAIL/STOP AND TURN SIGNAL LAMP - RIGHT



Connector Part Information

- Harness Type: Right Tail Lamp
- OEM Connector: 16530873
- Service Connector: Service by Harness - See Part Catalog
- Description: 3-Way F Lamp Socket Wedge Base W3 Right angle (NA)

Terminal Part Information

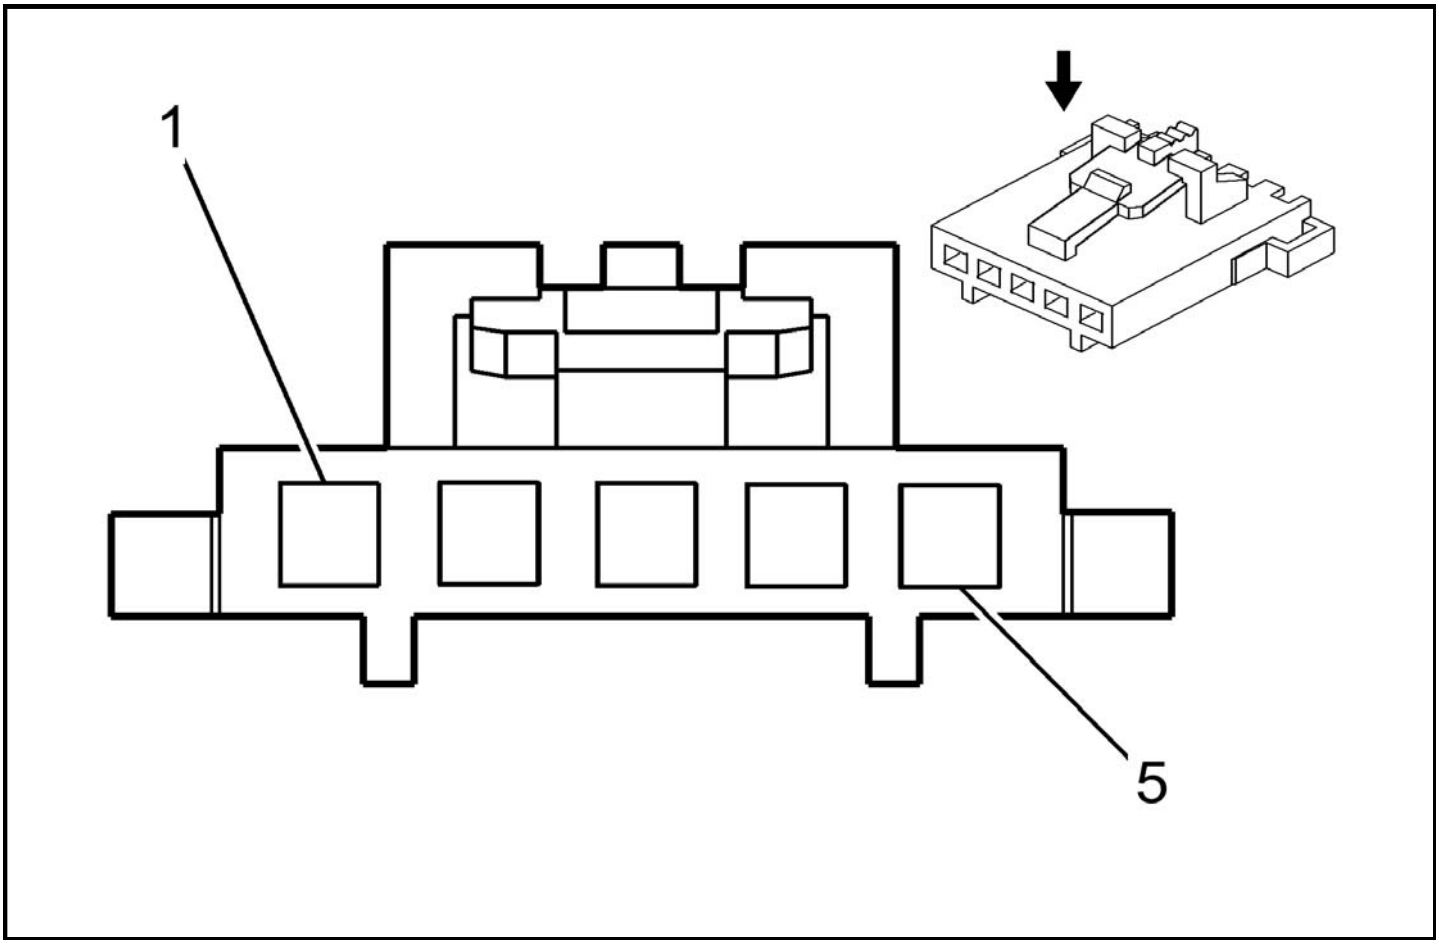
- Terminal/Tray: 12066638/5
- Core/Insulation Crimp: 2/5
- Release Tool/Test Probe: 12180559-1/J-35616-4A (PU)

Tail/Stop and Turn Signal Lamp - Right

Pin	Wire	Circuit	Function
A	0.5 YE	19	Right Rear Stop/Turn Lamp Supply Voltage
B	0.5 L-GN	309	Right Park Lamp Supply Voltage
	0.5 L-GN	309	Right Park Lamp Supply Voltage
G	0.5 BK	750	Ground

Pin	Wire	Circuit	Function
	0.5 BK	750	Ground

THEFT DETERRENT MODULE (TDM)



Connector Part Information

- Harness Type: Steering Column
- OEM Connector: 15383337
- Service Connector: 88988353
- Description: 5-Way F SL Series (BK)

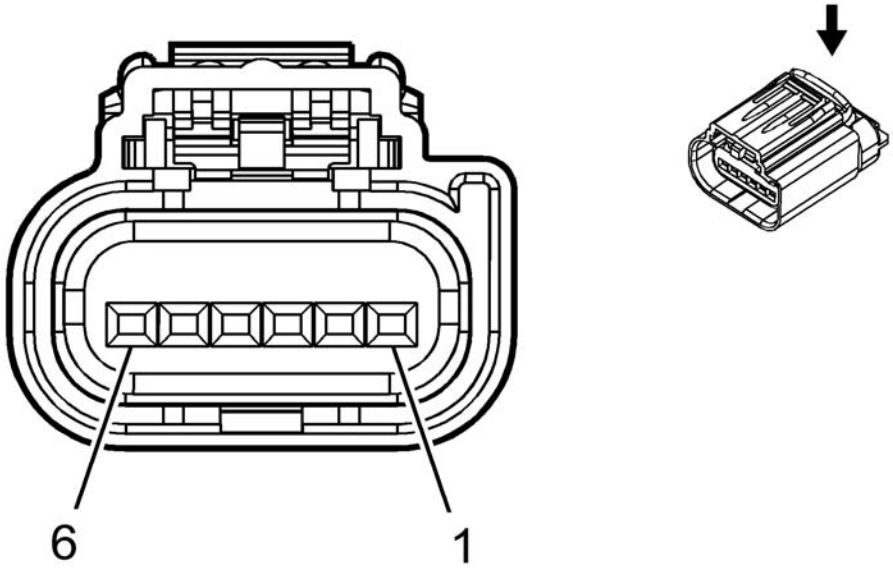
Terminal Part Information

- Terminated Lead: Service by Connector Assembly - 88988353
- Release Tool: J-38125-213
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: 16-02-1110/20
- Core/Insulation Crimp: H/H

Theft Deterrent Module (TDM)

Pin	Wire	Circuit	Function
1	0.35 RD/WH	1040	Battery Positive Voltage
2	0.35 BN	4	Accessory Voltage
3	0.35 BK/WH	1551	Ground
4	-	-	Not Used
5	0.35 D-GN	5060	Low Speed GMLAN Serial Data

Q38 THROTTLE BODY (LFR/LFX)



Connector Part Information

- Harness Type: Engine
- OEM Connector: 1-1419168-1
- Service Connector: 13580980
- Description: 6-Way F 0.64 GET Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-64B (LT BU)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	YE	581	Throttle Actuator Control Open	I	-

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
2	0.5	BN	582	Throttle Actuator Control Close	I	-

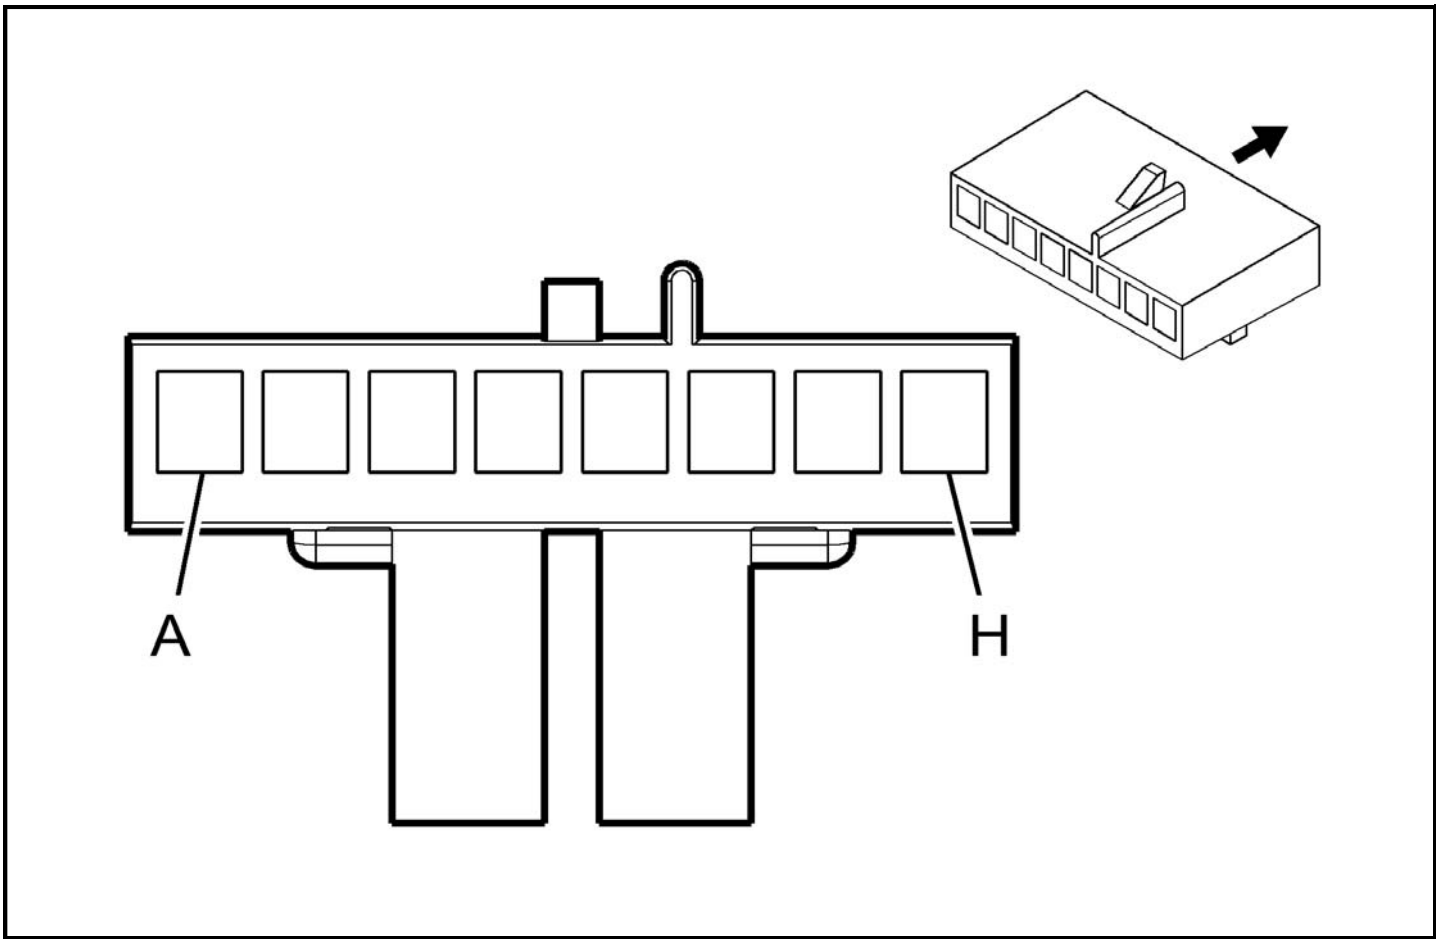
4	0.5	TN	2752	Throttle Position Sensor Low Reference	I	-
5	0.5	GY	2701	Throttle Position Sensor 5 Volt Reference	I	-
6	-	-	-	Not Occupied	-	-

TURN SIGNAL/MULTIFUNCTION SWITCH X1



Connector Part Information

- Harness Type: Steering Column
- OEM Connector: 12064862
- Service Connector: 12126438
- Description: 8-Way F Metri-Pack 150 Series (BK)

Terminal Part Information

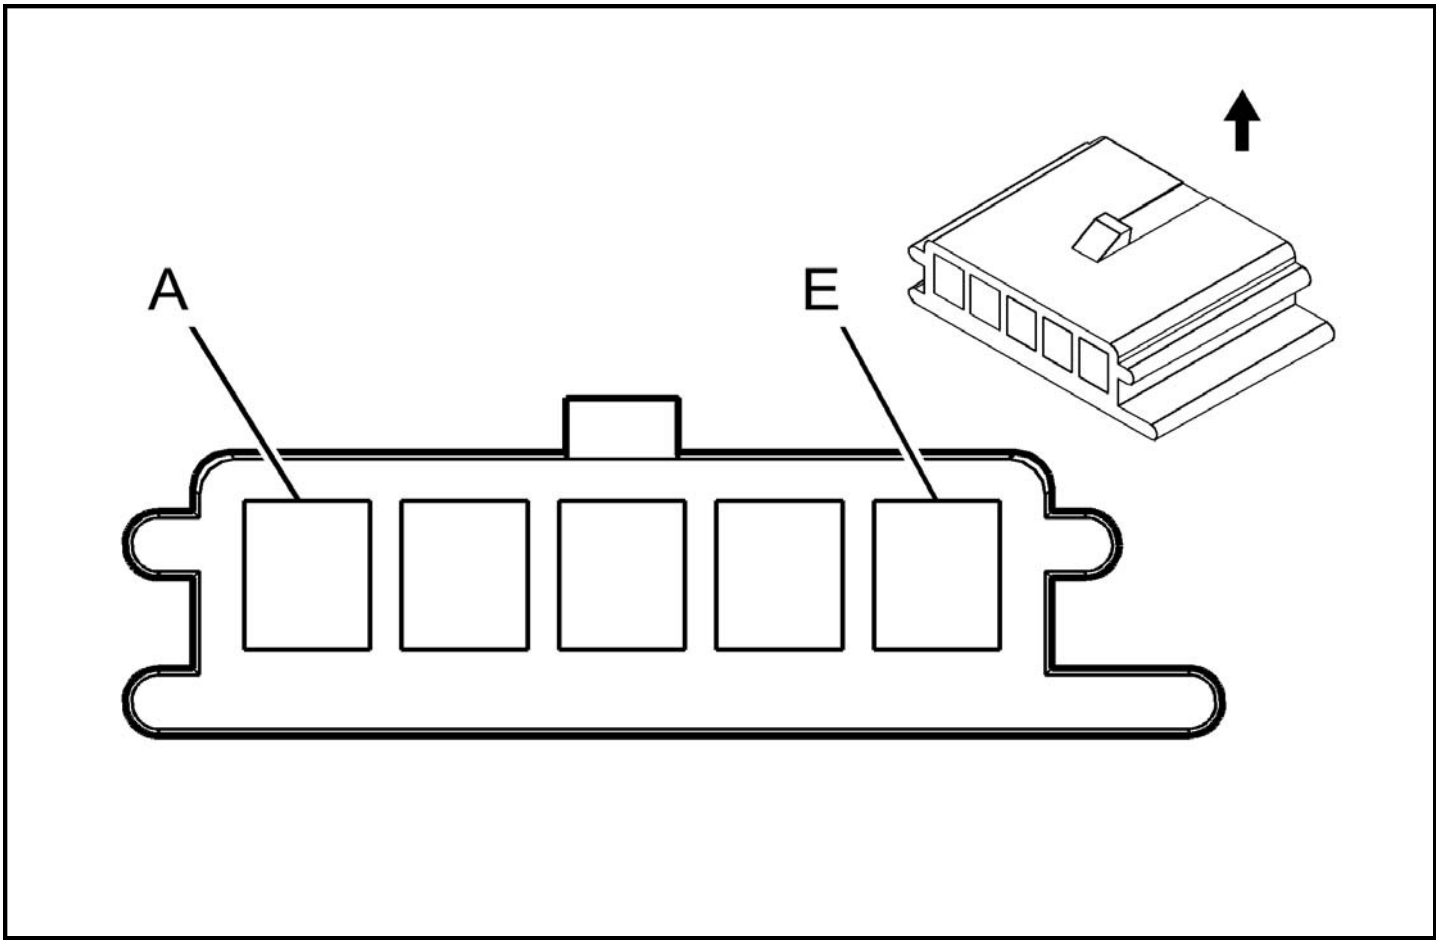
- Terminated Lead: 13575464

- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/5
- Core/Insulation Crimp: E/C

Turn Signal/Multifunction Switch X1

Pin	Wire	Circuit	Function
A-B	-	-	Not Used
C	0.35 TN	2144	Hazard Switch Signal
D	0.35 L-BU/WH	1414	Left Turn Signal Switch Signal
E	0.35 BK/WH	1551	Ground
F	0.35 D-BU/WH	1415	Right Turn Signal Switch Signal
G	-	-	Not Used
H	0.35 BK/WH	1551	Ground

TURN SIGNAL/MULTIFUNCTION SWITCH X2



Connector Part Information

- Harness Type: Steering Column
- OEM Connector: 12059800

- Service Connector: 15306169
- Description: 5-Way F Metri-Pack 150 Series (BK)

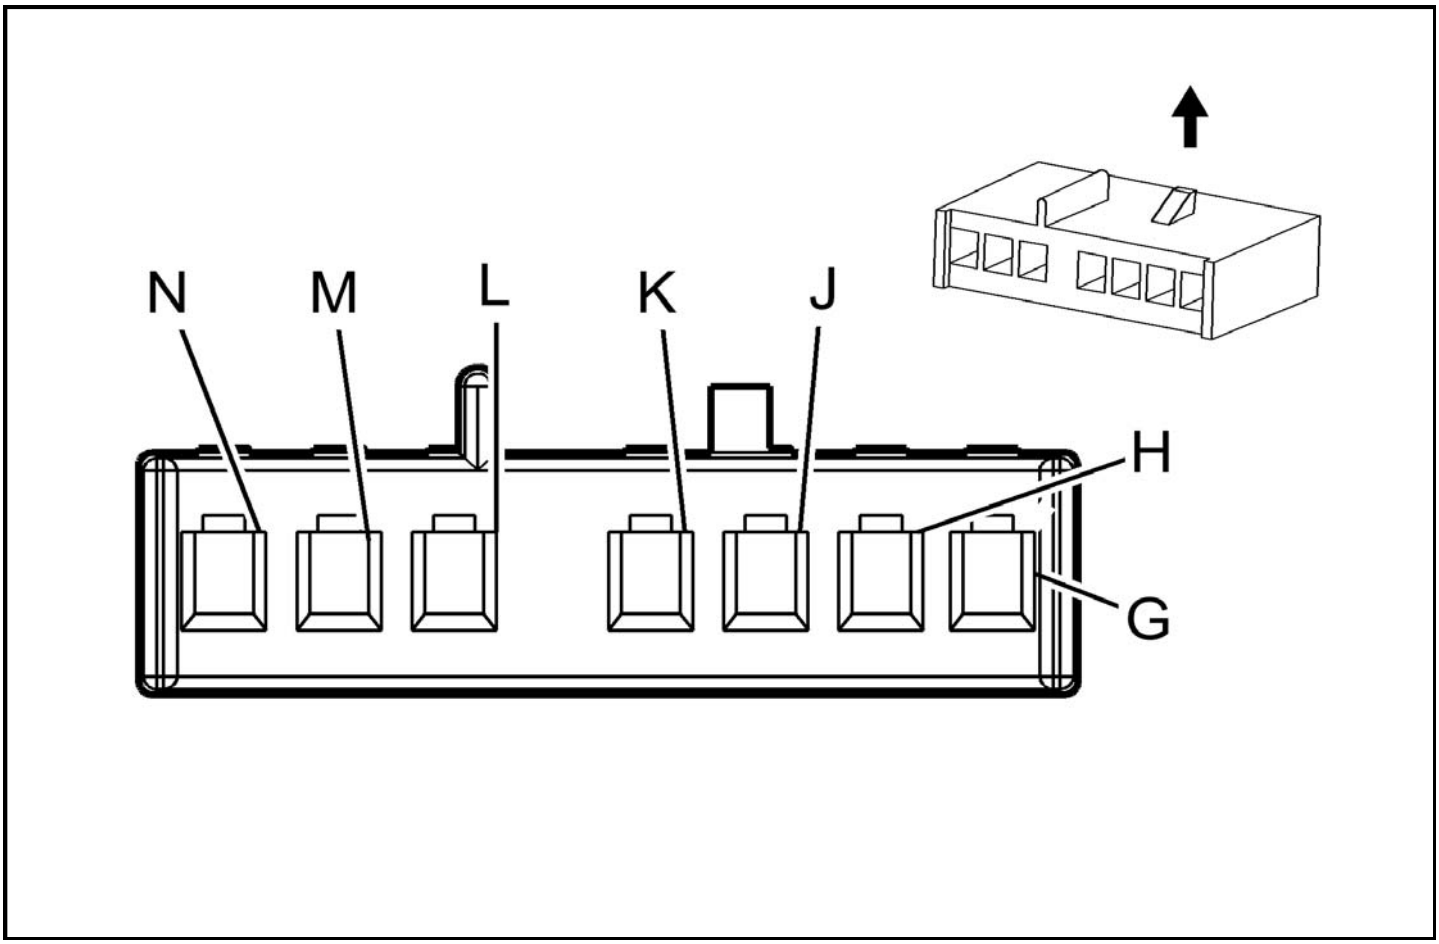
Terminal Part Information

- Terminated Lead: 13575464
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/5
- Core/Insulation Crimp: E/C

Turn Signal/Multifunction Switch X2

Pin	Wire	Circuit	Function
A	0.35 BN	1356	Flash To Pass Switch Signal
B-C	-	-	Not Used
D	0.35 BK/WH	1551	Ground
E	0.35 PU	524	Headlamp Dimmer Switch High Beam Signal

TURN SIGNAL/MULTIFUNCTION SWITCH X3



Connector Part Information

- Harness Type: Steering Column
- OEM Connector: 15339058
- Service Connector: Service by Harness - See Part Catalog
- Description: 7-Way F Metri-Pack 150 Series (GY)

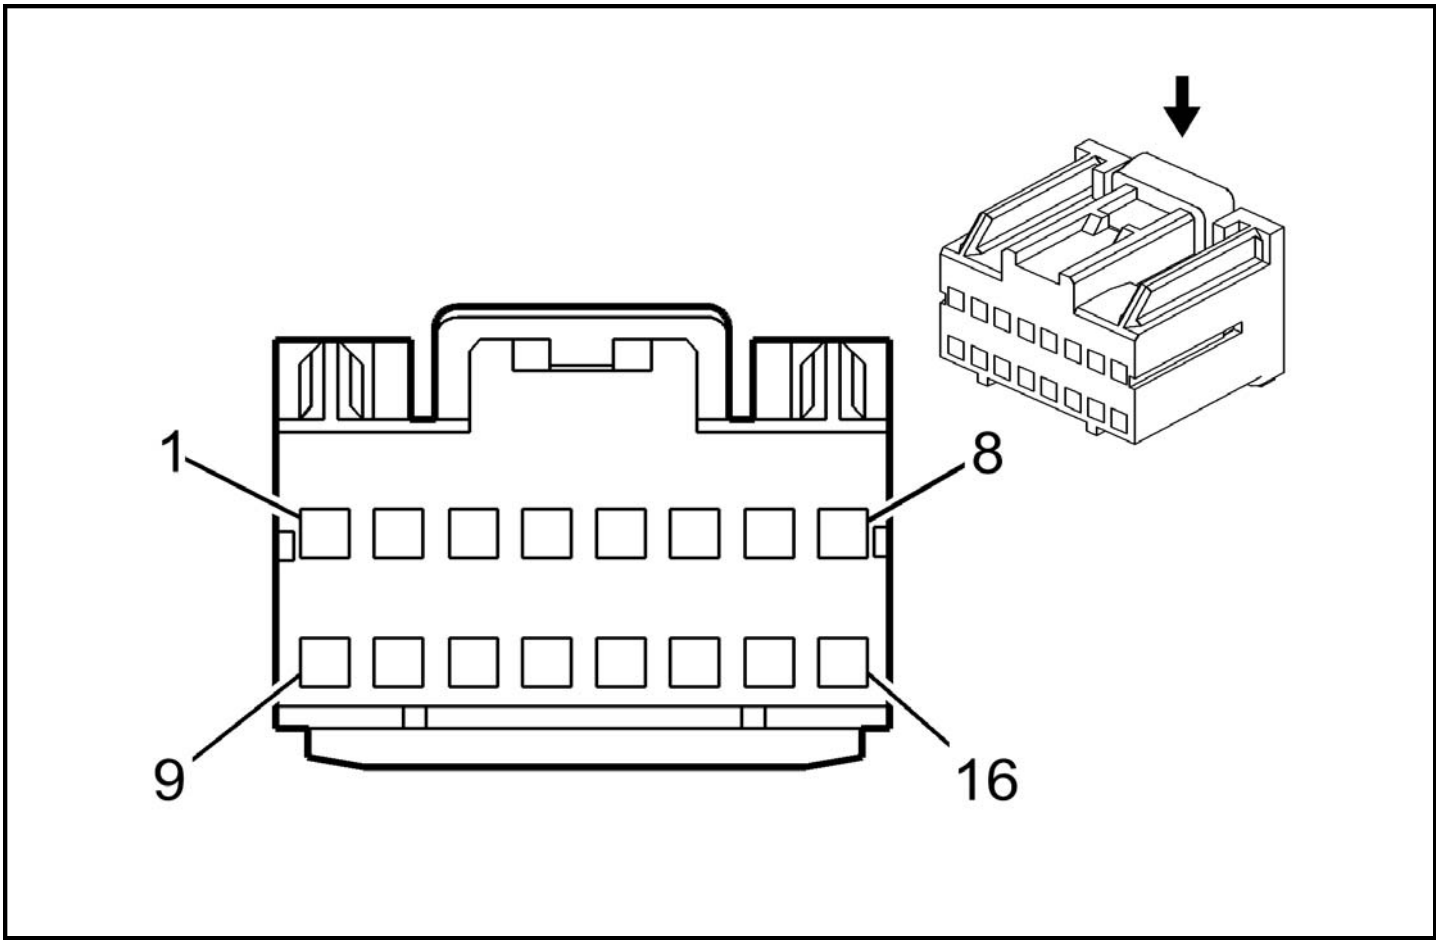
Terminal Part Information

- Terminated Lead: 13575464
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/5
- Core/Insulation Crimp: E/C

Turn Signal/Multifunction Switch X3

Pin	Wire	Circuit	Function
G	-	-	Not Used
H	0.35 BK/WH	1251	Ground
J	0.35 PK	94	Windshield Washer Switch Signal
K	0.35 L-GN	1715	Windshield Wiper Switch High Signal
L	0.35 L-BU	1714	Windshield Wiper Switch Low Signal
M-N	-	-	Not Used

VEHICLE COMMUNICATION INTERFACE MODULE (VCIM) (UE1) X1



Connector Part Information

- Harness Type: Body
- OEM Connector: 15441350
- Service Connector: 15306351
- Description: 16-Way F Micro-Pack 100A Series (BK)

Terminal Part Information

- Pins: 1-3, 6, 8-15
- Terminated Lead: 13575546
- Release Tool: J-38125-559
- Diagnostic Test Probe: J-35616-16 (L-GN)
- Terminal/Tray: 15445905/23
- Core/Insulation Crimp: J/J

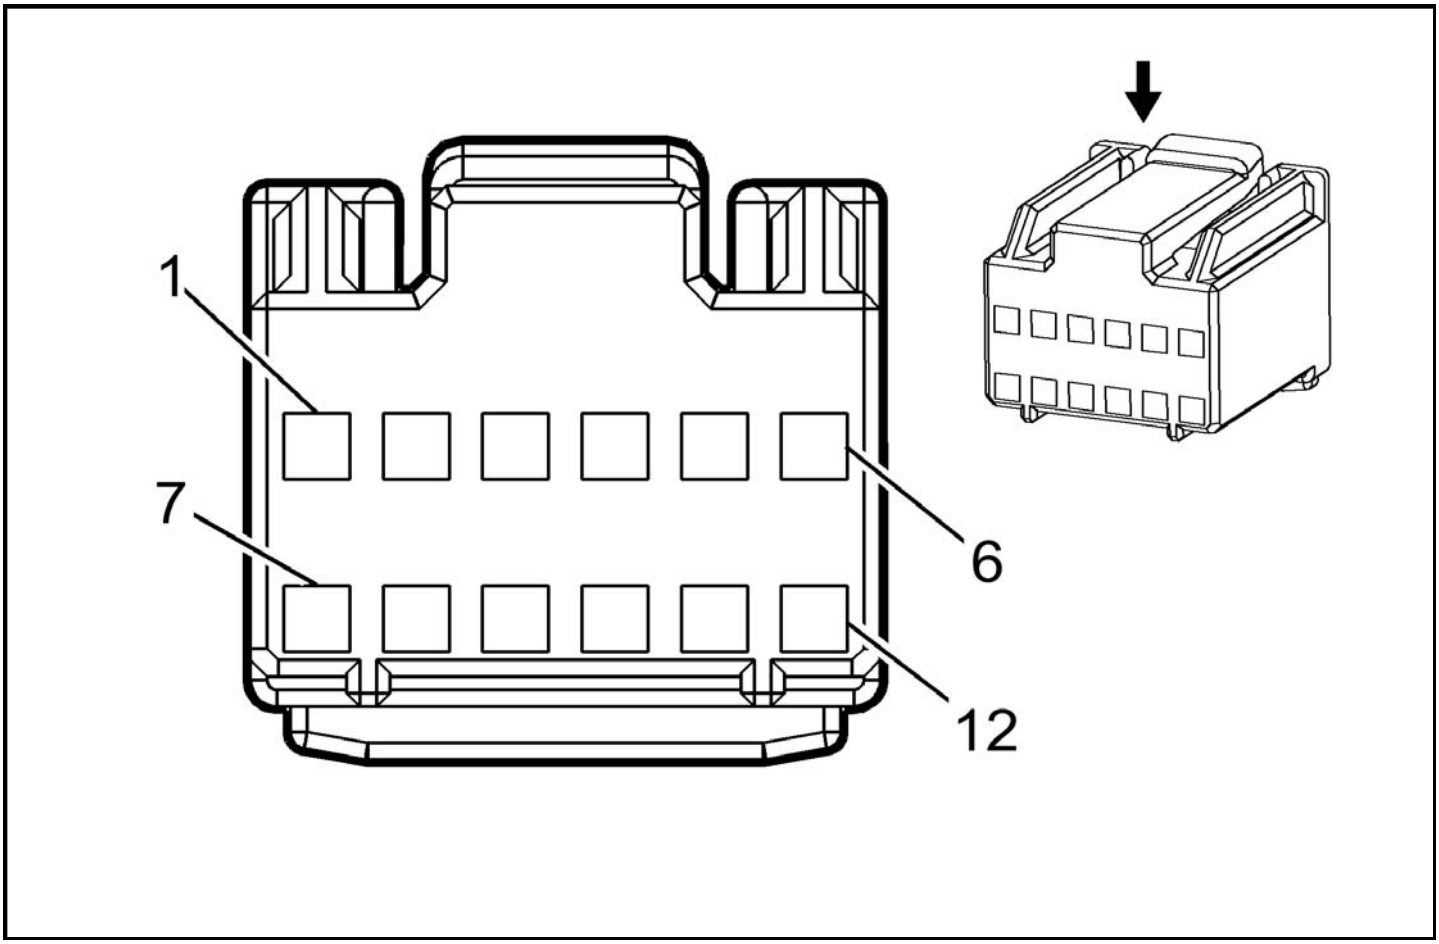
- Pins: 7
- Terminated Lead: 13575548
- Release Tool: J-38125-559
- Diagnostic Test Probe: J-35616-16 (L-GN)
- Terminal/Tray: 15445905/23

- Core/Insulation Crimp: K/K

Vehicle Communication Interface Module (VCIM) (UE1) X1

Pin	Wire	Circuit	Function
1	0.35 D-GN	5060	Low Speed GMLAN Serial Data
2	0.35 BN/WH	2517	Keypad Red LED Signal
3	0.35 YE/BK	2516	Keypad Green LED Signal
4-5	-	-	Not Used
6	0.35 L-GN/BK	2515	Keypad Supply Voltage
7	0.8 WH	1351	Ground
8-9	-	-	Not Used
10	0.35 TN/BK	2500	High Speed GMLAN Serial Data Bus +
11	0.35 D-GN/WH	2514	Keypad Signal
12	0.35 TN	2501	High Speed GMLAN Serial Data Bus -
13	0.5 GY/BK	5167	Battery Backup Low Reference
14	0.5 RD/WH	5235	Battery Backup Supply Voltage
15	0.5 RD/WH	2340	Battery Positive Voltage
16	-	-	Not Used

VEHICLE COMMUNICATION INTERFACE MODULE (VCIM) (UE1) X2



Connector Part Information

- Harness Type: Body
- OEM Connector: 15431365
- Service Connector: 88952886
- Description: 12-Way F Micro-Pack 100A Series (NA)

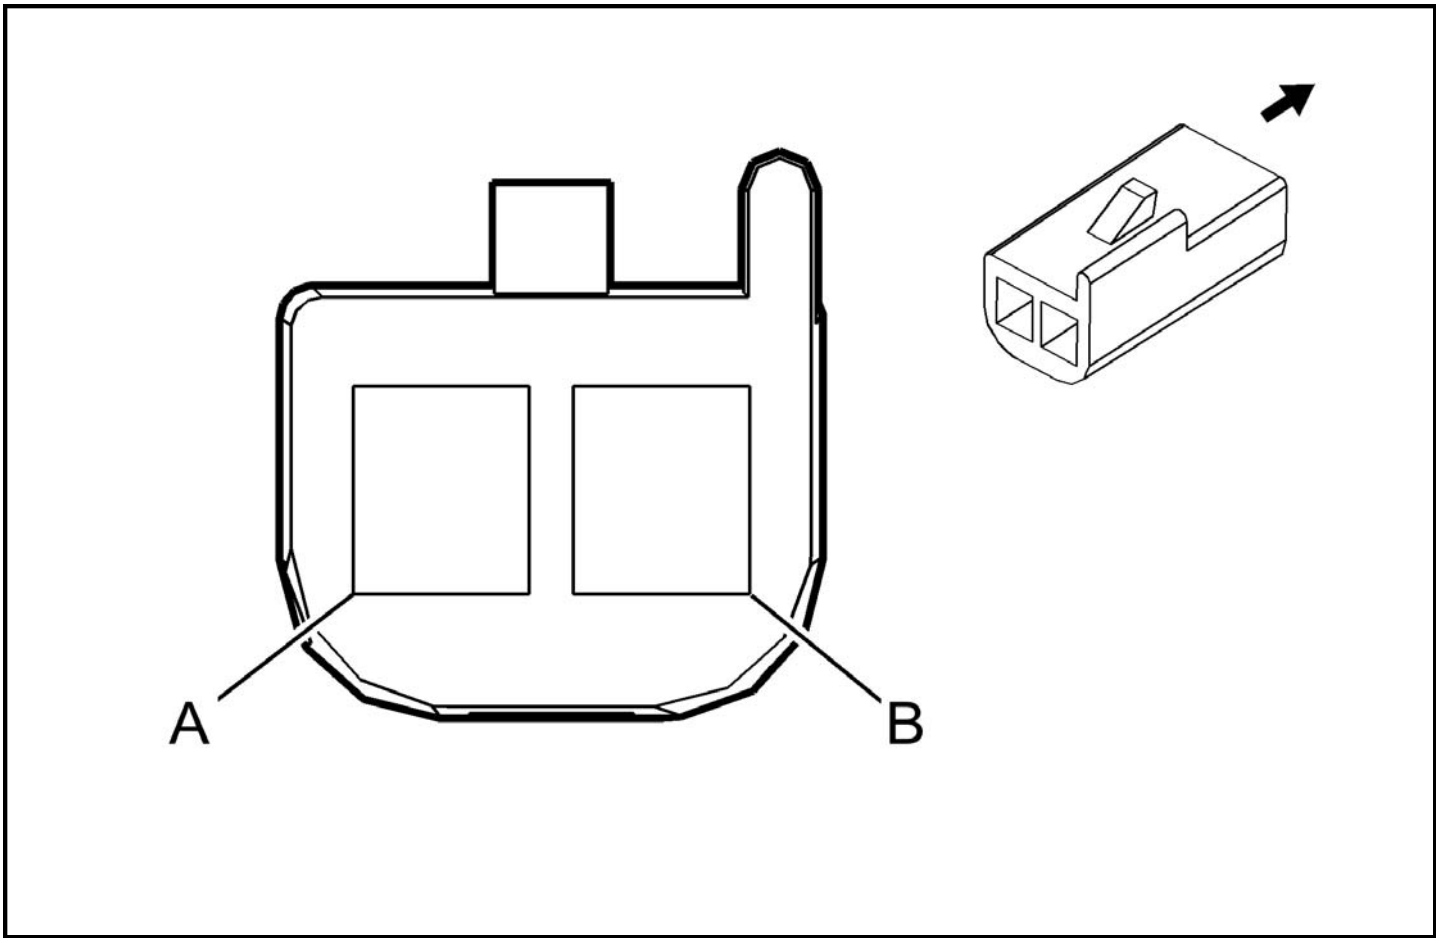
Terminal Part Information

- Terminated Lead: 13575548
- Release Tool: J-38125-559
- Diagnostic Test Probe: J-35616-16 (L-GN)
- Terminal/Tray: 15445905/23
- Core/Insulation Crimp: J/J

Vehicle Communication Interface Module (VCIM) (UE1) X2

Pin	Wire	Circuit	Function
1	0.35 OG/BK	1406	Left Audio Signal (+)
2	0.35 L-BU	1405	Audio Common Signal
3	0.35 TN/BK	2500	High Speed GMLAN Serial Data Bus +
4	0.35 TN	2501	High Speed GMLAN Serial Data Bus -
5-7	-	-	Not Used
8	0.35 BARE	813	Drain Wire
9	0.35 GY	655	Cellular Microphone Signal
10	0.35 BARE	1489	Drain Wire
11-12	-	-	Not Used

VEHICLE COMMUNICATION INTERFACE MODULE (VCIM) BATTERY (UE1)



Connector Part Information

- Harness Type: Body
- OEM Connector: 12047662
- Service Connector: 12085535
- Description: 2-Way F Metri-Pack 150 Series (BK)

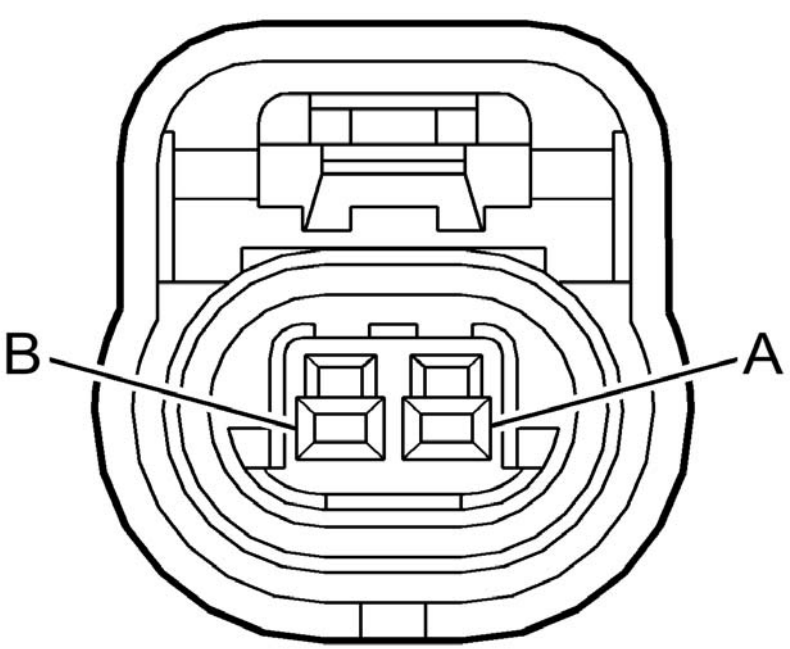
Terminal Part Information

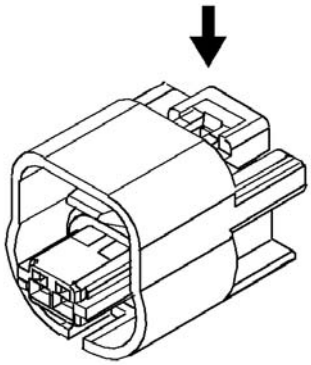
- Terminated Lead: 13575464
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 15326030/5
- Core/Insulation Crimp: E/C

Vehicle Communication Interface Module (VCIM) Battery (UE1)

Pin	Wire	Circuit	Function
A	0.5 RD/WH	5235	Battery Backup Supply Voltage
B	0.5 GY/BK	5167	Battery Backup Low Reference

VEHICLE SPEED SENSOR (VSS)





Connector Part Information

- Harness Type: Engine
- OEM Connector: 15336004
- Service Connector: 19178093
- Description: 2-Way F GT 150 Series, Sealed (BK)

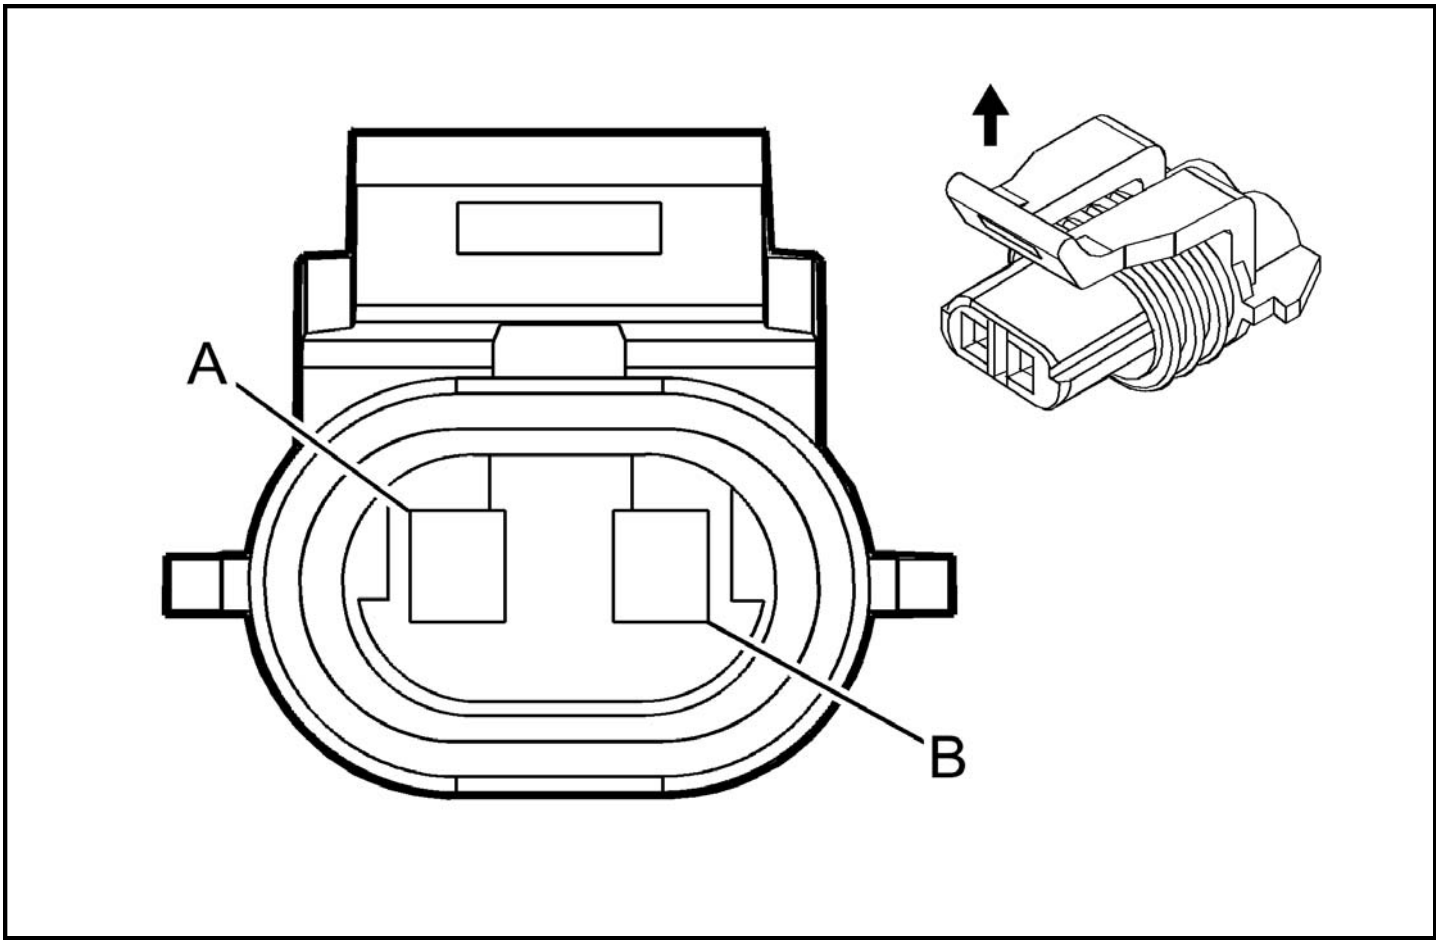
Terminal Part Information

- Terminated Lead: 13576360
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 15326267/19
- Core/Insulation Crimp: E/4

Vehicle Speed Sensor (VSS)

Pin	Wire	Circuit	Function
A	0.35 PU	401	Signal Low- Front
B	0.35 YE	400	Signal High- Front

WHEEL SPEED SENSOR (WSS) - LEFT FRONT



Connector Part Information

- Harness Type: Engine
- OEM Connector: 12052644
- Service Connector: 10340314
- Description: 2-Way F Metri-Pack 150 Series, Sealed (GY)

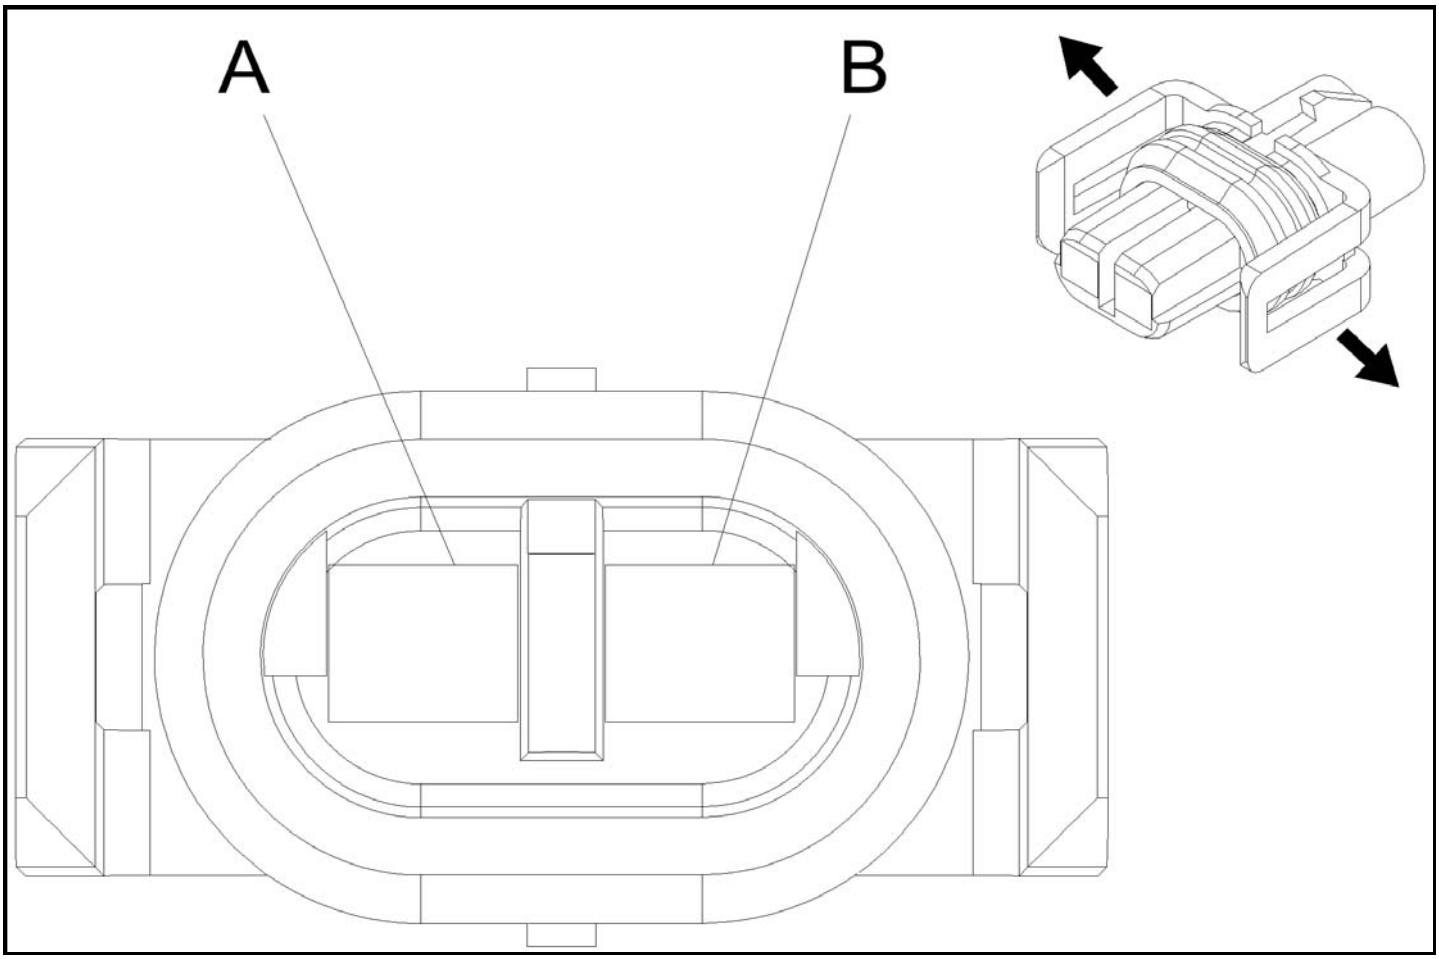
Terminal Part Information

- Terminated Lead: 13575419
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 12048074/2
- Core/Insulation Crimp: E/1

Wheel Speed Sensor (WSS) - Left Front

Pin	Wire	Circuit	Function
A	0.5 YE	873	Left Front Wheel Speed Sensor Low Reference
B	0.5 L-BU	830	Left Front Wheel Speed Sensor Signal

WHEEL SPEED SENSOR (WSS) - LEFT REAR



Connector Part Information

- Harness Type: Rear Chassis
- OEM Connector: 15305168
- Service Connector: 12167117
- Description: 2-Way F Metri-Pack 150 Series (GY)

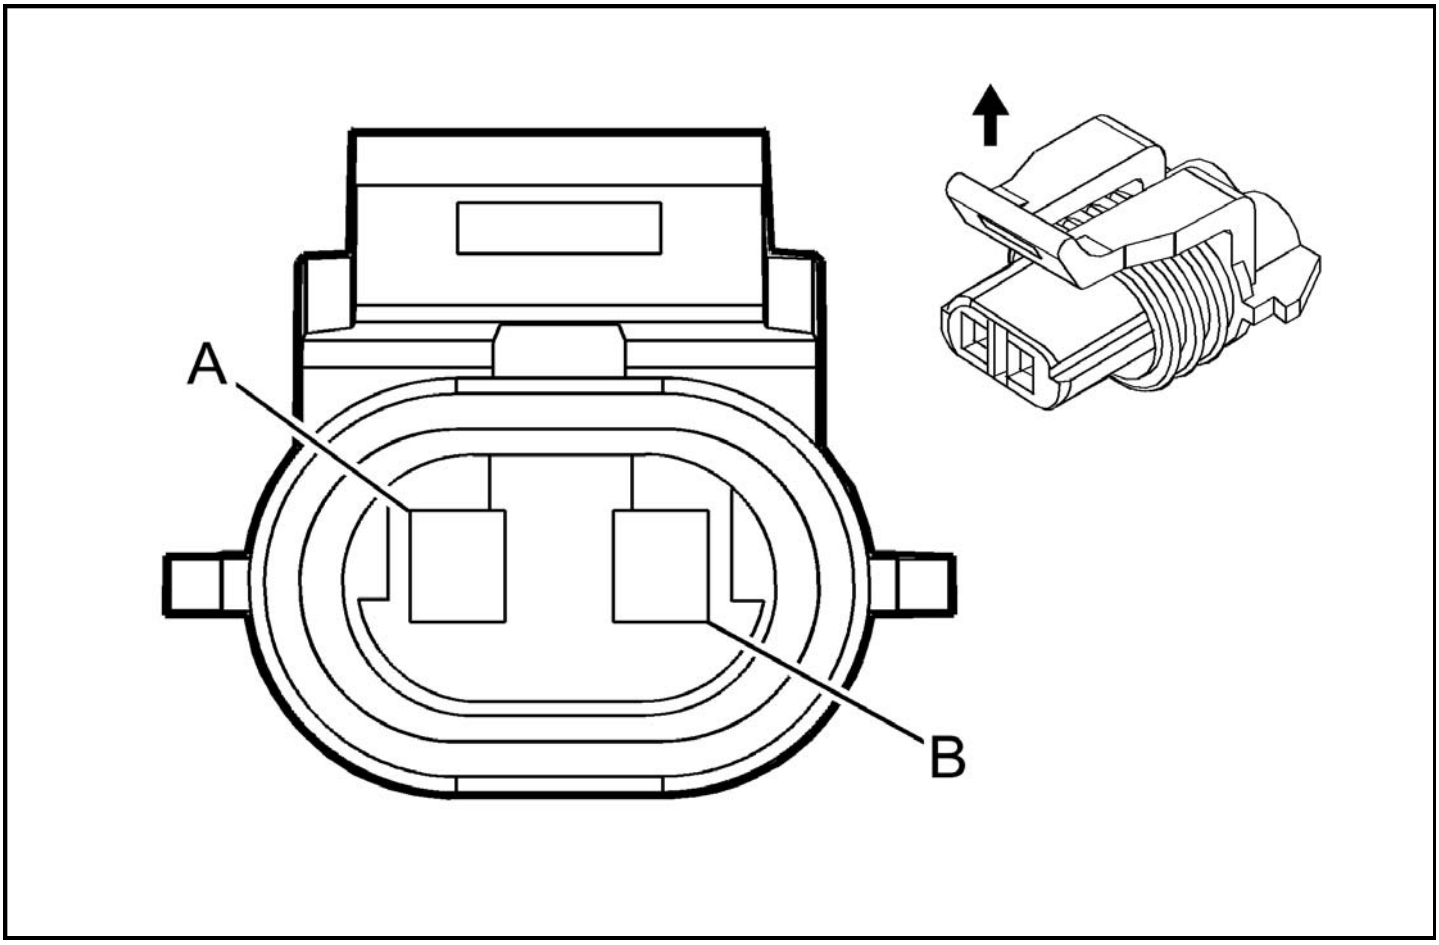
Terminal Part Information

- Terminal/Tray: 12048074/2
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Wheel Speed Sensor (WSS) - Left Rear

Pin	Wire	Circuit	Function
A	0.5 BK	884	Left Rear Wheel Speed Sensor Signal
B	0.5 RD	885	Left Rear Wheel Speed Sensor Low Reference

WHEEL SPEED SENSOR (WSS) - RIGHT FRONT



Connector Part Information

- Harness Type: Engine
- OEM Connector: 12052644
- Service Connector: 10340314
- Description: 2-Way F Metri-Pack 150 Series, Sealed (GY)

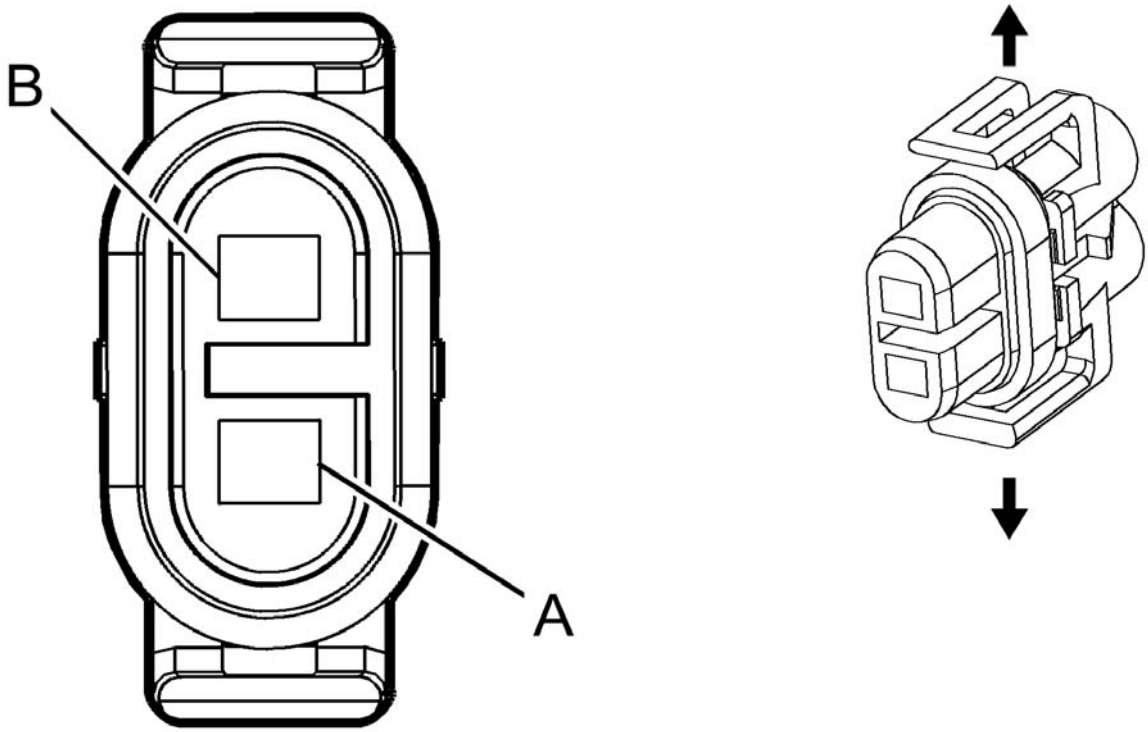
Terminal Part Information

- Terminated Lead: 13575419
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 12048074/2
- Core/Insulation Crimp: E/1

Wheel Speed Sensor (WSS) - Right Front

Pin	Wire	Circuit	Function
A	0.5 TN	833	Right Front Wheel Speed Sensor Low Reference
B	0.5 D-GN	872	Right Front Wheel Speed Sensor Signal

WHEEL SPEED SENSOR (WSS) - RIGHT REAR



Connector Part Information

- Harness Type: Rear Chassis
- OEM Connector: 15305168
- Service Connector: 12167117
- Description: 2-Way F Metri-Pack 150 Series (GY)

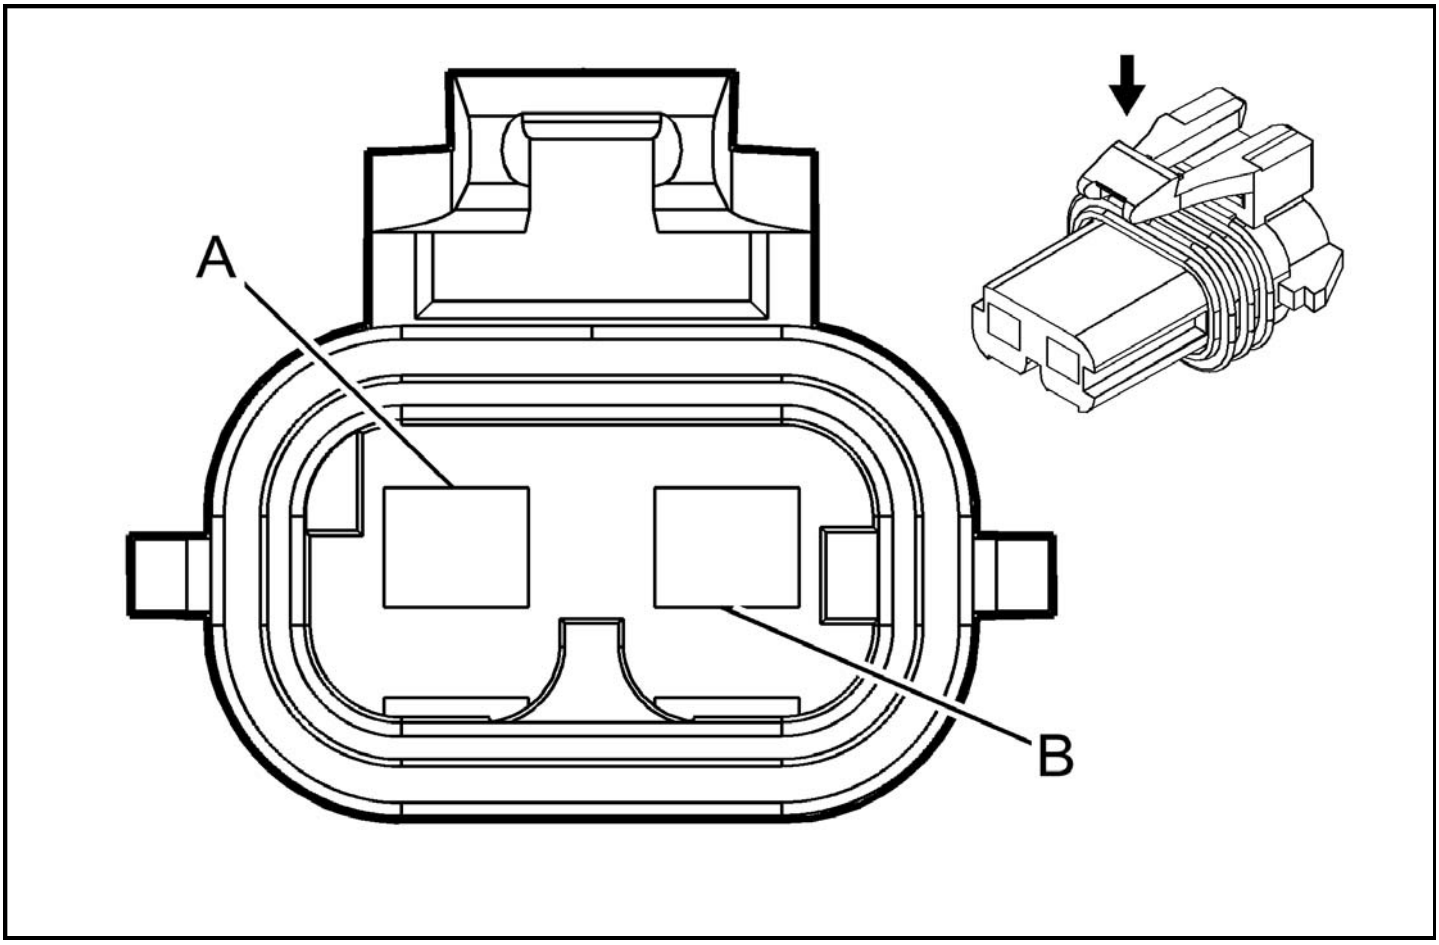
Terminal Part Information

- Terminal/Tray: 12048074/2
- Core/Insulation Crimp: E/1
- Release Tool/Test Probe: 12094429/J-35616-14 (GN)

Wheel Speed Sensor (WSS) - Right Rear

Pin	Wire	Circuit	Function
A	0.5 BN	882	Right Rear Wheel Speed Sensor Signal
B	0.5 WH	883	Right Rear Wheel Speed Sensor Low Reference

WINDOW MOTOR - DRIVER



Connector Part Information

- Harness Type: Left Front Door
- OEM Connector: 15497548
- Service Connector: Service by Harness- See Part Catalog
- Description: 2-Way F Metri-Pack 280 Series, Flexlock, Sealed (GY)

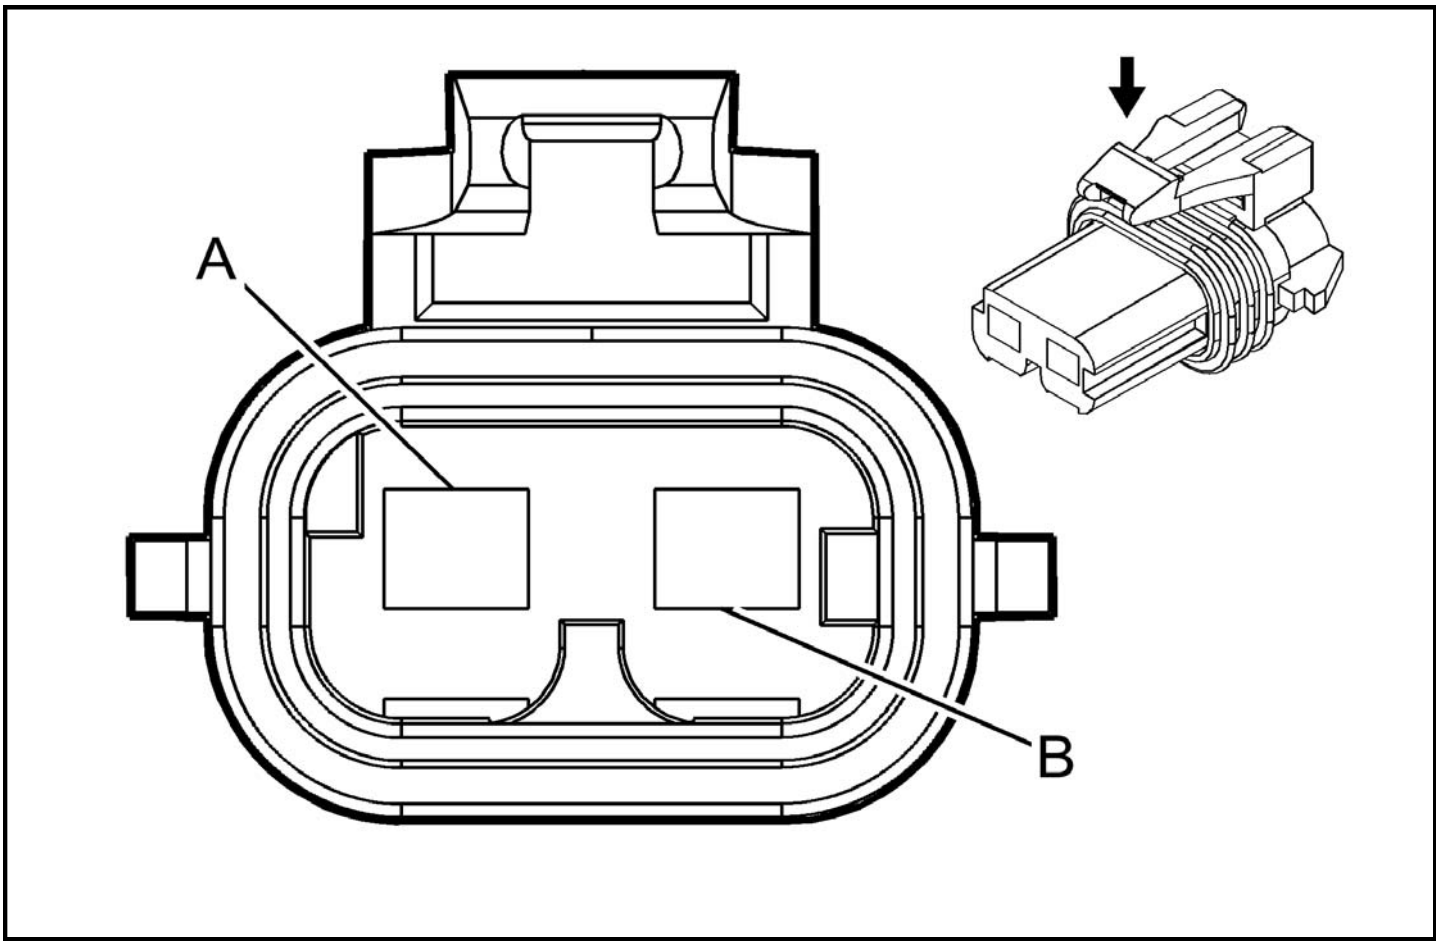
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 12110845/4
- Core/Insulation Crimp: A/5

Window Motor - Driver

Pin	Wire	Circuit	Function
A	2 BN	165	Power Window Motor Left Front Down Control
B	2 D-BU	164	Power Window Motor Left Front Up Control

WINDOW MOTOR - LEFT REAR



Connector Part Information

- Harness Type: Left Rear Door
- OEM Connector: 15497548
- Service Connector: Service by Harness- See Part Catalog
- Description: 2-Way F Metri-Pack 280 Series, Flexlock, Sealed (GY)

Terminal Part Information

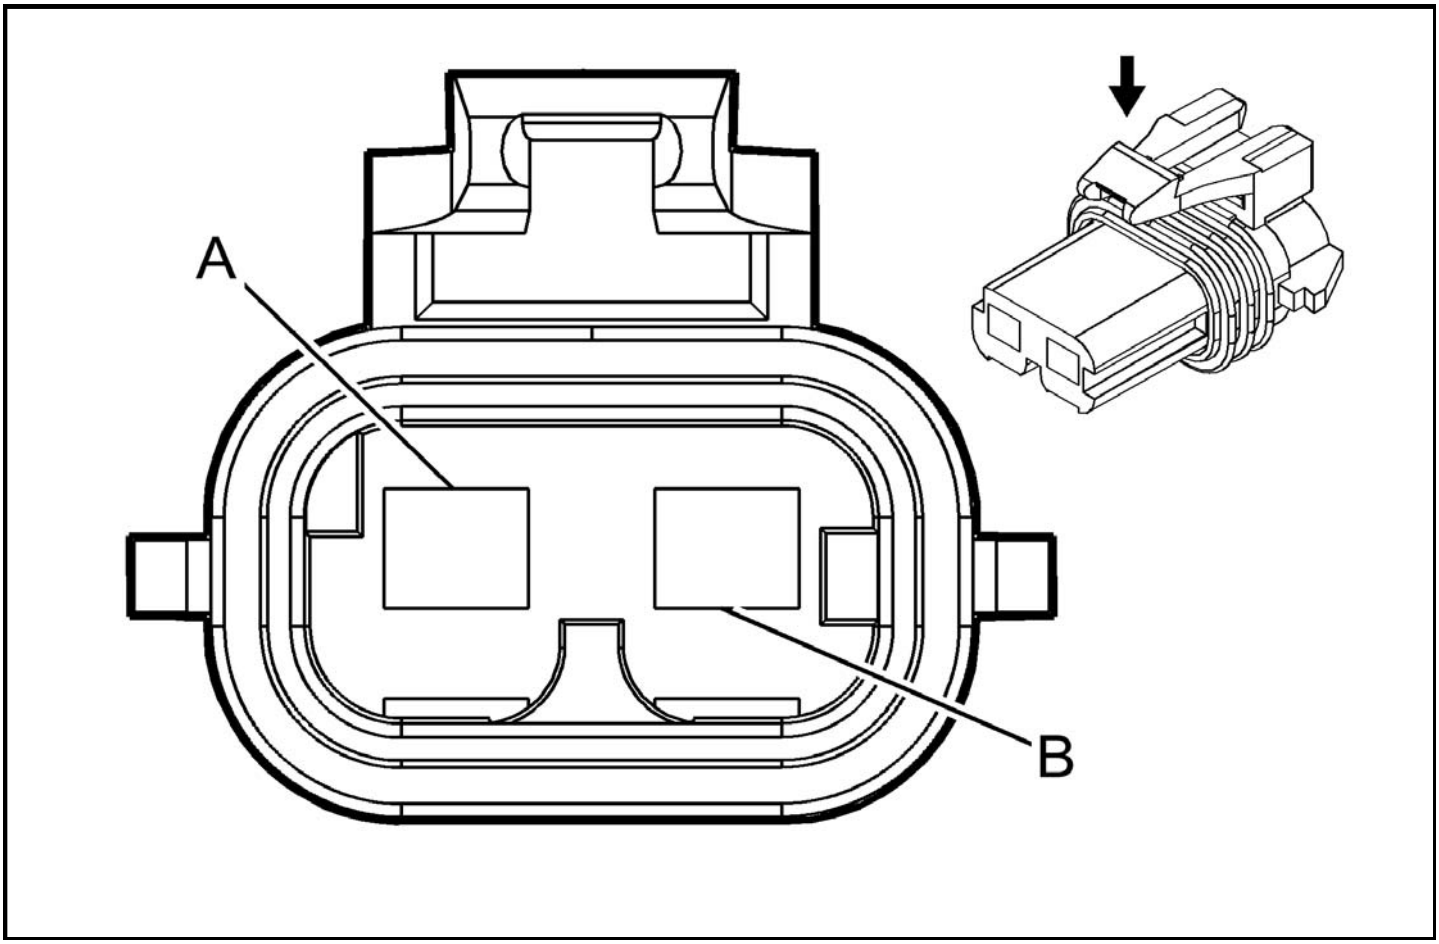
- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 12110845/4
- Core/Insulation Crimp: A/5

Window Motor - Left Rear

Pin	Wire	Circuit	Function
A	3 BN	669	Power Window Motor Left Rear Down Control

Pin	Wire	Circuit	Function
B	3 D-BU	668	Power Window Motor Left Rear Up Control

WINDOW MOTOR - PASSENGER



Connector Part Information

- Harness Type: Right Front Door
- OEM Connector: 15497548
- Service Connector: Service by Harness- See Part Catalog
- Description: 2-Way F Metri-Pack 280 Series, Flexlock, Sealed (GY)

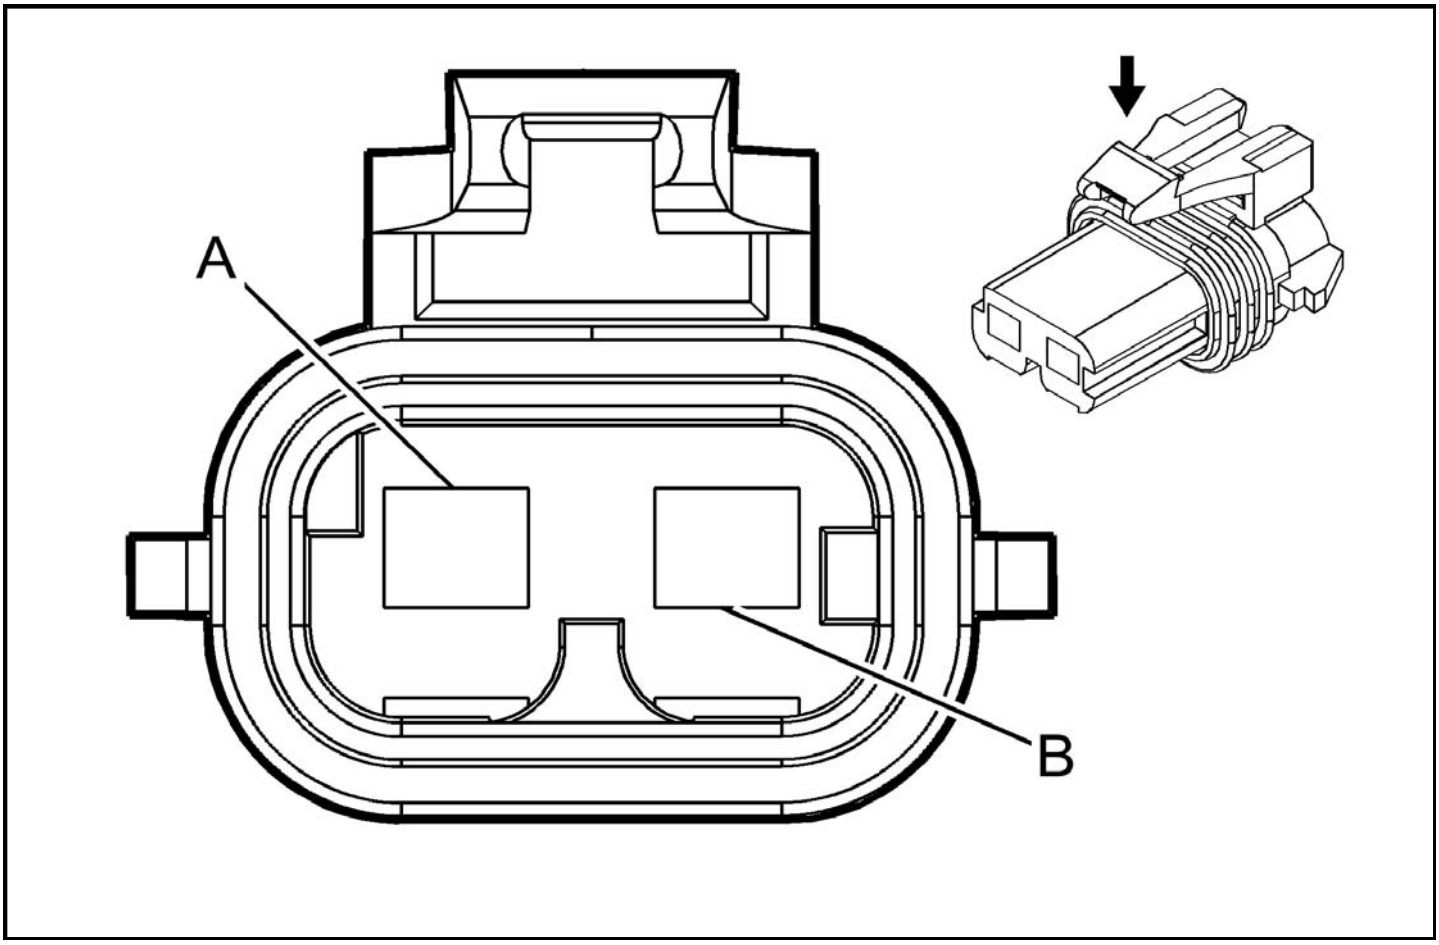
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 12110845/4
- Core/Insulation Crimp: A/5

Window Motor - Passenger

Pin	Wire	Circuit	Function
A	3 BN	667	Power Window Motor Right Front Down Control
B	3 D-BU	666	Power Window Motor Right Front Up Control

WINDOW MOTOR - RIGHT REAR



Connector Part Information

- Harness Type: Right Rear Door
- OEM Connector: 15497548
- Service Connector: Service by Harness- See Part Catalog
- Description: 2-Way F Metri-Pack 280 Series, Flexlock, Sealed (GY)

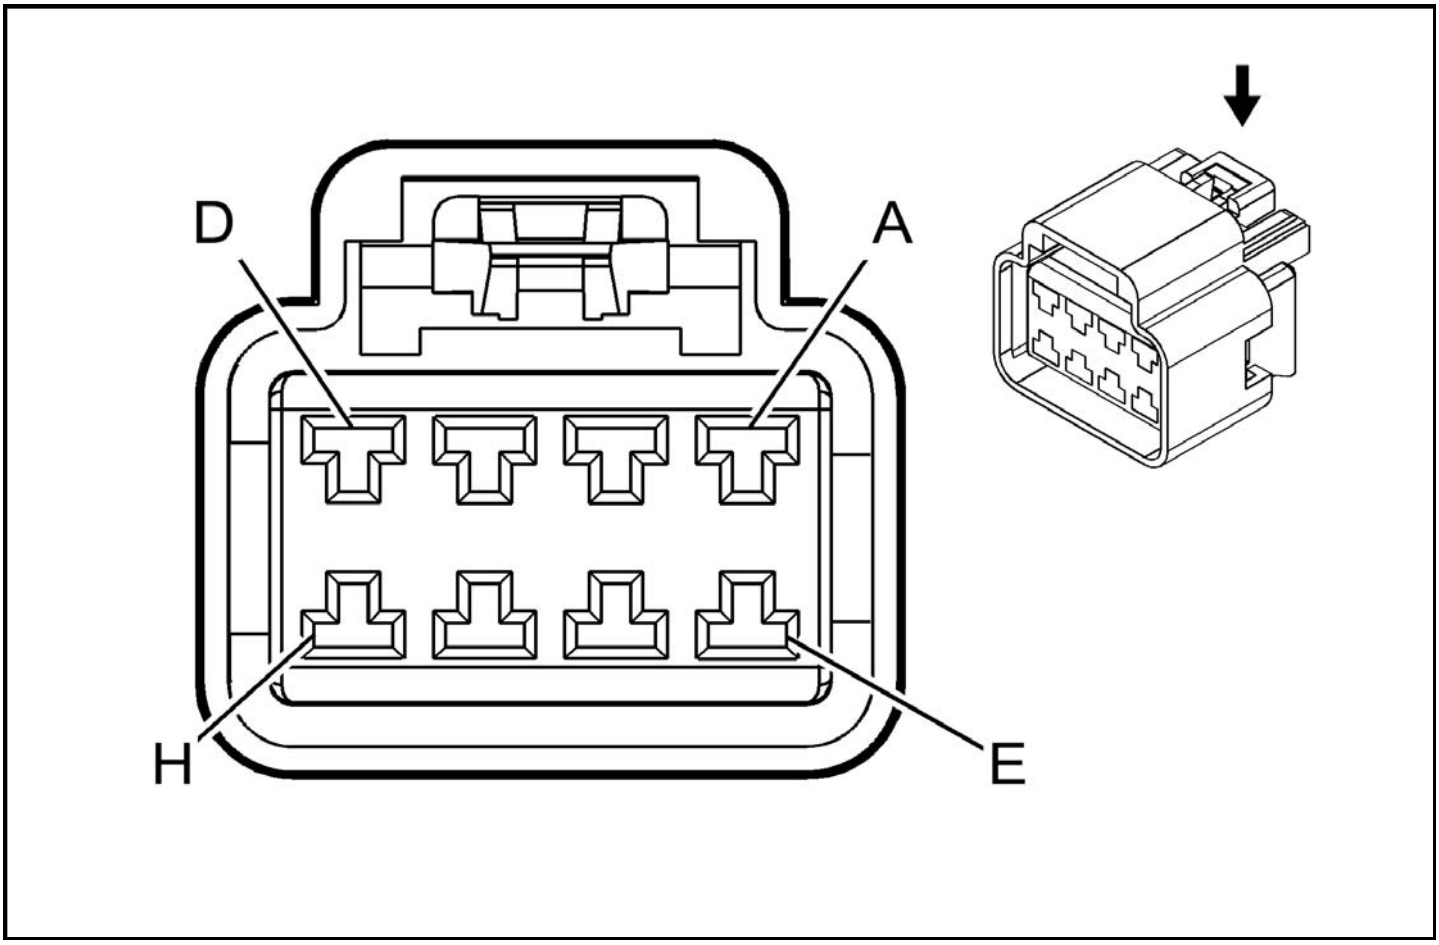
Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 12110845/4
- Core/Insulation Crimp: A/5

Window Motor - Right Rear

Pin	Wire	Circuit	Function
A	3 BN	671	Power Window Motor Right Rear Down Control
B	3 D-BU	670	Power Window Motor Right Rear Up Control

WINDOW SWITCH - DRIVER X1



Connector Part Information

- Harness Type: Left Front Door Trim
- OEM Connector: 15326924
- Service Connector: 19153751
- Description: 8-Way F GT 280 Series (BK)

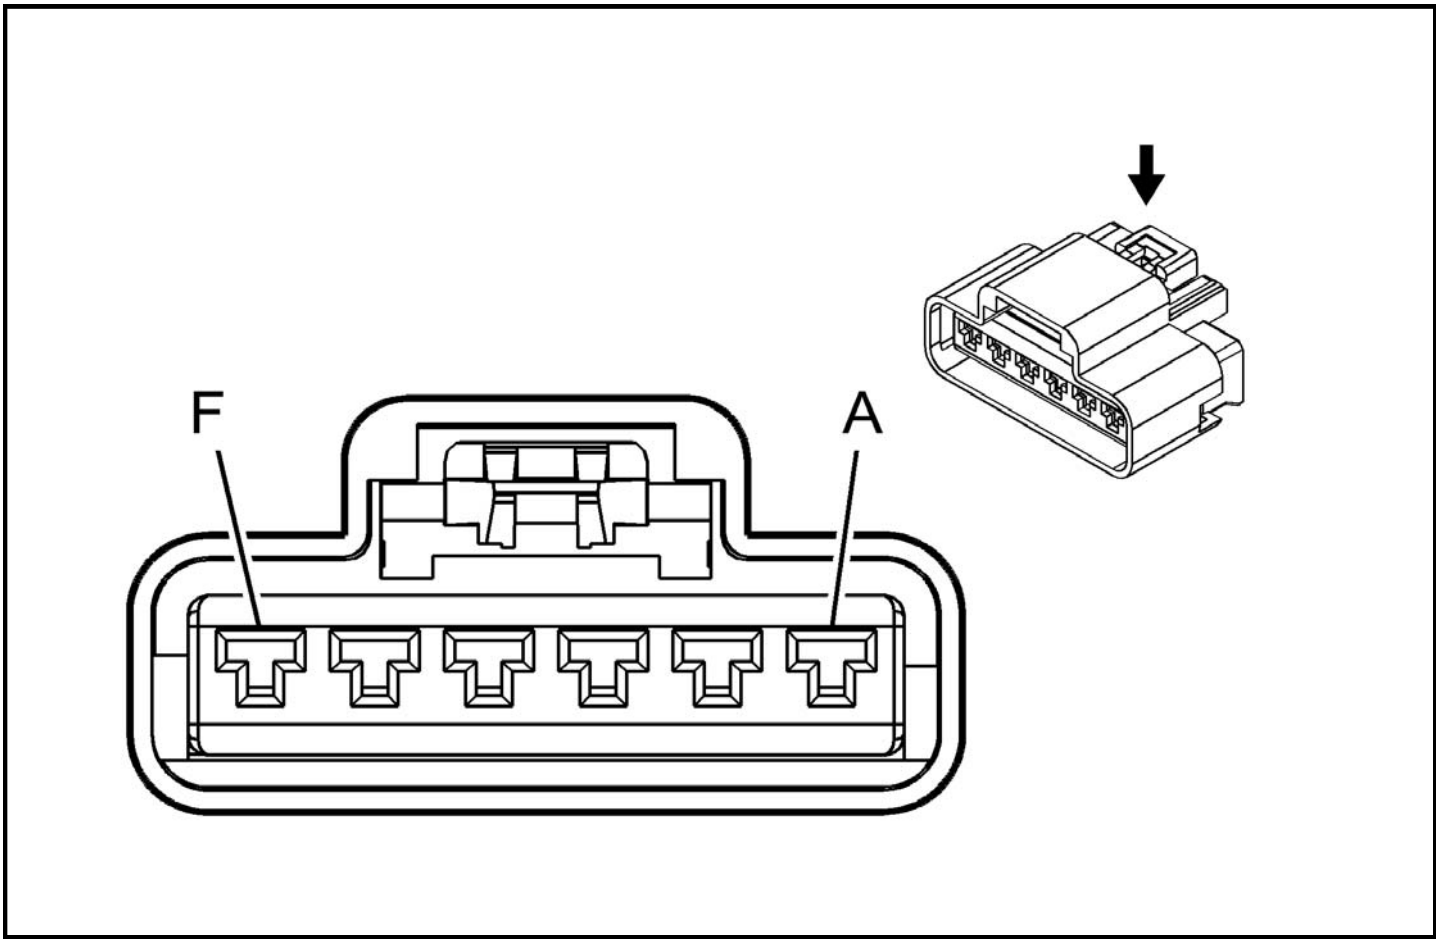
Terminal Part Information

- Terminated Lead: 13575754
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 15304713/19
- Core/Insulation Crimp: 4/4

Window Switch - Driver X1

Pin	Wire	Circuit	Function
A	-	-	Not Used
B	2 BK	550	Ground
C	2 PU	169	Power Window Master Switch Left Rear Down Signal
D	2 D-GN	168	Power Window Master Switch Left Rear Up Signal
E	2 YE	143	Accessory Voltage
F	2 D-BU	1307	Power Window Master Switch Lockout Signal
G	2 L-GN	170	Power Window Master Switch Right Rear Up Signal
H	2 PU	171	Power Window Master Switch Right Rear Down Signal

WINDOW SWITCH - DRIVER X2



Connector Part Information

- Harness Type: Left Front Door Trim
- OEM Connector: 15326900
- Service Connector: 13580860

- Description: 6-Way F GT 280 Series (BK)

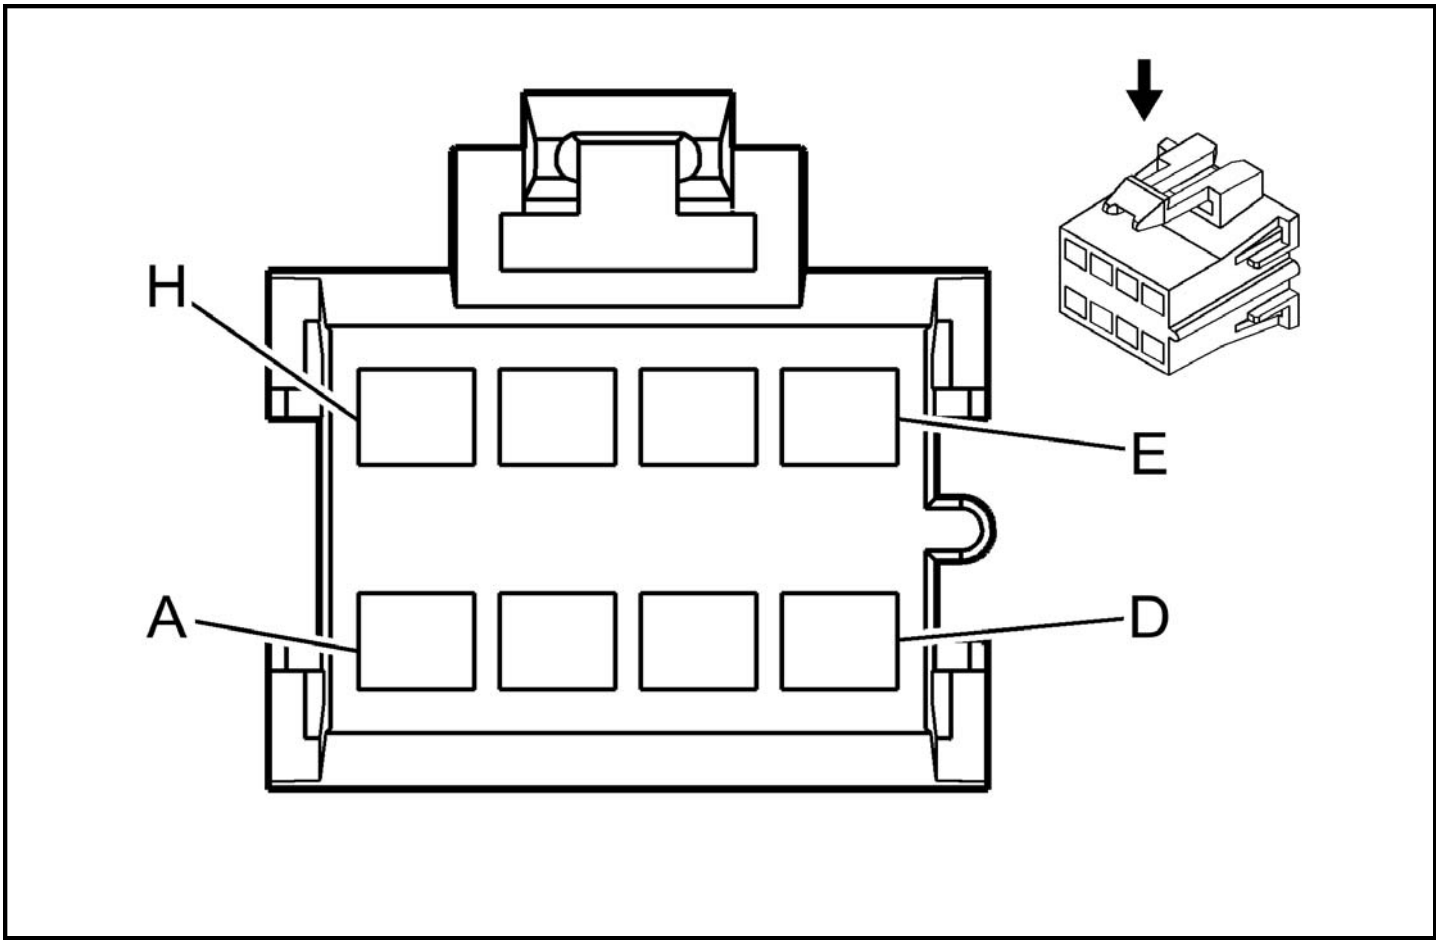
Terminal Part Information

- Terminated Lead: 13575754
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 15304713/19
- Core/Insulation Crimp: 4/4

Window Switch - Driver X2

Pin	Wire	Circuit	Function
A	2 BN	165	Power Window Motor Left Front Down Control
B	2 L-BU	166	Power Window Master Switch Right Front Up Signal
C	2 TN	167	Power Window Master Switch Right Front Down Signal
D	-	-	Not Used
E	2 D-BU	164	Power Window Motor Left Front Up Control
F	0.35 GY	8	Instrument Panel Lamp Supply Voltage

WINDOW SWITCH - LEFT REAR



Connector Part Information

- Harness Type: Left Rear Door
- OEM Connector: 12064998
- Service Connector: 15306189
- Description: 8-Way F Metri-Pack 280 Series (BK)

Terminal Part Information

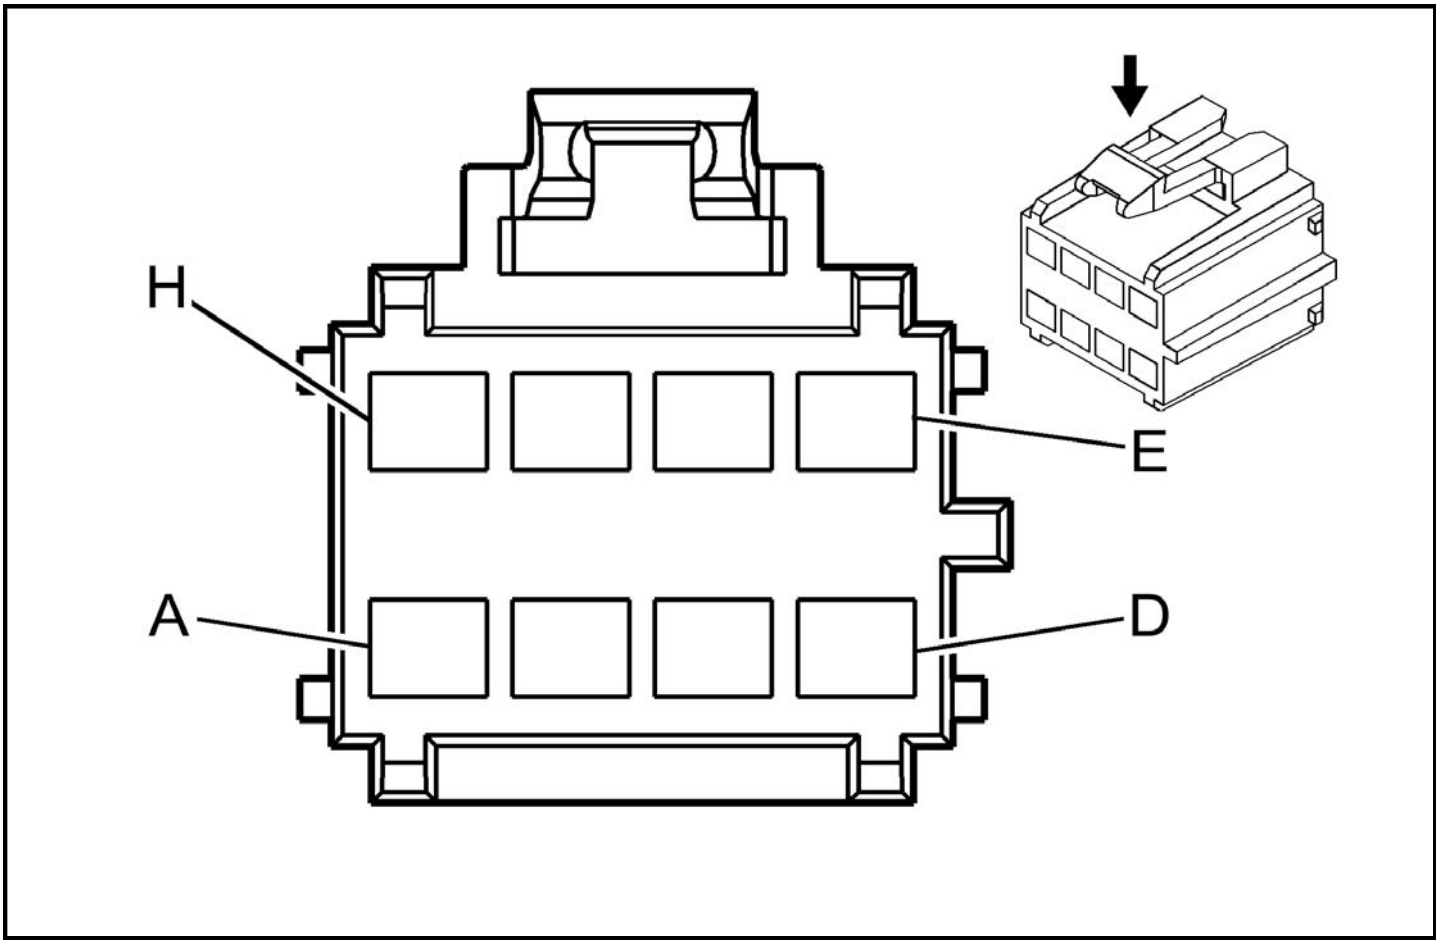
- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-11A
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 12015858/4
- Core/Insulation Crimp: F/G

Window Switch - Left Rear

Pin	Wire	Circuit	Function
A	3 BN	669	Power Window Motor Left Rear Down Control
B	-	-	Not Used

Pin	Wire	Circuit	Function
C	3 D-GN	168	Power Window Master Switch Left Rear Up Signal
D	3 D-BU	668	Power Window Motor Left Rear Up Control
E	3 D-BU	1307	Power Window Master Switch Lockout Signal
F-G	-	-	Not Used
H	3 PU	169	Power Window Master Switch Left Rear Down Signal

WINDOW SWITCH - PASSENGER



Connector Part Information

- Harness Type: Right Front Door
- OEM Connector: 12191825
- Service Connector: 15306048
- Description: 8-Way F Metri-Pack 280 Series (BN)

Terminal Part Information

- Pins: A, D, F, G, H

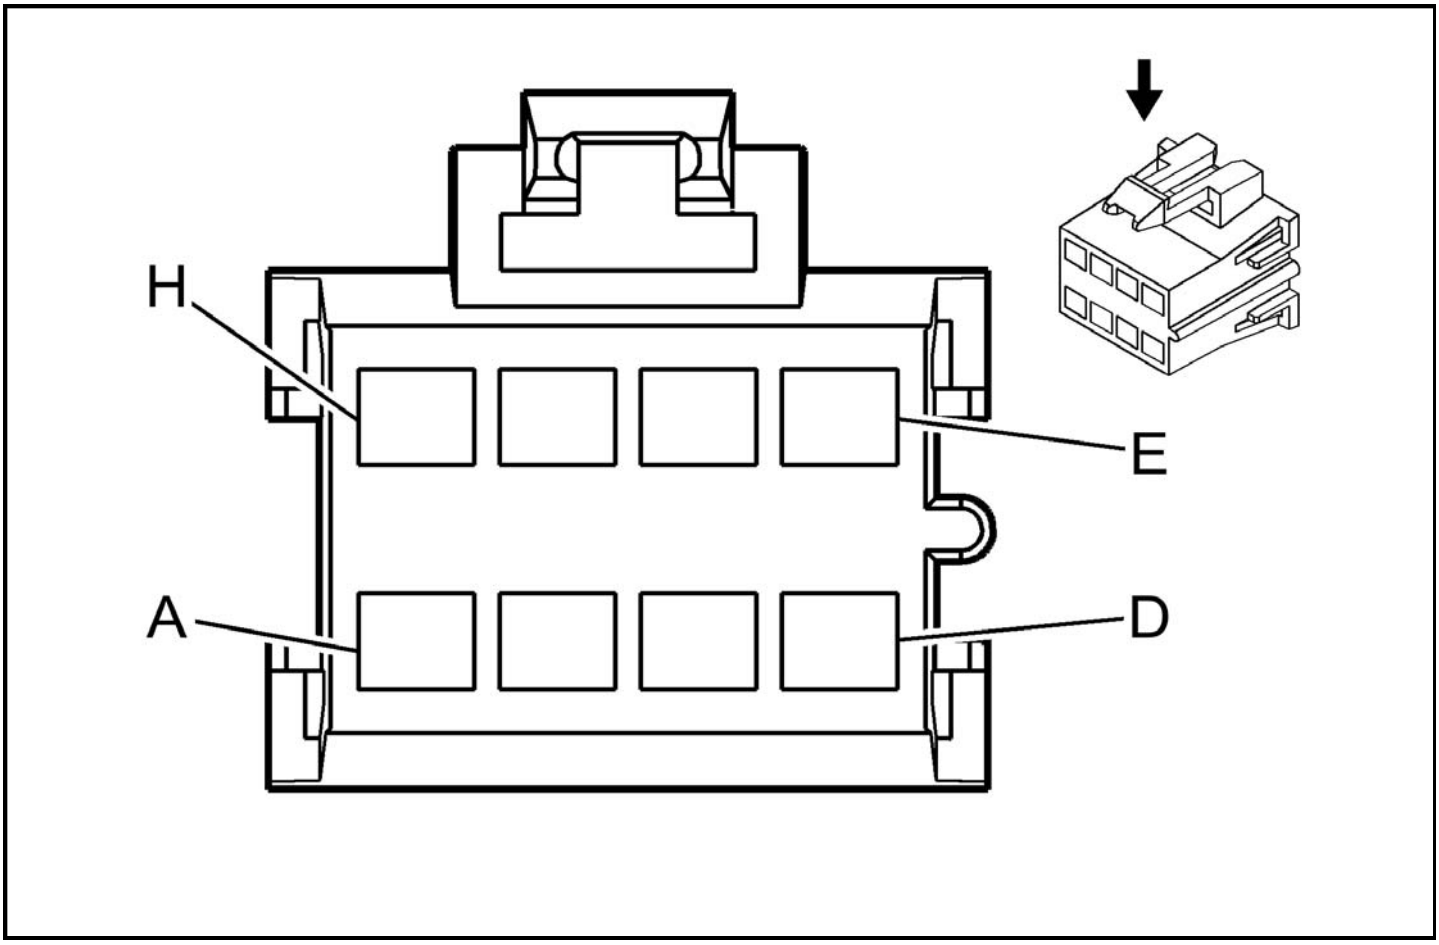
- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 15304711/8
- Core/Insulation Crimp: Not Available

- Pins: B, C
- Terminated Lead: 13575753
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 15304711/8
- Core/Insulation Crimp: E/A

Window Switch - Passenger

Pin	Wire	Circuit	Function
A	3 YE	143	Accessory Voltage
B	0.35 GY	8	Instrument Panel Lamp Supply Voltage
C	0.5 BK	750	Ground
D	3 TN	167	Power Window Master Switch Right Front Down Signal
E	-	-	Not Used
F	3 BN	667	Power Window Motor Right Front Down Control
G	3 D-BU	666	Power Window Motor Right Front Up Control
H	3 L-BU	166	Power Window Master Switch Right Front Up Signal

WINDOW SWITCH - RIGHT REAR



Connector Part Information

- Harness Type: Right Rear Door
- OEM Connector: 12064998
- Service Connector: 15306189
- Description: 8-Way F Metri-Pack 280 Series (BK)

Terminal Part Information

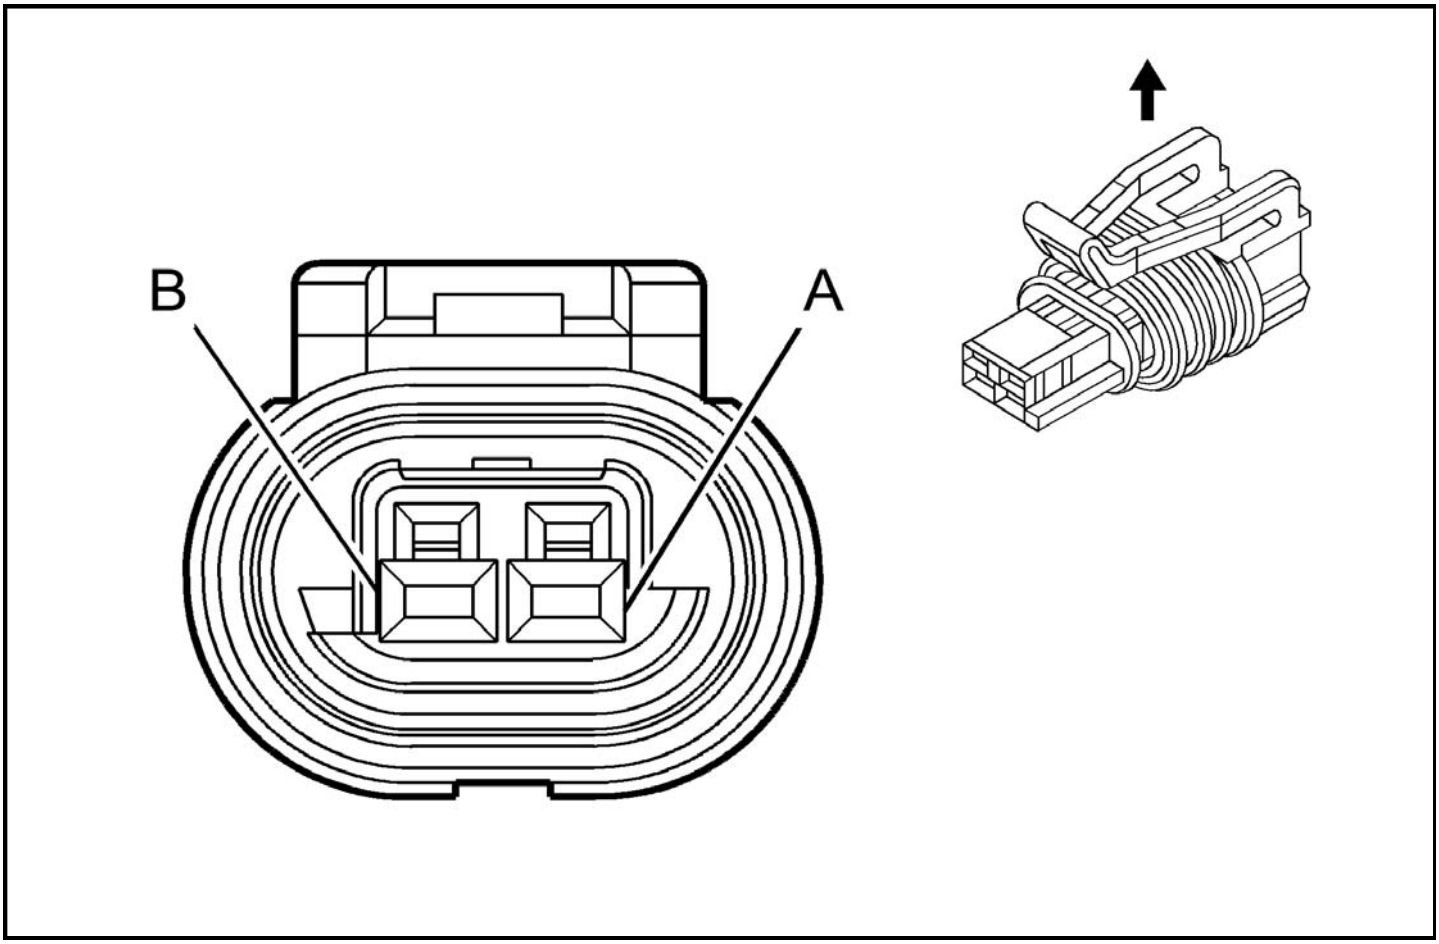
- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-11A
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 12015858/4
- Core/Insulation Crimp: F/G

Window Switch - Right Rear

Pin	Wire	Circuit	Function
A	3 BN	671	Power Window Motor Right Rear Down Control
B	-	-	Not Used

Pin	Wire	Circuit	Function
C	3 L-GN	170	Power Window Master Switch Right Rear Up Signal
D	3 D-BU	670	Power Window Motor Right Rear Up Control
E	3 D-BU	1307	Power Window Master Switch Lockout Signal
F-G	-	-	Not Used
H	3 PU	171	Power Window Master Switch Right Rear Down Signal

WINDSHIELD WASHER FLUID LEVEL SWITCH



Connector Part Information

- Harness Type: Forward Lamp
- OEM Connector: 15449028
- Service Connector: 88987993
- Description: 2-Way F GT 150 Series, Sealed (BK)

Terminal Part Information

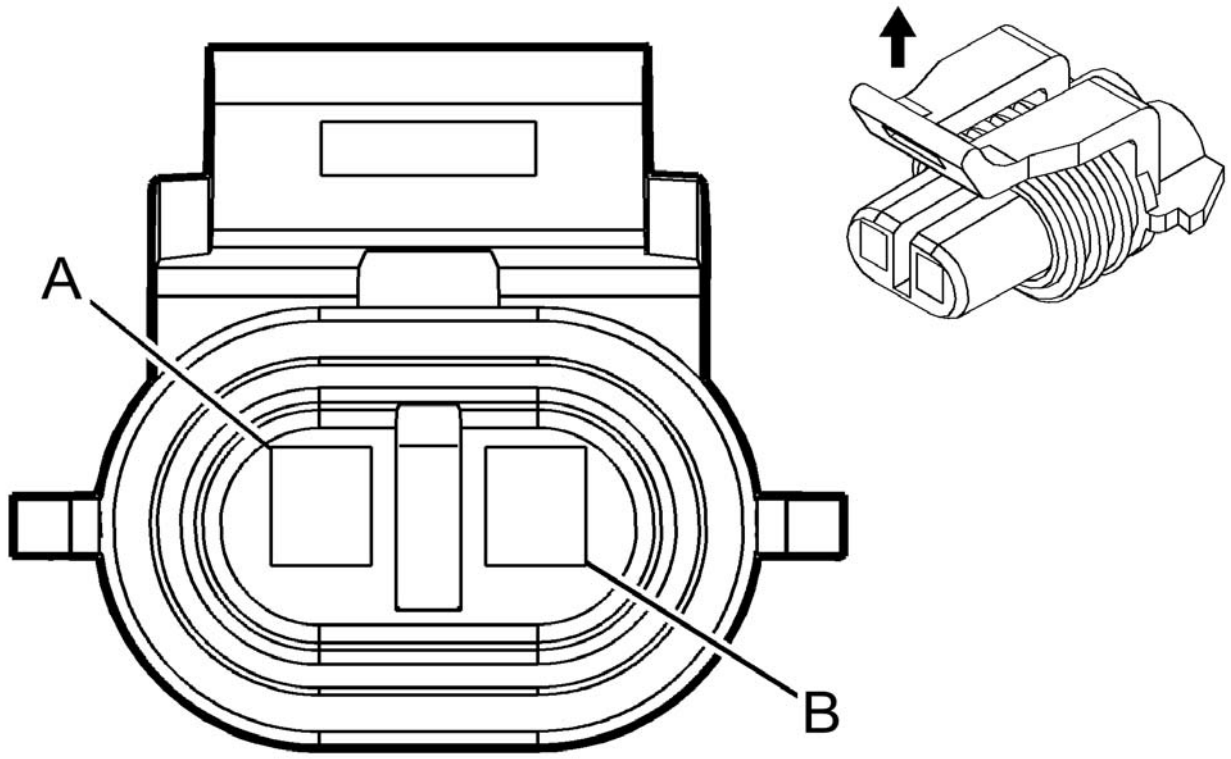
- Terminated Lead: 13576360

- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-2A (GY)
- Terminal/Tray: 15326267/19
- Core/Insulation Crimp: E/4

Windshield Washer Fluid Level Switch

Pin	Wire	Circuit	Function
A	0.35 TN	185	Low Washer Fluid Indicator Signal
B	0.5 BK	1250	Ground

WINDSHIELD WASHER FLUID PUMP



Connector Part Information

- Harness Type: Forward Lamp
- OEM Connector: 12052641
- Service Connector: 13586114
- Description: 2-Way F Metri-Pack 150 Series (BK)

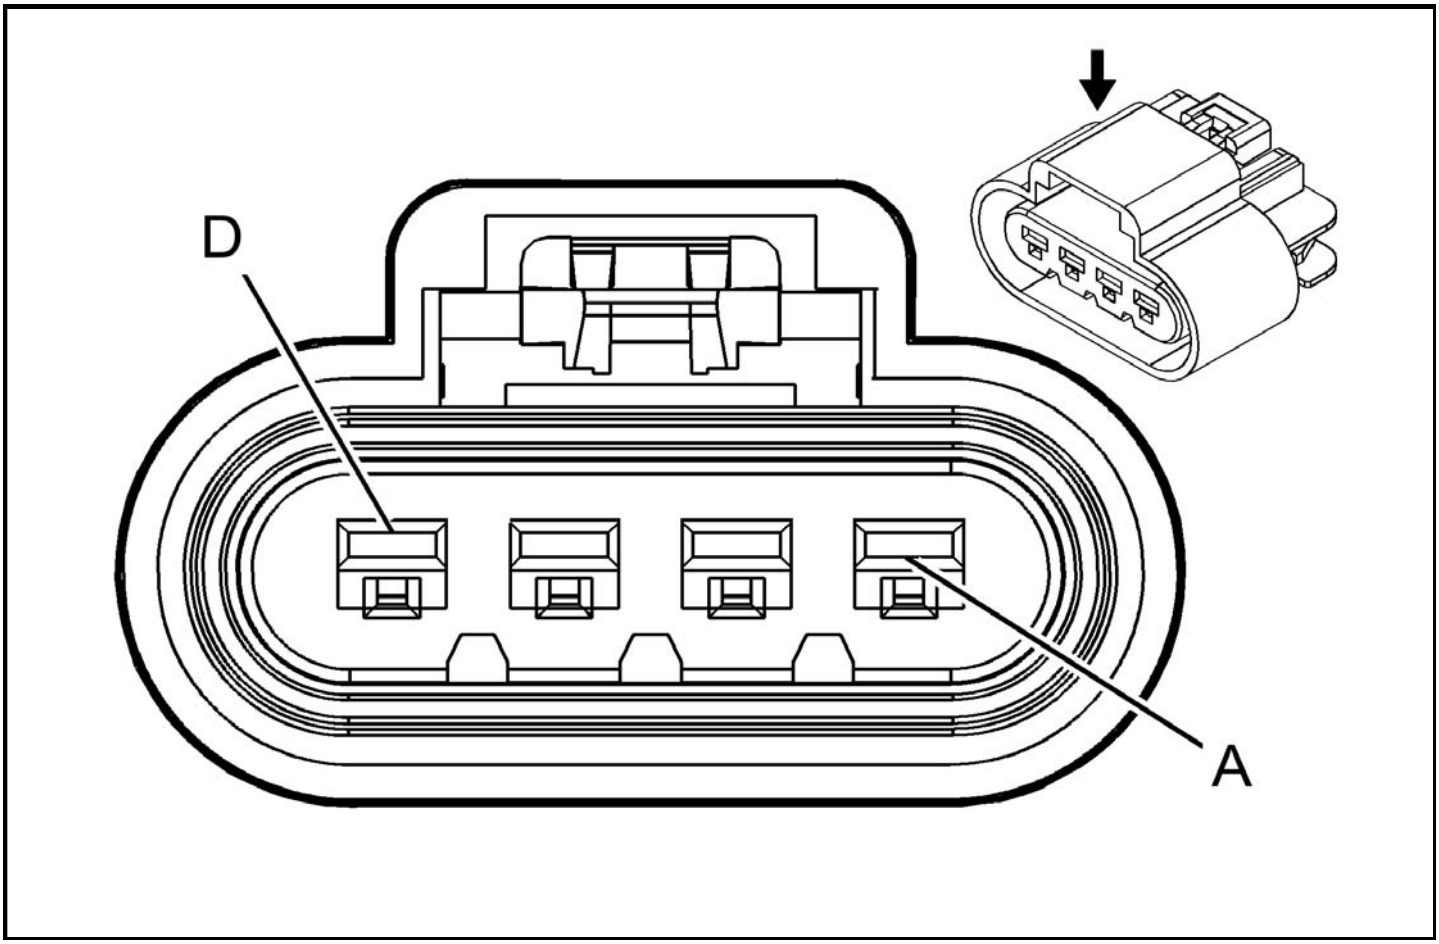
Terminal Part Information

- Terminated Lead: 13575427
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 12048074/2
- Core/Insulation Crimp: E/1

Windshield Washer Fluid Pump

Pin	Wire	Circuit	Function
A	0.8 OG	228	Windshield Washer Pump Control
B	0.8 BK	1250	Ground

WINDSHIELD WIPER MOTOR



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 15326631
- Service Connector: 13580864
- Description: 4-Way F GT 280 5.8 Series, Sealed (BK)

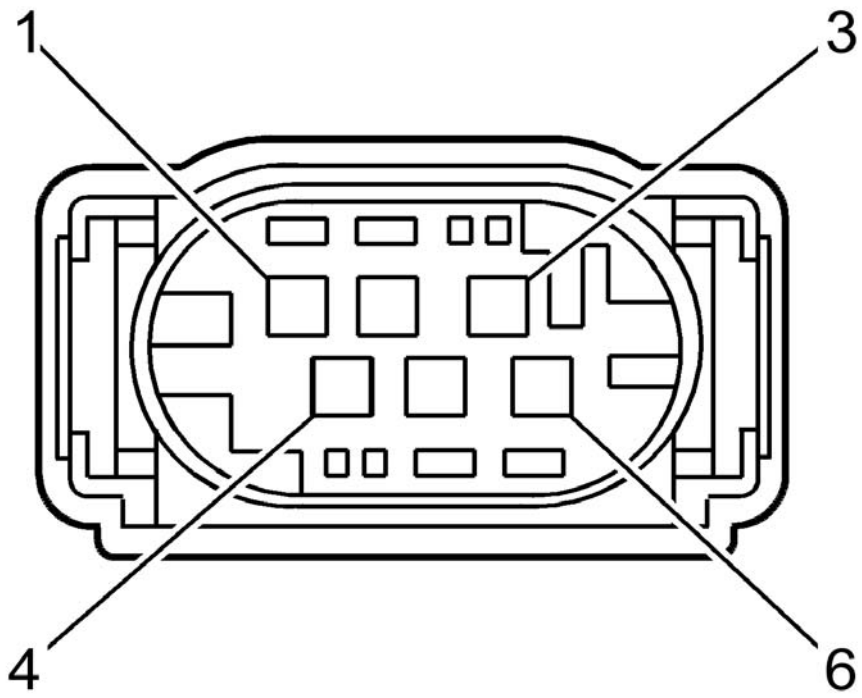
Terminal Part Information

- Terminated Lead: 13575405
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 15304719/19
- Core/Insulation Crimp: 2/5

Windshield Wiper Motor

Pin	Wire	Circuit	Function
A	1 BK	150	Ground
B	0.35 YE	196	Windshield Wiper Motor Park Switch Signal
C	1 PU	92	Windshield Wiper Motor High Speed Control
D	1 D-GN	95	Windshield Wiper Motor Low Speed Control

YAW AND LATERAL ACCELEROMETER SENSOR



Connector Part Information

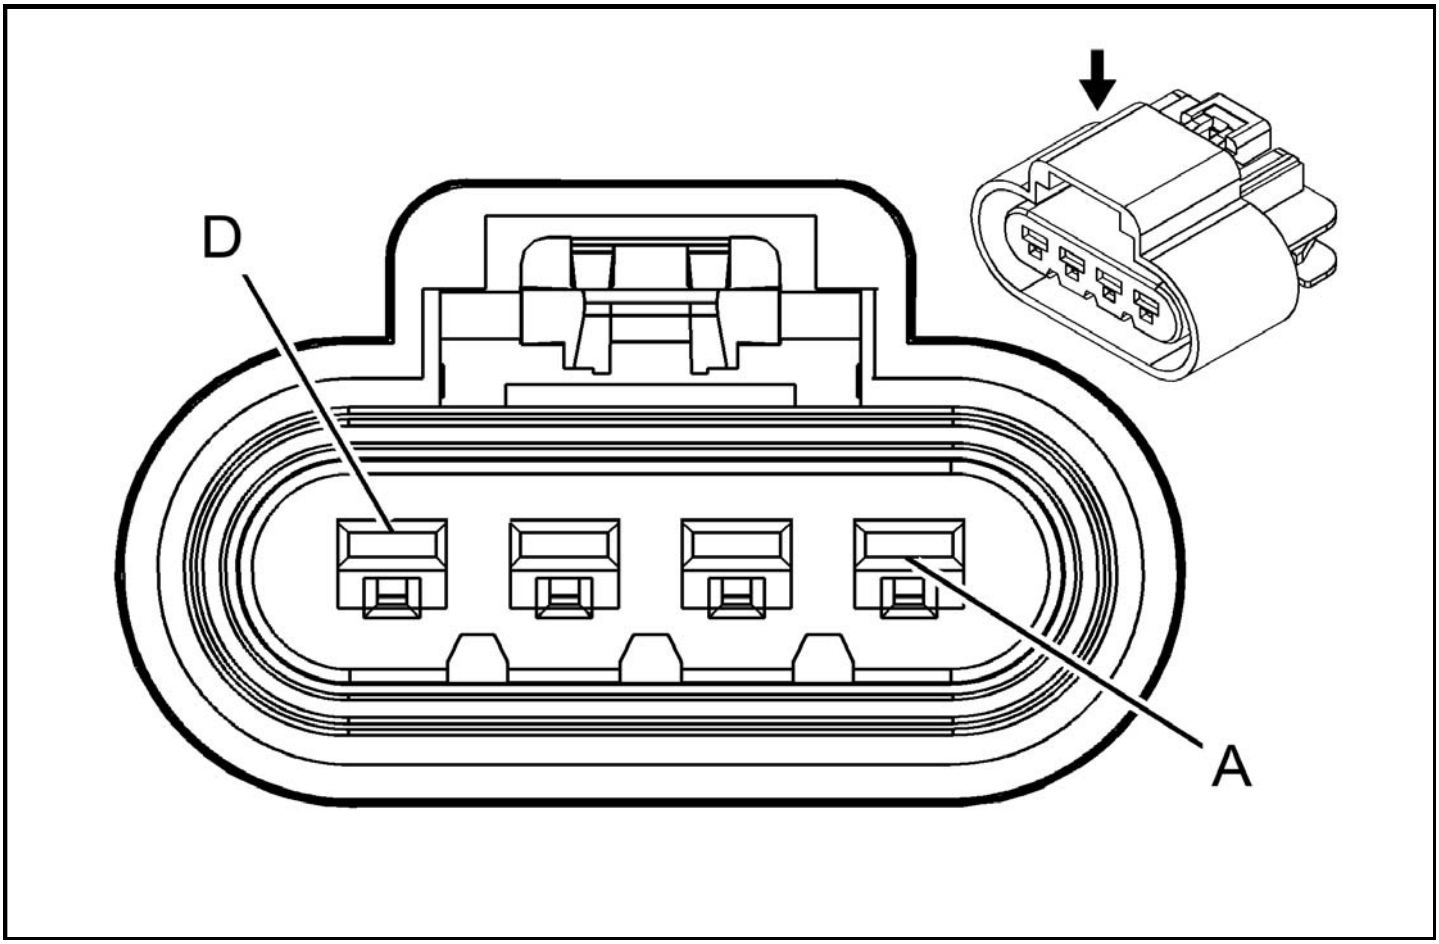
- Harness Type: Body
- OEM Connector: 15355474

- Terminated Lead: 13575427
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-14 (GN)
- Terminal/Tray: 12048074/2
- Core/Insulation Crimp: E/1

Windshield Washer Fluid Pump

Pin	Wire	Circuit	Function
A	0.8 OG	228	Windshield Washer Pump Control
B	0.8 BK	1250	Ground

WINDSHIELD WIPER MOTOR



Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 15326631
- Service Connector: 13580864
- Description: 4-Way F GT 280 5.8 Series, Sealed (BK)

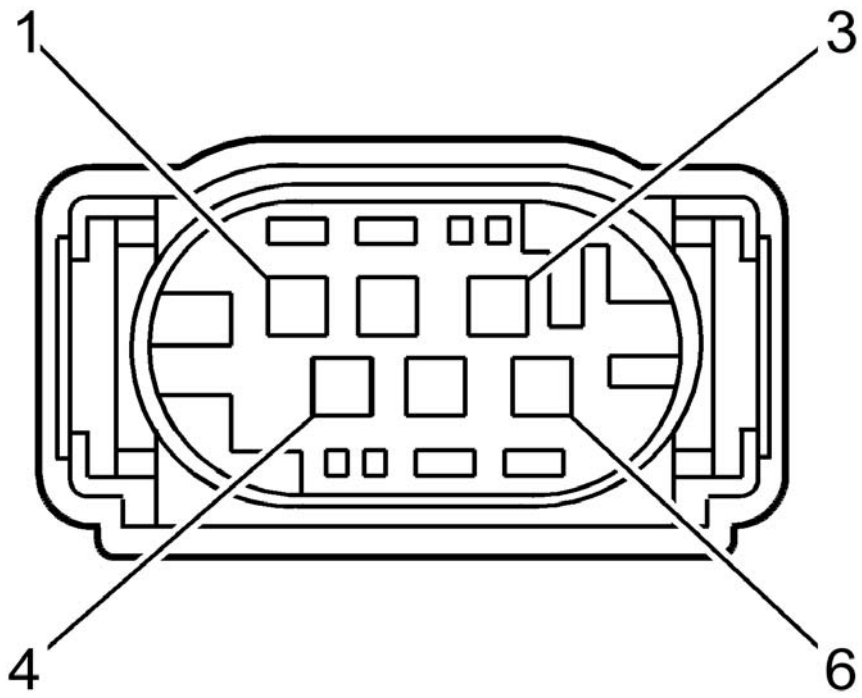
Terminal Part Information

- Terminated Lead: 13575405
- Release Tool: J-38125-553
- Diagnostic Test Probe: J-35616-4A (PU)
- Terminal/Tray: 15304719/19
- Core/Insulation Crimp: 2/5

Windshield Wiper Motor

Pin	Wire	Circuit	Function
A	1 BK	150	Ground
B	0.35 YE	196	Windshield Wiper Motor Park Switch Signal
C	1 PU	92	Windshield Wiper Motor High Speed Control
D	1 D-GN	95	Windshield Wiper Motor Low Speed Control

YAW AND LATERAL ACCELEROMETER SENSOR



Connector Part Information

- Harness Type: Body
- OEM Connector: 15355474

- Service Connector: 15306420
- Description: 6-Way F 0.64 MQS Series, Sealed (BK)

Terminal Part Information

- Terminated Lead: Service by Harness- See Part Catalog
- Release Tool: J-38125-12A
- Diagnostic Test Probe: J-35616-64B (L-BU)
- Terminal/Tray: 962885-5/15
- Core/Insulation Crimp: 6/6

FUSE BLOCK - UNDERHOOD LABEL

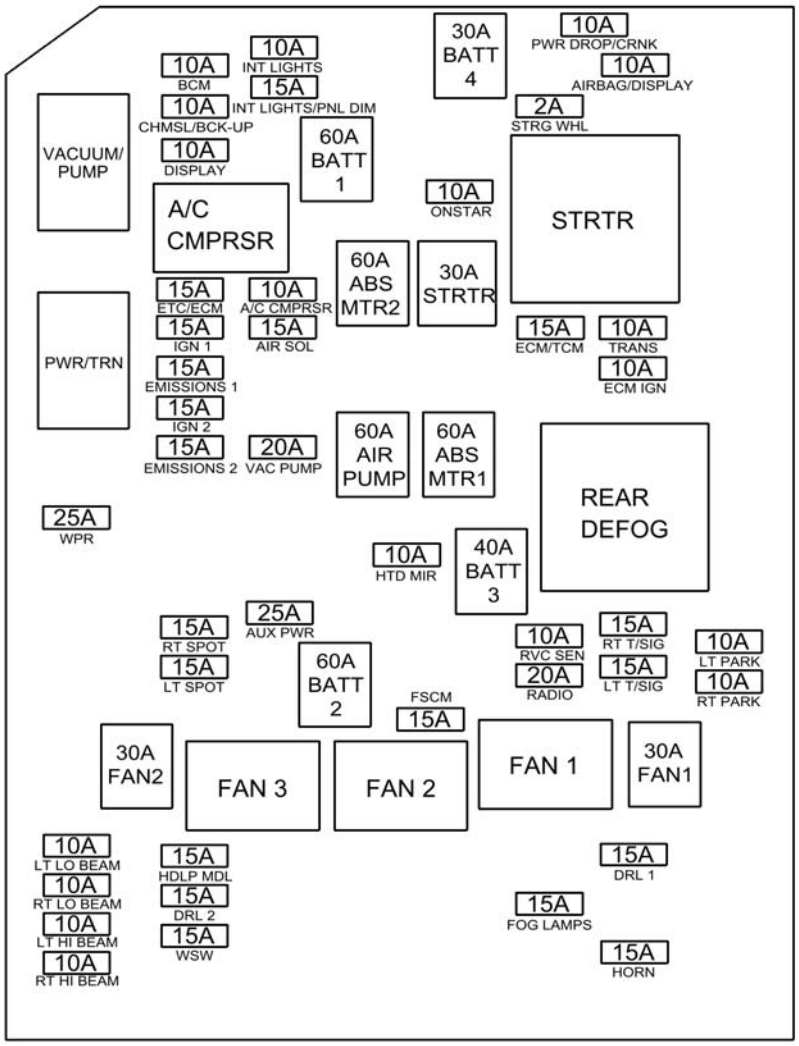

Fig. 1: Fuse Block -- Underhood Label
Courtesy of GENERAL MOTORS COMPANY

Fuse Block - Underhood Label Usage

Fuse And Relay Description	Rating	Circuits
A/C CMPRSR Fuse	10A	A/C Compressor Clutch
ABS MTR1 Fuse	60A	Electronic Brake Control Module (EBCM)
ABS MTR2 Fuse	60A	Electronic Brake Control Module (EBCM)

Fuse And Relay Description	Rating	Circuits
AIRBAG/DISPLAY Fuse	10A	Instrument Panel Cluster (IPC), HVAC Control Module, Inflatable Restraint Passenger Air Bag On/Off Indicator, and Inflatable Restraint Sensing and Diagnostic Module (SDM)
AUX PWR Fuse	25A	Accessory Power Outlet - I/P 1 and Accessory Power Outlet - I/P 2
BATT 1 Fuse	60A	CNSTR, XM, AMP, AUX Fuses, and Trunk Relay
BATT 2 Fuse	60A	HTD/SEAT, AIRBAG, PWR/MIR, S/ROOF, DR/LCK Fuses, PWR/SEAT Circuit Breaker, and RAP Relay
BATT 3 Fuse	40A	Rear Window Defogger Grid
BATT 4 Fuse	30A	Blower Motor Control Module
BCM Fuse	10A	Body Control Module (BCM), Ignition Switch, and Theft Deterrent Module (TDM)
CHMSL/BCK-UP Fuse	10A	Body Control Module (BCM)
DISPLAY Fuse	10A	Data Link Connector (DLC), Remote Control Door Lock Receiver (RCDLR), Instrument Panel Cluster (IPC), and HVAC Control Module
DRL 1 Fuse	15A	DRL 2 Fuse
DRL 2 Fuse	15A	LT LO BEAM Fuse, RT LO BEAM Fuse
ECM IGN Fuse	10A	Engine Control Module (ECM)
ECM/TCM Fuse	15A	Engine Control Module (ECM) and Transmission Control Module (TCM)
EMISSIONS 1 Fuse	15A	Heated Oxygen Sensor (HO2S) 1, Heated Oxygen Sensor (HO2S) 2, and Evaporative Emission (EVAP) Canister Purge Solenoid Valve
EMISSIONS 2 Fuse	15	Mass Air Flow (MAF)/Intake Air Temperature (IAT) Sensor, Valve Lifter Oil Manifold (VLOM) Assembly (LZG), Secondary Air Injection (AIR) Pump Relay (NU3), Secondary Air Injection (AIR) Solenoid Relay (NU3), A/C CMPRSR Relay, FAN 1 Relay, FAN 2 Relay, and FAN 3 Relay
ETC/ECM Fuse	15A	Engine Control Module (ECM)
FAN1 Fuse	30A	FAN 1 Relay
FAN2 Fuse	30A	FAN 3 Relay
FOG LAMPS Fuse	15A	Fog Lamp - Left Front and Fog Lamp - Right Front
FSCM Fuse	15A	Fuel Pump Flow Control Module
HDLP MDL Fuse	15A	C122 or Emergency Vehicle Headlamp Flasher (6J7)
HORN Fuse	15A	Horn Assembly
HTD MIR Fuse	10A	Outside Rearview Mirror - Driver and Outside Rearview Mirror - Passenger
INJ 1 Fuse	20A	Fuel Injectors 1-6
INJ 2 Fuse	20A	Ignition Control Module
INT LIGHTS Fuse	10A	Body Control Module (BCM)
INT LTS/PNL DIM Fuse	15A	Body Control Module (BCM)

Fuse And Relay Description	Rating	Circuits
LT HI BEAM FUSE	10A	Headlamp - High Beam - Left or Emergency Vehicle Headlamp Flasher (6J7)
LT LO BEAM Fuse	10A	Headlamp - Low Beam - Left
LT PARK Fuse	10A	Marker lamp - LF, Park/Turn Signal Lamp - Left Front, Tail Lamp - Left, and Tail/Stop and Turn Signal - Left
LT SPOT Fuse (9C1, 9C3)	15A	Spot Lamp - Left (7x6, 7X7)
LT T/SIG Fuse	15A	Body Control Module (BCM)
PWR DROP/CRNK Fuse	10A	Blunt Cut Wire (9C1, 9C3)
RADIO Fuse	20A	Radio
RT HI BEAM Fuse	10A	Headlamp - High Beam - Right or Emergency Vehicle Headlamp Flasher (6J7)
RT LO BEAM Fuse	10A	Headlamp - Low Beam - Right
RT PARK Fuse	10A	Marker Lamp - RF, Park/Turn Signal Lamp - RF, Tail Lamp - Right, and Tail/Stop and Turn Signal - Right
RT SPOT Fuse (9C1, 9C3)	15A	Spot Lamp - Right (7X7)
RT T/SIG Fuse	15A	Body Control Module (BCM)
RVC SEN Fuse	10A	Body Control Module (BCM)
Spare Fuse	2A	Not Used
Spare Fuse	10A	Not Used
Spare Fuse	15A	Not Used
Spare Fuse	20A	Not Used
Spare Fuse	25A	Not Used
STRG WHL Fuse	2A	Steering Wheel Controls - Left and Steering Wheel Controls - Right
STRTR Fuse	40A	Starter
TRANS Fuse	10A	1-2 Shift Solenoid (1-2 SS) Valve, 2-3 Shift Solenoid (2-3 SS) Valve, Torque Converter Clutch (TCC) Solenoid Valve, and Transmission Control Module (TCM)
VAC PUMP Fuse	20A	Brake Booster Pump - Auxiliary
WPR Fuse	25A	WIPER PCB Relay
WSW Fuse	15A	Windshield Washer Fluid Pump
A/C CMPRSR Relay	-	A/C CMPRSR Fuse
FAN 1 Relay	-	Engine Cooling Fan - Left
FAN 2 Relay	-	Engine Cooling Fan - Right
FAN 3 Relay	-	Engine Cooling Fan - Right
PWR/TRN Relay	-	ETC/ECM, INJ 1, INJ 2, EMISSIONS 1, and EMISSIONS 2 Fuses
REAR DEFOG Relay	-	BATT 3 and HTD MIR Fuses
STRTR Relay	-	STRTR Fuse
Vacuum Pump Relay	-	VAC Pump Fuse
Relays listed below are non-serviceable Printed Circuit Board (PCB) relays and are internal to the block.		
DRL PCB Relay	-	DRL 1 Fuse

Fuse And Relay Description	Rating	Circuits
FOG LP PCB Relay	-	FOG LAMPS Fuse
HIGH BEAM PCB Relay	-	LT HI BEAM and RT HI BEAM Fuses
HORN PCB Relay	-	HORN Fuse
IGN MAIN PCB Relay	-	AIRBAG/DISPLAY, ECM IGN, PWR DROP/CRNK, and TRANS Fuses
LOW BEAM PCB Relay	-	DRL 2, LT LO BEAM, and RT LO BEAM Fuses
PARK LP PCB Relay	-	LT PARK and RT PARK Fuses
WIPER PCB Relay	-	WIPER HIGH PCB Relay
WIPER HIGH PCB Relay	-	Windshield Wiper Motor
WS WASH PCB Relay	-	WSW Fuse

Fuse Block - I/P - Label Usage

Fuse And Relay Description	Rating	Circuits
AIRBAG Fuse	10A	Inflatable Restraint Sensing and Diagnostic Module (SDM), Inflatable Restraint Front Passenger Presence System (PPS) Module
AMP Fuse	25A	Audio Amplifier
AUX Fuse	20A	Accessory Power Outlet - Center Seat, Accessory Power Outlet - Center Console 1, Accessory Power Outlet - Center Console 2, Accessory Power Outlet - Center Console Compartment
CNSTR Fuse	10A	Evaporative Emission (EVAP) Canister Vent Solenoid
DR/LCK Fuse	25A	DOOR UNLOCK PCB Relay - Driver, DOOR UNLOCK PCB Relay, and DOOR LOCK PCB Relay

Fuse And Relay Description	Rating	Circuits
HTD/SEAT Fuse	20A	Heated Seat Control Module (KA1), Emergency Vehicle Rear Compartment Lid Lamps Relay (T53)
PWR/MIR Fuse	2A	Outside Rearview Mirror Switch
RAP Fuse	10A	Automatic Transmission Shift Lock Control Solenoid (with Floor Shifter), Inside Rearview Mirror (DD6), Sunroof Motor (CF5)
S/ROOF Fuse	20A	Sunroof Motor (CF5)
TRUNK Fuse	10A	Rear Compartment Lid Release Actuator
PWR/SEAT Circuit Breaker	25A	Seat Adjuster Switch - Driver, Seat Adjuster Switch - Passenger
PWR/WNDW Circuit Breaker	25A	Window Switch - Driver, and Window Switch - Passenger
Trunk Relay	-	Trunk Fuse
XM Fuse	10A	Digital Radio Receiver (U2K)
Relays listed below are non-serviceable Printed Circuit Board (PCB) relays and are internal to the block.		
DOOR LOCK PCB Relay	-	Door Locks
DOOR UNLOCK PCB Relay	-	Door Lock - Passenger, Door Lock - Left Rear, Door Lock - Right Rear
DOOR UNLOCK PCB Relay - Driver	-	Door Lock - Driver
RAP Relay	-	RAP Fuse

1	Speaker- Left Rear
2	Audio Amplifier (UQ3)
3	Rear Compartment Courtesy Lamp
4	Speaker- Right Rear

REAR OF THE VEHICLE COMPONENTS

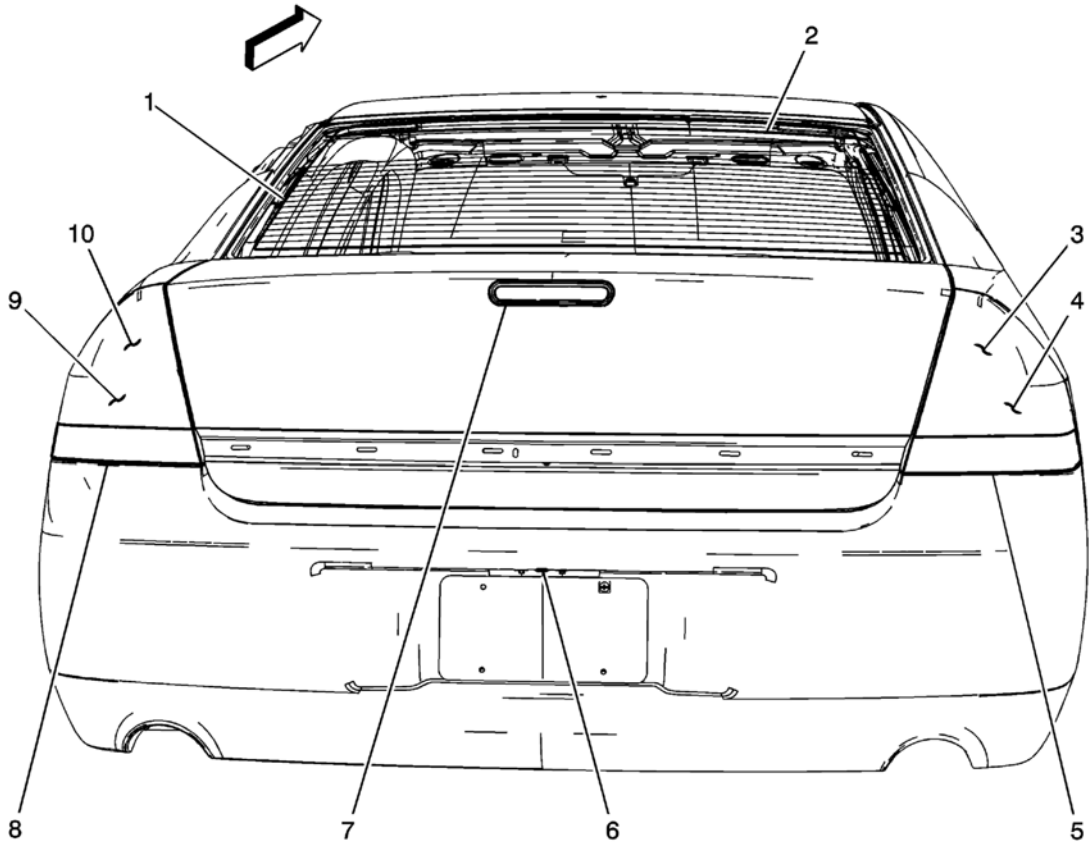

Fig. 7: Identifying Rear of the Vehicle
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Window Defogger Grid
2	Radio Rear Window Antenna
3	Tail/Stop and Turn Signal Lamp - Right
4	Tail Lamp - Right
5	Backup Lamp - Right
6	License Lamp
7	Center High Mounted Stop Lamp (CHMSL)
8	Backup Lamp - Left
9	Tail Lamp - Left
10	Tail/Stop and Turn Signal Lamp - Left

Article GUID: A00737232

MASTER ELECTRICAL COMPONENT LIST

Name	Location	Locator View	Connector End View
A/C Compressor Clutch	In the engine compartment, on the lower right front of the engine, at right side, part of the A/C compressor	Left Front of Engine Components	A/C Compressor Clutch
A/C Compressor Solenoid Valve	In the engine compartment, on the lower right front of the engine, at left side, part of the A/C compressor	Left Front of Engine Components	A/C Compressor Solenoid Valve
A/C Refrigerant Pressure Sensor	Left side of the engine compartment, mounted on the A/C line, under the air cleaner	Left Front of the Engine Compartment Components	A/C Refrigerant Pressure Sensor
Accelerator Pedal Position (APP) Sensor	In the passenger compartment, under the left side of the instrument panel, above the accelerator pedal	Below the Instrument Panel Components- Pedal Assemblies	Accelerator Pedal Position (APP) Sensor
Accessory Power Outlet - Center Console 1 (D55)	In the passenger compartment, at the left front of the center console bin, under the instrument panel	Center Console Components- Auxiliary Power Outlets (D55)	Accessory Power Outlet - Center Console 1 (D55)
Accessory Power Outlet - Center Console 2 (D55)	In the passenger compartment, at the right front of the center console bin, under the instrument panel	Center Console Components- Auxiliary Power Outlets (D55)	Accessory Power Outlet - Center Console 2 (D55)
Accessory Power Outlet - Center Console Compartment (D55)	In the passenger compartment, at the rear of the center console, in the bottom of the bin	Center Console Components- Auxiliary Power Outlets (D55)	Accessory Power Outlet - Center Console Compartment (D55)
Accessory Power Outlet - Center Seat (without D55)	In the passenger compartment, at the rear of the center front seat	Bottom Center of the Instrument Panel (without D55)	Accessory Power Outlet - Center Seat (without D55)

Name	Location	Locator View	Connector End View
Accessory Power Outlet - I/P 1 (without D55)	In the passenger compartment, behind the right side of the instrument panel, under the HVAC control module	Bottom Center of the Instrument Panel (without D55)	Accessory Power Outlet - I/P 1 (without D55)
Accessory Power Outlet - I/P 2 (without D55)	In the passenger compartment, behind the left side of the instrument panel, under the HVAC control module	Bottom Center of the Instrument Panel (without D55)	Accessory Power Outlet - I/P 2 (without D55)
Air Temperature Actuator - Left	In the passenger compartment, to the right of the accelerator pedal, behind the center of the instrument panel, on the HVAC case	Interior HVAC Components	Air Temperature Actuator - Left
Air Temperature Actuator - Right	In the passenger compartment, behind the center of the instrument panel, to the left of the instrument panel compartment, on the HVAC case	Interior HVAC Components	Air Temperature Actuator - Right
Ambient Air Temperature Sensor	In the engine compartment, in front of the radiator, just right of the center of the vehicle	Under the Hood Latch Trim Panel Components	Ambient Air Temperature Sensor
Ambient Light Sensor	In the passenger compartment, top center of the instrument panel	Instrument Panel Components	Ambient Light Sensor
Audio Amplifier (UQ3)	In the center of the rear compartment, mounted below the rear shelf panel	Radio and Speaker Components	• Audio Amplifier X1 (UQ3) • Audio Amplifier X2 (UQ3) • Audio Amplifier X3 (UQ3)
Automatic Transmission	In the engine compartment, left middle lower	Automatic Transmission Electronic Components	-
Automatic Transmission Fluid Temperature (TFT) Sensor	At the left front of the engine compartment, in the automatic	Automatic Transmission Electronic	-

Name	Location	Locator View	Connector End View
	transmission, part of the control solenoid valve assembly	Components	
Automatic Transmission Input Shaft Speed (ISS) Sensor	In the engine compartment, left middle lower, in the automatic transmission	Automatic Transmission Electronic Components	Automatic Transmission Input Shaft Speed (ISS) Sensor
Automatic Transmission Internal Mode Switch (IMS)	In the engine compartment, left middle lower, in the automatic transmission, part of the control solenoid valve assembly	Automatic Transmission Electronic Components	-
Automatic Transmission Shift Lock Control Solenoid (D55)	In the passenger compartment, under the center console, attached to the shifter lever	Center Console Components (D55)	Automatic Transmission Shift Lock Control Solenoid (D55)
Automatic Transmission Shift Lock Control Solenoid (without D55)	In the passenger compartment, attached to the right side of the steering column	Steering Column Components (without D55)	Automatic Transmission Shift Lock Control Solenoid (without D55)
Backup Lamp - Left	At the rear of the vehicle, in the bottom of the left rear tail lamp assembly	Rear of the Vehicle Components	Backup Lamp - Left
Backup Lamp - Right	At the rear of the vehicle, in the bottom of the right rear tail lamp assembly	Rear of the Vehicle Components	Backup Lamp - Right
Battery	At the right front of the engine compartment	Right Front of the Engine Compartment Components (2 of 2)	Battery Current Sensor
Battery Current Sensor	At the right front side of the engine compartment, on the positive battery cable	Right Front of the Engine Compartment Components (2 of 2)	Battery Current Sensor
Blower Motor	In the passenger compartment, behind the right side of the instrument panel, lower right side of the HVAC assembly, above foot area of the passenger floor	Interior HVAC Components	Blower Motor
Blower Motor Control Module	In the passenger compartment, behind the right side of the	Interior HVAC Components	Blower Motor Control Module

Name	Location	Locator View	Connector End View
	instrument panel, lower right side of the HVAC assembly, next to the blower motor		
Body Control Module (BCM)	In the passenger compartment, below the left side of the instrument panel, left of the steering column	Near the Steering Column Components	• Body Control Module (BCM) X1 • Body Control Module (BCM) X2 • Body Control Module (BCM) X3 • Body Control Module (BCM) X4 • Body Control Module (BCM) X5 • Body Control Module (BCM) X6 • Body Control Module (BCM) X7
Brake Fluid Level Switch	In the engine compartment, mounted under the center of the brake fluid reservoir	Left Rear of the Engine Compartment Components	Brake Fluid Level Switch
Brake Pedal Position (BPP) Sensor	In the passenger compartment, below the left side of the instrument panel, in the right side of the brake pedal bracket	Below the Instrument Panel Components- Pedal Assemblies	Brake Pedal Position (BPP) Sensor
Camshaft Position (CMP) Actuator Solenoid Valve - Bank 1 Exhaust	In the engine compartment, rear of the engine, at the right side	Right Rear of Engine Components	Camshaft Position (CMP) Actuator Solenoid Valve - Bank 1 Exhaust
Camshaft Position (CMP) Actuator Solenoid Valve - Bank 1 Intake	In the engine compartment, rear of the engine, at the right side	Right Rear of Engine Components	Camshaft Position (CMP) Actuator Solenoid Valve - Bank 1 Intake
Camshaft Position (CMP) Actuator Solenoid Valve - Bank 2 Exhaust	In the engine compartment, right side of the engine, near the front	Right Rear of Engine Components	Camshaft Position (CMP) Actuator Solenoid Valve - Bank 2 Exhaust
Camshaft Position (CMP) Actuator Solenoid Valve - Bank 2 Intake	In the engine compartment, right side of the engine, near the front	Right Rear of Engine Components	Camshaft Position (CMP) Actuator Solenoid Valve - Bank 2 Intake

Name	Location	Locator View	Connector End View
Camshaft Position (CMP) Sensor - Bank 1 Exhaust	In the engine compartment, right side of the engine, near the rear	Right Rear of Engine Components	Camshaft Position (CMP) Sensor - Bank 1 Exhaust
Camshaft Position (CMP) Sensor - Bank 1 Intake	In the engine compartment, right side of the engine, near the rear	Right Rear of Engine Components	Camshaft Position (CMP) Sensor - Bank 1 Intake
Camshaft Position (CMP) Sensor - Bank 2 Exhaust	In the engine compartment, right side of the engine, near the front	Right Rear of Engine Components	Camshaft Position (CMP) Sensor - Bank 2 Exhaust
Camshaft Position (CMP) Sensor - Bank 2 Intake	In the engine compartment, right side of the engine, near the front	Right Rear of Engine Components	Camshaft Position (CMP) Sensor - Bank 2 Intake
Cellular and Digital Radio Antenna (UE1 and/or U2K)	On the vehicle exterior, top rear center of the roof	Headliner Components- Top View	-
Cellular Telephone Microphone (UE1)	In the passenger compartment, on the headliner, near the left sunshade	-	Cellular Telephone Microphone (UE1)
Center High Mounted Stop Lamp (CHMSL)	In the rear compartment, on the upper center of the deck lid	Rear of the Vehicle Components	Center High Mounted Stop Lamp (CHMSL)
Control Solenoid Valve Assembly	In the left front of the engine compartment, in the automatic transmission	Automatic Transmission Electronic Components	• Control Solenoid Valve Assembly X1 • Control Solenoid Valve Assembly X2 • Control Solenoid Valve Assembly X3 • Control Solenoid Valve Assembly X4
Crankshaft Position (CKP) Sensor	In the engine compartment, rear of the engine, left side of the engine block	Right Rear of Engine Components	Crankshaft Position (CKP) Sensor
Data Link Connector (DLC)	In the passenger compartment, on the bottom of the instrument panel, left of the steering column	Below the Instrument Panel Components- Left Front Footwell	Data Link Connector (DLC)

Name	Location	Locator View	Connector End View
Data Link Resistor (without UE1)	In the right side luggage compartment, taped to the body harness, approximately 26 cm (10.25 in) from the fuel pump flow control module	-	-
Data Link Resistor (UE1)	In the left side luggage compartment, taped to the body harness, between the vehicle communication interface module and the vehicle communication interface module battery	-	-
Digital Radio Receiver (U2K)	In the luggage compartment, left side, above the Vehicle Communication Interface Module (VCIM)	**Radio and Speaker Components**	**Digital Radio Receiver (U2K)**
Dome/Reading Lamps	In the passenger compartment, inside center of the roof	**Headliner Components**	**Dome/Reading Lamps**
Door Lock - Driver	In the passenger compartment, in the rear of the driver door	**Driver Door Components**	• **Door Lock - Driver (UA6)** • **Door Lock - Driver (without UA6)**
Door Lock - Left Rear	In the passenger compartment, in the rear of the left rear door	**Left Rear Door Components**	**Door Lock - Left Rear**
Door Lock - Passenger	In the passenger compartment, in the rear of the passenger door	**Passenger Door Components**	**Door Lock - Passenger**
Door Lock - Right Rear	In the passenger compartment, in the rear of the right rear door	**Right Rear Door Components**	**Door Lock - Right Rear**
Door Lock Switch - Driver	In the passenger compartment, in the center of the driver door panel, near the door handle	**Driver Door Components**	**Door Lock Switch - Driver**
Door Lock Switch - Passenger	In the passenger compartment, in the center of the front	**Passenger Door Components**	**Door Lock Switch - Passenger**

Name	Location	Locator View	Connector End View
	passenger door panel, near the door handle		
Driver Information Center (DIC) Switch	In the passenger compartment, on the instrument panel, to the right of the instrument panel cluster	Instrument Panel Components	Driver Information Center (DIC) Switch
Electronic Brake Control Module (EBCM)	At the left side of the engine compartment, part of the brake pressure modulator valve, mounted to the back side of the strut tower	Left Front of the Engine Compartment Components	Electronic Brake Control Module (EBCM)
Emergency Vehicle Front Lamp Flasher (6J3)	Under the vehicle, in the right front footwell, mounted to the closeout panel	-	Emergency Vehicle Front Lamp Flasher (6J3)
Emergency Vehicle Headlamp Flasher (6J7)	At the front of the vehicle, at the left side of the right headlamp assembly	Right Headlamp Assembly Components (9C1 or 9C3)	-
Emergency Vehicle Rear Compartment Lid Lamp - Left (T53)	In the rear compartment, on the inside of the rear compartment lid	Rear Compartment Lid Components (9C1 or 9C3)	-
Emergency Vehicle Rear Compartment Lid Lamp - Right (T53)	In the rear compartment, on the inside of the rear compartment lid	Rear Compartment Lid Components (9C1 or 9C3)	-
Emergency Vehicle Rear Compartment Lid Lamp Relay (T53)	In the luggage compartment, at the upper right hand corner of the trunk opening	Luggage Compartment Components (T53)	-
Emergency Vehicle Rear Window Panel Lamp - Left (6J6)	In the rear compartment, on the left side of the package shelf	Package Shelf Components (9C1 or 9C3)	Emergency Vehicle Rear Window Panel Lamp - Left (6J6)
Emergency Vehicle Rear Window Panel Lamp - Right (6J6)	In the rear compartment, on the right side of the package shelf	Package Shelf Components (9C1 or 9C3)	Emergency Vehicle Rear Window Panel Lamp - Right (6J6)
Engine Control Module (ECM)	At the left side of the engine compartment, inside the air cleaner assembly	Left Front of the Engine Compartment Components	• Engine Control Module (ECM) X1 (LFX) • Engine Control Module (ECM) X2 (LFX) • Engine Control Module (ECM) X3 (LFX)

Name	Location	Locator View	Connector End View
Engine Coolant Temperature (ECT) Sensor	In the engine compartment, on the right front side of the cylinder head between exhaust ports 4 and 6	Left Front of Engine Components	Engine Coolant Temperature (ECT) Sensor
Engine Cooling Fan - Left	At the front of the engine compartment, mounted to the left side of the radiator	Engine Compartment Cooling Components	Engine Cooling Fan - Left
Engine Cooling Fan - Right	At the front of the engine compartment, mounted to the right side of the radiator	Engine Compartment Cooling Components	Engine Cooling Fan - Right
Engine Cooling Fan Diode - Left	In the engine compartment, near the Fuse Block - Underhood	-	-
Engine Cooling Fan Diode - Right	In the engine compartment, near the Fuse Block - Underhood	-	-
Engine Oil Pressure (EOP) Sensor	In the engine compartment, right front lower area of the engine, below the generator, above the A/C compressor	Left Front of Engine Components	Engine Oil Pressure (EOP) Switch
Evaporative Emission (EVAP) Canister Purge Solenoid Valve	In the engine compartment, right rear edge of the intake manifold	Right Rear of Engine Components	Evaporative Emission (EVAP) Canister Purge Solenoid Valve
Evaporative Emission (EVAP) Canister Vent Solenoid Valve	Under the vehicle, behind the left rear wheelhouse	Fuel Tank Components	Evaporative Emission (EVAP) Canister Vent Solenoid Valve
Evaporator Temperature Sensor	In the passenger compartment, front left of center, on left side of HVAC assembly	-	Evaporator Temperature Sensor
Fog Lamp - Left Front (T96)	At the front of the vehicle, on left front lower bumper fascia	Front of the Vehicle Components	Fog Lamp - Left Front (T96)
Fog Lamp - Right Front (T96)	At the front of the vehicle, on right front lower bumper fascia	Front of the Vehicle Components	Fog Lamp - Right Front (T96)
Fuel Injector 1	In the engine compartment, top of the engine, at number 1	Top Engine Components	Fuel Injector 1

Name	Location	Locator View	Connector End View
	cylinder intake port, below intake manifold		
Fuel Injector 2	In the engine compartment, top of the engine, at number 2 cylinder intake port, below intake manifold	**Top Engine Components**	**Fuel Injector 2**
Fuel Injector 3	In the engine compartment, top of the engine, at number 3 cylinder intake port, below intake manifold	**Top Engine Components**	**Fuel Injector 3**
Fuel Injector 4	In the engine compartment, top of the engine, at number 4 cylinder intake port, below intake manifold	**Top Engine Components**	**Fuel Injector 4**
Fuel Injector 5	In the engine compartment, top of the engine, at number 5 cylinder intake port, below intake manifold	**Top Engine Components**	**Fuel Injector 5**
Fuel Injector 6	In the engine compartment, top of the engine, at number 6 cylinder intake port, below intake manifold	**Top Engine Components**	**Fuel Injector 6**
Fuel Level Sensor	Under the vehicle, in the fuel tank, part of the Fuel Pump and Sender Assembly	**Fuel Tank Components**	-
Fuel Pressure Sensor	Under the vehicle, on the left hand side, rear of the engine compartment	-	**Fuel Pressure Sensor**
Fuel Pump and Sender Assembly	Under the vehicle, in the fuel tank	**Fuel Tank Components**	**Fuel Pump and Sender Assembly**
Fuel Pump Flow Control Module (Chassis Control Module)	In the luggage compartment, mounted to the rear of the right rear wheelhouse	**Right Side of the Luggage Compartment Components**	**Fuel Pump Flow Control Module**
Fuel Rail Pressure (FRP) Sensor	In the engine compartment, top of the engine, at the fuel rail near fuel injector 1	**Top Engine Components**	**Fuel Rail Pressure (FRP) Sensor**

Name	Location	Locator View	Connector End View
Fuel Tank Pressure (FTP) Sensor	Under the vehicle, at the top of the fuel tank, part of the fuel pump and sender assembly	**Fuel Tank Components**	**Fuel Tank Pressure (FTP) Sensor**
Fuse Block - Auxiliary (9C1 or 9C3)	In the passenger compartment, behind the instrument panel, right of the steering column, above the accelerator pedal	**Instrument Panel Harness Routing- Rear of the Instrument Panel Carrier**	-
Fuse Block - I/P	In the passenger compartment, behind the right front kick panel	**Right Front of the Passenger Compartment Components**	**Electrical Center Identification Views**
Fuse Block - Underhood	At the right side of the engine compartment, mounted to the strut tower	**Right Front of the Engine Compartment Components (1 of 2)**	**Electrical Center Identification Views**
Fusible Link (9C1 or 9C3)	In the passenger compartment, at the fuse block - underhood battery stud	**Instrument Panel Harness Routing- Engine Compartment**	-
Fusible Link (without 6J1)	In the engine compartment, near the starter, between starter and generator	-	-
Garage Door Opener (GDO) (UG1)	In the passenger compartment, front center of the headliner, above the inside rearview mirror, in the headliner console	**Headliner Components**	**Garage Door Opener (UG1)**
Generator	In the engine compartment, top right rear of the engine	**Right Front of the Engine Compartment Components (1 of 2)**	**Generator X1**
Headlamp - Left High Beam	In the left headlamp assembly	**Front of the Vehicle Components**	**Headlamp - Left High Beam**
Headlamp - Left Low Beam	At the front of the vehicle, in the left headlamp assembly	**Front of the Vehicle Components**	**Headlamp - Left Low Beam**
Headlamp - Right High Beam	At the front of the vehicle, in the right headlamp assembly	**Front of the Vehicle Components**	**Headlamp - Right High Beam**

Name	Location	Locator View	Connector End View
Headlamp - Right Low Beam	At the front of the vehicle, in the right headlamp assembly	Front of the Vehicle Components	Headlamp - Right Low Beam
Headlamp Switch	In the passenger compartment, left side of the instrument panel, left of the steering column	Instrument Panel Components	Headlamp Switch
Heated Oxygen Sensor (HO2S) - Bank 1 Sensor 1	In the rear of the engine compartment, in the exhaust pipe near the cylinder head	Oxygen Sensors	Heated Oxygen Sensor (HO2S) - Bank 1 Sensor 1
Heated Oxygen Sensor (HO2S) - Bank 1 Sensor 2	In the rear of the engine compartment, after the catalytic converter	Oxygen Sensors	Heated Oxygen Sensor (HO2S) - Bank 1 Sensor 2
Heated Oxygen Sensor (HO2S) - Bank 2 Sensor 1	In the front of the engine compartment, in the exhaust pipe near the cylinder head	Oxygen Sensors	Heated Oxygen Sensor (HO2S) - Bank 2 Sensor 1
Heated Oxygen Sensor (HO2S) - Bank 2 Sensor 2	In the lower front of the engine compartment, after the catalytic converter	Oxygen Sensors	Heated Oxygen Sensor (HO2S) - Bank 2 Sensor 2
Heated Seat Control Module (KA1)	In the passenger compartment, under the driver seat	Driver Seat Components	• Heated Seat Control Module (KA1) X1 • Heated Seat Control Module (KA1) X2 • Heated Seat Control Module (KA1) X3 • Heated Seat Control Module (KA1) X4
Heated Seat Element - Driver Back (KA1)	In the passenger compartment, under the upholstery of the driver seat back	Driver Seat Components	Heated Seat Element - Driver Back (KA1)
Heated Seat Element - Driver Cushion (KA1)	In the passenger compartment, under the upholstery of the driver seat cushion	Driver Seat Components	Heated Seat Element - Driver Cushion (KA1)
Heated Seat Element - Passenger Back (KA1)	In the passenger compartment, under the upholstery of the passenger seat back	Passenger Seat Components	Heated Seat Element - Passenger Back (KA1)

Name	Location	Locator View	Connector End View
Heated Seat Element - Passenger Cushion (KA1)	In the passenger compartment, under the upholstery of the passenger seat cushion	Passenger Seat Components	Heated Seat Element - Passenger Cushion (KA1)
High Pressure Fuel Pump (LFX)	In the engine compartment, near center middle, at the left rear of the bank 2 cylinder head	Left Front of Engine Components	G18 High Pressure Fuel Pump (LFX)
Hood Ajar Switch (AP3)	In the luggage compartment, part of the hood latch	Under the Hood Latch Trim Panel Components	Hood Ajar Switch (AP3)
Horn Assembly	At the front of the vehicle, behind the front fascia, mounted to the frame rail extension, below the right headlamp	Right Front of the Engine Compartment Components (1 of 2)	Horn Assembly
Horn Switch	In the passenger compartment, in the steering wheel, behind the inflatable restraint steering wheel module	Steering Wheel Components	Horn Switch
HVAC Control Module	In the passenger compartment, center of the instrument panel	Instrument Panel Components	• HVAC Control Module X1 • HVAC Control Module X2
I/P Courtesy Lamp - Left	In the passenger compartment, below the instrument panel, above the left footwell	Below the Instrument Panel Components- Left Front Footwell	I/P Courtesy Lamp - Left
I/P Courtesy Lamp - Right	In the passenger compartment, below the instrument panel, above the right footwell	Below the Instrument Panel Components- Right Front Footwell	I/P Courtesy Lamp - Right
Ignition Coil 1	In the engine compartment, on top of the engine, at cylinder 1	Right Rear of Engine Components	Ignition Coil 1
Ignition Coil 2	In the engine compartment, on top of the engine, at cylinder 2	Left Front of Engine Components	Ignition Coil 2
Ignition Coil 3	In the engine compartment, on top of the engine, at cylinder 3	Right Rear of Engine Components	Ignition Coil 3

Name	Location	Locator View	Connector End View
Ignition Coil 4	In the engine compartment, on top of the engine, at cylinder 4	**Left Front of Engine Components**	**Ignition Coil 4**
Ignition Coil 5	In the engine compartment, on top of the engine, at cylinder 5	**Right Rear of Engine Components**	**Ignition Coil 5**
Ignition Coil 6	In the engine compartment, on top of the engine, at cylinder 6	**Left Front of Engine Components**	**Ignition Coil 6**
Ignition Lock Cylinder Control Actuator (without D55)	In the passenger compartment, right side of the steering column	**In the Steering Column Components**	-
Ignition Switch	In the passenger compartment, right side of the steering column	**In the Steering Column Components**	**Ignition Switch**
Inflatable Restraint Front End Sensor - Left	At the left front of the vehicle, behind the front fascia, left of the hood latch	**Left Front of the Engine Compartment Components**	**Inflatable Restraint Front End Sensor - Left**
Inflatable Restraint Front End Sensor - Right	At the right front of the vehicle, behind the front fascia, right of the hood latch	**Right Front of the Engine Compartment Components (1 of 2)**	**Inflatable Restraint Front End Sensor - Right**
Inflatable Restraint Front Passenger Presence System (PPS) Module	In the passenger compartment, under the front passenger seat	**Passenger Seat Components**	**Inflatable Restraint Front Passenger Presence System (PPS) Module**
Inflatable Restraint Front Passenger Presence System (PPS) Sensor	In the passenger compartment, under the front passenger seat	**Passenger Seat Components**	-
Inflatable Restraint I/P Module	In the passenger compartment, right side of the instrument panel, above the instrument panel compartment	**Instrument Panel Components**	• **Inflatable Restraint I/P Module X1** • **Inflatable Restraint I/P Module X2**
Inflatable Restraint I/P Module Indicator	In the passenger compartment, on the instrument panel, to the right of the instrument panel cluster, above the radio	**Instrument Panel Components**	**Inflatable Restraint I/P Module Indicator**
Inflatable Restraint Roof Rail Module - Left	In the passenger compartment, mounted on	**Roof Rail Components**	**Inflatable Restraint Roof Rail Module - Left**

Name	Location	Locator View	Connector End View
	the left C-pillar, behind the trim		
Inflatable Restraint Roof Rail Module - Right	In the passenger compartment, mounted on the right C-pillar, behind the trim	Roof Rail Components	Inflatable Restraint Roof Rail Module - Right
Inflatable Restraint Sensing and Diagnostic Module (SDM)	In the passenger compartment, under the front passenger seat, under the carpet	Under the Passenger Seat Components	• Inflatable Restraint Sensing and Diagnostic Module (SDM) X1 • Inflatable Restraint Sensing and Diagnostic Module (SDM) X2
Inflatable Restraint Side Impact Module - Left	In the passenger compartment, on the left side of the driver seat back	Front Seat Airbag Components	Inflatable Restraint Side Impact Module - Left
Inflatable Restraint Side Impact Module - Right	In the passenger compartment, on the right side of the front passenger seat back	Front Seat Airbag Components	Inflatable Restraint Side Impact Module - Right
Inflatable Restraint Side Impact Sensor (SIS) - Left	In the passenger compartment, in the driver door	Driver Door Components	Inflatable Restraint Side Impact Sensor (SIS) - Left
Inflatable Restraint Side Impact Sensor (SIS) - Right	In the passenger compartment, in the front passenger door	Passenger Door Components	Inflatable Restraint Side Impact Sensor (SIS) - Right
Inflatable Restraint Steering Wheel Module	In the passenger compartment, in the center of the steering wheel	Near the Steering Column Components	• Inflatable Restraint Steering Wheel Module X1 • Inflatable Restraint Steering Wheel Module X2
Inflatable Restraint Steering Wheel Module Coil	In the passenger compartment, in the steering column, behind the steering wheel	Instrument Panel Components	• Inflatable Restraint Steering Wheel Module X1 • Inflatable Restraint Steering Wheel Module X2
Inline Fuse - Engine Cooling Fan - Left	In the engine compartment, near the Fuse Block - Underhood	-	-

Name	Location	Locator View	Connector End View
Inline Fuse - Engine Cooling Fan - Right	In the engine compartment, near the Fuse Block - Underhood	-	-
Inline Fuse - Generator (6J1)	In the engine compartment, near the starter, between the starter and the generator	-	-
Inside Rearview Mirror (ISRVM)	In the passenger compartment, top center of the windshield	**Above the Windshield Components**	• **Inside Rearview Mirror (DD6 or UE1)** • **Inside Rearview Mirror (without DD6 or UE1)**
Instrument Panel Cluster (IPC)	In the passenger compartment, left side of the instrument panel, above the steering column	**Instrument Panel Components**	**Instrument Panel Cluster (IPC)**
Junction Block - Rear (6J1)	In the rear compartment, behind the right rear wheelhouse	**Right Side of the Luggage Compartment Components**	-
Keyless Entry Antenna	In the passenger compartment, left side of the windshield, along the A-pillar	**Left Side of the Windshield Components**	-
Knock Sensor (KS) 1	In the engine compartment, rear of the engine, below the exhaust manifold, above the transmission	**Right Rear of Engine Components**	**Knock Sensor (KS) 1**
Knock Sensor (KS) 2	In the engine compartment, front of the engine, above the starter	**Left Front of Engine Components**	**Knock Sensor (KS) 2**
License Lamp	At the rear of the vehicle, center of the rear fascia, above the license plate opening	**Rear of the Vehicle Components**	**License Lamp**
Manifold Absolute Pressure (MAP) Sensor	In the engine compartment, rear near center, top left side of the intake manifold, left of the throttle body	**Right Rear of Engine Components**	**Manifold Absolute Pressure (MAP) Sensor**
Mode Actuator	In the passenger compartment, center of the instrument panel, to	**Interior HVAC Components**	**Mode Actuator**

Name	Location	Locator View	Connector End View
	the right of the radio, on the HVAC assembly		
Multifunction Intake Air Sensor	At the left front of the engine compartment, in the air cleaner duct	**Left Front of the Engine Compartment Components**	**Multifunction Intake Air Sensor**
Outside Rearview Mirror - Driver	On the vehicle exterior, upper front of the driver door	**Driver Door Components**	**Outside Rearview Mirror - Driver**
Outside Rearview Mirror - Passenger	On the vehicle exterior, upper front of the front passenger door	**Passenger Door Components**	**Outside Rearview Mirror - Passenger**
Outside Rearview Mirror Switch	In the passenger compartment, on the left front door trim panel	**Driver Door Components**	**Outside Rearview Mirror Switch**
Park Brake Switch	In the passenger compartment, below the left side of the instrument panel, part of the park brake pedal assembly	**Below the Instrument Panel Components- Pedal Assemblies**	**Park Brake Switch**
Park/Turn Signal Lamp - Left	At the front of the vehicle, in the left front headlamp assembly	**Front of the Vehicle Components**	**Park/Turn Signal Lamp - Left**
Park/Turn Signal Lamp - Right	At the front of the vehicle, in the right front headlamp assembly	**Front of the Vehicle Components**	**Park/Turn Signal Lamp - Right**
Pressure Control (PC) Solenoid Valve 1	At the left front of the engine compartment, in the automatic transmission, part of the control solenoid valve assembly	**Automatic Transmission Electronic Components**	-
Pressure Control (PC) Solenoid Valve 2	At the left front of the engine compartment, in the automatic transmission, part of the control solenoid valve assembly	**Automatic Transmission Electronic Components**	-
Pressure Control (PC) Solenoid Valve 3	At the left front of the engine compartment, in the automatic transmission, part of the control solenoid valve assembly	**Automatic Transmission Electronic Components**	-

Name	Location	Locator View	Connector End View
Pressure Control (PC) Solenoid Valve 4	At the left front of the engine compartment, in the automatic transmission, part of the control solenoid valve assembly	Automatic Transmission Electronic Components	-
Pressure Control (PC) Solenoid Valve 5	At the left front of the engine compartment, in the automatic transmission, part of the control solenoid valve assembly	Automatic Transmission Electronic Components	-
Radio	In the passenger compartment, center of the instrument panel	Instrument Panel Components	• Radio X1 • Radio X2
Radio Antenna Module	In the passenger compartment, left of the back window	Above the Rear Seat Components	Radio Antenna Module
Radio Rear Window Antenna	At the rear of the vehicle, attached to the top of the rear window, above the rear window defogger grid	Rear of the Vehicle Components	-
Reading Lamp - Auxiliary (6C7)	In the passenger compartment, center of the roof, forward of the dome lamp	Headliner Components (9C1 or 9C3)	Reading Lamp - Auxiliary (6C7)
Rear Compartment Courtesy Lamp	In the rear compartment, in the rear deck, below the center of the rear window panel	Under the Rear Package Shelf Components	Rear Compartment Courtesy Lamp
Rear Compartment Lid Latch Release Actuator	In the rear compartment, mounted to the rear center of the deck lid, on the lid latch	Rear Center Deck Lid Components	-
Rear Window Defogger Grid	At the rear of the vehicle, on the inside rear window glass	Rear of the Vehicle Components	• Rear Window Defogger Grid X1 • Rear Window Defogger Grid X2
Recirculation Actuator	In the passenger compartment, back of the instrument panel compartment, on the	Interior HVAC Components	Recirculation Actuator

Name	Location	Locator View	Connector End View
	upper HVAC case, near the right A-pillar		
Remote Control Door Lock Receiver (RCDLR)	In the passenger compartment, on the upper center of the instrument panel, under the defroster grille panel	**Behind the Instrument Panel Components**	**Remote Control Door Lock Receiver (RCDLR)**
Seat Adjuster Motor Assembly - Driver (AG1 or AH5)	In the passenger compartment, below the driver seat	**Driver Seat Components**	**Seat Adjuster Motor Assembly - Driver (AG1, AH5)**
Seat Adjuster Motor Assembly - Passenger (AG2)	In the passenger compartment, below the front passenger seat	**Passenger Seat Components**	**Seat Adjuster Motor Assembly - Passenger (AG2)**
Seat Adjuster Switch - Driver (AG1 or AH5)	In the passenger compartment, left side of the driver seat cushion	**Driver Seat Components**	• **Seat Adjuster Switch - Driver (AG1)** • **Seat Adjuster Switch - Driver (AH5)**
Seat Adjuster Switch - Passenger (AG2)	In the passenger compartment, right side of the front passenger seat cushion	**Passenger Seat Components**	**Seat Adjuster Switch - Passenger (AG2)**
Seat Belt Pretensioner - Driver	In the passenger compartment, mounted to the left side of the driver seat, under the seat cushion	-	**Seat Belt Pretensioner - Driver**
Seat Belt Pretensioner - Passenger	In the passenger compartment, mounted to the right side of the passenger seat, under the seat cushion	-	**Seat Belt Pretensioner - Passenger**
Seat Belt Retractor Pretensioner - Driver	In the passenger compartment, mounted to the left front retractor, at the base of the B-pillar	**Left B-Pillar Components**	**Seat Belt Retractor Pretensioner - Driver**
Seat Belt Retractor Pretensioner - Passenger	In the passenger compartment, mounted to the right front retractor, at the base of the B-pillar	**Right B-Pillar Components**	**Seat Belt Retractor Pretensioner - Passenger**
Seat Belt Switch - Driver	In the passenger compartment, inside the driver seat belt buckle	-	**Seat Belt Switch - Driver**

Name	Location	Locator View	Connector End View
Seat Belt Switch - Passenger	In the passenger compartment, inside the front passenger seat belt buckle	**Passenger Seat Components**	**Seat Belt Switch - Passenger**
Seat Recline Motor - Driver (AH5)	In the passenger compartment, attached to the right side of the driver seat back	**Driver Seat Components**	**Seat Recline Motor - Driver (AH5)**
Secondary Air Injection (AIR) Pump (NU5 or NU6)	At the left front of the engine compartment, above the starter, near G111	**Left Front of the Engine Compartment Components (NU5 or NU6)**	**Secondary Air Injection (AIR) Pump (NU5/NU6)**
Secondary Air Injection (AIR) Pump Relay (NU5 or NU6)	In the engine compartment, near the mass air flow/intake air temperature sensor	**Left Front of the Engine Compartment Components (NU5 or NU6)**	**Secondary Air Injection (AIR) Pump Relay (NU5/NU6)**
Secondary Air Injection (AIR) Pump Solenoid (NU5 or NU6)	In the engine compartment, near the ignition control module	**Left Front of the Engine Compartment Components (NU5 or NU6)**	**Secondary Air Injection (AIR) Pump Solenoid Bank 1 (NU5/NU6)**
Secondary Air Injection (AIR) Pump Solenoid Relay (NU5 or NU6)	In the engine compartment, near the mass air flow/intake air temperature sensor	**Left Front of the Engine Compartment Components (NU5 or NU6)**	**Secondary Air Injection (AIR) Pump Solenoid Relay (NU5/NU6)**
Shift Solenoid (SS) Valve 1	At the left front of the engine compartment, in the automatic transmission, part of the control solenoid valve assembly	**Automatic Transmission Electronic Components**	-
Shift Solenoid (SS) Valve 2	At the left front of the engine compartment, in the automatic transmission, part of the control solenoid valve assembly	**Automatic Transmission Electronic Components**	-
Side Marker Lamp - Left Front	At the front of the vehicle, in the left front headlamp assembly	**Front of the Vehicle Components**	**Side Marker Lamp - Left Front**

Name	Location	Locator View	Connector End View
Side Marker Lamp - Right Front	At the front of the vehicle, in the right front headlamp assembly	Front of the Vehicle Components	Side Marker Lamp - Right Front
Speaker - Left Front	In the passenger compartment, lower front of the driver door trim panel	Radio and Speaker Components	Speaker - Left Front
Speaker - Left Front Tweeter (UQ3)	In the passenger compartment, on the left front A-pillar	Left A-Pillar Components	Speaker - Left Front Tweeter
Speaker - Left Rear	In the rear compartment, mounted in the left side of the rear package shelf	Radio and Speaker Components	• Speaker - Left Rear (UW6) • Speaker - Left Rear (UQ3)
Speaker - Right Front	In the passenger compartment, lower front of the front passenger door trim panel	Radio and Speaker Components	Speaker - Right Front
Speaker - Right Front Tweeter (UQ3)	In the passenger compartment, on the right front A-pillar	Right A-Pillar Components	Speaker - Right Front Tweeter
Speaker - Right Rear	In the rear compartment, mounted in the right side of the rear package shelf	Radio and Speaker Components	• Speaker - Right Rear (UW6) • Speaker - Right Rear (UQ3)
Spot Lamp - Left (7X6 or 7X7)	In the passenger compartment, on the left A-pillar	A-Pillar Components (9C1 or 9C3)	-
Spot Lamp - Right (7X7)	In the passenger compartment, on the right A-pillar	A-Pillar Components (9C1 or 9C3)	Spot Lamp - Right (7X7)
Starter Motor	In the engine compartment, lower front of the engine, facing the radiator, at the transmission	Left Front of Engine Components	Starter X2
Steering Angle Sensor	In the passenger compartment, at the base of the steering column	-	Steering Angle Sensor
Steering Wheel Control Switch - Left (UK3)	In the passenger compartment, on the left side of the steering wheel	Steering Wheel Components	Steering Wheel Control Switch - Left

Name	Location	Locator View	Connector End View
Steering Wheel Control Switch - Right	In the passenger compartment, on the right side of the steering wheel	**Steering Wheel Components**	**Steering Wheel Control Switch - Right (UK3)**
Sunroof Control Module (CF5)	In the passenger compartment, front center of the sunroof module, above the windshield header panel, under the headliner	**Headliner Components- Top View**	**Sunroof Control Module (CF5)**
Sunroof Switch (CF5)	In the passenger compartment, front center of the headliner, above the inside rearview mirror	**Headliner Components**	**Sunroof Switch (CF5)**
Sunshade - Left (DH6)	In the passenger compartment, mounted in the sunshade, on the left side of the windshield header	**Above the Windshield Components**	**Sunshade - Left (DH6)**
Sunshade - Right (DH6)	In the passenger compartment, mounted in the sunshade, on the right side of the windshield header	**Above the Windshield Components**	**Sunshade - Right (DH6)**
Tail Lamp - Left	At the rear of the vehicle, in the left tail lamp assembly	**Rear of the Vehicle Components**	**Tail Lamp - Left**
Tail Lamp - Right	At the rear of the vehicle, in the right tail lamp assembly	**Rear of the Vehicle Components**	**Tail Lamp - Right**
Tail/Stop and Turn Signal Lamp - Left	At the rear of the vehicle, in the left tail lamp assembly	**Rear of the Vehicle Components**	**Tail/Stop and Turn Signal Lamp - Left**
Tail/Stop and Turn Signal Lamp - Right	At the rear of the vehicle, in the right tail lamp assembly	**Rear of the Vehicle Components**	**Tail/Stop and Turn Signal Lamp - Right**
Theft Deterrent Module (TDM)	In the passenger compartment, around the ignition key cylinder housing	**In the Steering Column Components**	**Theft Deterrent Module (TDM)**
Throttle Body	In the engine compartment, top of the engine, at the intake manifold inlet	**Right Rear of Engine Components**	**Q38 Throttle Body (LFR/LFX)**

Name	Location	Locator View	Connector End View
Torque Converter Clutch (TCC) Pressure Control (PC) Solenoid Valve	In the engine compartment, left front lower, in the automatic transmission, part of the control solenoid valve assembly	**Automatic Transmission Electronic Components**	-
Transmission Control Module (TCM)	In the engine compartment, left front lower, inside the front of the automatic transmission, part of the control solenoid valve assembly	**Left Front of the Engine Compartment Components**	-
Turn Signal/Multifunction Switch	In the passenger compartment, inside the steering column, below the inflatable restraint steering wheel module coil, on the left side	**Instrument Panel Components**	• **Turn Signal/Multifunction Switch X1** • **Turn Signal/Multifunction Switch X2** • **Turn Signal/Multifunction Switch X3**
Vehicle Communication Interface Module (VCIM) (UE1)	In the rear compartment, mounted to the rear of the left rear wheelhouse	**Left Side of the Luggage Compartment Components**	• **Vehicle Communication Interface Module (VCIM) (UE1) X1** • **Vehicle Communication Interface Module (VCIM) (UE1) X2**
Vehicle Communication Interface Module (VCIM) Battery (UE1)	At the left side of the rear compartment, attached to the side of the vehicle communication interface module	**Left Side of the Luggage Compartment Components**	**Vehicle Communication Interface Module (VCIM) Battery (UE1)**
Wheel Speed Sensor (WSS) - Left Front	Under the vehicle, inside the left front wheel hub	**Front Wheel Components**	**Wheel Speed Sensor (WSS) - Left Front**
Wheel Speed Sensor (WSS) - Left Rear	Under the vehicle, inside the left rear wheel hub	**Rear Wheel Components**	**Wheel Speed Sensor (WSS) - Left Rear**
Wheel Speed Sensor (WSS) - Right Front	Under the vehicle, inside the right front wheel hub	**Front Wheel Components**	**Wheel Speed Sensor (WSS) - Right Front**
Wheel Speed Sensor (WSS) - Right Rear	Under the vehicle, inside the right rear wheel hub	**Rear Wheel Components**	**Wheel Speed Sensor (WSS) - Right Rear**

Name	Location	Locator View	Connector End View
Window Motor - Driver	In the passenger compartment, center of the driver door, behind the door panel	Driver Door Components	Window Motor - Driver
Window Motor - Left Rear	In the passenger compartment, center of the left rear door, behind the door panel	Left Rear Door Harness Routing	Window Motor - Left Rear
Window Motor - Passenger	In the passenger compartment, center of the front passenger door, behind the door panel	Passenger Door Components	Window Motor - Passenger
Window Motor - Right Rear	In the passenger compartment, center of the right rear door, behind the door panel	Right Rear Door Harness Routing	Window Motor - Right Rear
Window Switch - Driver	In the passenger compartment, center of the driver door trim panel	Driver Door Components	• Window Switch - Driver X1 • Window Switch - Driver X2
Window Switch - Left Rear	In the passenger compartment, in the left rear inside door handle trim bezel	Left Rear Door Components	Window Switch - Left Rear
Window Switch - Passenger	In the passenger compartment, center of the front passenger door trim panel	Passenger Door Components	Window Switch - Passenger
Window Switch - Right Rear	In the passenger compartment, in the right rear inside door handle trim bezel	Right Rear Door Components	Window Switch - Right Rear
Windshield Washer Fluid Level Switch	At the right side of the engine compartment, in the lower portion of washer fluid container	Right Front of the Engine Compartment Components (1 of 2)	Windshield Washer Fluid Level Switch
Windshield Washer Fluid Pump	At the right side of the engine compartment, in the lower portion of washer fluid container	Right Front of the Engine Compartment Components (1 of 2)	Windshield Washer Fluid Pump
Windshield Wiper Motor	In the engine compartment, in the left side cowl panel, below	Left Front of the Engine Compartment	Windshield Wiper Motor

Name	Location	Locator View	Connector End View
	the air inlet screen	Components	
Yaw and Lateral Accelerometer Sensor	In the passenger compartment, mounted on the floor under the center console	-	Yaw and Lateral Accelerometer Sensor
X101 (10 cavities)	Instrument panel harness to engine harness, left rear of the engine compartment, near the brake booster, bolted to the left strut tower, next to X111	Engine Harness Routing - Left Rear	X101 I/P Harness to Engine Harness
X105 (2 cavities)	Instrument panel harness to battery cable harness, forward of the right front strut tower	Battery Cable Harness Routing (Typical)	X105 Battery Harness to I/P Harness
X111 (14 cavities)	Instrument panel harness to engine harness, left rear of the engine compartment, near the brake booster, bolted to the left strut tower, next to X101	Engine Harness Routing - Left Rear	X111 I/P Harness to Engine Harness
X115 (14 cavities)	Engine harness to instrument panel harness, left rear of the engine compartment, on the left strut tower	Engine Harness Routing - Left Rear	X115 Engine Harness to Instrument Panel Harness
X120 (10 cavities)	Instrument panel harness to forward lamp harness, left side of the engine compartment, behind the left headlamp assembly, on the frame	Forward Lamp Harness Routing	X120 I/P Harness to Forward Lamp Harness
X122 (6 cavities) (9C1 or 9C3 without 6J7)	Forward lamp harness to forward lamp harness, at the left side of the right headlamp assembly	Forward Lamp Harness Routing	X122 Forward Lamp Harness to Forward Lamp Harness (9C1/9C3 without 6J7)
X123 (4 cavities) (9C1 or 9C3)	Instrument panel harness to grille lamp jumper harness, forward of the right front strut tower	Instrument Panel Harness Routing- Engine Compartment	X123 I/P Harness to the Grille Lamp Jumper Harness (6J3)
X141 (5 cavities)	Forward lamp harness to left headlamp harness, behind the left headlamp	Forward Lamp Harness Routing	X141 Forward Lamp Harness to Left Front Headlamp Assembly Harness

Name	Location	Locator View	Connector End View
	assembly		
X142 (5 cavities)	Forward lamp harness to right headlamp harness, behind the right headlamp assembly	**Forward Lamp Harness Routing**	**X142 Forward Lamp Harness to Right Front Headlamp Assembly Harness**
X160 (12 cavities)	Engine harness to even fuel injector harness, top right left of the engine	**Engine Harness Routing - Left Rear**	**X160 Engine Harness to Even Fuel Injector Harness**
X161 (6 cavities)	Engine harness to odd fuel injector harness, top left side of engine, next to X160	**Engine Harness Routing - Left Rear**	**X161 Engine Harness to Odd Fuel Injector Harness**
X200 (40 cavities)	Body harness to instrument panel harness, behind the right front kick panel, below the instrument panel fuse panel	**Instrument Panel Harness Routing**	**X200 Body Harness to I/P Harness**
X201 (10 cavities)	Steering column harness to instrument panel harness, behind the knee bolster, to the right of the steering column	**Instrument Panel Harness Routing**	**X201 Steering Column Harness to I/P Harness**
X203 (22 cavities)	Body harness to instrument panel harness, behind the knee bolster, to the left of the steering column, behind the left instrument panel access panel, near X250	**Instrument Panel Harness Routing**	**X203 I/P Harness to Body Harness**
X208 (9C1 or 9C3)	SEO auxiliary harness to body harness, in the right front footwell	-	**X208 SEO Auxiliary Harness to Body Harness (9C1, 9C3)**
X210 (2 cavities)	Instrument panel harness to HVAC harness, on the right side of the HVAC module assembly	**HVAC Module Harness Routing**	**X210 I/P Harness to HVAC Harness**
X223 (2 cavities) (9C1 or 9C3)	Instrument panel harness to instrument panel harness, under the right side of the instrument panel, in the rear stop/turn signal supply circuits, near G301	**Left Front of the Passenger Compartment Components**	**X223 I/P Harness to I/P Harness (6J6)**

Name	Location	Locator View	Connector End View
X250 (4 cavities)	Inflatable restraint steering wheel module coil wiring harness to the body wiring harness, near X203, behind the left instrument panel access panel	**Instrument Panel Harness Routing- Lower Left**	**X250 SIR Coil to the Body Harness**
X266 (1 cavity) (6J4)	Instrument panel harness to instrument panel harness, above the right front footwell, in the horn control circuit	**Instrument Panel Harness Routing**	**X266 I/P Harness to I/P Harness (6J4)**
X268 (8 cavities) (9C1 or 9C3)	Instrument panel harness to C267B, above the right front footwell	-	**X268 I/P Harness to I/P Harness (9C1, 9C3 with WX7)**
X268 (8 cavities) (WX7)	Instrument panel harness to WX7 speaker jumper harness, above the right front footwell	-	-
X269 (8 cavities) (9C1 or 9C3)	Instrument panel harness to C267A, above the right front footwell	-	**X269 I/P Harness to I/P Harness (9C1, 9C3 with WX7)**
X269 (8 cavities) (WX7)	Instrument panel harness to WX7 speaker jumper harness, above the right front footwell	-	-
X275 (8 cavities)	Inflatable restraint steering wheel module coil harness to steering column harness, on the steering column, near the knee bolster, taped to the steering column harness	-	• **X275 SIR Coil to Steering Column Harness** • **X277 SIR Coil to Steering Column Harness**
X277 (8 cavities)	Inflatable restraint steering wheel module coil harness to steering wheel harness, behind the inflatable restraint steering wheel module	**Instrument Panel Harness Routing- Lower Left**	-
X278 (4 cavities)	Inflatable restraint instrument panel module jumper harness to body harness, behind the right instrument panel access panel	**Right Front of the Passenger Compartment Components**	**X278 Inflatable Restraint I/P Module Jumper Harness to the Body Harness**

Name	Location	Locator View	Connector End View
X297 (6 cavities) (9C1 or 9C3)	Instrument panel harness to emergency vehicle front lamps flasher harness, above the right front footwell	Instrument Panel Harness Routing	X297 I/P Harness to Grille Lamp Jumper Harness (9C1, 9C3, 6J3)
X303 (1 cavity)	Instrument panel harness to body harness, COAX connector at the right front door sill, next to G302, under the carpet	Right Front of the Passenger Compartment Components	-
X311 (12 cavities)	Body harness to driver seat harness, below the driver seat	Body Harness Routing- Left Front Passenger Compartment	X311 Body Harness to Left Front Seat Harness
X313 (12 cavities)	Body harness to front passenger seat harness, below the front passenger seat	Body Harness Routing- Right Front Passenger Compartment	X313 Body Harness to Right Front Seat Harness
X315 (4 cavities)	Driver seat harness to body harness, below the driver seat	Seat Harness Routing- Airbags and Inlines	X315 Left Front Seat Harness to Body Harness
X316 (4 cavities)	Passenger seat harness to body harness, below the passenger seat	Seat Harness Routing- Airbags and Inlines	X316 Right Front Seat Harness to Body Harness
X322 (2 cavities) (9C1 or 9C3)	Body harness to roof provision harness, in the rear compartment, near the right C-pillar	Body Harness Routing- Rear Passenger Compartment	X322 Body Harness to Roof Provision Harness (9C1, 9C3)
X340 (2 cavities) (D55)	Console harness to body harness, below the center floor console, on the left side of the floor shifter	Body Harness Routing- Left Front Passenger Compartment	X340 Console Harness to Body Harness (D55)
X340 (2 cavities) (without D55)	Body harness to auxiliary power outlet seat jumper harness, under the center of the front seat	-	X340 Body Harness to Console Harness (without D55)
X360 (1 cavity) (9C1 or 9C3)	Body harness to instrument panel harness, right side of the instrument panel, near X200	Body Harness Routing- Right Front Passenger Compartment	X360 Body Harness to I/P Harness (9C1, 9C3)
X362 (1 cavity) (9C1 or 9C3)	Body harness to instrument panel harness, right side of the instrument panel, near	G200, G201, G202, and G204	X362 Body Harness to I/P Harness (9C1, 9C3)

Name	Location	Locator View	Connector End View
	X200		
X398 (6 cavities) (CF5)	Roof harness to sunroof harness, near the right front corner of the sunroof, under the headliner, above the sunshade	Sunroof and Headliner Harness Routing	X398 Roof Harness to Sunroof Harness (CF5)
X401 (4 cavities)	Rear body harness to left tail lamp harness, below the left tail lamp assembly	Rear Fascia Harness Routing	X401 Rear Body Harness to Left Tail Lamp Harness
X402 (4 cavities)	Rear body harness to right tail lamp harness, below the right tail lamp assembly	Body Harness Routing- Rear Passenger Compartment	X402 Rear Body Harness to Right Tail Lamp Harness
X405 (16 cavities)	Rear chassis harness to body harness, forward and to the right of the spare tire well	Body Harness Routing- Rear Passenger Compartment	X405 Rear Chassis Harness to Body Harness
X406 (8 cavities)	Body harness to rear body harness, in the rear compartment, below the right tail lamp assembly, clipped on the bumper fascia	Body Harness Routing- Rear Passenger Compartment	X406 Body Harness to Rear Body Harness
X409 (2 cavities) (T53)	Emergency vehicle rear compartment lid lamps harness to body harness, between the center high mounted stop lamp and the junction block - rear	Body Harness Routing- Rear Passenger Compartment	X409 Emergency Vehicle Rear Compartment Lid Lamps Harness to Body Harness (9C1, 9C3)
X490 (18 cavities)	Headliner harness to body harness, under the left side of the rear package shelf trim panel	Sunroof and Headliner Harness Routing	X490 Headliner Harness to Body Harness
X500 (40 cavities)	Body harness to left front door harness, below the A-pillar, between the door hinges	Body Harness Routing- Left Front Passenger Compartment	X500 Body Harness to Left Front Door Harness
X503 (40 cavities)	Driver door harness to driver door trim harness, in the driver door, near the speaker - left front door	Driver Door Harness Routing	X503 Left Front Door Harness to Left Front Door Trim Harness

Name	Location	Locator View	Connector End View
X600 (40 cavities)	Body harness to right front door harness, below the A-pillar, between the door hinges	**Body Harness Routing- Right Front Passenger Compartment**	**X600 Body Harness to Right Front Door Harness**
X604 (10 cavities)	Front passenger door trim harness to front passenger door harness, near the speaker - right front	**Passenger Door Harness Routing**	**X604 Right Front Door Trim Harness to Right Front Door Harness**
X700 (9 cavities)	Body harness to left rear door harness, center of the left B-pillar	**Body Harness Routing- Left Front Passenger Compartment**	**X700 Body Harness to Left Rear Door Harness**
X800 (9 cavities)	Body harness to right rear door harness, center of the right B-pillar	**Body Harness Routing- Right Front Passenger Compartment**	**X800 Body Harness to Right Rear Door Harness**
G100	(CKTs 250, 1250) On the forward lamp harness, in back of the right headlamp assembly, on the frame	**Right Front of the Engine Compartment Components (1 of 2)**	-
G101	(CKT 1350) On the forward lamp harness, in back of the left headlamp assembly, on the frame	**G101**	-
G102	(CKT 50) Near the battery, in back of the right headlamp assembly, on the frame	**G102**	-
G111	(CKTs 51, 451) In the engine compartment, near front middle, below starter motor	**G111, G113 and G115**	-
G113	(CKT 51,1050) In the engine compartment, near front right, on the engine block, below oil filter	**G111, G113 and G115**	-
G115	(CKT 251, 350) On the transmission case, below the brake booster	**G111, G113 and G115**	-
G200	(CKT 150) Front of the instrument panel carrier, above the instrument panel compartment, to the left of the inflatable	**G200, G201, G202, and G204**	-

Name	Location	Locator View	Connector End View
	restraint instrument panel module		
G201	(CKT 1450) Front of the instrument panel carrier, behind the knee bolster, on the right side of the steering column, above G202	**G200, G201, G202, and G204**	-
G202	(CKTs 351, 1551) Front of the instrument panel carrier, behind the knee bolster, on the right side of the steering column, below G201	**G200, G201, G202, and G204**	-
G204 (9C1 or 9C3)	(CKT 2350) Right side of the instrument panel carrier, to the left of the inflatable restraint instrument panel module, next to G200	**G200, G201, G202, and G204**	-
G301	(CKT 550) Below the driver door opening, rear of the left A-pillar	**G301**	-
G302	(CKTs 750, 1751) Below the passenger front door opening, rear of the right A-pillar	**G302**	-
G303	COAX capacitance ground for the remote control door lock receiver windshield antenna, near the top of the left A-pillar, behind the trim panel	-	-
G403	(CKTs 1150, 1351) On the left side of the package shelf, near the C-pillar	**G403 and G404**	-
G404	(CKT 851) On the right side of the package shelf, near the C-pillar	**G403 and G404**	-
J100	In the engine harness, in the engine compartment, on branch to front of engine	**Engine Harness Routing - Right Front**	-

Name	Location	Locator View	Connector End View
J101	(CKT 451) Engine harness, in the engine compartment, front near middle, in main bundle between branch to ECM and branch to ECT	**Engine Harness Routing - Right Front**	-
J102	(CKT 17) Engine harness, in the engine compartment, front left on branch to ECM	**Engine Harness Routing - Right Front**	-
J103	Engine harness, in the engine compartment, front right, in branch on front of engine, near generator	**Engine Harness Routing - Right Front**	-
J109	Engine Harness, In the engine compartment, in the main bundle on left side of engine above transmission	**Engine Harness Routing - Left Rear**	-
J110	(CKT 51) In Engine Harness, In the engine compartment, in the main bundle on left side of engine above transmission	**Engine Harness Routing - Left Rear**	-
J124	(CKT 1250) On the forward lamp harness, behind the right headlamp, approximately 8 cm (3.2 in) from the breakout to G100, toward the inflatable restraint front end sensor - right	**Forward Lamp Harness Routing**	-
J126	(CKT 1250) On the right head lamp assembly harness	-	-
J127	(CKT 1350) On the left head lamp assembly harness	-	-
J128	(CKT 1250) On the right headlamp harness	-	-
J129	(CKT 1350) On the left headlamp harness	-	-

Name	Location	Locator View	Connector End View
J162	Engine Harness, In the engine compartment, rear near middle, in the main bundle between ignition coil 5 and fuel injector inlines	**Engine Harness Routing - Left Rear**	-
J163	Engine Harness, In the engine compartment, rear near middle, in the main bundle between ignition coil 5 and ignition coil 3	**Engine Harness Routing - Left Rear**	-
J164	Engine Harness, In the engine compartment, right front in the main bundle on front of the engine, between ignition coil 2 and camshaft sensors and actuators	**Engine Harness Routing - Right Front**	-
J165	Engine Harness, In the engine compartment, front near middle, in the main bundle on front of the engine, between ignition coil 6 and breakout to ECT	**Engine Harness Routing - Right Front**	-
J175	Engine Harness, In the engine compartment, in the main bundle on left side of engine above transmission	**Engine Harness Routing - Left Rear**	-
J195	(CKT 335) Located where the engine harness and cooling fan jumper harness meet	-	-
J196	(CKT 504) Located where the Engine Cooling Fan - Left and cooling fan jumper harness meet	-	-
J197	(CKT 532) Located where the Engine Cooling Fan - Left and cooling fan jumper harness meet	-	-

DESCRIPTION AND OPERATION

ELECTRONIC PARK LOCK DESCRIPTION AND OPERATION

If the vehicle is equipped with automatic transmission and a floor mounted console gear shift, it has an electronic park lock system (EPL). The EPL system purpose is to prevent the ignition key from being turned to the OFF position when the transmission is in any position other than PARK and the vehicle may still be moving. The EPL system consists of an ignition lock cylinder solenoid, and a park position switch that is located in the A/T shift lock control switch. The ignition lock cylinder solenoid contains a pin that is spring loaded to mechanically prevent the ignition key cylinder from being turned to the lock position when the vehicle transmission is not in the PARK position. If vehicle power is lost, and/or the transmission is not in the Park position the operator will not be able to turn the ignition key to the lock position and will not be able to remove the ignition key from the column.

POWER MODE DESCRIPTION AND OPERATION

Serial Data Power Mode Master

Power to many of this vehicles circuits is controlled by the module that is designated the power mode master (PMM). This vehicles PMM is the body control module (BCM). The BCM has multiple B+ circuits that feed into it. Each of those circuits are partitioned within the controller to drive certain outputs of the vehicle's body functions. An open or short in any one of the B+ circuits may induce multiple codes/or a section of non-functionality within the BCM with the rest of the BCM functioning normally. In this case it is useful to refer to the power distribution schematics to determine if the non-functional partition of the controller shares a common B+ circuit. The ignition switch is a low current switch with multiple discrete ignition switch signals to the PMM for determination of the power mode that will be sent over the serial data circuits to the other modules that need this information. The PMM will also activate relays and other direct outputs of the PMM as needed. The PMM determines which power mode (Off, Accessory, Run, Crank Request) is required, and reports this information to other modules via serial data. Modules which have switched voltage inputs may operate in a default mode if the PMM serial data message does not match what the individual module can see from its own connections.

The PMM receives ignition switch signals to identify the operators desired power mode. The PMM Power Mode Parameters table below illustrates the correct state of these input parameters (circuits) in correspondence to the ignition switch position:

PMM Power Mode Parameters

Ignition Switch Position	Power Mode Transmitted	Ignition Off / Run / Crank (Off / Run Crank voltage circuit)	Ignition Accessory / Run (Accessory voltage circuit)	Ignition Run / Crank (Ignition 1 Voltage circuit)
Off Key Out	Off	Key Out/ACC	Inactive	Inactive
Off Key IN	Off	Key In/Off	Inactive	Inactive
Accessory	Accessory	Key Out/ACC	Active	Inactive
Run	Run	Run	Active	Active

Ignition Switch Position	Power Mode Transmitted	Ignition Off / Run / Crank (Off / Run Crank voltage circuit)	Ignition Accessory / Run (Accessory voltage circuit)	Ignition Run / Crank (Ignition 1 Voltage circuit)
Start	Crank Request	Crank	Inactive	Active

Relay Controlled Power Mode

The body control module (BCM) uses the discrete ignition switch inputs Off/Run/Crank Voltage, Accessory Voltage, and Ignition 1 Voltage, to distinguish the correct power mode. The BCM, after determining the desired power mode, will activate the appropriate relays for that power mode.

The RAP relay remains on for a timed period after the Ignition key is removed. Refer to **Retained Accessory Power Description and Operation** for more information on the retained accessory power (RAP) function.

BCM Awake/Sleep States

The body control module (BCM) is able to control or perform all of the BCM functions in the awake state. The BCM enters the sleep state when active control or normal monitoring of system functions has stopped and a time limit has passed. The BCM must detect certain wake-up inputs before entering the awake state. The BCM monitors for these inputs during the sleep state.

The BCM will enter the awake state if any of the following wake-up inputs are detected:

- Activity on the serial data line.
- Detection of a battery reconnect.
- Any door open signal.
- Headlamps ON.
- Key-in-ignition.
- Ignition ON.
- Park lamps ON.
- Keyless entry or remote start message.

The BCM will enter a sleep state when all of the following conditions exist:

- The ignition switch is OFF, key out.
- No activity exists on the serial data line.
- No outputs are commanded.
- No delay timers are actively counting.
- No wake-up inputs are present.

If all these conditions are met, the BCM will enter a low power or sleep condition.

RETAINED ACCESSORY POWER DESCRIPTION AND OPERATION

Retained Accessory Power (RAP)

The retained accessory power (RAP) system allows certain vehicle functions to operate for a specific amount of

time after the ignition switch is turned OFF. The body control module (BCM) monitors the ignition switch position, battery condition, and each door ajar switch status to determine whether RAP should be initiated or terminated. RAP is controlled with two different methods; serial data and relay control. Some modules receive a RAP message from the BCM over the serial data circuits. Serial data controlled RAP is deactivated as required by their modules RAP power mode operation. Other subsystems are activated directly by the BCM through a RAP relay. Components and systems that are active in RAP are also activated anytime the ignition is any position other than OFF regardless of the door switch signals.

Relay Controlled RAP

The BCM keeps the RAP relay energized during all power modes, except Off-Awake and Crank. The relay is also energized for approximately 10 minutes after shutting the ignition OFF and removing the key, providing no door is opened.

Relay controlled RAP will end when one of the following conditions is met:

- The BCM receives an input from any door ajar or open switch indicating the opening of any door after the ignition key is out of the ignition.

  IMPORTANT: If the BCM is receiving any door ajar or open signal from those switches when the ignition key is turned OFF, RAP will not initiate.

- The BCM internal timer for the RAP expires after approximately 10 minutes.
- The BCM detects a decrease in battery capacity below a prescribed limit.

Systems powered by the RAP relay during the RAP power mode are as follows:

- A/T shift lock control solenoid assembly (w/ floor shifter)
- Power window circuit breaker
- RAP fuse
  - Inside rearview mirror (DD6)
  - Sunroof (CF5)

Serial Data Controlled RAP

RAP systems controlled by serial data are as follows:

Radio

Radio RAP activation/termination is the same as relay operation with 1 exception; the only door switch that will turn off the radio during RAP is the driver door open switch.

Vehicle Communication Interface Module (VCIM) (OnstarÂ®)

VCIM RAP activation/termination is the same as radio operation with 1 exception; if there is an active call when the ignition key is turned off the VCIM will remain in RAP mode, and keep the radio in RAP mode until the call is terminated.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B0005: IN PARK SIGNAL CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B0005 00

In Park Signal Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Park Enable Signal Circuit	B0005	1	-	-
1. Will cause symptom related to SEO device (6J1).				

Circuit/System Description

The park enable signal circuit is a voltage output from the body control module (BCM) only when the vehicle is not in the PARK position. This circuit is for the control of a SEO device relay when equipped with RPO 6J1.

Conditions for Running the DTC

- The system voltage is between 9-16 volts.
- The DTC can only set when the output is actively being requested by the module.

Conditions for Setting the DTC

The DTC will set only when the module requests the output and there is a short to ground for greater than 5 seconds.

Action Taken When the DTC Sets

The module output driver will be shut down and not supply voltage to the circuit.

Conditions for Clearing the DTC

- The current DTC will clear when the malfunction is no longer present.

- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Testing

1. Ignition OFF, disconnect the SEO relay controlled by the park enable signal circuit.
2. Connect a test lamp between the park enable signal circuit and battery positive voltage.
3. Ignition ON, transmission in the PARK position. Verify the test lamp does not illuminate.
    - If the test lamp illuminates, test for a short to ground on the park enable signal circuit. If the circuit tests normal and the DTC is current, replace the BCM.
4. If the circuit tests normal and the DTC is current, test or replace the SEO relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

1. Power Mode Mismatch
2. Scan Tool Does Not Communicate
3. This circuit is a pass through circuit in the BCM and will cause the B+ circuit fuse to open.
4. This circuit/condition will cause the B+ circuit fuse to open, and may cause a no start condition.

Circuit/System Description

The vehicle power mode master (PMM) is the body control module (BCM). The ignition switch is a low current switch with multiple discrete ignition switch signals to the PMM for determination of the power mode. The PMM receives the ignition switch signals, and additionally a reference voltage signal from the BCM, through the ignition switch, and back to the BCM. There are redundancies within the PMM system that can allow operation of certain subsystems when there are faults in the ignition switch circuits. Other information such as serial data input from other modules and DTCs is also used to determine what power mode signals and information is transmitted by the PMM. The BCM logic uses all this information to identify the operator's desired power mode and activate specific discrete signals, and serial data messages for the operation of different subsystems as necessary. Other modules which have switched voltage inputs may operate in a default mode if the PMM serial data message does not match what the individual module can detect from its own connections.

The PMM will activate relays and other direct outputs of the PMM as needed according to the calculated power mode. Some relays controlled by the BCM are switched ignition voltage outputs that are pass through circuits within the BCM directly from the ignition switch. If these circuits short to ground, the B+ circuit fuse to the ignition switch will open.

Conditions for Running the DTC

B1370 01

Ignition switch is in the OFF or ACC positions.

B1370 06, B1380 01, B1441 01, B1441 06

Ignition switch is in the START position.

B1380 06, B1440

Ignition switch is in the RUN position.

Conditions for Setting the DTC

B1370 01

Ignition circuit is shorted to voltage.

B1370 06

- Ignition 1 voltage circuit is open.
- B+ circuit of the ignition switch is open or shorted to ground.

B1380 01

Accessory circuit is shorted to voltage.

B1380 06

- Accessory voltage circuit is open.
- B+ circuit of the ignition switch is open or shorted to ground.

B1440

BCM senses an open or short to voltage on the off/run/crank circuit when both ignition accessory/run and ignition run/crank parameters are active.

BCM senses an open on the B+ circuit to the ignition switch while the engine is running. An open on the B+ circuit can be caused by a short to ground on any of the circuits listed below:

- B+
- Accessory
- Run/crank ignition voltage BCM terminal 19, X4
- Off/run/crank

B1441 01

Off/run/crank circuit is shorted to voltage.

B1441 06

Off/run/crank circuit is open.

Actions Taken When the DTC Sets

- The BCM operates in a fail-safe power mode dependent on the last valid power mode detected and the state of the engine run flag data on the serial data communications circuits.
- The other modules on the vehicle operate in a fail-safe power mode dependent on the last valid power mode transmitted by the BCM and the state of the engine run flag on the serial data communications circuits.

Conditions for Clearing the DTC

A current DTC clears when the malfunction is no longer present.

Diagnostic Aids

- A short to ground in the ignition circuit of the run crank relay will cause an open fuse to the ignition switch. DTC B1428 should be current.
- The power modes and controls are determined using BCM logic. Comparing the Body Control Module Power Mode data display parameters listed in Circuit/System Verification to the scan tool values of the vehicle will determine if there is a power mode fault.

Circuit/System Verification

1. Verify that the following DTCs are not set: U1814, B1428.
   - If either of the DTCs are set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
2. With a scan tool, access BCM, Power Mode data display list and compare all parameters listed with the corresponding ignition key position. The PMM Power Mode Parameters table below illustrates the correct state of these input parameters in correspondence to the ignition switch position. The circuits which the individual parameters are related to are in parentheses.

PMM Power Mode Parameters

Ignition Switch Position	Current Power Mode	Ignition Off/Run /Crank (Ignition Switch,	Ignition Accessory/Run (Ignition Switch,	Ignition Run/Crank (Ignition Switch,

		Terminal 5)	Terminal 3)	Terminal 1)
Off Key Out	Off	Key Out/ACC	Inactive	Inactive
Off Key IN	Off	Key In/Off	Inactive	Inactive
Accessory	Accessory	Key Out/ACC	Active	Inactive
Run	Run	Run	Active	Active
Start	Crank Request	Crank	Inactive	Active

Circuit/System Testing

IMPORTANT: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

1. Connect a test lamp between each fuse test terminal of the ignition switch B+ circuit fuse and ground. The test lamp should illuminate.
   - If the test lamp does not illuminate, test the circuits listed below for a short to ground. If all circuits test OK, replace the BCM.
   - B+ terminal 2
   - Ignition terminal 1
   - Ignition terminal 3
   - Ignition terminal 5
   - Ignition, BCM terminal 21, X4
2. Disconnect the harness connector at the ignition switch.
3. Connect a test lamp between the B+ circuit terminal 2 and ground. The test lamp should illuminate.
   - If the test lamp does not illuminate, test the B+ circuit for an open/high resistance.

   IMPORTANT: The ignition switch component test must be performed before proceeding with this test to verify the integrity of the switch.

4. Perform the ignition switch component test. Verify the switch passes the test.
   - If the ignition switch does not test normal, replace the ignition switch.
5. Disconnect the X 1 harness connector at the BCM, test for less than 1.0 V between the following ignition circuit terminals of the BCM and ground.
   - terminal 2
   - terminal 4
   - terminal 14
   - terminal 21
   - If greater than specified, test the circuit for a short to voltage.
6. Test for less than 1.0 Ω between the BCM and the ignition switch on the circuits listed below:
   - Ignition terminal 4, X1 and ignition switch terminal 6
   - Ignition terminal 2, X1 and ignition switch terminal 5
   - Ignition terminal 21, X1 and ignition switch terminal 3
   - Ignition terminal 14, X1 and ignition switch terminal 1

- If greater than specified, test the circuit for open/high resistance

7. If all circuits test normal, replace the BCM.

Component Testing

Ignition Switch

1. Ignition OFF, disconnect the harness connector at the ignition switch.
2. Verify the resistance between the terminals listed below match for each ignition switch position.
   - If not the specified value, replace the ignition switch.

Resistance Test

Ignition Switch Position	Terminals 1 and 2	Terminals 2 and 3	Terminals 2 and 5	Terminals 2 and 6	Terminals 5 and 6
Off Key Out	Infinite	Infinite	Infinite	Infinite	Infinite
Off Key IN	Infinite	Infinite	< 5.0 Ω	Infinite	Infinite
Accessory	Infinite	< 5.0 Ω	Infinite	Infinite	Infinite
Run	< 5.0 Ω	< 5.0 Ω	Infinite	Infinite	< 5.0 Ω
Start	< 5.0 Ω	Infinite	Infinite	Infinite	1275-1325 Ω

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Ignition and Start Switch Replacement**
- **Control Module References** for BCM replacement, setup, and programming

DTC B1428: IGNITION SWITCHED POWER RELAY 1

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1428 00

Ignition Switched Power Relay 1 Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Run/Crank Relay Coil Control	B1428 00	1	2	-
1. No Start. SIR system will retain DTC B1370 06 as current. 2. Vehicle will start and continue to run after the ignition key is removed.				

Circuit/System Description

The body control module (BCM) controls the IGN MAIN PCB relay through the run/crank relay coil control circuit by applying voltage to the circuit. The IGN MAIN PCB relay is energized when the ignition switch is in ON or START, or when a remote start is requested.

Conditions for Running the DTC

- The system voltage is between 9-16 volts.
- The DTC can only run when the output is activated.

Conditions for Setting the DTC

The DTC will set only when the output is activated and there is a short to ground in the run/crank relay coil control circuit.

Action Taken When the DTC Sets

The module output driver will be shut down and not supply voltage to the run/crank relay coil control circuit.

Conditions for Clearing the DTC

- The current DTC will clear when the module request for the output is removed or the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Use the DMM MIN/MAX function to capture/locate intermittent conditions.
- Short to voltage in the run/crank relay coil control circuit will cause the malfunction indicator lamp (MIL) to illuminate with the ignition key OFF, and the engine will remain running if started and the ignition key is removed.

Circuit/System Testing

1. Ignition OFF, disconnect the X4 harness connector at the BCM.
2. Test for greater than 70 ohms of resistance between the BCM run/crank relay coil control circuit terminal 21 and ground.
    - If less than specified, test the control circuit for a short to ground. If the circuit tests normal, replace the underhood fuse block.
3. If the circuit tests normal, test or replace the BCM.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Control Module References for BCM replacement, setup, and programming
- Accessory Wiring Junction Block Replacement

DTC B1475: RETAINED ACCESSORY POWER

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B1475 00

Retained Accessory Power Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
RAP Relay Coil Supply Voltage	B1475 00	1	1	-
1. Retained Accessory Power (RAP) Malfunction				

Circuit/System Description

The body control module (BCM) controls the RAP relay through the rap relay coil supply voltage circuit by applying voltage to the coil side of the relay. The RAP relay is energized when any of the following conditions are true:

- Ignition switch is in ACC or ON.
- The vehicle was remote started.
- The vehicle is in RAP mode.

Conditions for Running the DTC

- The system voltage is between 9-16 volts.
- The DTC can only set when the output is actively being requested by the module.

Conditions for Setting the DTC

The DTC will set only when the module requests the output and there is a short to ground in the rap relay coil supply voltage circuit.

Action Taken When the DTC Sets

The module output driver will be shut down and not supply voltage to the circuit.

Conditions for Clearing the DTC

- The current DTC will clear when the module request for the output is removed or the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Use the DMM MIN/MAX function to capture/locate intermittent conditions.
- The radio RAP mode is separate function and will still operate properly.
- The ignition switch will not return to the OFF position if the RAP relay does not energize.

Circuit/System Testing

1. Ignition OFF, disconnect the Rap relay.
2. Connect a test lamp between the relay coil control circuit terminal and ground.
3. Cycle the ignition ON and OFF. The test lamp should turn ON and OFF when changing ignition switch positions.
    - If the test lamp is always ON, test the control circuit for a short to voltage. If the circuit tests normal, replace the BCM.
    - If the test lamp is always OFF, test the control circuit for a short to ground or open/high resistance. If the circuit tests normal, replace the BCM.
4. If the test lamp illuminates normal, test or replace the Rap relay.

Component Testing

Rap Relay Test

1. Ignition OFF, disconnect the RAP relay.
2. Test for 70-110 ohms of resistance between terminals 85 and 86.
    - If the resistance is not within the specified range, replace the relay.
3. Test for infinite resistance between the following terminals:
    - 30 and 86
    - 30 and 87
    - 30 and 85
    - 85 and 87
    - If less than infinite, replace the relay.
4. Install a 20-amp fused jumper wire between relay terminal 85 and 12 volts. Install a jumper wire between relay terminal 86 and ground. Test for less than 5 ohms of resistance between terminals 30 and 87.
    - If greater than 5 ohms, replace the relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

DTC P2534 OR P2535: IGNITION ON/START SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P2534

Ignition On/Start Switch Circuit Low Voltage

DTC P2535

Ignition On/Start Switch Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	P2534	P2534	P2535	-
Ground	-	P2534	-	-

Circuit/System Description

The transmission control module (TCM) samples the system voltage on the Ignition 1 voltage circuit every 0.1 s. Lower than normal voltage may be inadequate to operate the transmission control solenoids properly. Improper solenoid operation may cause erratic transmission operation, which may result in internal damage.

Conditions for Running the DTC

P2534

The TCM ignition voltage signal is valid, with the ignition ON.

P2535

The TCM ignition voltage signal is valid, with the ignition OFF.

Conditions for Setting the DTC

P2534

The TCM detects 6 V or less on the ignition voltage circuit, with the ignition turned ON.

P2535

The TCM detects greater than 6 V or greater on the ignition voltage circuit, with the ignition turned OFF.

Action Taken When the DTC Sets

P2534

- DTC P2534 is a Type A DTC.
- The TCM turns the high side driver OFF.
- The TCM turns OFF all solenoids.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM commands the TCC OFF.
- The TCM allows the vehicle to operate in transmission protection mode.

- The TCM disables Tap up and Tap down functions.

P2535

DTC P2535 is a Type A DTC.

Conditions for Clearing the DTC

DTCs P2534 and P2535 are Type A DTCs.

Diagnostic Aids

If all circuits test normal, ensure the transmission pass through connector and harness terminals are clean and not damaged, and the charging system is functioning correctly.

Circuit/System Verification

1. Engine running.
2. Verify the scan tool TCM Ignition Voltage Signal parameter is between 12.6-15 V.
    - **If not between 12.6-15 V**

Refer to Circuit/System Testing.

- **If between 12.6-15 V**

3. Verify that the DTC does not set by operating the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions you observe from the Freeze Frame/Failure Records data. If the vehicle passes the Circuit/System Verification procedure, then STOP. Do not perform the Circuit/System Testing or Component Testing as this may result in an unnecessary part replacement. Refer to **Testing for Intermittent Conditions and Poor Connections**.

Circuit/System Testing

1. Ignition OFF, and all vehicle systems OFF, disconnect the X1 harness connector at the T12 Automatic Transmission Assembly.
2. Test for less than 10 Ω between ground circuit terminal 1 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Test for less than 10 Ω between ground circuit terminal 18 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
4. Ignition ON.
5. Verify a test lamp illuminates between B+ circuit terminal 10 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF, remove the test lamp.
   2. Test for less than 2 Ω in the B+ circuit end to end
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF, remove the test lamp.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
   - **If the test lamp illuminates**
6. Ignition OFF.
7. Test for less than 1 V between the ignition circuit terminal 13 and ground.

- **If 1 V or greater**

  Repair the short to voltage on the circuit.

- **If less than 1 V**

8. Ignition ON.
9. Verify a test lamp illuminates between ignition circuit terminal 13 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF, remove the test lamp.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, refer to **Power Mode Mismatch**.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF, remove the test lamp.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
   - **If the test lamp illuminates**
10. Replace the K71 Transmission Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for transmission control module replacement, programming, and setup.

DTC P2537: IGNITION ACCESSORY SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P2537

Ignition Accessory Switch Circuit Low Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
IGN	P2537	P2537	-
Ground	-	P2537	-

Circuit/System Description

The transmission control module (TCM) continuously monitors the voltage on the Ignition Accessory/Run circuit from the body control module (BCM). When the ignition is in the Accessory or Run position, the BCM sends a 12 V wake up signal to the TCM. This wake up signal allows the TCM to power up and start functioning before the engine is started.

Conditions for Running the DTC

The ignition is in the Accessory or Run position.

Conditions for Setting the DTC

The TCM detects the Ignition Accessory/Run circuit is less than 6 V for 1 minute.

Action Taken When the DTC Sets

DTC P2537 is a Type C DTC.

Conditions for Clearing the DTC

DTC P2537 is a Type C DTC.

Special Tools

DT-47825-10 Jumper Harness

For equivalent regional tools, refer to **Special Tools** .

Circuit/System Verification

1. Ignition in the ACCESSORY position.
2. Verify the scan tool BCM Accessory Relay Command parameter is Active.
   - **If the parameter is not Active**

     Refer to **Power Mode Mismatch**.

   - **If the parameter is Active**
3. Ignition ON.
4. Verify the scan tool BCM Accessory Relay Command parameter is Active.
   - **If the parameter is not Active**

     Refer to **Power Mode Mismatch**.

   - **If the parameter is Active**
5. Ignition ON, clear all DTCs in the K9 Body Control Module and the Transmission Control Module, ignition OFF for 2 min.
6. Engine Running for 1 min with the transmission in Park.
7. Verify DTC P2537 is not set in the Transmission Control Module.
   - **If DTC P2537 is set**

     Refer to Circuit/System Testing.

   - **If DTC P2537 is not set**
8. After performing the above steps, verify that the DTC does not set by operating the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions you observe from the Freeze Frame/Failure Records data. If the vehicle passes the Circuit/System Verification procedure, then STOP. Do not perform the Circuit/System Testing or Component Testing as this may result in an unnecessary part replacement. Refer to **Testing for Intermittent Conditions and Poor Connections**.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the T12 Automatic Transmission Assembly. Install the **DT-47825-10** Jumper harness to the X1 vehicle wire harness connector.
2. Ignition ON.
3. Verify a test lamp illuminates between the ignition circuit terminal 15 and ground.
   - **If the test lamp does not illuminate.**

1. Ignition OFF remove the test lamp, disconnect the X4 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the ignition circuit and ground.
    - If less than infinite resistance, repair the short to ground in the circuit.
    - If infinite resistance
3. Test for less than 2 Ω on the ignition circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K9 Body Control Module.

- **If the test lamp illuminates**

4. Replace the K71 Transmission Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for body control module or transmission control module replacement, programming, and setup.

SYMPTOMS - WIRING SYSTEMS

NOTE: **The following steps must be completed before using the symptom tables.**

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
    - There are no DTCs set.
    - The control modules can communicate via the serial data links.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to:
    - **Power Mode Description and Operation**
    - **Retained Accessory Power Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to **Checking Aftermarket Accessories**.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections**.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Power Mode Mismatch**

- **Retained Accessory Power Malfunction**

IGNITION CAN/CANNOT BE TURNED OFF WITH TRANSMISSION IN ANY GEAR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	1	1	-	-
Control	1	1	2	-
Ground	-	1	-	-
1. Ignition key will not turn to OFF with vehicle in park. 2. Ignition key will turn to OFF with vehicle out of park.				

Circuit/System Description

If the vehicle is equipped with automatic transmission and a floor mounted console gear shift, it has an electronic park lock system. The electronic park lock system purpose is to prevent the ignition key from being turned to the OFF position when the transmission is in any position other than PARK and the vehicle may still be moving. The electronic park lock system consists of an ignition lock cylinder solenoid, and a park position switch that is located in the A/T shift lock control switch. The ignition lock cylinder solenoid contains a pin that is spring loaded to mechanically prevent the ignition key cylinder from being turned to the lock position when it is not energized. The park position switch receives voltage from the body control module (BCM) when the ignition is turned ON. When the transmission shift selector is in PARK, the park position switch closes and energizes the key capture solenoid actuator retracting the pin, allowing the ignition switch to be turned OFF. If vehicle power is lost, power is lost to the ignition switch, the ignition switch has a fault, and/or the transmission is not in the Park position the operator will not be able to turn the ignition key to the lock position and will not be able to remove the ignition key from the column.

Diagnostic Aids

- Verify that the transmission shift selector indicator matches the position of the gear shift lever while selecting between the Park, Reverse, Drive and Low positions.
- Lost power to the ignition switch or a faulty ignition switch can prevent the ignition key from turning to the lock position and prevent ignition key removal from the column.

Circuit/System Verification

1. Ignition OFF, gear shift selector in PARK, ignition ON.
2. Verify that S39 Ignition Switch can be rotated to the ON position.
   - **If the ignition switch cannot be rotated to the ON position and Ignition Key Cannot Be Inserted, Rotated, or Removed from the Ignition Lock Cylinder has NOT been performed**

     Refer to **Ignition Key Cannot Be Inserted, Rotated, or Removed from the Ignition Lock Cylinder**.

   - **If the ignition switch can not be rotated to the ON position and Ignition Key Cannot Be Inserted, Rotated, or Removed from the Ignition Lock Cylinder has been performed**

     Refer to Circuit/System Testing.

   - **If the ignition switch can be rotated to the ON position**
3. Ignition ON, gear shift selector in NEUTRAL, ignition OFF.
4. Verify that the S39 Ignition Switch cannot be rotated to the LOCK position.
   - **If the ignition switch can be rotated to the LOCK position and Ignition Key Cannot Be Inserted, Rotated, or Removed from the Ignition Lock Cylinder has NOT been performed**

     Refer to **Ignition Key Cannot Be Inserted, Rotated, or Removed from the Ignition Lock Cylinder**.

   - **If the ignition switch can be rotated to the LOCK position and Ignition Key Cannot Be Inserted, Rotated, or Removed from the Ignition Lock Cylinder has been performed**

     Refer to Circuit/System Testing.

   - **If the ignition switch cannot be rotated to the LOCK position**
5. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the Ignition Lock Cylinder Control Actuator. It may take up to 2 minutes for all vehicle systems to power down.

2. Test for less than 10 Ω between the ground circuit terminal B and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON
4. Verify that a test lamp illuminates between the Ignition terminal A and ground with the gear shift selector in PARK.
    - **If the test lamp does not illuminate and the Ignition fuse is good**
    1. Ignition OFF, remove the test lamp.
    2. Test for less than 2 Ω in the Ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, refer to **Power Mode Mismatch**.
    - **If the test lamp does not illuminate and the Ignition fuse is open**
    1. Ignition OFF, remove the test lamp.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the Ignition Lock Cylinder Control Actuator
    - **If the test lamp illuminates**
5. Verify that a test lamp does not illuminate between the ignition terminal A and ground with the gear shift selector in NEUTRAL .
    - **If the test lamp illuminates**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the Automatic Transmission Shift Lock Control Solenoid, ignition ON.
        - **If the test lamp illuminates**

          Repair the short to voltage on the ignition circuit

        - **If the test lamp does not illuminate**
6. Test or replace the Automatic Transmission shift lock Control Solenoid.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

2. Scan Tool Does Not Communicate
3. This circuit is a pass through circuit in the BCM and will cause the B+ circuit fuse to open.
4. This circuit/condition will cause the B+ circuit fuse to open, and may cause a no start condition.

Circuit/System Description

The vehicle power mode master (PMM) is the body control module (BCM). The ignition switch is a low current switch with multiple discrete ignition switch signals to the PMM for determination of the power mode. The PMM receives the ignition switch signals, and additionally a reference voltage signal from the BCM, through the ignition switch, and back to the BCM. There are redundancies within the PMM system that can allow operation of certain subsystems when there are faults in the ignition switch circuits. Other information such as serial data input from other modules and DTCs is also used to determine what power mode signals and information is transmitted by the PMM. The BCM logic uses all this information to identify the operator's desired power mode and activate specific discrete signals, and serial data messages for the operation of different subsystems as necessary. Other modules which have switched voltage inputs may operate in a default mode if the PMM serial data message does not match what the individual module can detect from its own connections.

The PMM will activate relays and other direct outputs of the PMM as needed according to the calculated power mode. Some relays controlled by the BCM are switched ignition voltage outputs that are pass through circuits within the BCM directly from the ignition switch. If these circuits short to ground, the B+ circuit fuse to the ignition switch will open.

Conditions for Running the DTC

B1370 01

Ignition switch is in the OFF or ACC positions.

B1370 06, B1380 01, B1441 01, B1441 06

Ignition switch is in the START position.

B1380 06, B1440

Ignition switch is in the RUN position.

Conditions for Setting the DTC

B1370 01

Ignition circuit is shorted to voltage.

B1370 06

- Ignition 1 voltage circuit is open.
- B+ circuit of the ignition switch is open or shorted to ground.

B1380 01

Accessory circuit is shorted to voltage.

B1380 06

- Accessory voltage circuit is open.
- B+ circuit of the ignition switch is open or shorted to ground.

B1440

BCM senses an open or short to voltage on the off/run/crank circuit when both ignition accessory/run and ignition run/crank parameters are active.

BCM senses an open on the B+ circuit to the ignition switch while the engine is running. An open on the B+ circuit can be caused by a short to ground on any of the circuits listed below:

- B+
- Accessory
- Run/crank ignition voltage BCM terminal 19, X4
- Off/run/crank

B1441 01

Off/run/crank circuit is shorted to voltage.

B1441 06

Off/run/crank circuit is open.

Actions Taken When the DTC Sets

- The BCM operates in a fail-safe power mode dependent on the last valid power mode detected and the state of the engine run flag data on the serial data communications circuits.
- The other modules on the vehicle operate in a fail-safe power mode dependent on the last valid power

mode transmitted by the BCM and the state of the engine run flag on the serial data communications circuits.

Conditions for Clearing the DTC

A current DTC clears when the malfunction is no longer present.

Diagnostic Aids

- A short to ground in the ignition circuit of the run crank relay will cause an open fuse to the ignition switch. DTC B1428 should be current.
- The power modes and controls are determined using BCM logic. Comparing the Body Control Module Power Mode data display parameters listed in Circuit/System Verification to the scan tool values of the vehicle will determine if there is a power mode fault.

Circuit/System Verification

1. Verify that the following DTCs are not set: U1814, B1428.
   - If either of the DTCs are set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
2. With a scan tool, access BCM, Power Mode data display list and compare all parameters listed with the corresponding ignition key position. The PMM Power Mode Parameters table below illustrates the correct state of these input parameters in correspondence to the ignition switch position. The circuits which the individual parameters are related to are in parentheses.

PMM Power Mode Parameters

Ignition Switch Position	Current Power Mode	Ignition Off/Run /Crank (Ignition Switch, Terminal 5)	Ignition Accessory/Run (Ignition Switch, Terminal 3)	Ignition Run/Crank (Ignition Switch, Terminal 1)
Off Key Out	Off	Key Out/ACC	Inactive	Inactive
Off Key IN	Off	Key In/Off	Inactive	Inactive
Accessory	Accessory	Key Out/ACC	Active	Inactive
Run	Run	Run	Active	Active
Start	Crank Request	Crank	Inactive	Active

Circuit/System Testing

IMPORTANT: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

1. Connect a test lamp between each fuse test terminal of the ignition switch B+ circuit fuse and ground. The test lamp should illuminate.
   - If the test lamp does not illuminate, test the circuits listed below for a short to ground. If all circuits test OK, replace the BCM.
   - B+ terminal 2
   - Ignition terminal 1
   - Ignition terminal 3
   - Ignition terminal 5
   - Ignition, BCM terminal 21, X4
2. Disconnect the harness connector at the ignition switch.
3. Connect a test lamp between the B+ circuit terminal 2 and ground. The test lamp should illuminate.
   - If the test lamp does not illuminate, test the B+ circuit for an open/high resistance.

   IMPORTANT: The ignition switch component test must be performed before proceeding with this test to verify the integrity of the switch.

4. Perform the ignition switch component test. Verify the switch passes the test.
   - If the ignition switch does not test normal, replace the ignition switch.
5. Disconnect the X 1 harness connector at the BCM, test for less than 1.0 V between the following ignition circuit terminals of the BCM and ground.
   - terminal 2
   - terminal 4
   - terminal 14
   - terminal 21
   - If greater than specified, test the circuit for a short to voltage.
6. Test for less than 1.0 Ω between the BCM and the ignition switch on the circuits listed below:
   - Ignition terminal 4, X1 and ignition switch terminal 6

- Ignition terminal 2, X1 and ignition switch terminal 5
- Ignition terminal 21, X1 and ignition switch terminal 3
- Ignition terminal 14, X1 and ignition switch terminal 1
- If greater than specified, test the circuit for open/high resistance

7. If all circuits test normal, replace the BCM.

Component Testing

Ignition Switch

1. Ignition OFF, disconnect the harness connector at the ignition switch.
2. Verify the resistance between the terminals listed below match for each ignition switch position.
   - If not the specified value, replace the ignition switch.

Resistance Test

Ignition Switch Position	Terminals 1 and 2	Terminals 2 and 3	Terminals 2 and 5	Terminals 2 and 6	Terminals 5 and 6
Off Key Out	Infinite	Infinite	Infinite	Infinite	Infinite
Off Key IN	Infinite	Infinite	< 5.0 Ω	Infinite	Infinite
Accessory	Infinite	< 5.0 Ω	Infinite	Infinite	Infinite
Run	< 5.0 Ω	< 5.0 Ω	Infinite	Infinite	< 5.0 Ω
Start	< 5.0 Ω	Infinite	Infinite	Infinite	1275-1325 Ω

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Ignition and Start Switch Replacement**
- **Control Module References** for BCM replacement, setup, and programming

RETAINED ACCESSORY POWER MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
RAP Relay Coil Control	B1475, 1	1	2	-
Battery Positive Voltage	3	4	2	-
Accessory Voltage (Relay Output)	3	4	2	-
Ground (RAP Relay)	-	1	-	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
1. All relay controlled RAP functions inoperative. 2. Relay RAP remains on past the timer limit after key out and will not turn off when a vehicle door is opened. 3. Partial relay controlled RAP functions inoperative with open fuse. 4. Partial relay controlled RAP functions inoperative with fuse OK.				

Circuit/System Description

The retained accessory power (RAP) system allows specific vehicle functions to operate after the ignition is turned OFF for a predetermined time. The RAP relay is located in the instrument panel (I/P) fuse block. The relay accessory voltage (output) feeds the RAP fuse and the PWR/WNDW circuit breaker within the I/P fuse block. Relay RAP is controlled by the BCM using inputs from the door ajar switches to determine control of the relay when the ignition is turned OFF. Radio RAP is controlled by a serial data message from the BCM using inputs from the driver door open switch. Refer to **Retained Accessory Power Description and Operation** for more detail on subsystems using RAP.

Diagnostic Aids

- The radio RAP function is a separate RAP function controlled by serial data and the specific module. These functions are not effected by the BCM RAP relay circuits.
- A short to ground or open/high resistance in the RAP relay switched voltage circuits will cause only part of the RAP functions to be inoperative. Diagnose these symptoms within the respective system sections.
- A short to voltage on the RAP relay control or switched voltage circuits would cause the RAP function to remain on past the designated time.
- A stuck relay switch could cause a RAP always on, or a RAP inoperative condition.

Control Module References for Scan Tool Information

Circuit/System Verification

IMPORTANT: Battery voltage must remain above 9.6 V for RAP to operate properly.

Radio RAP

1. With all passenger doors closed, observe the courtesy lamps while opening and closing the driver door. The courtesy lamps should illuminate when the door is opened and turn off approximately 30 seconds after closing the door.
    - If the courtesy lamp operation is incorrect from the drivers door, refer to **Courtesy Lamps Malfunction** .
2. If courtesy lamp operation is correct, and the radio is the only RAP concern, replace the radio.

Relay RAP

1. Ignition ON, observe the appropriate scan tool parameters listed below while opening and closing each vehicle door. The reading should change between Door Closed/Door Ajar.

    Parameter

    - Driver Door Ajar Sw.
    - Left Rear Door Ajar Sw.
    - Passenger Door Ajar Sw.
    - Right Rear Door Ajar Sw.
    - If any parameter does not change as specified, refer to **Door Ajar Indicator Malfunction** .
2. Command the scan tool Accy/RAP Relay OFF. Attempt to operate any RAP relay controlled component within 5 seconds. The component should not operate.
3. Command the scan tool Accy/RAP Relay ON. Attempt to operate any RAP relay controlled component within 5 seconds. The component should operate.
4. Ignition ON, all doors closed. Observe the scan tool parameter Accy/RAP Relay Command. Ignition OFF, key removed, the reading should be ON for approximately 10 minutes then change to OFF.
    - If the parameter does not respond as specified, replace the BCM.

Circuit/System Testing

1. Ignition OFF, disconnect the RAP Relay.
2. Test for less than 2 ohms of resistance between ground circuit terminal and ground.
    - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Connect a test lamp between relay coil control circuit terminal and ground.

4. With the driver and passenger doors open, cycle the ignition key ON and OFF. The test lamp should turn ON and OFF when cycling the ignition switch.
    - If the test lamp remains ON all the time, test the relay coil control circuit for a short to voltage. If the circuit tests normal, replace the BCM.
    - If the test lamp remains OFF all the time, test the relay coil control circuit for a short to ground or open/high resistance. If the circuit tests normal, replace the BCM.
5. Connect a test lamp between the relay accessory voltage circuit terminal and ground. The test lamp should not illuminate.
    - If the test lamp illuminates, test the accessory voltage circuit for a short to voltage.
6. If all circuits test normal, test or replace the RAP relay.

Component Testing

Relay Test

1. Ignition OFF, disconnect the RAP relay.
2. Test for 70-110 ohms of resistance between terminals 85 and 86.
    - If the resistance is not within the specified range, replace the relay.
3. Test for infinite resistance between the following terminals:
    - 30 and 86
    - 30 and 87
    - 30 and 85
    - 85 and 87
    - If not the specified value, replace the relay.
4. Install a 20 amp fused jumper wire between relay terminal 85 and 12 volts. Install a jumper wire between relay terminal 86 and ground. Test for less than 2.0 ohms of resistance between terminals 30 and 87.
    - If greater than the specified range, replace the relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Relay Replacement (Attached to Wire Harness)** **Relay Replacement (Within an Electrical Center)**
- **Control Module References** for module replacement, setup, and programming

GENERAL ELECTRICAL DIAGNOSIS

Basic Knowledge Required

Without a basic knowledge of electricity, it will be difficult to use the diagnostic procedures contained in the service manual. You should understand the basic theory of electricity, and know the meaning of voltage (V), current (A), and resistance (Ω). You should also be able to read and understand a wiring diagram, as well as understand what happens in a circuit with an open or a shorted wire.

CHECKING AFTERMARKET ACCESSORIES

WARNING: Refer to SIR Warning .

Do not connect aftermarket accessories into the SIR circuits, all such circuits are indicated on circuit diagrams with the SIR symbol.

Always check for aftermarket accessories (non-OEM) as the first step in diagnosing electrical problems. If the vehicle is so equipped, disconnect the system to verify that these add-on accessories are not the cause of the problems.

Possible causes of vehicle problems related to aftermarket accessories include:

- Power feeds connected to points other than the battery
- Antenna location
- Transceiver wiring located too close to vehicle electronic modules or wiring
- Poor shielding or poor connectors on antenna feed line
- Check for recent service bulletins detailing installation guidelines for aftermarket accessories.

CIRCUIT TESTING

The Circuit Testing section contains the following diagnostic testing information. Using this information along with the diagnostic procedures will identify the cause of the electrical malfunction.

- **Using Connector Test Adapters**
- **Probing Electrical Connectors**
- **Troubleshooting with a Digital Multimeter**
- **Troubleshooting with a Test Lamp**
- **Using Fused Jumper Wires**
- **Measuring Voltage**
- **Measuring Voltage Drop**
- **Measuring Frequency**

USING CONNECTOR TEST ADAPTERS

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to Special Tools .

WARNING: **This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.**

CAUTION: **Do not insert test equipment probes (DMM etc.) into any connector or fuse block terminal. The diameter of the test probes will deform most terminals. A deformed terminal will cause a poor connection, which will result in a system failure. Always use the J-35616-F GM Approved Terminal Release Tool Kit in order to front probe terminals. Do not use paper clips or other substitutes to probe terminals.**

When using the J-35616-F GM Approved Terminal Release Tool Kit , ensure the terminal test adapter choice is the correct size for the connector terminal. Do not visually choose the terminal test adapter because some connector terminal cavities may appear larger than the actual terminal in the cavity. Using a larger terminal test adapter will damage the terminal. Refer to the J-35616-F GM Approved Terminal Release Tool Kit label on the inside of the J-35616-F GM Approved Terminal Release Tool Kit for the correct adapter along with the connector end view for terminal size.

PROBING ELECTRICAL CONNECTORS

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to Special Tools .

WARNING: **This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.**

NOTE: **Always be sure to reinstall the connector position assurance (CPA) and terminal position assurance (TPA) when reconnecting connectors or replacing terminals.**

Front probe

Disconnect the connector and probe the terminals from the mating side (front) of the connector.

CAUTION: **Refer to Test Probe Caution .**

NOTE: **When probing female 0.64 terminals, it is important to use the correct adapter. There have been some revisions to the test adapter for 0.64 terminals. The proper adapter for 0.64 terminals is the J-35616-64B which has a gold terminal and a black wire between the base and tip. Failure to use the proper test adapter may result in damage to the terminal being tested and improper**

diagnosis.

NOTE: **The proper adapter for probing the terminals for fuses, relays, or diodes in an electrical center is J-35616-35. Using any other tool or adapter may damage the terminal being tested.**

Refer to the following table as a guide in selecting the correct test adapter for front probing connectors:

Test Adapter	Description
J-35616-2A	150 Male Probe Adapter (gray)
J-35616-3	150 Female Probe Adapter (gray)
J-35616-4A	280 Male Probe Adapter (purple)
J-35616-5	280 Female Probe Adapter (purple)
J-35616-6	100W Male (round) Probe Adapter (brown)
J-35616-7	100W Female (round) Probe Adapter (brown)
J-35616-8	Weather Pack Male Probe Adapter (orange)
J-35616-9	Weather Pack Female Probe Adapter (orange)
J-35616-10	100W Male (round) Probe Adapter (green)
J-35616-11	100W Female (round) Probe Adapter (green)
J-35616-12	130 Male Probe Adapter (blue)
J-35616-13	130 Female Probe Adapter (blue)
J-35616-14	150 Male Probe Adapter (green)
J-35616-16	100 Male Probe Adapter (lt green)
J-35616-17	100 Female Probe Adapter (lt green)
J-35616-18	220 Male Probe Adapter (black)
J-35616-19	220 Female Probe Adapter (black)
J-35616-21	950 Female Probe Adapter (red)
J-35616-22	950 Male Probe Adapter (red)
J-35616-31	500 Male Probe Adapter (orange)
J-35616-32	500 Female Probe Adapter (orange)
J-35616-33	160/180 Male Probe Adapter (yellow)
J-35616-34	160/180 Female Probe Adapter (yellow)
J-35616-35	280 Male Probe Adapter (violet)
J-35616-40	480 Male Probe Adapter (dk blue)
J-35616-41	480 Female Probe Adapter (dk blue)
J-35616-42	630 Male Probe Adapter (red)
J-35616-43	630 Female Probe Adapter (red)
J-35616-44	800 Male Probe Adapter (yellow)
J-35616-45	800 Female Probe Adapter (yellow)
J-35616-54	280 Male (round) Probe Adapter (tan)
J-35616-55	280 Female (round) Probe Adapter (tan)
J-35616-64B	0.64 Male Probe Adapter (lt blue)
J-35616-65B	0.64 Female Probe Adapter (lt blue)

Test Adapter	Description
J-35616-66	150 Male (round) Probe Adapter (yellow)
J-35616-67	150 Female (round) Probe Adapter (yellow)

Backprobe

NOTE:

- **Backprobe connector terminals only when specifically required in diagnostic procedures.**
- **Do not backprobe a sealed (Weather PackÂ®) connector, less than a 280 series Metri-Pack connector, a Micro-Pack connector, or a flat wire connector.**
- **Backprobing can be a source of damage to connector terminals. Use care in order to avoid deforming the terminal, either by forcing the test probe too far into the cavity or by using too large of a test probe.**
- **After backprobing any connector, inspect for terminal damage. If terminal damage is suspected, test for proper terminal contact.**

Do not disconnect the connector and probe the terminals from the harness side (back) of the connector.

TROUBLESHOOTING WITH A DIGITAL MULTIMETER

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to Special Tools .

WARNING: **High voltage circuits should only be tested using a digital multimeter (DMM) and test leads with at least a CAT III rating, such as the J 39200-A Digital Multimeter. Failure to follow the procedures may result in serious injury or death.**

CAUTION: **Refer to Test Probe Caution .**

Digital Multimeter (DMM) Basic Requirements

Service information is validated using digital multimeters that meet or exceed the following requirements. Using a multimeter that does not meet these basic requirements may give inaccurate readings which could lead to an incorrect diagnosis.

Display and Settings

1. Four digits displayed
2. Voltage, current, resistance, frequency, diode test settings, and min-max function
3. Display positive and negative values

Voltage

1. Have at least 10 M Ω input impedance
2. Test a DC voltage range of 0.1-1000 V.
3. Test an AC voltage range of 0.1-1000 V.

Current

1. Test a DC current range of 0.1µA-10 A.
2. Test an AC current range of 0.1µA-10 A.

Resistance

Test a resistance range of 0.1 Ω-40 MΩ and displays infinite for a value greater than 40 M Ω (O.L. (Over-load))

Frequency

Test for a frequency range of 0.5 HZ-199 K HZ

Diode Test

1. Apply at least 2 mA when performing the diode bias test
2. Display the break over voltage drop (0-3 V) of a forward biased diode
3. Display infinite (O.L. (Over-load)) when a diode is reverse biased

Min-Max Readings

1. Can update at a 25 ms sample rate
2. Saves and displays minimum and maximum values

NOTE: **Circuits which include any solid state control modules, such as the engine control module (ECM), should only be tested with a 10 megohm or higher impedance digital multimeter such as the EL-39200.**

The DMM instruction manual is a good source of information and should be read thoroughly upon receipt of the DMM as well as kept on hand for future reference.

A DMM should be used instead of a test lamp in order to test for voltage in high impedance circuits. While a test lamp shows whether voltage is present if the impedance is low enough, a DMM indicates how much voltage is present. In other words, if there is not enough current, the test lamp will not illuminate even though voltage is present.

The ohmmeter function on a DMM shows how much resistance exists between 2 points along a circuit. Low resistance in a circuit means good continuity.

NOTE: **Disconnect the power feed from the suspect circuit when measuring resistance with a DMM. This prevents incorrect readings. DMMs apply such a small voltage to measure resistance that the presence of voltages can upset a resistance reading.**

Diodes and solid state components in a circuit can cause a DMM to display a false reading. To find out if a

component is affecting a measurement take a reading once, then reverse the leads and take a second reading. If the readings differ the solid state component is affecting the measurement.

Following are examples of the various methods of connecting the DMM to the circuit to be tested:

- Probe both ends of the connector and either hold the leads in place while manipulating the connector or tape the leads to the harness for continuous monitoring while you perform other operations or test driving. Refer to **Probing Electrical Connectors**.
- Disconnect the harness at both ends of the suspected circuit where it connects either to a component or to other harnesses.
- If the system that is being diagnosed has a specified pinout or breakout box, it may be used in order to simplify connecting the DMM to the circuit or for testing multiple circuits quickly.

TROUBLESHOOTING WITH A TEST LAMP

Special Tools

EL-35616-200 Test Light - Probe Kit

For equivalent regional tools, refer to Special Tools .

WARNING: This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.

CAUTION: Refer to Test Probe Caution .

A test lamp can simply and quickly test a low impedance circuit for voltage. A digital multimeter (DMM) should be used instead of a test lamp in order to test for voltage in high impedance circuits. While a test lamp shows whether voltage is present if the impedance is low enough, a DMM indicates how much voltage is present. In other words, if there is not enough current, the test lamp will not illuminate even though voltage is present.

The **EL-35616-200** kit is Micro-Pack compatible and comprised of a 12 V light bulb with an attached pair of leads.

To properly operate this tool use the following procedures.

When testing for voltage:

1. Attach one lead to ground.
2. Touch the other lead to various points along the circuit where voltage should be present.
3. When the bulb illuminates, there is voltage at the point being tested.

When testing for ground:

1. Attach one lead to battery positive voltage.
2. Touch the other lead to various points along the circuit where ground should be present.
3. When the bulb illuminates, there is ground at the point being tested.

USING FUSED JUMPER WIRES

Special Tools

EL 35616-20F Fused Jumper Wire

For equivalent regional tools, refer to Special Tools .

NOTE: **A fused jumper may not protect solid state components from being damaged.**

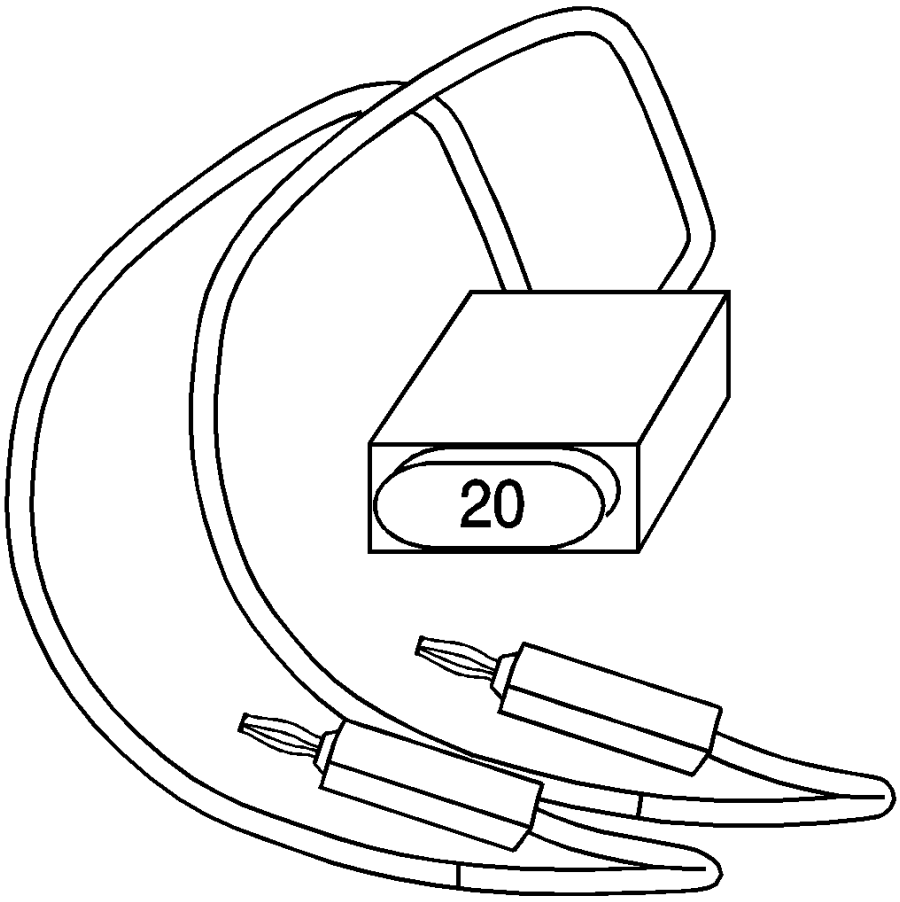

Fig. 1: Fused Jumper Wire
Courtesy of GENERAL MOTORS COMPANY

The **EL 35616-20F** Fused Jumper Wire includes banana jack connectors that provide adaptation to most connectors without damage. This fused jumper wire is supplied with a 20 A fuse which may not be suitable for some circuits. Do not use a fuse with a higher rating than the fuse that protects the circuit being tested.

MEASURING VOLTAGE

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to Special Tools .

WARNING: **Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:**

- **Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedure exactly as written may result in serious injury or death.

CAUTION: **Refer to Test Probe Caution .**

The following procedure measures the voltage at a selected point in a circuit.

1. Disconnect the electrical harness connector for the circuit being tested, if necessary.
2. Enable the circuit and/or system being tested. Use the following methods:
   - Turn ON the ignition, with the engine OFF.
   - Turn ON the engine.
   - Turn ON the circuit and/or system with a scan tool in Output Controls.
   - Turn ON the switch for the circuit and/or system being tested.
3. Select the V (AC) or V (DC) position on the digital multimeter (DMM).
4. Connect the positive lead of the DMM to the point of the circuit to be tested.
5. Connect the negative lead of the DMM to a good ground.
6. The DMM displays the voltage measured at that point.

MEASURING VOLTAGE DROP

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to Special Tools .

CAUTION: **Refer to Test Probe Caution .**

The following procedure determines the difference in voltage potential between 2 points.

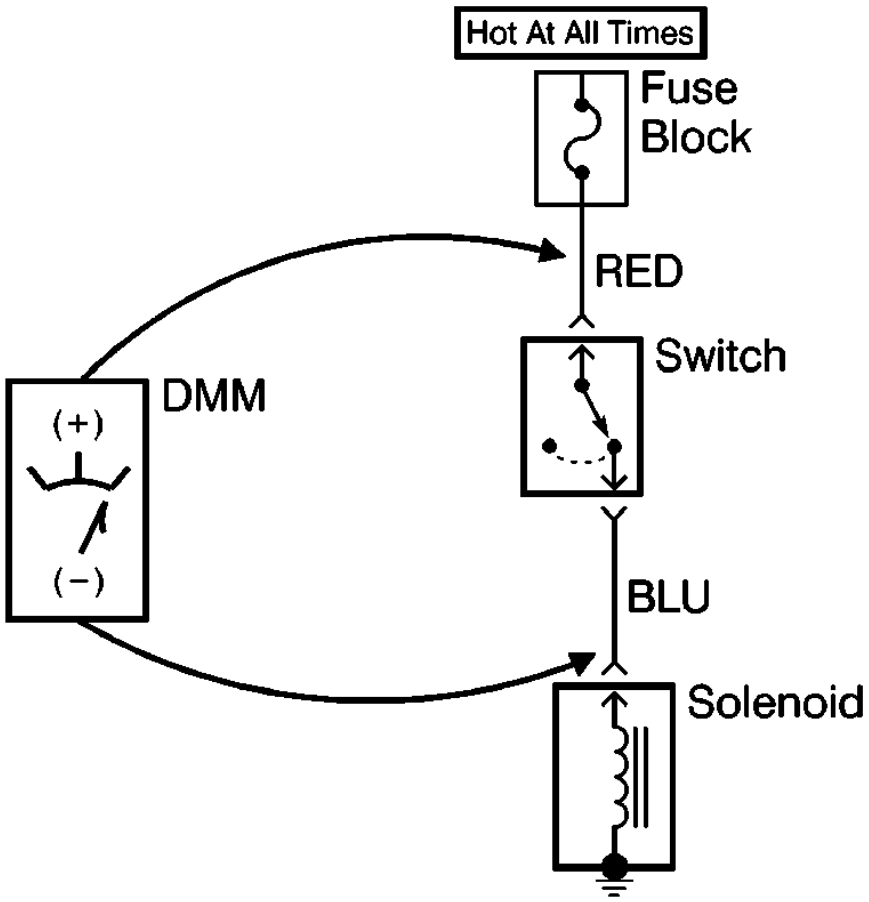

Fig. 2: Measuring Voltage Drop
Courtesy of GENERAL MOTORS COMPANY

1. Set the Digital Multimeter (DMM) to the V (DC) position.
2. Connect the positive lead of the DMM to one point of the circuit to be tested.
3. Connect the negative lead of the DMM to the other point of the circuit.
4. Operate the circuit.
5. The DMM displays the difference in voltage between the 2 points.

MEASURING FREQUENCY

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to Special Tools .

CAUTION: **Refer to Test Probe Caution .**

The following procedure determines the frequency of a signal.

NOTE: **Connecting the Digital Multimeter (DMM) to the circuit before pressing the Hz button will allow the DMM to autorange to an appropriate range.**

1. Apply power to the circuit.
2. Set the DMM to the V (AC) position.
3. Connect the positive lead of the DMM to the circuit to be tested.
4. Connect the negative lead of the DMM to a good ground.
5. Set to Hz on the DMM.
6. The DMM will display the frequency measured.

TESTING GROUND AND LOW REFERENCE CIRCUITS

Because a test lamp can light with up to 200 Ω in a ground or low reference circuit they are not recommended to be used for this type of test. A low impedance test lamp can light and indicate the circuit is good when there is as much as 20-30 Ω present, while a high impedance test lamp can light with up to 200 Ω present in the circuit. This is why the Digital Multi-Meter (DMM) is used when validating a ground or low reference circuit continuity.

When using the DMM there are many vehicle conditions that can affect the ground and low reference continuity testing. If these conditions are not met, a ground or low reference circuit test can fail on a good circuit. This may cause longer diagnosis time and incorrect component replacement.

Any current flow through a ground or low reference circuit, while being tested, will skew the DMM continuity reading, or display a reading higher than when there is no current flowing. Performing a ground or low reference circuit continuity test, in reference to the vehicles battery negative terminal, will have the highest risk of failing a good ground or low reference circuit test than any other ground reference point. The best ground test points would be a control module housing (if the control modules housing is metal and grounded), under dash metal frame work, engine block, or body ground studs (other than where the negative battery cable is attached).

A typical DMM ground or low reference circuit continuity reading can be as high as 100 Ω with the ignition ON, and drop to 15-25 Ω after the ignition is turned OFF. The reading will drop below 10 Ω after 30-40 seconds, then below 5 Ω after 60 seconds. Once the vehicle completely goes to sleep (generally 3-10 minutes) the reading will drop below 0.3 Ω.

The following list of conditions may need to be met to ensure a valid continuity reading on a ground or low reference circuit:

- Ignition OFF
- Key out of the ignition switch (when not equipped with keyless entry and remote start)
- Retained Accessory Power (RAP) OFF (open and close the driver door after ignition OFF)
- Battery charger set at a 2 A or less charge rate
- Scan tool not communicating with any vehicle control module (in some cases it may need to be disconnected from the DLC)
- All entry doors closed

- Headlamps OFF (auto headlamps disabled)
- Any delay lighting OFF
- HVAC after blow OFF
- Any accessory that can work when the ignition is OFF
- Wait up to 60 seconds (after all other listed conditions are met)

Activating the DOOR LOCK function with a key fob can greatly reduce the time to achieve a valid ground or low reference continuity test result.

TESTING FOR CONTINUITY

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to Special Tools .

WARNING: **This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.**

CAUTION: **Refer to Test Probe Caution .**

The following procedures verify good continuity in a circuit.

With a Digital Multimeter (DMM)

1. Set the DMM to the Ω position.
2. Disconnect the power feed (i.e. fuse, control module) from the suspect circuit.
3. Disconnect the load.
4. Select the MIN MAX function on the DMM.
5. Connect one lead of the DMM to one end of the circuit to be tested.
6. Connect the other lead of the DMM to the other end of the circuit.
7. If the DMM displays low or no resistance, the circuit has good continuity.

With a Test Lamp

NOTE: **Only use the test lamp procedure on low impedance power and ground circuits.**

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Connect one lead of the test lamp to one end of the circuit to be tested.
4. Connect the other lead of the test lamp to battery positive voltage.
5. Connect the other end of the circuit to ground.
6. If the test lamp illuminates (full intensity), then the circuit has good continuity.

TESTING FOR SHORT TO GROUND

WARNING: **This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.**

CAUTION: **Refer to Test Probe Caution .**

The following procedures test for a short to ground in a circuit.

With a Digital Multimeter (DMM)

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Set the rotary dial of the DMM to the Ω position.
4. Connect one lead of the DMM to one end of the circuit to be tested.
5. Connect the other lead of the DMM to a good ground.
6. If the DMM does NOT display infinite resistance (OL), there is a short to ground in the circuit.

With a Test Lamp

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Connect one lead of the test lamp to battery positive voltage.
4. Connect the other lead of the test lamp to one end of the circuit to be tested.
5. If the test lamp illuminates, there is a short to ground in the circuit.

Fuse Powering Several Loads

1. Review the system schematic and locate the fuse that is open.
2. Open the first connector or switch leading from the fuse to each load.
3. Connect a DMM across the fuse terminals (be sure that the fuse is powered).
    - When the DMM displays voltage the short is in the wiring leading to the first connector or switch.
    - If the DMM does not display voltage refer to the next step.
4. Close each connector or switch until the DMM displays voltage in order to find which circuit is shorted.

TESTING FOR A SHORT TO VOLTAGE

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to Special Tools .

WARNING: **This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.**

CAUTION: **Refer to Test Probe Caution .**

The following procedure tests for a short to voltage in a circuit.

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Set the digital multimeter (DMM) to the V (DC) position.
4. Connect the positive lead of the DMM to one end of the circuit to be tested.
5. Connect the negative lead of the DMM to a good ground.
6. Turn ON the ignition and operate all accessories.
7. If the voltage measured is greater than 1 V, there is a short to voltage in the circuit.

TESTING FOR INTERMITTENT CONDITIONS AND POOR CONNECTIONS

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to Special Tools .

WARNING: This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.

When the condition is not currently present, but is indicated in DTC history, the cause may be intermittent. An intermittent may also be the cause when there is a customer complaint, but the symptom cannot be duplicated. Refer to the Symptom Table of the system that is suspect of causing the condition before trying to locate an intermittent condition.

Most intermittent conditions are caused by faulty electrical connections or wiring. Inspect for the following items:

- Wiring broken inside the insulation
- Poor connection between the male and female terminal at a connector
- Poor terminal to wire connection-Some conditions which fall under this description are poor crimps, poor solder joints, crimping over the wire insulation rather than the wire itself, and corrosion in the wire to terminal contact area, etc.
- Pierced or damaged insulation can allow moisture to enter the wiring causing corrosion. The conductor can corrode inside the insulation, with little visible evidence. Look for swollen and stiff sections of wire in the suspect circuits.
- Wiring which has been pinched, cut, or its insulation rubbed through may cause an intermittent open or short as the bare area touches other wiring or parts of the vehicle.
- Wiring that comes in contact with hot or exhaust components
- Refer to **Inducing Intermittent Fault Conditions** in order to duplicate the conditions required, in order to verify the customer concern.
- Refer to **Testing for Electrical Intermittents** for test procedures to detect intermittent open, high resistance, short to ground, and short to voltage conditions.
- Refer to **Scan Tool Snapshot Procedure** for advanced intermittent diagnosis and Vehicle Data Recorder operation.

Testing for Terminal Fretting

Some intermittent conditions can be caused by wire terminal fretting corrosion. Fretting corrosion is a build-up of insulating, oxidized wear debris that can form when there is a small motion between electrical contacts. The oxidized wear debris can pile up enough at the electrical contact spots that the electrical resistance across the connection increases. Movement between the contacting surfaces as small as 10 to 100 microns can cause fretting. To put this in perspective, a sheet of paper is about 100 microns thick, so fretting motion is small and hard to see. Vibration and thermal expansion/contraction are the main sources that create fretting motion. Since vehicles vibrate and can experience large temperature swings, they are a good source for fretting motion. Tin, copper, nickel, and iron surfaces are all susceptible to fretting corrosion. Fretting corrosion can be difficult to see but it looks like small, dark smudges on the terminals contact surface.

To correct a fretting condition disconnect the suspect connector and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to both sides of the connector terminals. Then reconnect the connector and wipe away any excess lubricant. This will correct the additional terminal contact resistance due to the terminal fretting corrosion.

Testing for Proper Terminal Contact

It is important to test terminal contact at the component and any inline connectors before replacing a suspect component. Mating terminals must be inspected to ensure good terminal contact. A poor connection between the male and female terminal at a connector may be the result of contamination or deformation.

Contamination may be caused by the connector halves being improperly connected. A missing or damaged connector seal, damage to the connector itself, or exposing the terminals to moisture and dirt can also cause contamination. Contamination, usually in the underhood or underbody connectors, leads to terminal corrosion, causing an open circuit or intermittently open circuit.

Deformation is caused by probing the mating side of a connector terminal without the proper adapter. Always use the **EL-35616** kit when probing connectors. Other causes of terminal deformation are improperly joining the connector halves, or repeatedly separating and joining the connector halves. Deformation, usually to the female terminal contact tang, can result in poor terminal contact causing an open or intermittently open circuit.

Testing for Proper Terminal Contact in Bussed Electrical Centers (BEC)

It is very important to use the correct test adapter when testing for proper terminal contact of fuses and relays in a bussed electrical center (BEC). Use **EL-35616** kit to test for proper terminal contact. Failure to use **EL-35616** kit can result in improper diagnosis of the bussed electrical center.

Follow the procedure below in order to test terminal contact:

1. Separate the connector halves.
2. Visually inspect the connector halves for contamination. Contamination may result in a white or green build-up within the connector body or between terminals. This causes high terminal resistance, intermittent contact, or an open circuit. An underhood or underbody connector that shows signs of contamination should be replaced in its entirety: terminals, seals, and connector body.
3. Using an equivalent male terminal/terminated lead, verify that the retention force is significantly different between a known good terminal and the suspect terminal. Replace the female terminal in question.

Flat Wire Connectors

There are no serviceable parts for flat wire connectors on the harness side or the component side.

Follow the procedure below in order to test terminal contact:

1. Remove the component in question.
2. Visually inspect each side of the connector for signs of contamination. Avoid touching either side of the connector as oil from your skin may be a source of contamination as well.
3. Visually inspect the terminal bearing surfaces of the flat wire circuits for splits, cracks, or other imperfections that could cause poor terminal contact. Visually inspect the component side connector to ensure that all of the terminals are uniform and free of damage or deformation.
4. Insert the appropriate adapter from the on the flat wire harness connector in order to test the circuit in question.

Control Module/Component Voltage and Grounds

Poor voltage or ground connections can cause widely varying symptoms.

- Test all control module voltage supply circuits. Many vehicles have multiple circuits supplying voltage to a control module. Other components in the system may have separate voltage supply circuits that may also need to be tested. Inspect connections at the module/component connectors, fuses, and any intermediate connections between the voltage source and the module/component. A test lamp or a DMM may indicate that voltage is present, but neither tests the ability of the circuit to carry sufficient current. Operate the component to test the ability of the circuit to carry sufficient current. Refer to **Circuit Testing**, and **Power Distribution Schematics** .
- Test all control module ground and system ground circuits. The control module may have multiple ground circuits. Other components in the system may have separate grounds that may also need to be tested. Inspect grounds for clean and tight connections at the grounding point. Inspect the connections at the component and in splice packs, where applicable. Operate the component to test the ability of the circuit to carry sufficient current. Refer to **Circuit Testing**, and **Ground Distribution Schematics** .

Temperature Sensitivity

- An intermittent condition may occur when a component/connection reaches normal operating temperature. The condition may occur only when the component/connection is cold, or only when the component/connection is hot.
- Freeze Frame, Failure Records, Snapshot, or Vehicle Data Recorder data may help with this type of intermittent condition, where applicable.
- If the intermittent is related to heat, review the data for a relationship with the following:
  - High ambient temperatures
  - Underhood/engine generated heat
  - Circuit generated heat due to a poor connection, or high electrical load
  - Higher than normal load conditions, towing, etc.
- If the intermittent is related to cold, review the data for the following:
  - Low ambient temperatures-In extremely low temperatures, ice may form in a connection or component. Inspect for water intrusion.
  - The condition only occurs on a cold start.

    - The condition goes away when the vehicle warms up.
- Information from the customer may help to determine if the trouble follows a pattern that is temperature related.
- If temperature is suspected of causing an intermittent fault condition, attempt to duplicate the condition. Refer to **Inducing Intermittent Fault Conditions** in order to duplicate the conditions required.

Electromagnetic Interference and Electrical Noise

Some electrical components/circuits are sensitive to electromagnetic interference (EMI) or other types of electrical noise. Inspect for the following conditions:

- A mis-routed harness that is too close to high voltage/high current devices such as secondary ignition components, motors, generator, etc .-These components may induce electrical noise on a circuit that could interfere with normal circuit operation.
- Electrical system interference caused by a malfunctioning relay, or a control module driven solenoid or switch - These conditions can cause a sharp electrical surge. Normally, the condition will occur when the malfunctioning component is operating.
- Improper installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. - These accessories may create interference in other circuits while operating and the interference would disappear when the accessory is not operating. Refer to **Checking Aftermarket Accessories**.
- Test for an open diode across the A/C compressor clutch and for other open diodes. Some relays may contain a clamping diode.
- The generator may be allowing AC noise into the electrical system.

Incorrect Control Module

- There are only a few situations where reprogramming a control module is appropriate:
    - A new service control module is installed.
    - A control module from another vehicle is installed.
    - Revised software/calibration files have been released for this vehicle.

NOTE: **DO NOT re-program the control module with the SAME software/calibration files that are already present in the control module. This is not an effective repair for any type of concern.**

- Verify that the control module contains the correct software/calibration. If incorrect programming is found, reprogram the control module with the most current software/calibration. Refer to **Control Module References** for replacement, setup, and programming.

INDUCING INTERMITTENT FAULT CONDITIONS

Special Tools

J-25070 Heat Gun

For equivalent regional tools, refer to Special Tools .

Many intermittent open or shorted circuits are affected by harness/connector movement that is caused by vibration, engine torque, bumps/rough pavement, etc. In order to duplicate the customer's concern, it may be necessary to manipulate the wiring harness if the malfunction appears to be vibration related. Manipulation of a circuit can consist of a wide variety of actions, including:

- Wiggling the harness
- Disconnecting a connector and reconnecting
- Stressing the mechanical connection of a connector
- Pulling on the harness or wire in order to identify a separation/break inside the insulation
- Relocating a harness or wires

All these actions should be performed with some goal in mind. For instance, with a scan tool connected, wiggling the wires may uncover a faulty input to the control module. The snapshot option would be appropriate here. Refer to **Scan Tool Snapshot Procedure**. Another option is, with the component commanded ON and OFF by the scan tool, to move related connectors and wiring and observe the component operation. With the engine running, move related connectors and wiring while monitoring engine operation. If harness or connector movement affects the data displayed, component/system operation, or engine operation, inspect and repair the harness/connections as necessary.

You may need to load the vehicle in order to duplicate the concern. This may require the use of weights, floor jacks, jackstands, frame machines, etc. In these cases you are attempting to duplicate the concern by manipulating the suspension or frame. This method is useful in finding harnesses that are too short and their connectors pull apart enough to cause a poor connection. A DMM set to the Min/Max mode and connected to the suspect circuit while testing can yield desirable results. Refer to **Testing for Electrical Intermittents**.

Certainly, using the senses of sight, smell, and hearing while manipulating the circuit can provide good results as well.

There may be instances where circuit manipulation alone will not meet the required criteria for the fault condition to appear. In such cases it may be necessary to expose the suspect circuit to other conditions while manipulating the harness. Such conditions would include high moisture conditions, along with exceptionally high or low temperatures. The following discusses how to expose the circuit to these kinds of conditions.

High Temperature Conditions

If the complaint tends to be heat related, you can simulate the condition using the **J-25070** heat gun.

Using the heat gun, you can heat up the suspected area or component. Manipulate the harnesses under high temperature conditions while monitoring the scan tool or DMM to locate the fault condition.

The high temperature condition may be achieved simply by test driving the vehicle at normal operating temperature. If a heat gun is unavailable, consider this option to enhance your diagnosis. This option does not allow for the same control, however.

Low Temperature Conditions

Depending on the nature of the fault condition, placing a fan in front of the vehicle while the vehicle is in the shade can have the desired effect.

If this is unsuccessful, use local cooling treatments such as ice or a venturi type nozzle (one that provides hot or cold air). This type of tool is capable of producing air stream temperatures down to -18Â°C (0Â°F) from one end and +71Â°C (160Â°F) from the other. This is ideally suited for localized cooling needs. In addition, circuit cooling spray can be used to cool down a component or circuit.

Once the vehicle, component, or harness has been sufficiently cooled, manipulate the harness or components in an effort to duplicate the concern.

Duplicating Failure Conditions

- If none of the previous tests are successful, attempt to duplicate and/or capture the failure conditions.
- Freeze Frame/Failure Records data, where applicable, contains the conditions that were present when the DTC set.
    1. Review and record Freeze Frame/Failure Records data.
    2. Clear the DTCs using the scan tool.
    3. Turn the key to OFF and wait 15 seconds.
    4. Operate the vehicle under the same conditions that were noted in Freeze Frame/Failure Records data, as closely as possible. The vehicle must also be operating within the Conditions for Running the DTC. Refer to Conditions for Running the DTC in the supporting text if a DTC is being diagnosed.
    5. Monitor DTC Status for the DTC being tested. The scan tool will indicate Ran, when the enabling conditions have been satisfied long enough for the DTC to run. The scan tool will also indicate whether the DTC passed or failed.
- An alternate method is to drive the vehicle with the DMM connected to a suspected circuit. An abnormal reading on the DMM when the concern occurs, may help you locate the concern.

TESTING FOR ELECTRICAL INTERMITTENTS

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to Special Tools .

WARNING: This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.

Perform the following procedures while wiggling the harness from side to side. Continue this at convenient points (about 6 inches apart) while watching the test equipment.

- **Testing for Short to Ground**
- **Testing for Continuity**
- **Testing for a Short to Voltage**

If the fault is not identified, perform the procedure below using the MIN MAX feature on the **EL-39200** DMM. This feature allows you to manipulate the circuit without having to watch the DMM . The DMM will generate an audible tone when a change is detected.

NOTE: **The DMM must be used in order to perform the following procedure since the DMM can monitor current, resistance or voltage while recording the minimum (MIN), and maximum (MAX) values measured.**

1. Connect the DMM to both sides of a suspected connector (still connected), or from one end of a suspected circuit to the other. Refer to **Troubleshooting with a Digital Multimeter** for information on connecting the DMM to the circuit.
2. Set the rotary dial of the DMM to the V (AC) or V (DC) position.
3. Press the range button of the DMM in order to select the desired voltage range.

NOTE: **The 100 ms RECORD mode is the length of time an input must stay at a new value in order to record the full change.**

4. Select the MIN MAX function of the DMM. The DMM displays the 100 ms RECORD and emits an audible tone (beep).
5. Simulate the condition that is potentially causing the intermittent connection, either by wiggling the connections or the wiring, test driving, or performing other operations. Refer to **Inducing Intermittent Fault Conditions**.
6. Listen for the audible Min Max Alert which indicates that a new minimum or maximum value has been recorded.
7. Press the MIN MAX button until the MAX value is displayed and note the value.
8. Press the MIN MAX button until the MIN value is displayed and note the value.
9. Determine the difference between the MIN and MAX values.
    - If the variation between the recorded MIN and MAX voltage values is 1 V or greater an intermittent open or high resistance condition exists. Repair the condition as necessary.
    - If the variation between the recorded MIN and MAX voltage values is less than 1 V an intermittent open or high resistance condition does not exist.

SCAN TOOL SNAPSHOT PROCEDURE

Reviewing Stored Data in Global Diagnostic System (GDS)

Overview

A snapshot is a recording of what a control module on the vehicle was receiving for information while the snapshot is being made. A snapshot is used to analyze the data during the time a vehicle condition is current. In GDS 2 there is not a traditional snapshot as there has been in the past. GDS 2 saves all past VIN and diagnostic data for future viewing. GDS 2 automatically records data whenever the user views Module Diagnostics, Vehicle Diagnostics and/or Systems Diagnostics. Module Diagnostics includes DTC Data, Identification Information, Data Display, Control Functions and Configuration/Reset Functions. Vehicle Diagnostics includes Vehicle Wide DTCs. Systems Diagnostics includes Inspection/Maintenance Status and Inspection/Maintenance Information.

Reviewing Stored Data

The Review Stored Data function allows viewing and playing of previously recorded vehicle data. This information can be used in analysis of vehicle problems and detection of trigger error conditions. The graph

function can be used to compare multiple parameters to see if a component is functioning properly. Recorded sessions can be selected for viewing by the following two methods:

- From the Home Page, click on Review Stored Data. In the Review Stored Data page, highlight a vehicle in the Sessions screen located in the upper pane and highlight the desired Stored Data in the lower pane, then click the Review button.
- The user can view stored data without ending a current on-vehicle diagnostic session by clicking the Vehicle Menu button (when active) or Back button until the Session Manager is displayed in the menu. This is used when a user is viewing live data and wants the quickest way to review the data. Click on the Session Manager button. Highlight the desired Stored Data in the lower pane and click the Review button.

Stored Data Review Selections

The following information can be selected in the tabs at the top of the screen:

- Graphical Data Display - Allows a detailed review of parameter data. The buttons on the right side modify the graph data
- Diagnostic Data Display - Displays incoming information from the file. The current value of the parameters is displayed on the screen.
- Line Graph - Allows selected locked parameters to be graphed with parameters overlaid for data comparison. The current value of the parameters is displayed on the screen. Use the buttons on the right side to modify the graph data.
- Bookmarks - If bookmarks are present, this displays the Type, Description and Time of automatic and manually generated bookmarks.
- System Information - Displays the GDS 2 Software Version and MDI Serial Number used when the session was recorded.
- Selected Vehicle Configuration - Displays vehicle identifiers, such as transmission type, for the vehicle selected on the Stored Data Review screen in the Sessions field.
- RPO - Displays vehicle build information.

Graphical Data Display

On the Graphical Data Display tab there are multiple selections at the top of the page. The selections available are:

- Create Report - Opens and internet browser page where a data display report can be printed or saved for future reference.
- Unit Switch - Toggles graph units between English and metric.
- Lock - When a parameter is selected, clicking the lock button locks a selected parameter for viewing in the Line Graph tab. In the Line Graph tab, locked parameters are isolated and overlaid for data comparison.
- Up Arrow - Click the up arrow to move a highlighted parameter up a position on the list.
- Down Arrow - Click the down arrow to move a highlighted parameter down a position on the list.
- Save As - This selection is available in the Graphical Data Display and Diagnostic Data Display tabs. This allows the user to export the graph data to a worksheet for in depth analysis and to timestamp data.

Review Stored Data Functions

To review the session there are buttons at the bottom of the window to control the cursor. From left to right the buttons are:

- Insert Bookmark - This button allows the user to insert bookmarks anywhere along the timeline. This provision allows the user to record notes regarding the inserted bookmark.
- Return Bookmark - This button moves the cursor to the previous bookmark.
- Back - This button moves the cursor back 1 frame.
- Timeline Slider Control - This allows the user to slide and select any position on the Timeline required.
- Forward - This button moves the cursor forward 1 frame.
- Forward Bookmark - This button moves the cursor forward 1 bookmark.
- Bookmarks - Allows the user to toggle bookmark visibility ON and OFF.

Graphical Preference Selections

The vertical side bar on the right side of the screen in the Graphical Data Display and Line Graph tabs toggles the Graphical Selection Panel from hidden to visible. The graphical preference selections available are:

- Reset - Resets the graph display back to the initial standard GDS 2 setting.
- Grid Line Toggle - This toggle reverses the current state of showing or removing grid lines.
- Hash Mark Toggle - This toggle reverses the current state of showing or removing data acquisition points or hash marks.
- Horizontal Graph Compression - Compresses the scale of the graph horizontally.
- Horizontal Graph Expansion - Expands the scale of the graph horizontally.
- Vertical Graph Compression - Compresses the scale of the graph vertically.
- Vertical Graph Expansion - Expands the scale of the graph vertically.
- Move Centerline of Graph Up - Moves the centerline of the graph up incrementally.
- Move Centerline of Graph Down - Moves the centerline of the graph down incrementally.

CIRCUIT PROTECTION - FUSES

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to Special Tools .

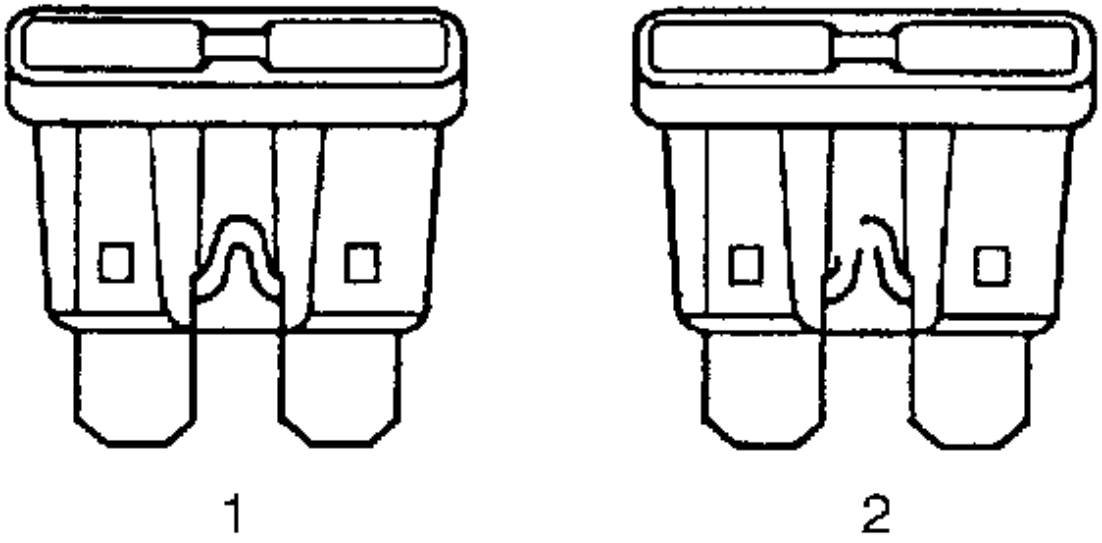

Fig. 3: Identifying Open Fuse Element
Courtesy of GENERAL MOTORS COMPANY

The fuse is the most common method of an automotive wiring circuit protection. Whenever there is an excessive amount of current flowing through a circuit the fusible element will melt and create an open or incomplete circuit. Fuses are a one time protection device and must be replaced each time the circuit is overloaded. To determine if a fuse is open, remove the suspected fuse and examine if the element in the fuse is broken (2). If not broken (1), also check for continuity using a Digital Multimeter (DMM) or a continuity tester. If the element is broken or continuity is suspect, replace the fuse with one of equal current rating.

Fuse Types

Current Rating Amperes	Color
Auto Fuses, Mini Fuses

CIRCUIT PROTECTION - CIRCUIT BREAKERS

A circuit breaker is a protective device that is designed to open the circuit when a current load is in excess of the rated breaker capacity. If there is a short or other type of overload condition in the circuit, the excessive current will open the circuit between the circuit breaker terminals. Two types of circuit breakers are used.

Circuit Breaker

This type opens when excessive current passes through it for a period of time. It closes again after a few seconds, and if the cause of the high current is still present, it will open again. The circuit breaker will continue to cycle open and closed until the condition causing the high current is removed.

Positive Temperature Coefficient (PTC) Circuit Breaker

This type greatly increases its resistance when excessive current passes through it. The excessive current heats the PTC device, as the device heats its resistance increases. Eventually the resistance gets so high that the circuit is effectively open. Unlike the ordinary circuit breaker the PTC unit will not reset until the circuit is opened, by removing the voltage from its terminals. Once the voltage is removed the circuit breaker will re-close within a second or 2.

CIRCUIT PROTECTION - FUSIBLE LINKS

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to Special Tools .

NOTE: **When repairing a fusible link, fusible links cut longer than 225 mm (approximately 9 in) will not provide sufficient overload protection.**

Fusible link is wire designed to melt and break continuity when excessive current is applied. It is often located between or near the battery and starter or electrical center. Use a continuity tester or a Digital Multimeter (DMM) at each end of the wire containing the fusible link in order to determine if it is broken. If broken, it must be replaced with fusible link of the same gauge size.

WIRING REPAIRS

The Wiring Repairs section contains the following types of wiring repair information. Using these elements together will make wiring repair faster and easier:

- **Testing for Intermittent Conditions and Poor Connections**
- **Flat Wire Repairs**
- **GMLAN and Media Oriented Systems Transport (MOST) Wiring Repairs**
- **High Temperature Wiring Repairs**
- **Heated Oxygen Sensor Wiring Repairs**
- **Splicing Copper Wire Using Splice Sleeves**
- **Splicing Twisted or Shielded Cable**
- **Splicing Inline Harness Diodes**
- **SIR/SRS Wiring Repairs**

REPAIRING DAMAGED WIRE INSULATION

WARNING: **In order to reduce the risk of personal injury, loss of high voltage isolation to ground and higher system impedance, do not attempt to repair any HV wiring, connector, or terminal that is damaged. High voltage coaxial type cables are not repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high voltage wiring, cables, or terminals. Performing this procedure on high voltage circuits may result in serious injury or death.**

If the wire insulation has been chafed, or broken, enough to show the conductive portion of the wire, and the wire is not damaged, determine the length of insulation that needs to be repaired. If the repair is less than 280 mm (11 in), cut the wire within the damaged area. Then slide the appropriate heat shrink tubing (listed below) over the wire, and repair the wire by splicing the wires together. Refer to **Splicing Copper Wire Using Splice Sleeves**. Once the wire is spliced together slide heat shrink tubing over the damaged area and apply heat to seal

the repaired wire.

If the wire is damaged, or the damaged area is larger than 280 mm (11 in), then replace the damaged wire by splicing in a new section of wire. Refer to **Splicing Copper Wire Using Splice Sleeves**.

GM Part Number	Diameter		Description	Color	Length	
	Metric	English			Metric	English
12355003	9.5 mm^2	0.375 in	Tubing, Shrink 3/8	Black	305 mm^2	12 in
12355005	12.7 mm^2	0.5 in	Tubing, Shrink 1/2	Black	305 mm^2	12 in
12355011	19.1 mm^2	0.75 in	Tubing, Shrink 3/4	Black	305 mm^2	12 in
12355008	25.4 mm^2	1.0 in	Tubing, Shrink 1.00	Black	305 mm^2	12 in

COAXIAL CABLE REPAIRS

The GM global coaxial (coax) cable repair strategy uses coaxial cables, connectors and jumpers to repair coaxial cables. The intent is to install the new service cable in vehicle, but removal of the old cable is not necessary. There are several repair scenarios:

- New cables, jumpers, and connector housing are required.
- Only new cables are required while it is possible to reuse the existing connector housing in vehicle. A jumper may or may not be needed.
- Only new connector housing are required, while it is possible to reuse the existing cable in the vehicle.
- A new cable would need to be installed from source to destination and by-pass the inline connector in some cases when an inline connector is unrepairable (Example: a cracked male end of a 1-way connector).

Coaxial Cable Kits

Four different kits will be available to repair coaxial cables. Components of each kit cannot be ordered separately from the kit.

- **Communication Interface Module Antenna Cable Kit** (Kit # 13581174) is used to repair Cellular coaxial cables. This kit uses RG58 low loss coaxial cables that are available in four lengths. The coaxial cables can be attached together in various lengths to closely match the length of the faulty/damaged coaxial cable.
- **Digital Radio and Vehicle Locator Antenna Coaxial Cable Kit** (Kit # 13581173) is used to repair XM and GPS coaxial cables. For vehicles that have a combined GPS and Cellular/OnStar signal on one cable, use Kit # 13581174. This kit uses RG316 low loss coaxial cables that are available in three lengths. The coaxial cables can be attached together in various lengths to closely match the length of the faulty/damaged coaxial cable.
- **Digital Radio, Mobile Telephone and Vehicle Locator Antenna Coaxial Cable Kit** (Kit # 19119056) is used with OnStar, XM, and GPS cables. This kit consists of jumpers and connectors. The jumpers are used to adapt different types of connectors together (to attach 2-way and 3-way connector onto the long 7, 5, and 3 foot cables). The connectors are used to replace existing connectors. The 1-way and 2-way connectors in the kit are in water-blue color (different than what the vehicle is built with) and are non-keyed (universal fit). The 3-way connectors in the kit are in the same color as in the vehicle.
- **Communication Interface Module Antenna Cable Kit** (Kit # 22803854) is used for the OnStar module on some vehicles built before the 2011 model year.

		Tan female connector
		Tan male connector
		Gray female connector
		Gray male connector
	2-way Gen 1 sub-kit	1-way to 2-way Gen 1 jumper for female connector - Part # 13581156 - 4in/10cm
		Water-blue female connector
	2-way Gen 2 sub-kit (wide)	1-way to 2-way Gen 2 jumper for female connector - Part # 13581157 - 4in/10cm
		1-way to 2-way Gen 2 jumper for male connector - Part # 13581158 - 4in/10cm
		Water-blue female connector
		Water-blue male connector
	2-way Gen 2 and 3 sub-kit (narrow)	1-way to 2-way Gen 2 and 3 jumper for female connector - Part # 13582468 - 4in/10cm
		Use the 1-way to 2-way Gen 2 jumper for female connector 19119058 - 4in/10cm from the 2-way Gen 2 sub-kit.
		Water-blue female connector
		Water-blue male connector
	Right-angle jumper with water-blue universal 1-way connector - 4in/10cm	
Communication Interface Module Antenna Cable Kit (Kit # 22803854)		1-way to mini UHF jumper - 4in/10cm

Connector Housing Repair Procedure

The connector housings (available in Digital Radio, Mobile Telephone and Vehicle Locator Antenna Coaxial Cable Kit) are available for 1-way housings, 2-way housings and 3-way housings. Determine the connector housing required:

1-way housing

No change to the service coaxial cable is necessary in order to install the new coaxial cable into the vehicle.

2-way housing

A 4-inch jumper is required.

1. Determine the appropriate generation (1, 2, or 3) and/or size (12.7mm or 8mm) of the 2-way housing that is in the vehicle.
2. Remove the faulty/damaged coaxial cable from the 2-way connector housing by removing the terminal position assurance (TPA) from the connector housing and then slide the cable out of the connector.

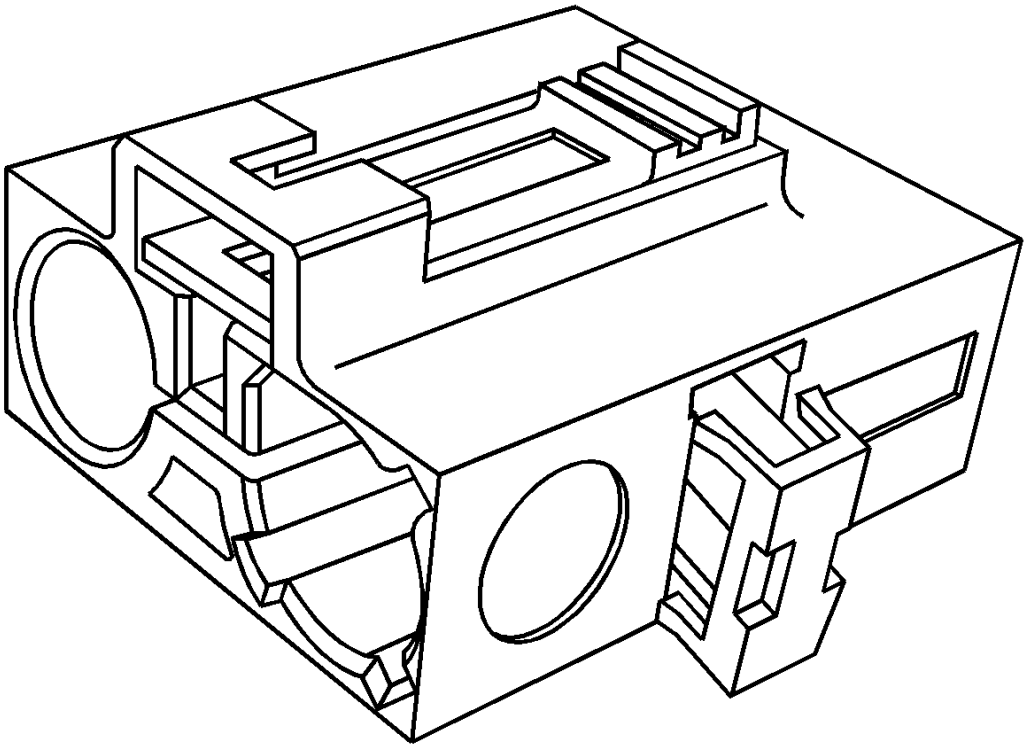

Fig. 4: Connector Housing
Courtesy of GENERAL MOTORS COMPANY

3. Install the new service coaxial cable into the vehicle. Use the 4-inch jumper for the appropriate 2-way connector housing to connect the new service coaxial cable to the connector housing.
4. If the issue is found to be the connector housing and not cable, a new connector housing may be installed while reusing all other components.

3-way housing

A 4-inch jumper is required.

1. Determine the appropriate generation (1 or 2) and keyed 3-way connector housing based on the connector housing color.
2. Note the locations of each of the cables in 3-way housing, as it is important for new cables be placed in the appropriate terminal location in the new connector. The connector housing colors are not interchangeable.
3. Remove the faulty/damaged coaxial cable from the 3-way connector housing by using a pair of side/diagonal cutters to nip and break away the housing.

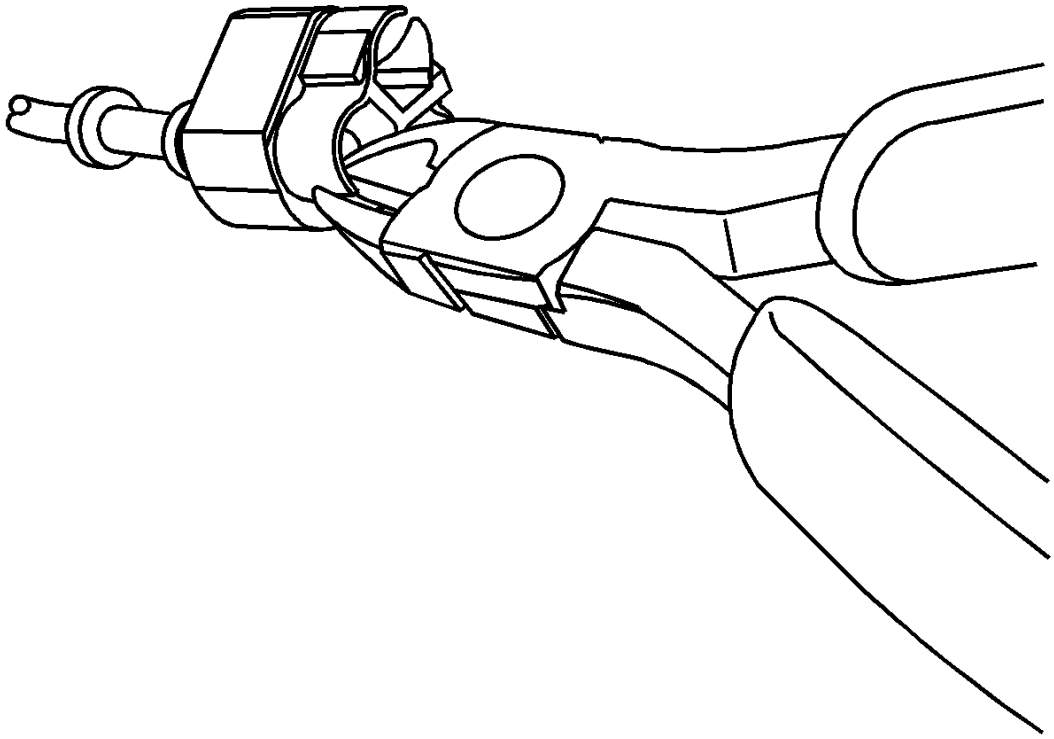

Fig. 5: Using Side/Diagonal Cutters To Nip And Break Away Connector Housing
Courtesy of GENERAL MOTORS COMPANY

4. Use caution not to damage the conductive ends of the coaxial cables inside the connector housing. Do not bend or force the terminal out or it could be damaged.

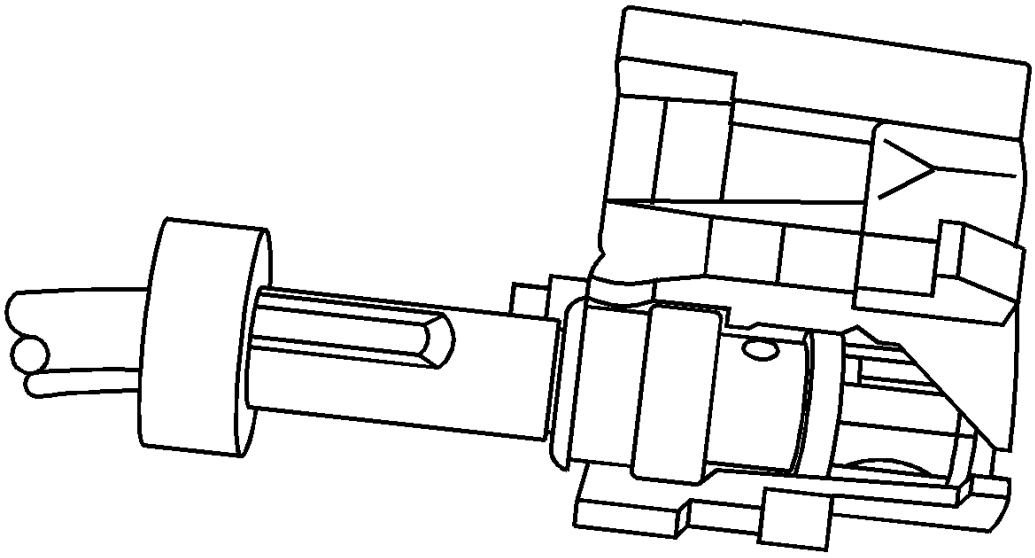

Fig. 6: Connecting New Service Coaxial Cable To New 3-Way Connector Housing
Courtesy of GENERAL MOTORS COMPANY

5. Install the new service coaxial cable into the vehicle. Use the 4-inch jumper for the appropriate color 3-way connector housing to connect the new service coaxial cable to the new 3-way connector housing.
6. If the issue is found to be the connector housing and not cable, a new connector housing may be installed while reusing all other components.

Coaxial Cable Repair Procedure

1. Identify the faulty/damaged coaxial cable.
2. Disconnect the faulty/damaged coaxial cable and leave it in the vehicle.
3. Identify the type of coaxial cable to be replaced and match up with the appropriate pieces to repair the damaged coaxial cable. Match up the type of coaxial cable, cable length and connector types. In some cases there may be extra length of cable left over.

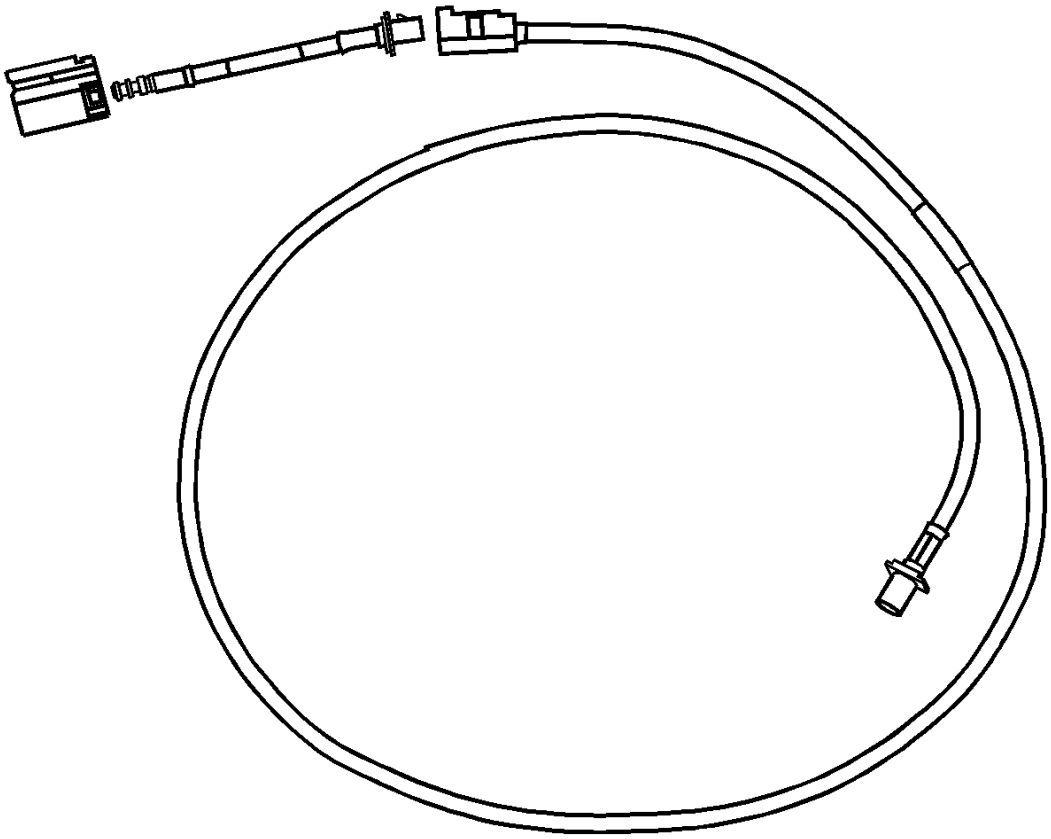

Fig. 7: Coaxial Cable
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Avoid routing the new coaxial cable near sharp edges that can damage the new coaxial cable.**

4. Install the new coaxial cable in the vehicle.

   Use tie-straps to attach the new service coaxial cable to existing harnesses or brackets. Use felt tape/foam to reduce rattles, as necessary.

   NOTE: **To avoid permanent damage, do not pinch the cable or bend it tighter than a 2 inch (5 centimeter) radius.**

5. Remove the faulty/damaged connectors, if applicable.
6. Install new connectors or jumpers, as needed. Refer to Connector Housing Repair Procedure.
7. Verify the repair by operating the system with the engine running.

FLAT WIRE REPAIRS

The flat wire within the flex wiring harness is not serviceable. If an open or short exists within the flex wiring harness the complete harness must be replaced.

FOLDED-OVER WIRE REPAIR

Special Tools

- **EL-38125-10** Splice Sleeve Crimping Tool (non GMNA)
- **J-38125-5A** Ultra Torch Special Tool
- **J-38125-8** Splice Sleeve Crimping Tool (GMNA)

For equivalent regional tools, refer to Special Tools .

The GM global wire repair strategy uses connector assemblies (pigtails) and terminated leads to repair wiring harnesses.

To reduce and manage GM Service Parts proliferation, the service pigtails and terminated leads are designed with the largest wire gauge size that can be held by either the terminal or the connector housing.

The folded over wire repair technique, in which the copper wire strands are folded over before being installed into a splice sleeve, allows the service part to be used when repairing a smaller gauge size wire in a vehicle. This technique has passed all GM testing standards.

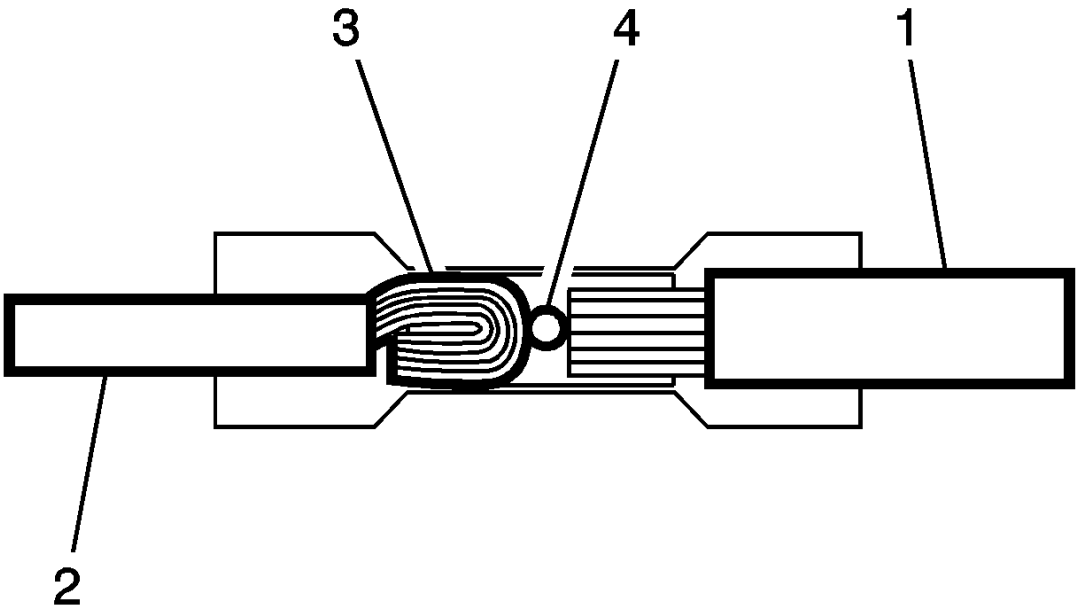

Fig. 8: View Of Stripped Wires In Splice Sleeve Connector
Courtesy of GENERAL MOTORS COMPANY

The larger harness size wires (1) will be placed in one side of the splice sleeve and match the splice sleeve closely in size. The wires are moved into the splice sleeve until they hit the stop (4) in the splice sleeve. The smaller harness size wires (2) will be placed in the other side of the splice sleeve. The smaller harness size wires will be folded over (3) to match up with the splice sleeve size.

Use the folded over wire repair for:

NOTE: **Increasing the amount of copper strands in the smaller gauge size will allow for a better crimp**

- Splicing wires of 0.35 mm or less (22, 24, 26 gauge sizes)

NOTE: **Vehicle side needs to be of same or less gauge size (not greater than the service part's gauge size)**

- Splicing wires of different gauges

Use the Service Information (SI) connector end-views to determine:

- Gauge size of wiring harness
- Recommended Repair: Terminated Lead or Pigtail

The following table lists the acceptable variance within the gauge size

Folded-Over Wire Selection Table

Harness Wire Gauge		**Connector Assembly (Pigtail) or Terminated Lead Wire Gauge Size**			
-		Salmon Color Splice Sleeve		Blue Color Splice Sleeve	Yellow Color Splice Sleeve
Metric	-	0.35 mm	0.5-0.8 mm	1.0-2.0 mm	3.0-5.0 mm
-	Wire Gauge (AWG)	22	20-18	16-14	12-10
0.13 mm	26	Fold Over Wire	Fold Over Wire	Fold Over Wire	Not Acceptable
0.22 mm	24	Fold Over Wire	Fold Over Wire	Fold Over Wire	Not Acceptable
0.35 mm	22	Fold Over Wire	Fold Over Wire	Fold Over Wire	Not Acceptable
0.5 mm	20	Not Acceptable	Wire to Wire	Fold Over Wire	Not Acceptable
0.75 mm	-	Not Acceptable	Wire to Wire	Fold Over Wire	Not Acceptable
0.8 mm	18	Not Acceptable	Wire to Wire	Fold Over Wire	Not Acceptable
1.0 mm	16	Not Acceptable	Wire to Wire	Fold Over Wire	Not Acceptable
1.5 mm	-	Not Acceptable	Not Acceptable	Wire to Wire	Fold Over Wire
2.0 mm	14	Not Acceptable	Not Acceptable	Wire to Wire	Fold Over Wire
2.5 mm	-	Not Acceptable	Not Acceptable	Wire to Wire	Fold Over Wire
3.0-5.0 mm	12-10	Not Acceptable	Not Acceptable	Not Acceptable	Wire to Wire

Example

For an IP Harness of 0.22 mm (24 gauge on left side of table) wire size, the SI connector end-view recommends a pigtail with leads of 0.8 mm (18 gauge on the top of the table) with a salmon colored DuraSeal splice sleeve of 0.5-1.0 mm (20-16 gauge).

Follow these steps to use the folded over wire (1) technique on an IP Harness.

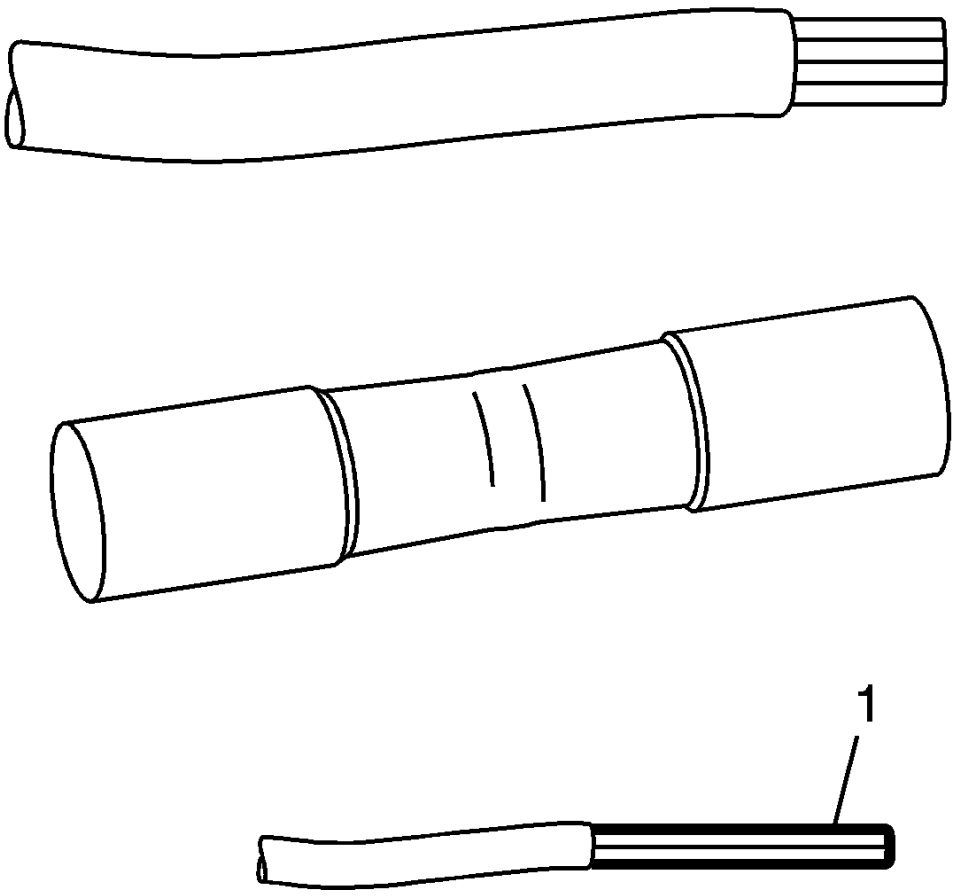

Fig. 9: View Of Stripped Wires
Courtesy of GENERAL MOTORS COMPANY

Strip twice the amount of insulation on the smaller (1) wire (IP Harness is the lower wire) than normally required. Normally, the terminated leads have 5 mm of insulation stripped off the wire.

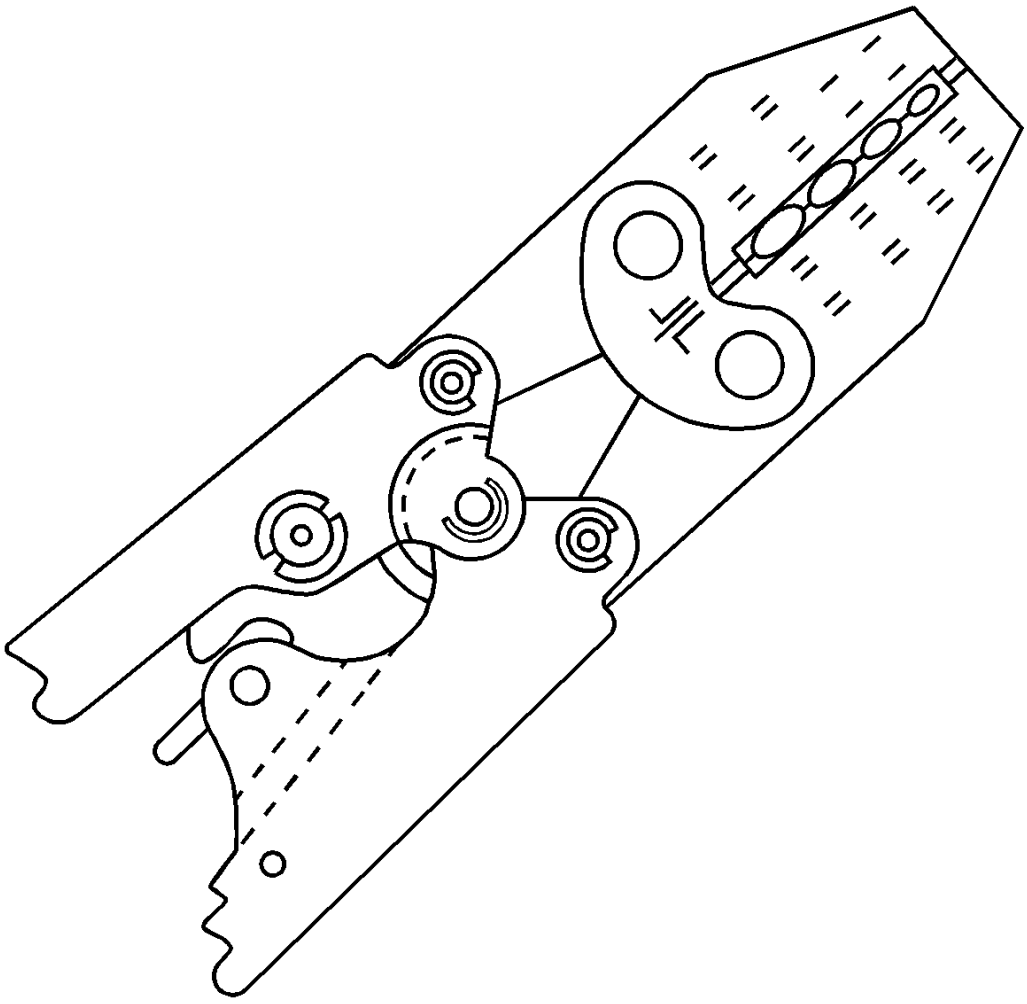

Fig. 10: Splice Sleeve Crimping Tool
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Use EL-38125-10 splice sleeve crimping tool (non GMNA) or J-38125-8 splice sleeve crimping tool (GMNA).**

1. For wiring repair, refer to **Splicing Copper Wire Using Splice Sleeves**.

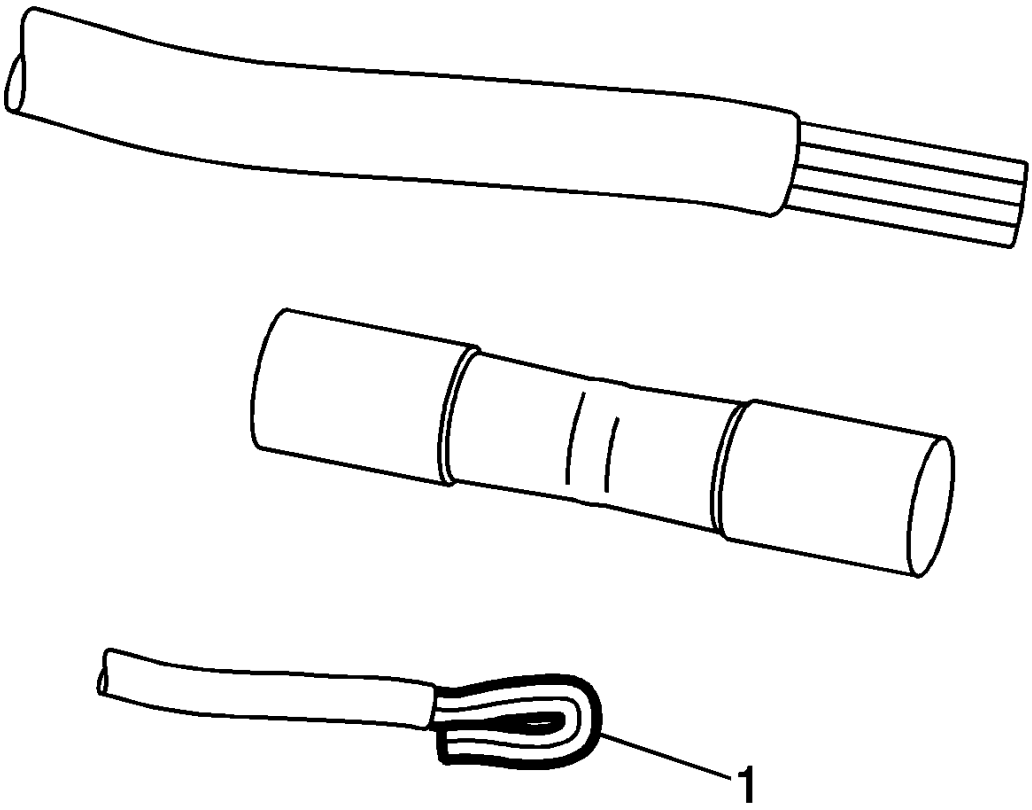

Fig. 11: View Of Twisted And Folded Wire To Length
Courtesy of GENERAL MOTORS COMPANY

2. Twist the wires before you fold them over to prevent the wire strands from opening up. Fold over the copper wire strands of the smaller (1) gauge wire so that it is the same length as the non-folded wire.

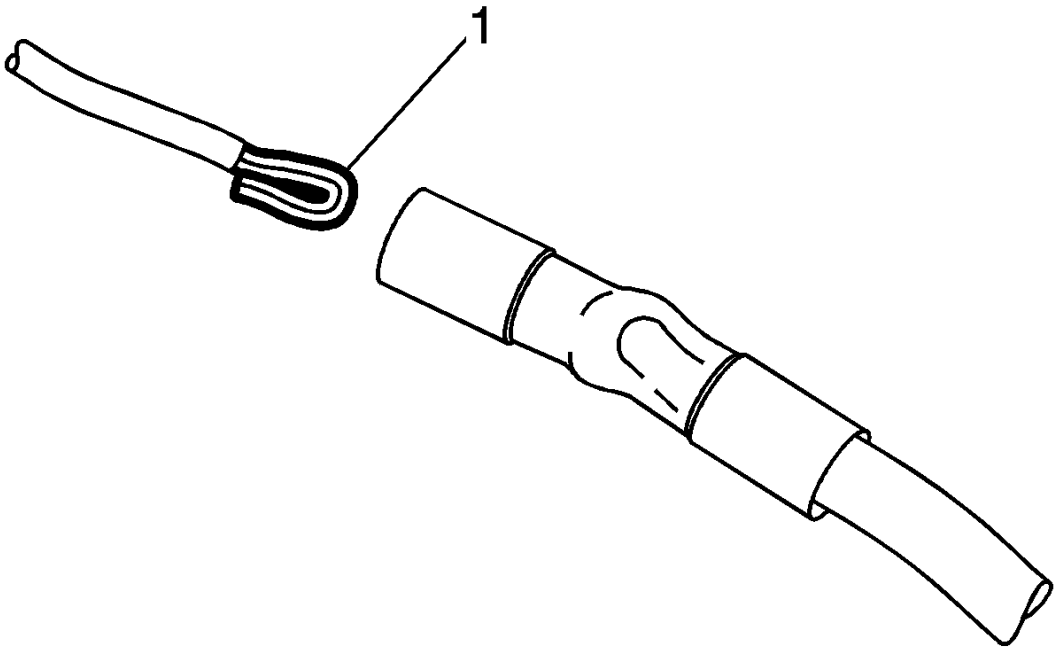

Fig. 12: View Of Folded Wire & Splice Sleeve
Courtesy of GENERAL MOTORS COMPANY

3. Insert the folded over wire (1) into the splice sleeve.

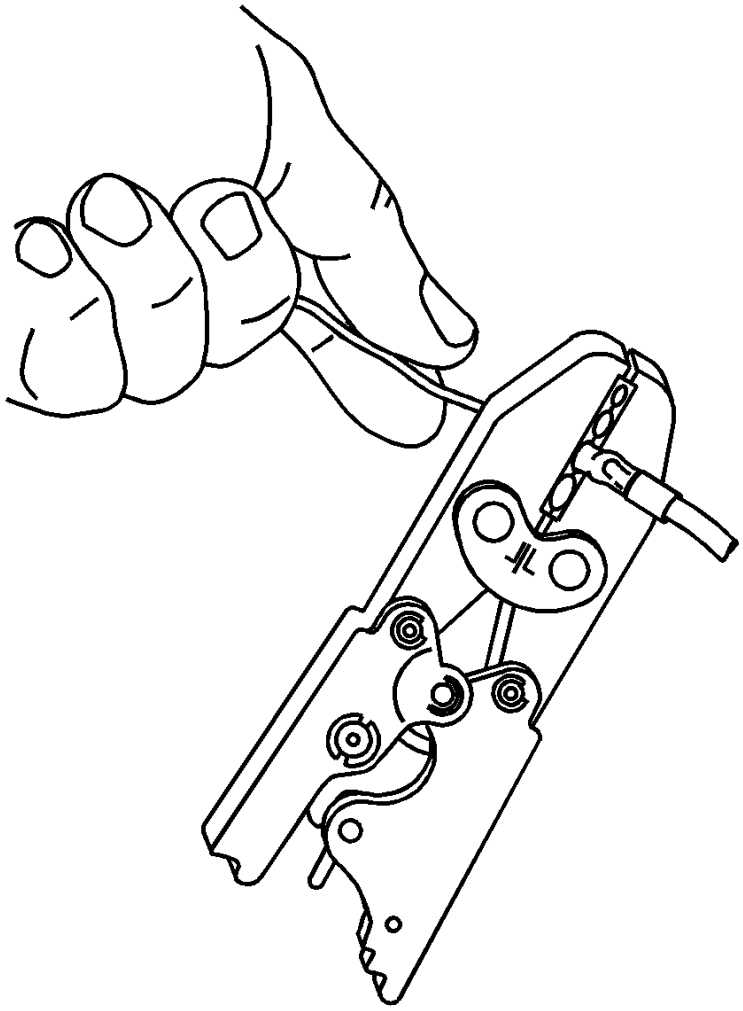

Fig. 13: Crimping The Splice Sleeve
Courtesy of GENERAL MOTORS COMPANY

4. Use the proper crimp tool to crimp the splice sleeve to the smaller wire (harness side of repair). Complete the crimp as usual (using the heat tool to shrink the tube).

HIGH TEMPERATURE WIRING REPAIRS

NOTE: **All wiring repairs need to be 200 mm from the heat zone. Areas of consideration would be any area located near the exhaust manifolds, catalytic converter, exhaust pipes, and turbocharged engines.**

Items Required

- DuraSeal splice sleeves to crimp and seal connections
- High temperature SCT1 shrink tubing to protect the splice sleeves
- Terminated leads or pigtails
- The correct tools to remove the terminals from the connectors

Use high temperature bulk wire rated at 150Â°C (302Â°F) continuous temperature of the same or larger gauge

size as the original wire when repair damage wire. Also replace any reflective tape that you remove during the repair.

High Temperature Wiring

Wiring that is exposed to high temperatures, 135Â°C (275Â°F) or higher, for prolonged periods of time may use materials i.e. wires, connectors, and shielding that has a higher heat rating than typical wiring. When making a repair in a high temperature area observe the following:

- Use high temperature bulk wire rated at 150Â°C (302Â°F) continuous temperature to replace any damaged wire.
- Replace any heat shielding that is removed.
- Cover any DuraSeal splice sleeves with SCT1 shrink tubing.
- After making a wiring repair, ensure that the location of the wiring is not moved closer to the heat source.

Identifying High Temperature Wiring

NOTE: **High temperature areas would be areas located near exhaust manifolds, catalytic converters, exhaust pipes, and turbocharged engines.**

Wiring that is exposed to high temperature, 135Â°C (275Â°F) or higher, for prolonged periods of time need special considerations when making wiring repairs. Areas that may be exposed to higher temperatures can be identified by heat resistant materials that are being used in those areas. These materials may include heat reflective tape, moon tape, and high temperature shrink tubing. Also conduit and other protective coverings may be used. Because conduit or similar coverings are used throughout the vehicle regardless of the temperature, it may be necessary for the technician to determine if an area is exposed to excessive heat before making a wiring repair.

HEATED OXYGEN SENSOR WIRING REPAIRS

CAUTION: **Do not solder repairs under any circumstances as this could result in the air reference being obstructed.**

If the heated oxygen sensor pigtail wiring, connector, or terminal is damaged the entire oxygen sensor assembly must be replaced. Do not attempt to repair the wiring, connector, or terminals. In order for the sensor to function properly it must have a clean air reference. This clean air reference is obtained by way of the oxygen sensor signal and heater wires. Any attempt to repair the wires, connectors or terminals could result in the obstruction of the air reference and degrade oxygen sensor performance.

The following guidelines should be used when servicing the heated oxygen sensor:

- Do not apply contact cleaner or other materials to the sensor or vehicle harness connectors. These materials may get into the sensor, causing poor performance. Also, the sensor pigtail and harness wires must not be damaged in such a way that the wires inside are exposed. This could provide a path for foreign materials to enter the sensor and cause performance problems.
- Neither the sensor nor vehicle lead wires should be bent sharply or kinked. Sharp bends, kinks, etc., could block the reference air path through the lead wire.
- Do not remove or defeat the oxygen sensor ground wire (where applicable). Vehicles that utilize the

ground wire sensor may rely on this ground as the only ground contact to the sensor. Removal of the ground wire will also cause poor engine performance.

- To prevent damage due to water intrusion, be sure that the peripheral seal remains intact on the vehicle harness connector.

SPLICING COPPER WIRE USING SPLICE SLEEVES

Special Tools

- **EL-38125-10** Splice Sleeve Crimping Tool
- **EL-38125-5** Ultra Torch Special Tool
- DuraSeal splice sleeves, in order to repair the SIR/SRS wiring

For equivalent regional tools, refer to Special Tools .

WARNING: **In order to reduce the risk of personal injury, loss of high voltage isolation to ground and higher system impedance, do not attempt to repair any HV wiring, connector, or terminal that is damaged. High voltage coaxial type cables are not repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high voltage wiring, cables, or terminals. Performing this procedure on high voltage circuits may result in serious injury or death.**

NOTE: **If the wiring harness internal to the transmission is damaged, the wiring harness must be replaced. The use of splice sleeves in an attempt to repair the internal transmission wires, connectors, or terminals could result in performance issues.**

NOTE: **Do not splice wires in Door Harness Grommets.**

NOTE:

- **Use only DuraSeal splice sleeves. Other splice sleeves may not protect the splice from moisture or provide a good electrical connection.**
- **For wire Gauge smaller than .5 mm (18 gauge) refer to Folded-Over Wire Repair**

Use DuraSeal splice sleeves to form a one-to-one splice on all types of insulation except high voltage and specialty cables. Use DuraSeal splice sleeves where there are special requirements such as moisture sealing. Follow the instructions below in order to splice copper wire using DuraSeal splice sleeves.

Splice Sleeve Color	Crimp Tool Nest Color		Wire Gauge mm^2 / (AWG)
	3 Crimp Nests	4 Crimp Nests	
Salmon (Yellow-Pink) 19168446	Red (1) or Red/Green (1)	Red (2)	0.5-0.8/(18-20)
Blue 19168447	Blue (2)	Blue (3)	1.0-2.6/(14-16)

Splice Sleeve Color	Crimp Tool Nest Color		Wire Gauge mm^2 / (AWG)
	3 Crimp Nests	4 Crimp Nests	
Yellow 19168448	Yellow (3)	Yellow (4)	3.0-5.0/(10-12)

NOTE: **You must perform the following procedures in the listed order. Repeat the procedure if any wire strands are damaged. You must obtain a clean strip with all of the wire strands intact.**

1. Open the harness by removing any tape:
   - Use a sewing seam ripper, available from sewing supply stores, in order to cut open the harness in order to avoid wire insulation damage.
   - Use the DuraSeal splice sleeves on all types of insulation except Tefzel and coaxial.
   - Do not use the crimp and DuraSeal splice sleeve to form a splice with more than 2 wires coming together.
2. Cut as little wire off the harness as possible. You may need the extra length of wire in order to change the location of a splice.

   Adjust splice locations so that each splice is at least 40 mm (1.5 in) away from the other splices, harness branches, or connectors.

3. Strip the insulation:
   - When adding a length of wire to the existing harness, use the same size wire as the original wire.
   - Perform one of the following items in order to find the correct wire size:
     - Find the wire on the schematic and convert to regional wiring gauge size.
     - If you are unsure of the wire size, begin with the largest opening in the wire stripper and work down until achieving a clean strip of the insulation.
   - Strip approximately 5.0 mm (0.20 in) of insulation from each wire to be spliced.
   - Do not nick or cut any of the strands. Inspect the stripped wire for nicks or cut strands.
   - If the wire is damaged, repeat this procedure after removing the damaged section.
4. For high temperature wiring, slide a section of high temperature SCT1 shrink tubing down the length of wire to be spliced. Ensure that the shrink tubing will not interfere with the splice procedure.
5. Select the proper DuraSeal splice sleeve according to the wire size. Refer to the above table at the beginning of the repair procedure for the color coding of the DuraSeal splice sleeves and the crimp tool nests.

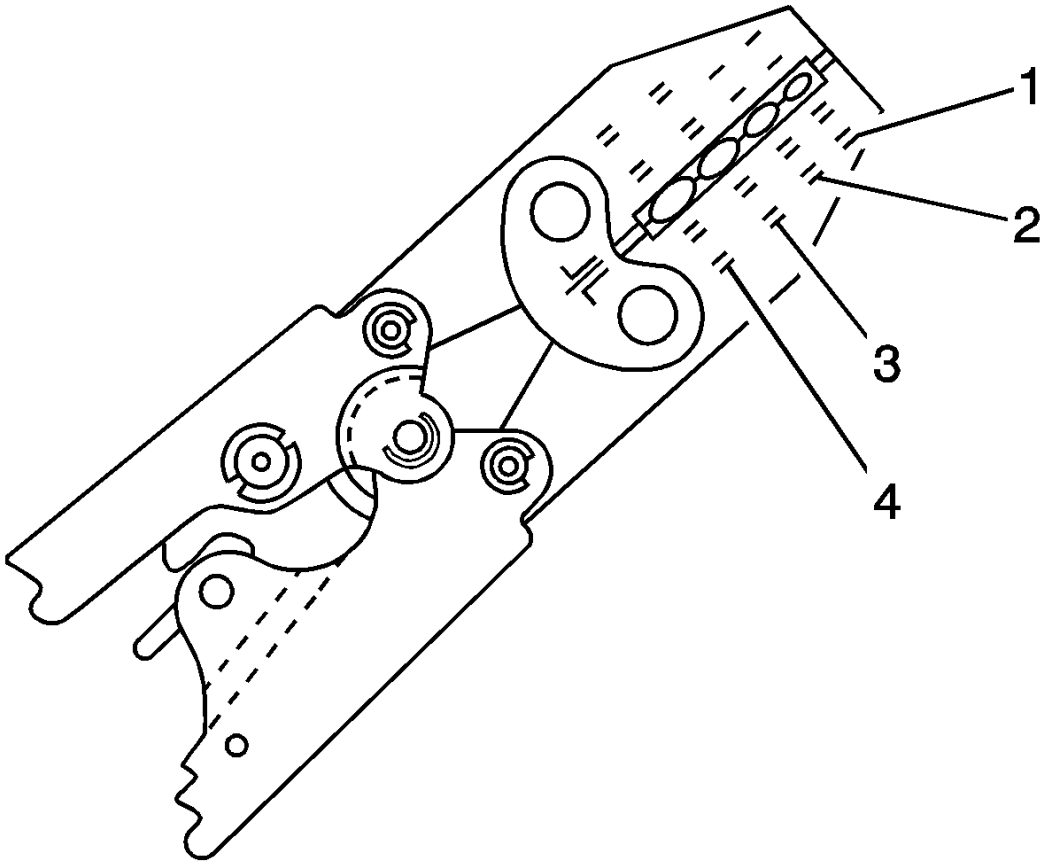

Fig. 14: Crimping Tool
Courtesy of GENERAL MOTORS COMPANY

6. The **EL-38125-10** splice sleeve crimping tool has four crimp nests. The largest crimp nest (4) is used for crimping 10 and 12 gauge wires. The second largest crimp nest (3) is used for crimping 14 and 16 gauge wires. The third largest crimp nest (2) is used for crimping 18 and 20 gauge wires. The smallest crimp nest (1) is used for crimping 22 to 26 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.

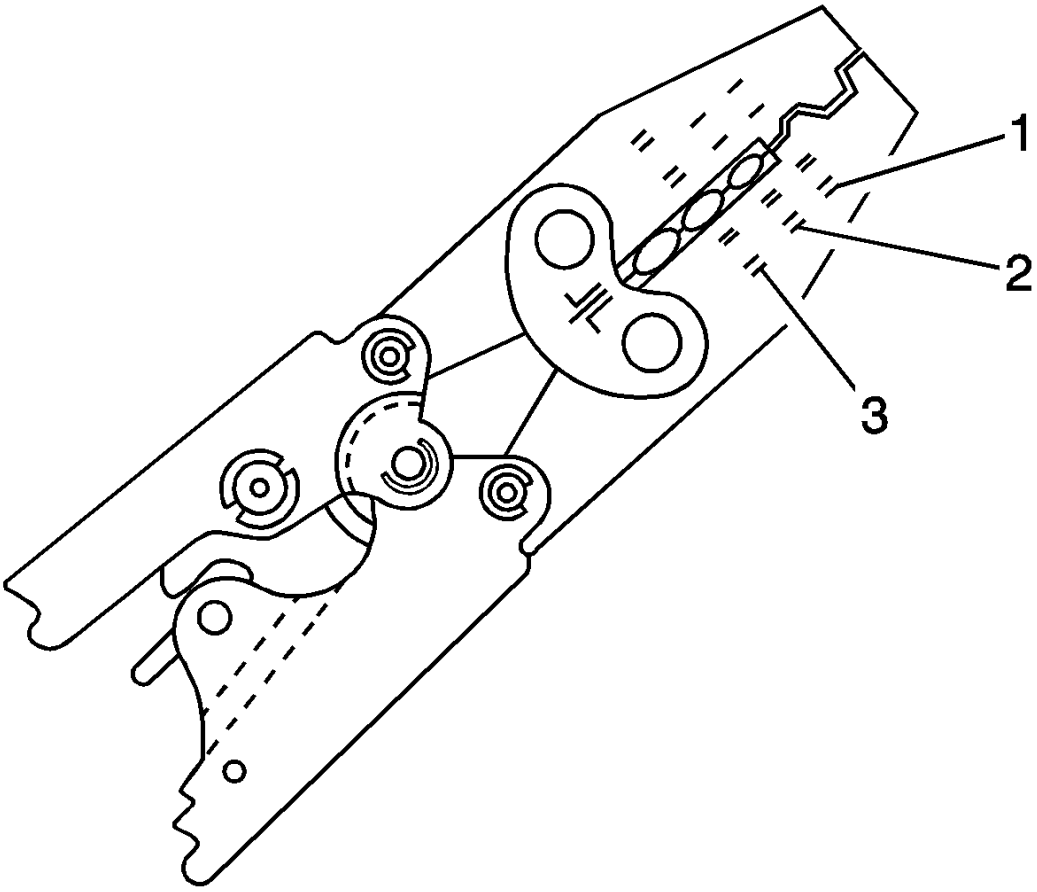

Fig. 15: Identifying Splice Crimp Tool Nests Terminal Identification
Courtesy of GENERAL MOTORS COMPANY

7. The **J-38125-8** splice sleeve crimping tool has three crimp nests. The largest crimp nest (3) is used for crimping 10 and 12 gauge wires. The second largest crimp nest (2) is used for crimping 14 and 16 gauge wires. The smallest crimp nest (1) is used for crimping 18 to 20 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.
8. Use the splice sleeve crimp tool in order to position the DuraSeal splice sleeve in the proper color nest of the splice sleeve crimp tool. For the four crimp nest tool, use the three largest crimp nests to crimp the splice sleeves. For the three crimp nest tool, use all three crimp nests to crimp the splice sleeves. Use the four and three crimp tool diagrams (above) and the table (farther above) to match the splice sleeve with the correct crimp nest. The crimp tool diagram callout numbers match the numbers in the table (under crimp tool nest color).

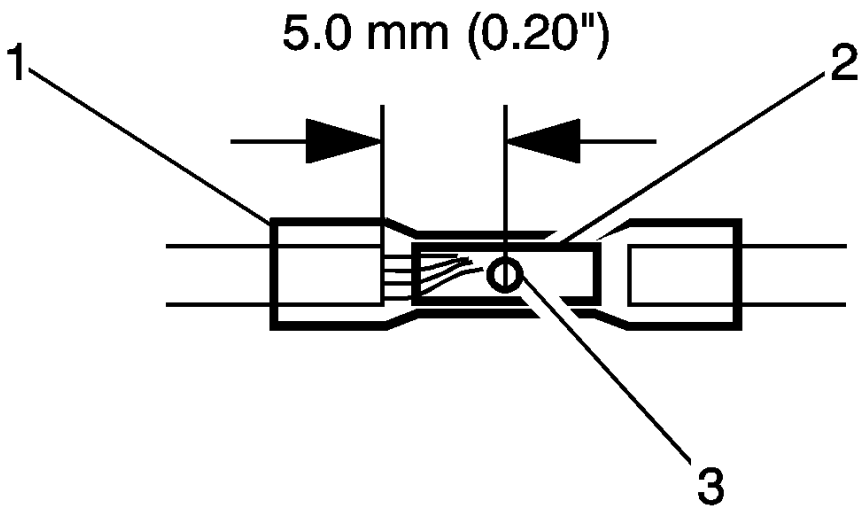

Fig. 16: Identifying Duraseal Splice Sleeve
Courtesy of GENERAL MOTORS COMPANY

9. Place the DuraSeal splice sleeve in the nest. Ensure that the crimp falls midway between the end of the barrel and the stop. The sleeve has a stop (3) in the middle of the barrel (2) in order to prevent the wire (1) from going further. Close the hand crimper handles slightly in order to firmly hold the DuraSeal splice sleeve in the proper nest.

Fig. 17: Crimped Duraseal Splice Sleeve
Courtesy of GENERAL MOTORS COMPANY

10. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop.
11. Tightly close the handles of the crimp tool until the crimper handles open when released.

    The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Repeat steps 4 and 6 for the opposite end of the splice.

Fig. 18: Crimped Duraseal Splice Sleeve
Courtesy of GENERAL MOTORS COMPANY

12. Using the EL-38125-5 ultra torch, apply heat to the crimped area of the barrel.
13. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
    - The tubing will shrink completely as the heat is moved along the insulation.
    - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

High Temperature Wiring Repairs

Use the following procedures to perform high temperature wiring repairs:

1. Center the high temperature SCT1 shrink tube over the DuraSeal splice sleeve.
2. Using the EL-38125-5 ultra torch, apply heat to the high temperature heat shrink tubing.
3. Gradually move the heat from the center to the open end of the tubing:

- The tubing will shrink completely as the heat is moved along the insulation.
- A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

4. Replace any reflective tape and clips that may have been removed during the repair.

SPLICING TWISTED OR SHIELDED CABLE

WARNING: In order to reduce the risk of personal injury, loss of high voltage isolation to ground and higher system impedance, do not attempt to repair any HV wiring, connector, or terminal that is damaged. High voltage coaxial type cables are not repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high voltage wiring, cables, or terminals. Performing this procedure on high voltage circuits may result in serious injury or death.

Twisted/shielded cable is used in order to protect wiring from electrical noise. Two-conductor cable of this construction is used between the radio and the Delco-BoseÂ® speaker/amplifier units and other applications where low level, sensitive signals must be carried. Follow the instructions below in order to repair the twisted/shielded cable.

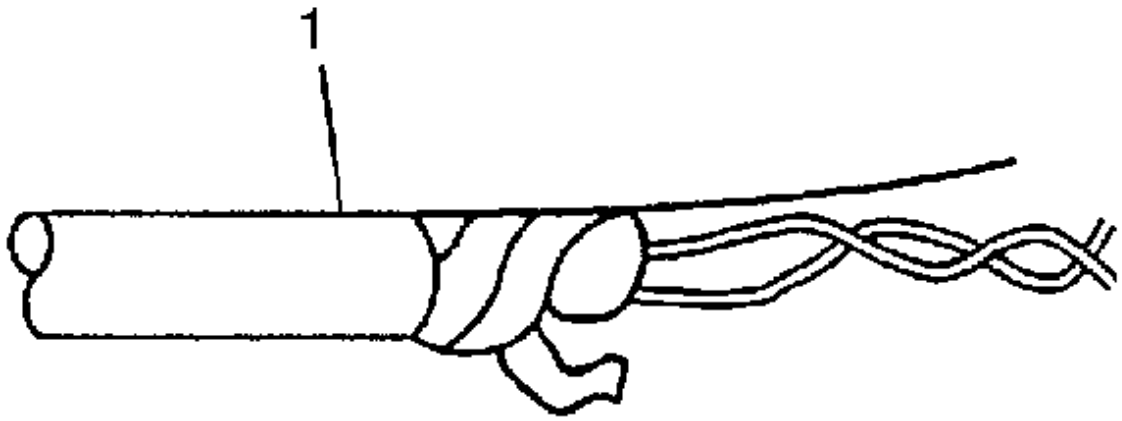

Fig. 19: View Of Outer Wiring Jacket
Courtesy of GENERAL MOTORS COMPANY

1. Remove the outer jacket (1). Use care not to cut into the drain wire of the mylar tape.
2. Unwrap the tape. Do not remove the tape. Use the tape in order to rewrap the twisted conductors after the splice is made.

Fig. 20: Preparing The Splice
Courtesy of GENERAL MOTORS COMPANY

3. Prepare the splice. Untwist the conductors and follow the instructions for **Splicing Copper Wire Using Splice Sleeves**. Staggering the splices by 65 mm (2.5 in) is recommended.

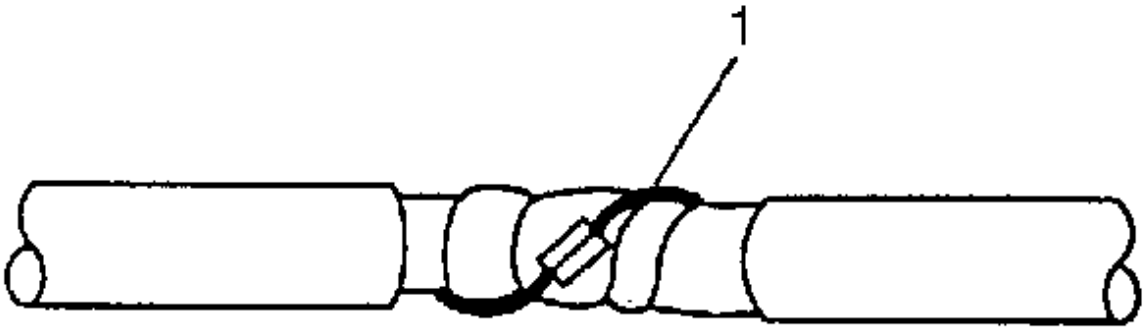

Fig. 21: Identifying Diode On Wire
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Apply the mylar tape with the aluminum side inward. This ensures good electrical contact with the drain wire.**

4. Re-assemble the cable.
    - Rewrap the conductors with the mylar tape. If the mylar tape is damaged, use 3M product AL-36FR to replace the damaged mylar tape.
    - Use caution not to wrap the drain wire in the tape (1).
    - Follow the splicing instructions for copper wire and splice the drain wire.
    - Wrap the drain wire around the conductors and tape with electrical tape to replace the outer insulation.

Fig. 22: View Of Repaired Wire Covered With Electrical Tape
Courtesy of GENERAL MOTORS COMPANY

5. Tape over the entire cable. Use a winding motion when you apply the tape.

SPLICING INLINE HARNESS DIODES

Many vehicle electrical systems use a diode to isolate circuits and protect the components from voltage spikes. When installing a new diode use the following procedure.

1. Open the harness.
    - If the harness is taped, remove the tape.
    - To avoid wiring insulation damage, use a sewing seam ripper (available from sewing supply stores) in order to cut open the harness.
    - If the harness has a black plastic conduit, pull out the diode.
2. If the diode is taped to the harness, remove all of the tape.

3. Check and record the current flow direction and orientation of diode.
4. Remove the inoperative diode from the harness with a suitable soldering tool.

NOTE: **If the diode is located next to a connector terminal remove the terminal(s) from the connector to prevent damage from the soldering tool.**

5. Carefully strip away a section of insulation next to the old soldered portion of the wire(s). Do not remove any more than is needed to attach the new diode.
6. Check current flow direction of the new diode, being sure to install the diode with correct bias. Reference the appropriate service manual wiring schematic to obtain the correct diode installation position.
7. Attach the new diode to the wire(s) using 60/40 rosin core solder. Before soldering attach some heat sinks (aluminum alligator clips) across the diode wire ends to protect the diode from excessive heat. Follow the manufacturer's instruction for the soldering equipment.
8. Reinstall terminal(s) into the connector body if previously removed.

NOTE: **To prevent shorts to ground and water intrusion, completely cover all exposed wire and diode attachment points with tape.**

9. Tape the diode to the harness or connector using electrical tape.

SIR/SRS WIRING REPAIRS

NOTE: **Refer to SIR Service Precautions .**

For European Regions

CAUTION: **If the SIR/SRS wiring, connector, or terminal is damaged, the affected wiring harness must be replaced. Do not attempt to repair the wiring, connector, or terminals. Any attempt to repair the wires, connectors, or terminals could result in performance problems of the SIR/SRS System. Operations on restraint systems must only be performed by trained and qualified personnel.**

For Non-European Regions

Special Tools

Splice Sleeve Crimping Tool, refer to Special Tools .

The Supplemental Inflatable Restraint (SIR) System/Supplemental Restraint System (SRS) requires special wiring repair procedures due to the sensitive nature of the circuitry. Follow the specific procedures and instructions when working with the SIR/SRS, and the wiring components, such as connectors and terminals.

SIR/SRS Connector Repair (Plastic Body and Terminal Metal Pin)

NOTE: **Do not use the terminals in the kit in order to replace damaged SIR/SRS system terminals. Use either an SIR/SRS pigtail or a terminated lead from the SIR Repair Kit Tray.**

The terminals in the SIR/SRS system are made with a special plating. This plating provides the necessary

contact integrity for the sensitive, low energy circuits.

Pigtail repair packs are available for SIR/SRS connectors with eight or less terminals. Only the connector body is available for connectors with more than eight terminals. Terminated leads can be used to replace damaged terminals when replacing the connector body.

SIR/SRS Component Wire Pigtail Repair

NOTE: **Do not make wire, connector, or terminal repairs on components with wire pigtails.**

A wire pigtail is a wire or wires attached directly to the device, not by a connector. If a wiring pigtail is damaged, you must replace the entire component, with pigtail. The inflatable restraint steering wheel module coil is an example of a pigtail component.

SIR/SRS Wire Repair

CAUTION: **Do not install more than 2 DuraSeal splice sleeves per SIR deployment loop. A deployment loop consists of both wires from the K36 Inflatable Restraint Sensing and Diagnostic Module to the deployable component. If more than 2 DuraSeal splice sleeves are required for any SIR deployment loop, the complete circuit of the loop must be replaced. More than 2 DuraSeal splice sleeves per deployment loop may increase the resistance in the circuit causing a DTC to be set.**

NOTE: **Refer to Wiring Repairs in the service information connector end views or the vehicle schematics in order to determine the correct wire size for the circuit you are repairing. You must obtain this information in order to ensure circuit integrity.**

If any wire except the pigtail is damaged, repair the wire by splicing in a new section of wire of the same gauge size (0.5 mm, 0.8 mm, 1.0 mm etc.). Use the DuraSeal splice sleeves and the appropriate splice sleeve crimping tool. For wiring repair, refer to **Splicing Copper Wire Using Splice Sleeves**.

For connector position assurance (CPA), refer to **Connector Position Assurance Locks**.

For terminal position assurance (TPA), refer to **Terminal Position Assurance Locks**.

CONNECTOR REPAIRS

Connector Repairs contains a list of all connector repairs. The connector repairs are listed by the connector manufacturer and then by connector type. If the technician cannot identify the manufacturer of the connector, refer to Identifying Connectors below. Knowing the connector manufacturer will assist in finding the correct connector repair from the following list:

- **Connector Position Assurance Locks**
- **Terminal Position Assurance Locks**
- **AFL/EPC Connectors**
- **Bosch Connectors (BSK)Bosch Connectors (0.64)Bosch Connectors (2.8 JPT)Bosch Connectors**

(ECM)

- Delphi Connectors (Weather Pack)Delphi Connectors (Push To Seat)Delphi Connectors (Pull To Seat)Delphi Connectors (Micro-Pack 100W)Delphi Connectors (Micro .64)Delphi Connectors (12-Way)Delphi Connectors (Steering Gear)
- FCI Connectors (Lever Lock)FCI Connectors (SIR)
- FEP Connectors (Steering Gear)
- JST Connectors
- Kostal Connectors (Glow Plug Control Module)Kostal Connectors (Transmission)
- Molex ConnectorsMolex Connectors (SIR)
- Sumitomo Connectors
- Tyco/AMP Connectors (CM 42-Way)Tyco/AMP Connectors (Sensor)Tyco/AMP Connectors (0.25 Cap)Tyco/AMP Connectors (43-Way)Tyco/AMP Connectors (Door Module)Tyco/AMP Connectors (Seat)Tyco/AMP Connectors (102-Way Inline)Tyco/AMP Connectors (SIR)
- Yazaki Connectors (2-Way)Yazaki Connectors (16-Way)
- Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)

11	Inner Connector

Identifying Connectors

Knowing the connector manufacturer is helpful when trying to locating the correct connector repair procedure. There are many different connector designs used on GM vehicles and it is sometimes difficult to identify the connector manufacturer. The information in this document should help with the identification of connector manufactures.

The following connector manufacturers make most of the connectors found in GM vehicles:

- AFL/EPC (Alcoa Fujikura Ltd./Engineered Plastics Components)
- Bosch
- Delphi
- FCI (Framatome Connectors International)
- JAE (Japan Aviation Electronics)
- JST (Japan Solderless Terminals)
- Kostal
- Molex
- Sumitomo
- Tyco/AMP
- Yazaki

Identifying the manufacturer of a connector is often difficult. When trying to determine the manufacturer of a connector, look for specific identifying marks that are unique to that connector supplier. Most of these identify marks are hard to find or see. Check the connector carefully and refer to the information below for pictures and descriptions of connector identification markings.

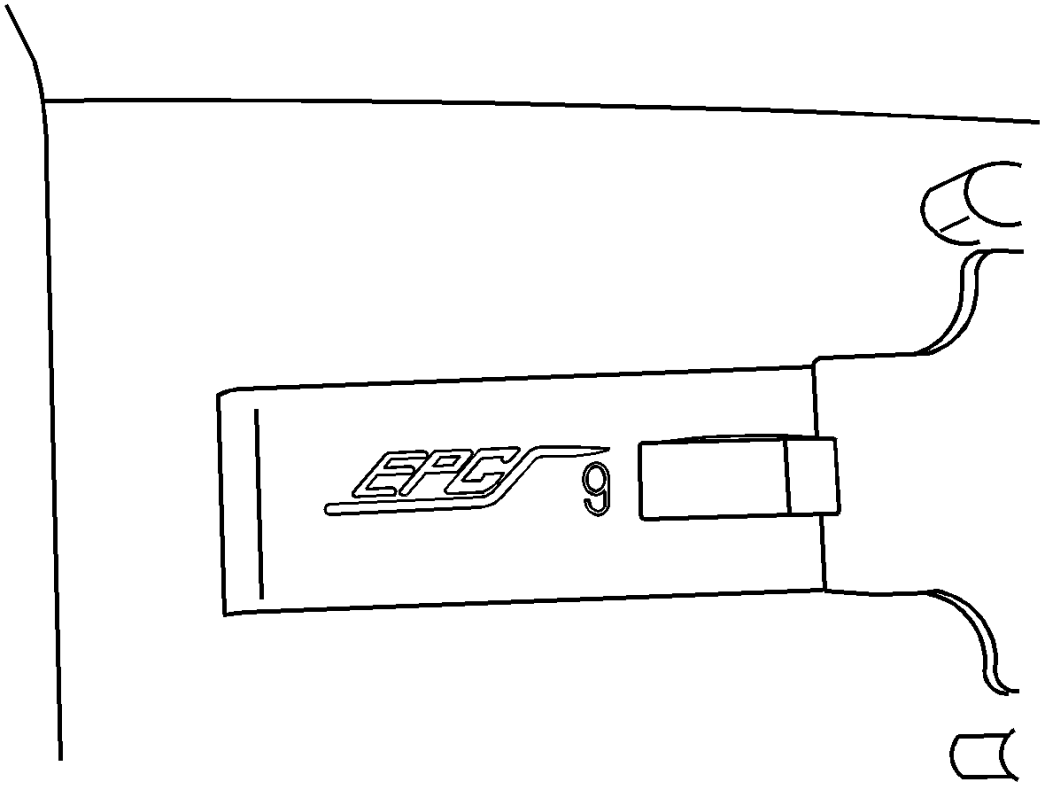

Fig. 24: View Of EPC Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

- Most of AFL's connectors have EPC on their connector body. Some of the smaller connectors will not have any markings on them.

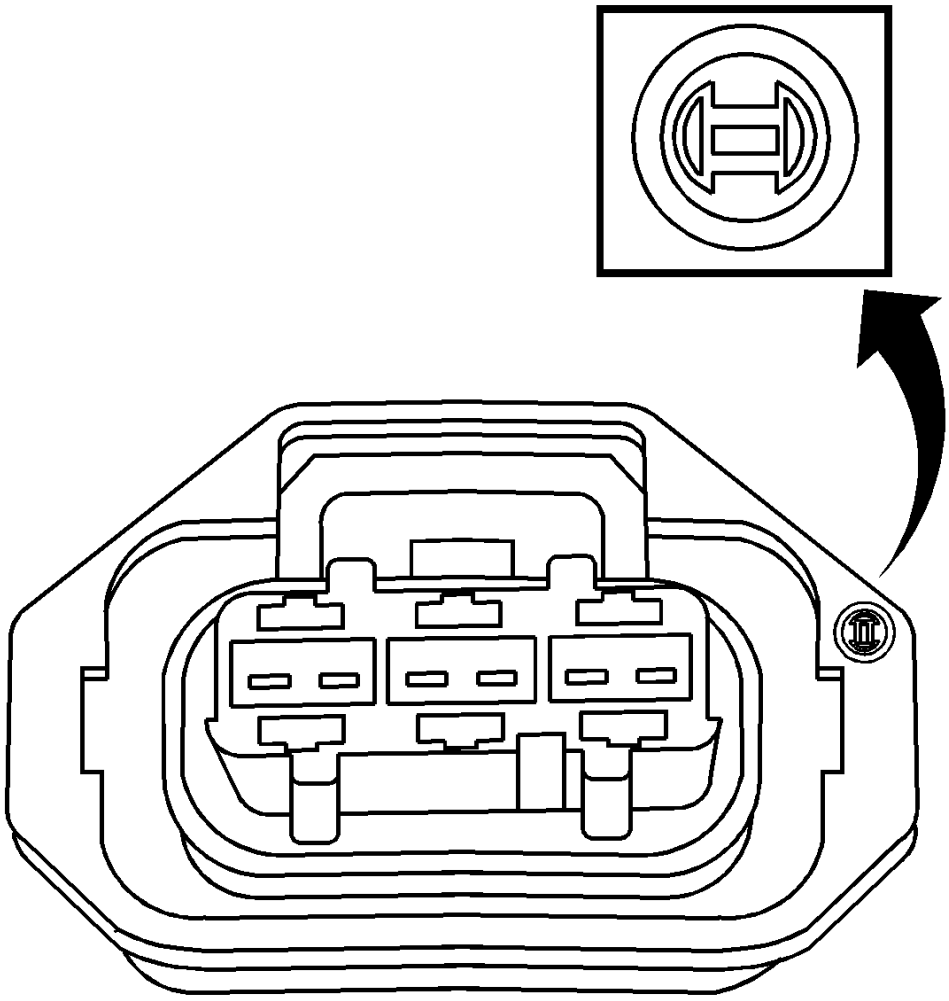

Fig. 25: View Of Bosch Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

- In some cases Bosch will actually be printed on the connector. If Bosch does not appear on the connector, look for the Bosch logo. The Bosch logo is a circle with a blunted arrow inside. This logo can appear anywhere on the connector and is often very small.

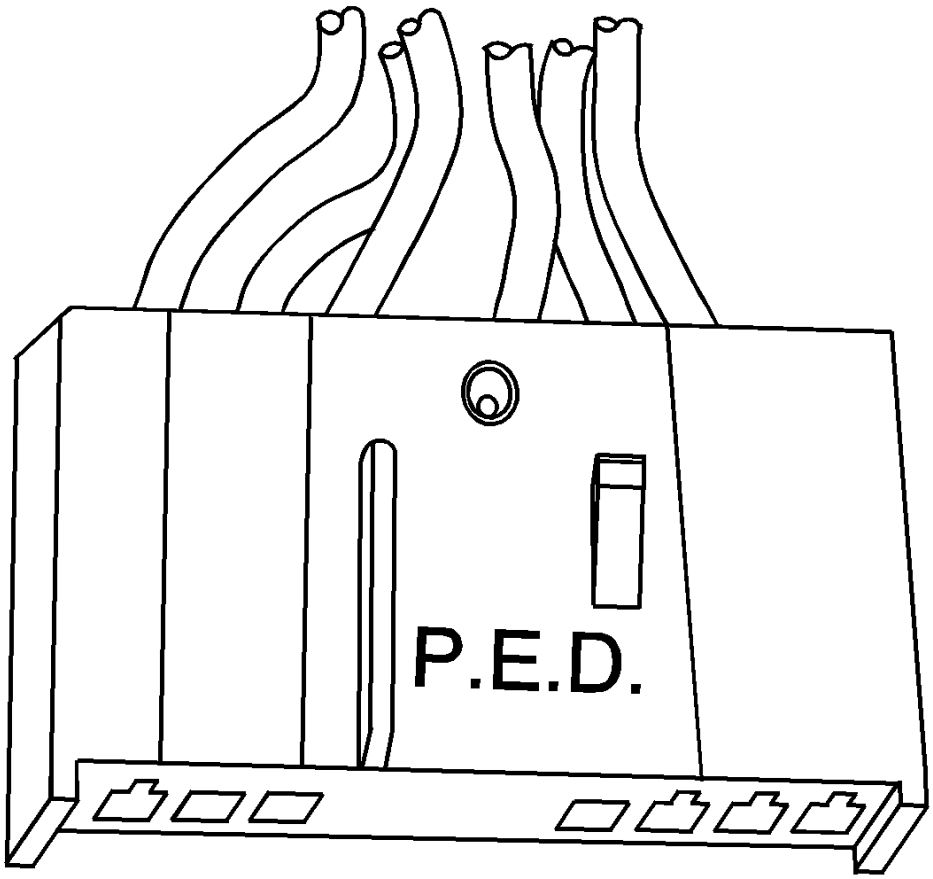

Fig. 26: View Of PED Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

- In some cases Delphi will actually be printed on the connector. If Delphi is not printed on the connector, look for PED. In both cases there is no specific orientation for Delphi or PED and they can appear anywhere on the connector.

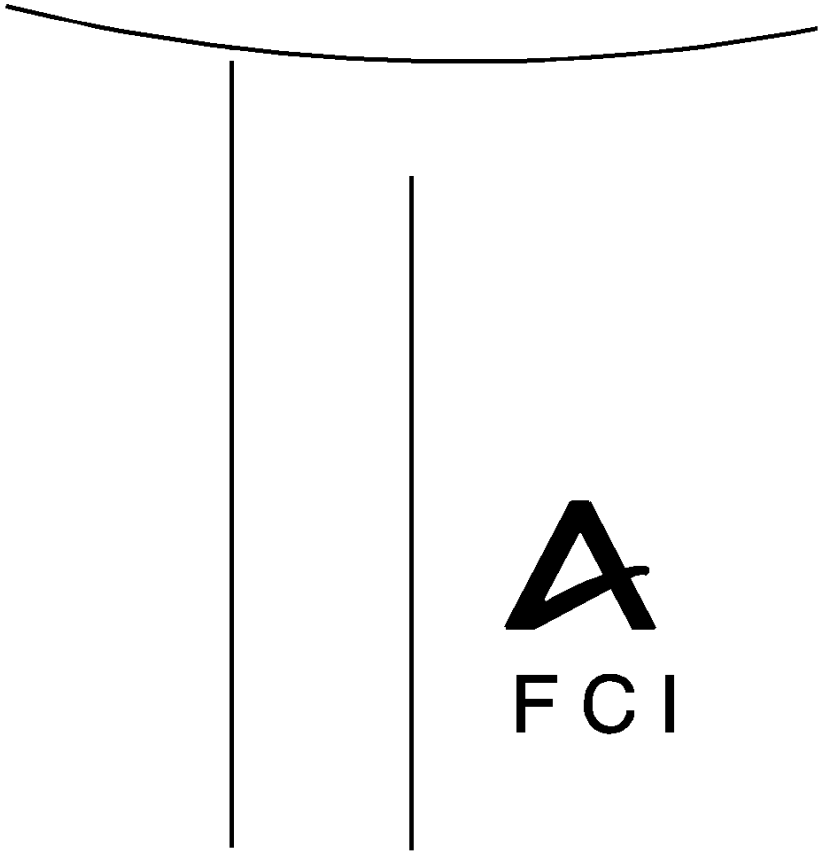

Fig. 27: View Of FCI Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

- FCI connectors may have the FCI logo on their connectors. The logo is the letters FCI with an "A" above it.

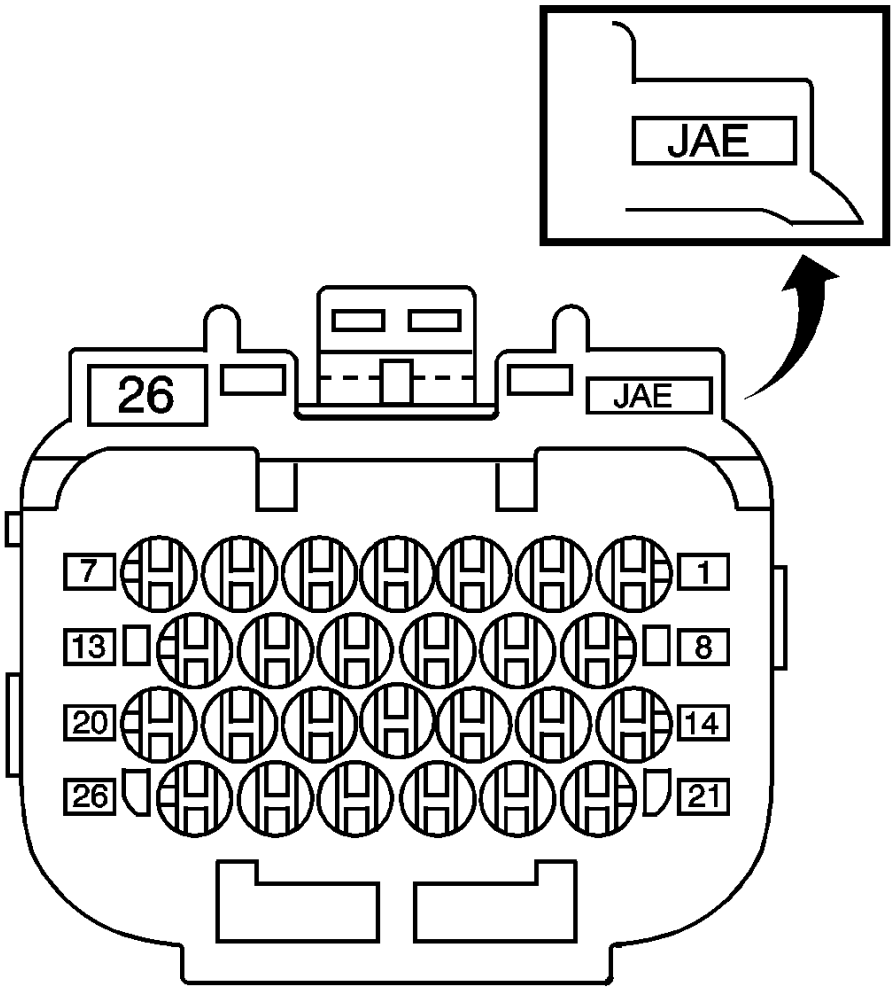

Fig. 28: View Of JAF Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

- JAE connector have JAE in small letters on their connectors.

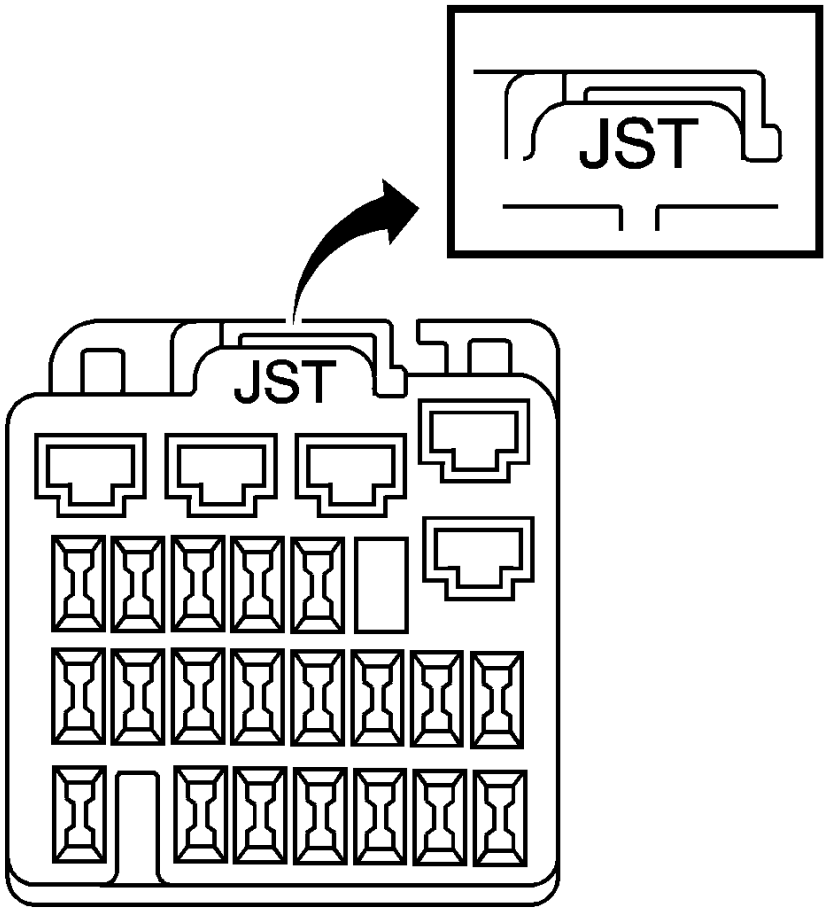

Fig. 29: View Of JST Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

- JST connectors have JST in small letters on their connectors, similar to that above. The location of the logo will vary with the connector size and style.

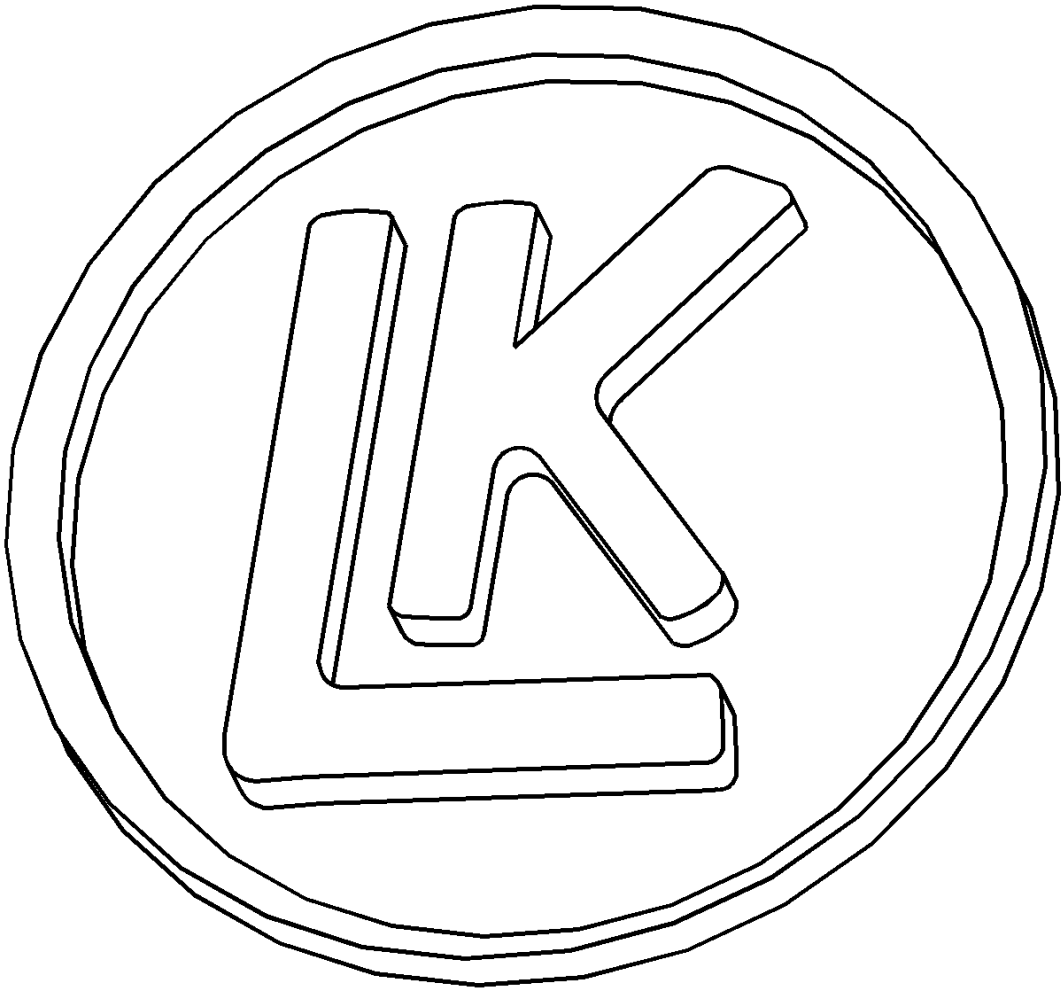

Fig. 30: View Of Kostel Connector Identifier
Courtesy of GENERAL MOTORS COMPANY

- Kostel has an "LK" with a circle around it. These connector are usually used as a transmissions connection.

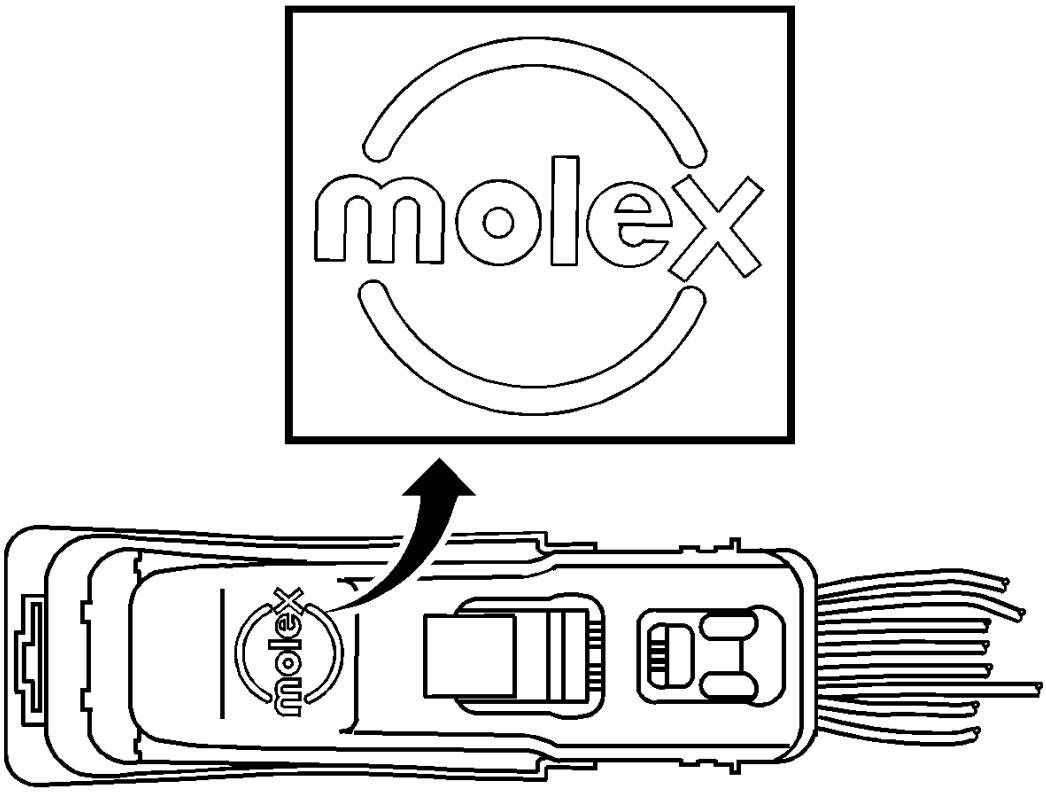

Fig. 31: View Of Molex Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

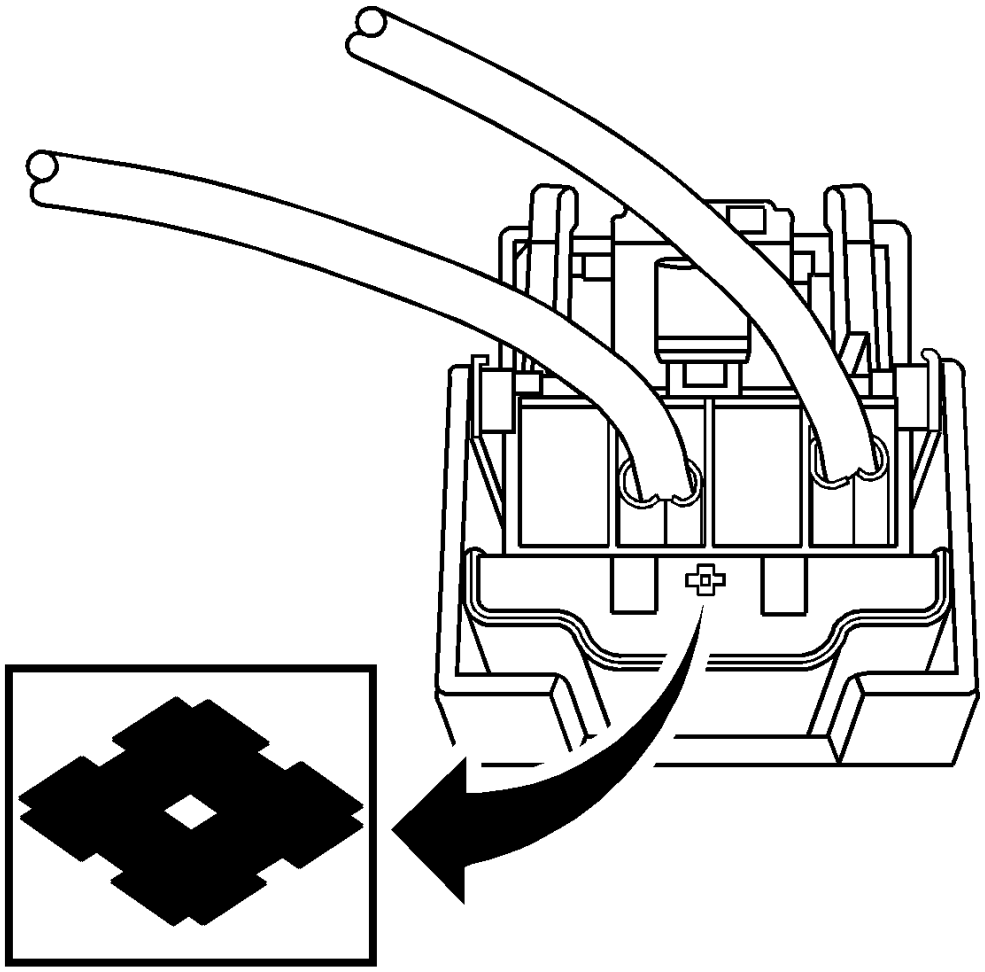

Fig. 32: View Of Sumitono Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

- Most Molex connectors will have the Molex logo on the dresscover of the connector. In some cases the connectors may have MX followed by another letter. The third letter indicates where the connector was made. A connector with MXD is a Molex connector made in Detroit.

  Sumitomo has a unique symbol on their connector and possibly a part number. The symbol is similar to that of a diamond lying on its side, similar to that shown. The logo could appear anywhere but the most common place is at the wire side of the housing.

- Tyco/AMP has many different and unique connector designs. Some may or may not have identifiable marks on them.

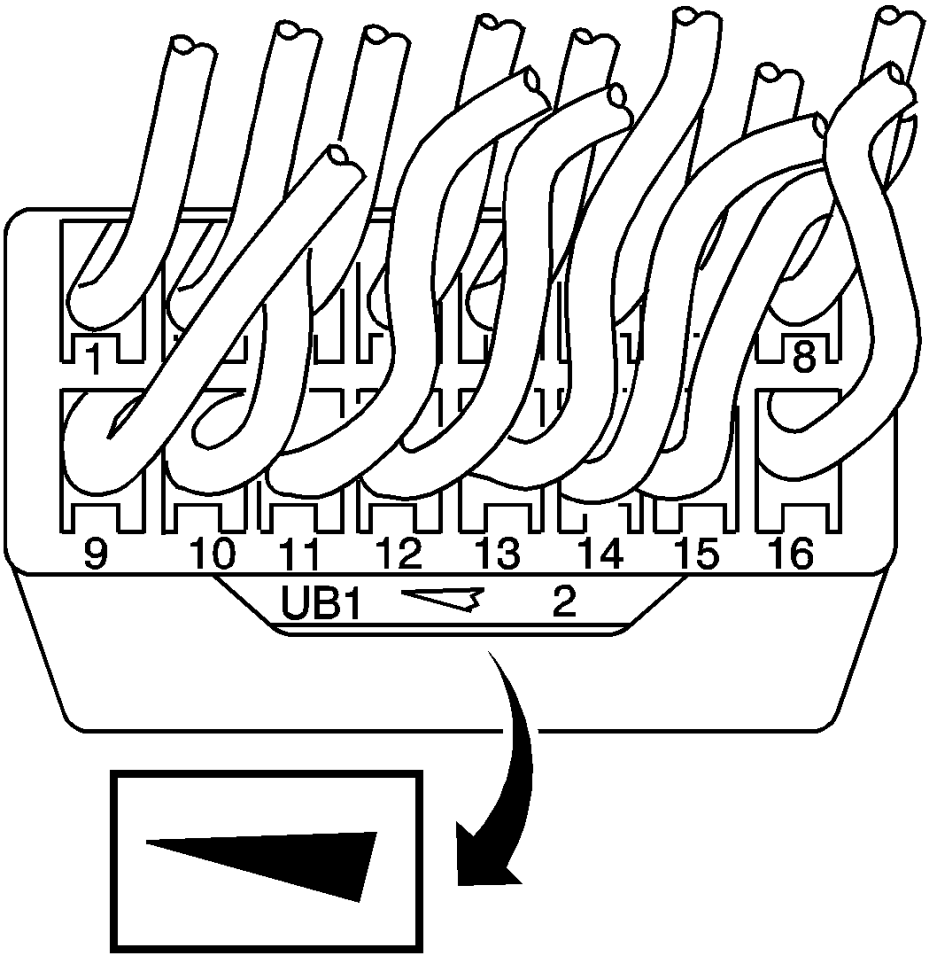

Fig. 33: View Of Yazaki Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

- Yazaki has a wedge or arrow shape, similar to that shown.

CONNECTOR POSITION ASSURANCE LOCKS

The connector position assurance (CPA) is a small plastic insert that fits through the locking tabs of the connector. CPAs are used in various connectors throughout the vehicle. CPAs are also used in all SIR system electrical connectors. The CPA ensures that the connector halves cannot vibrate apart. You must have the CPA in place in order to ensure good contact between the mating terminals of the connector.

TERMINAL POSITION ASSURANCE LOCKS

The terminal position assurance (TPA) insert resembles the plastic combs used in the control module connectors. The TPA keeps the terminal securely seated in the connector body. Do not remove the TPA from the connector body unless you remove a terminal for replacement. If the TPA is removed, be sure to reinstall it before reconnecting the connector.

AFL/EPC CONNECTORS

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-12A** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

Follow the steps below in order to remove terminals from the connector.

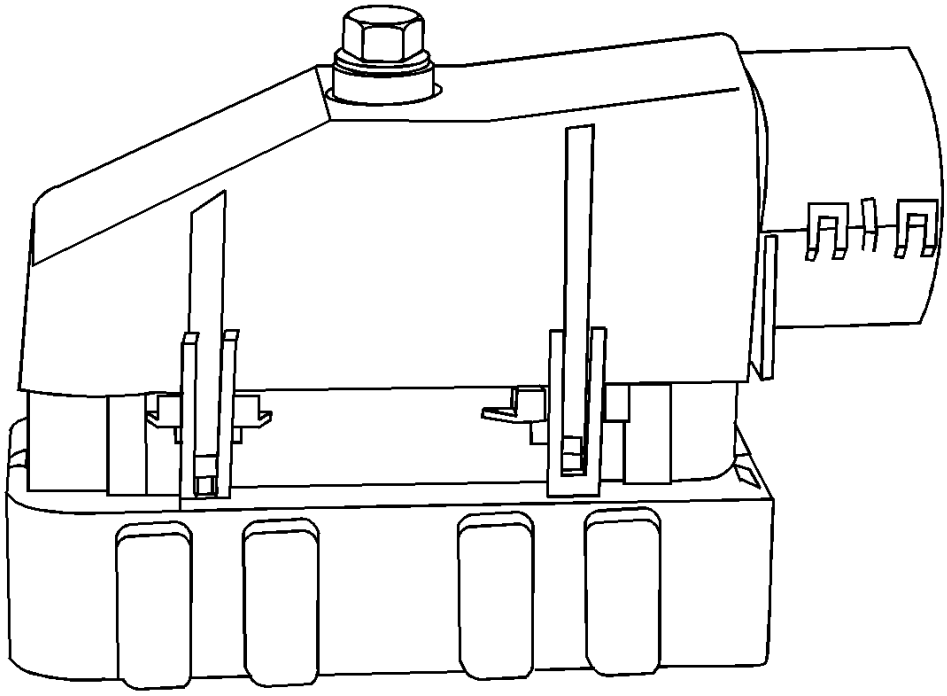

Fig. 34: View Of Bolt On Connector Cover
Courtesy of GENERAL MOTORS COMPANY

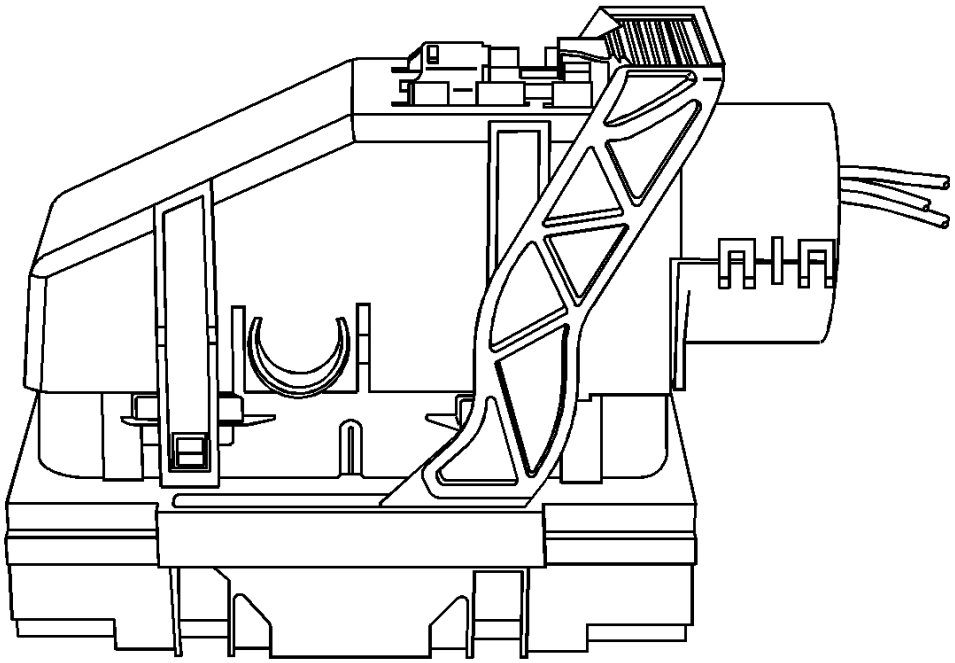

Fig. 35: Identifying Connector Position Assurance (CPA)
Courtesy of GENERAL MOTORS COMPANY

1. For connectors with a bolt in the dress cover, turn the bolt counterclockwise to remove the connector from the component.
2. Locate the connector position assurance (CPA) on the top of the wire dress cover. Slide the CPA forward.

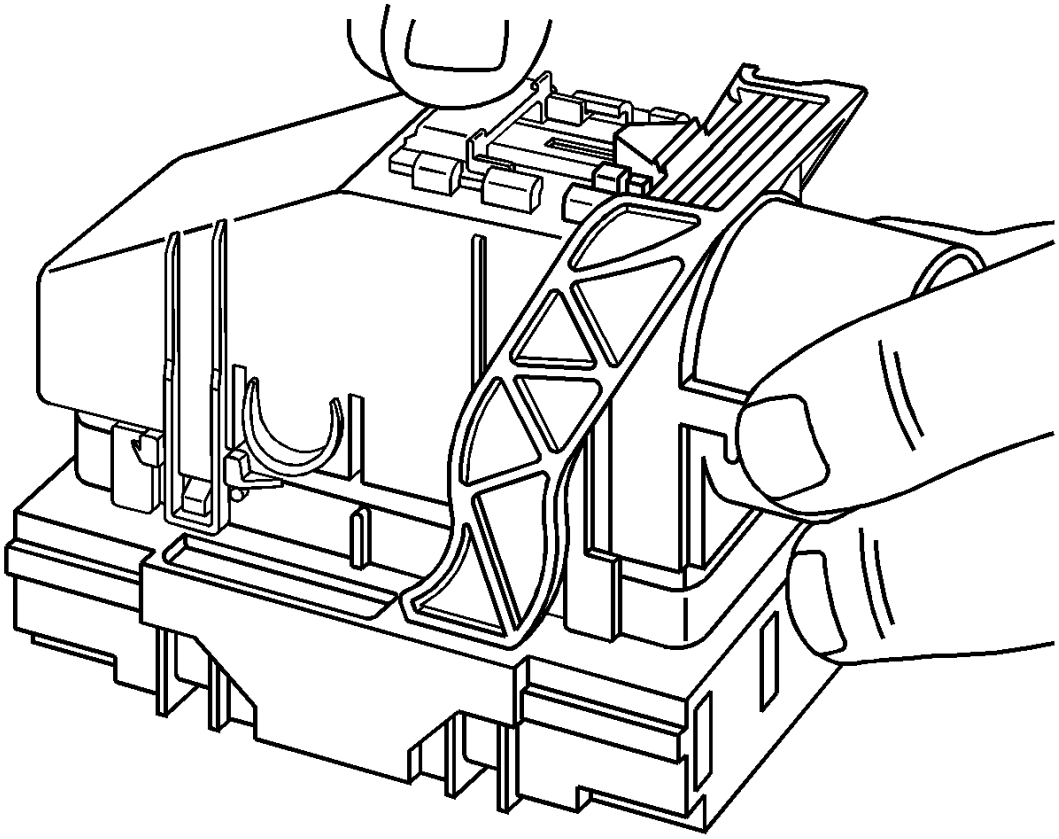

Fig. 36: Identifying Lever Lock & Lever Lock Release Tab
Courtesy of GENERAL MOTORS COMPANY

3. Slide the lever lock forward while pressing down on the lever lock release tab.

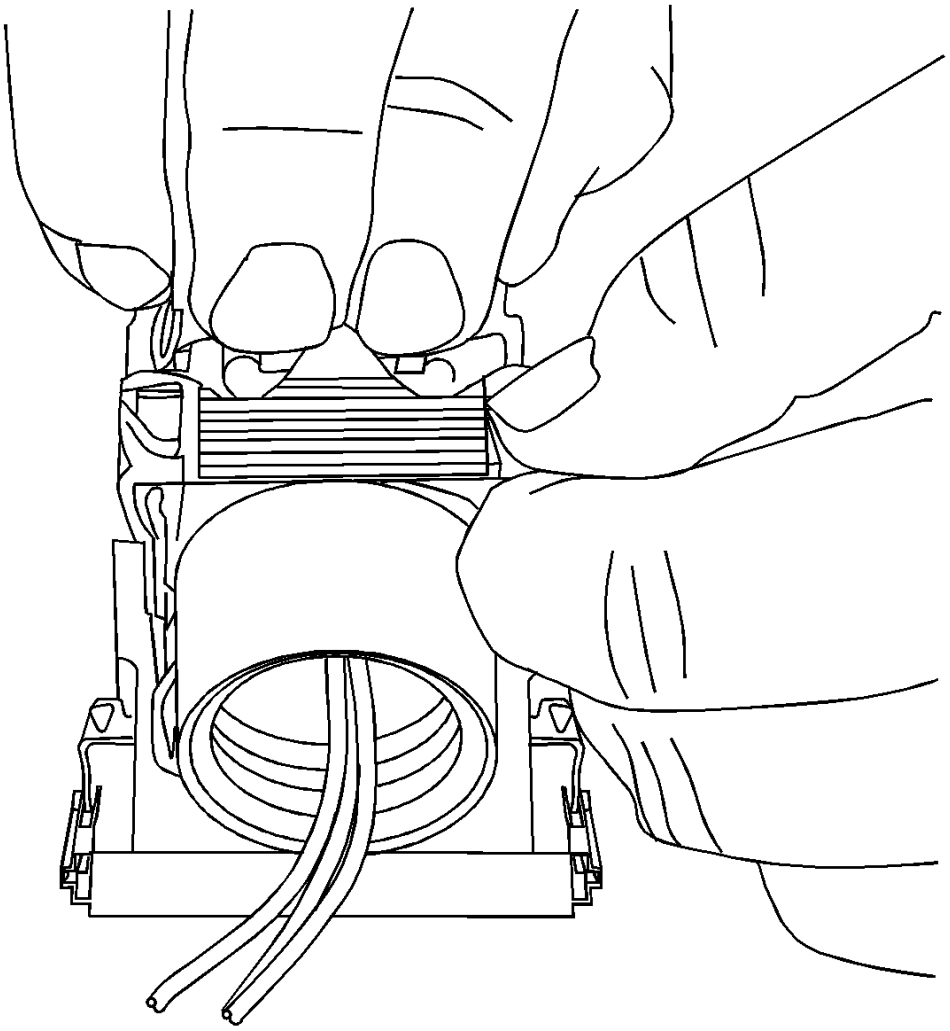

Fig. 37: View Showing Depressing Lever Lock Release Tab
Courtesy of GENERAL MOTORS COMPANY

4. View showing depressing of the lever lock release tab.

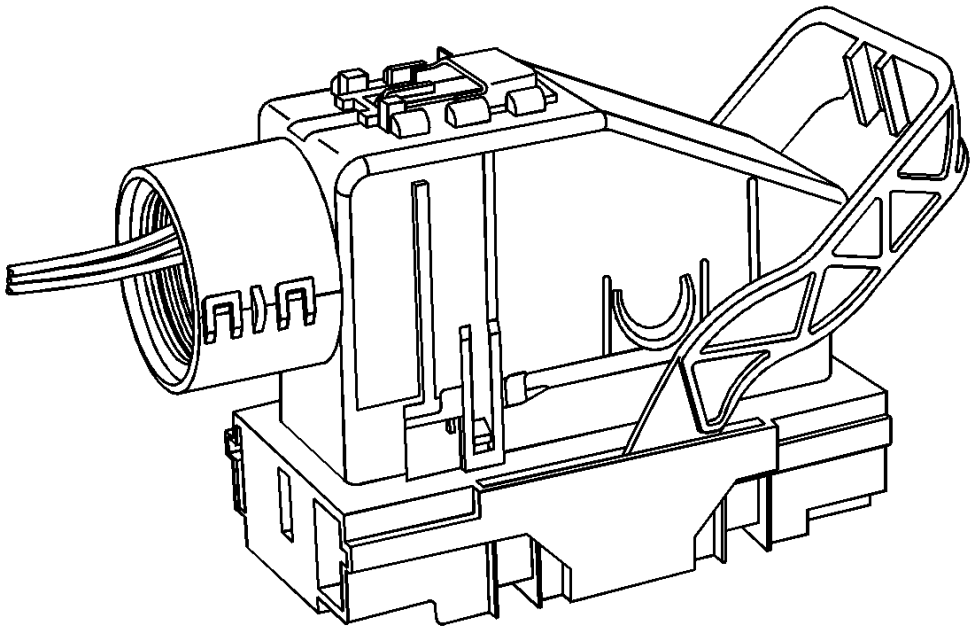

Fig. 38: View of connector in released position
Courtesy of GENERAL MOTORS COMPANY

5. View of connector in released position.
6. Disconnect the connector from the component.
7. Locate the dress cover locking tabs at the corners of the dress cover. Use a small flat-blade tool to release the locking tabs and remove the dress cover.

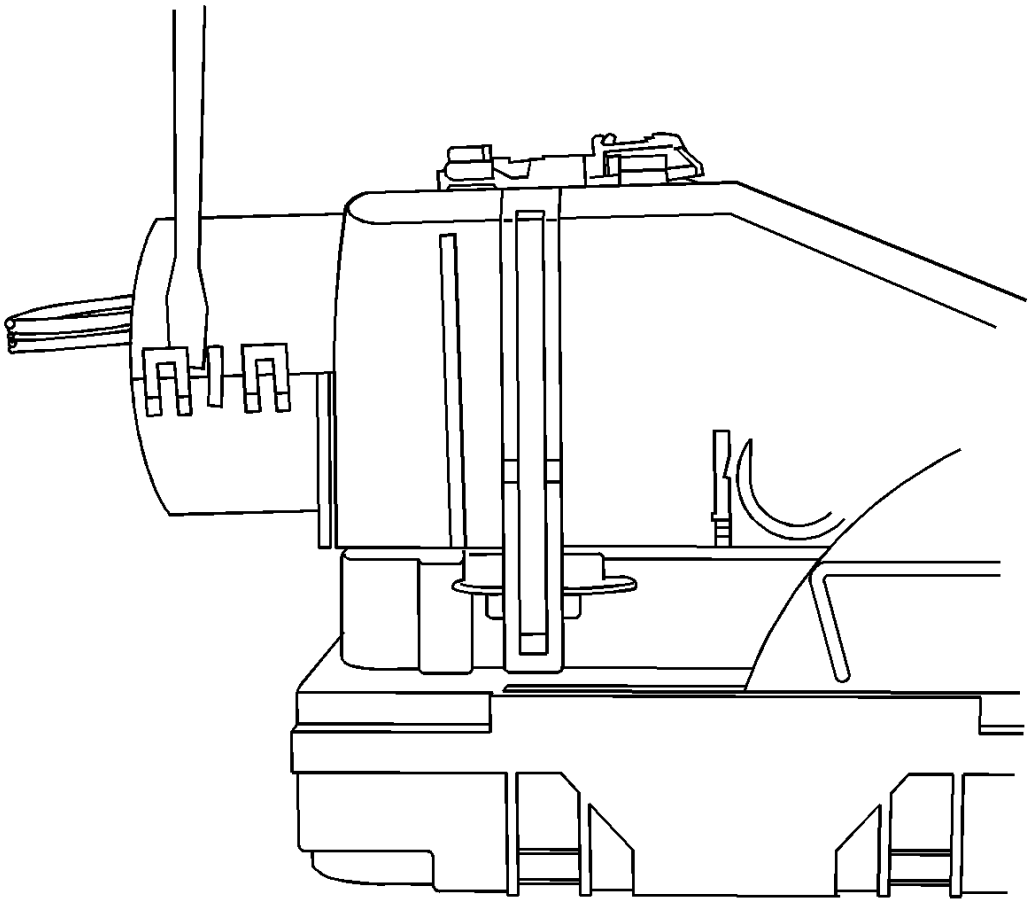

Fig. 39: View Of Connector In Released Position
Courtesy of GENERAL MOTORS COMPANY

8. Release the rear lower half of the wiredress cover.

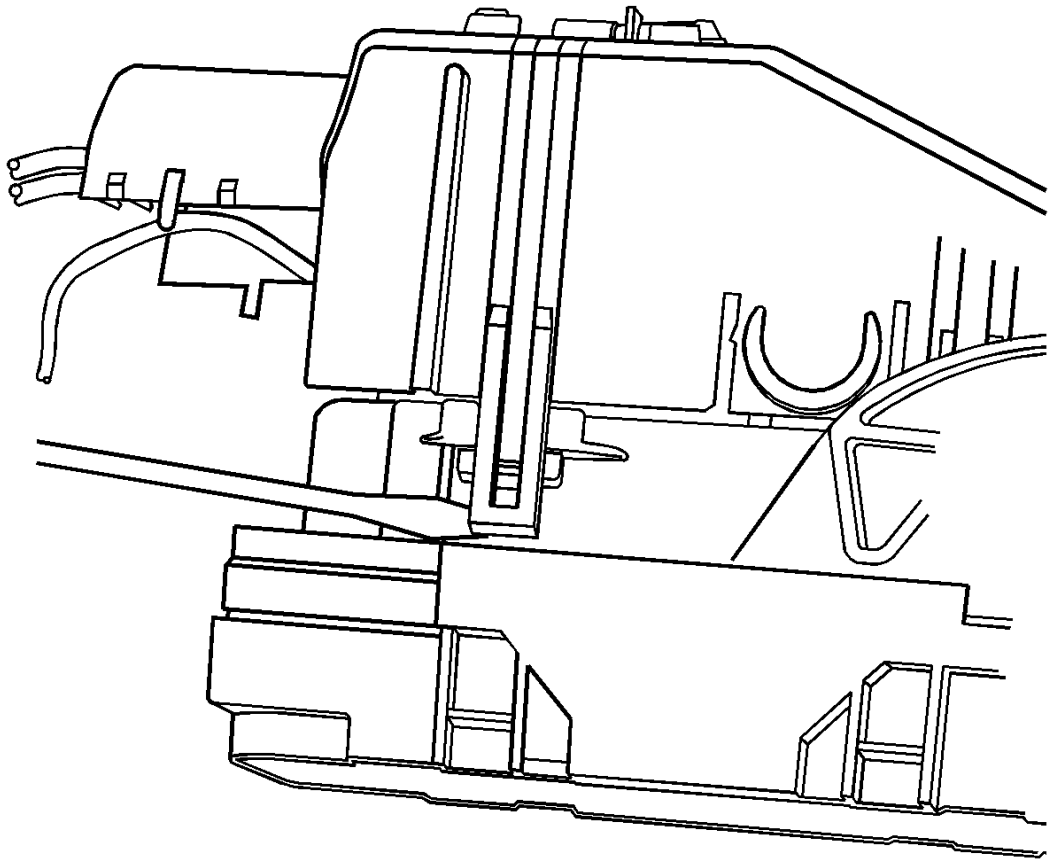

Fig. 40: Identifying Tabs Holding Wiredress Cover
Courtesy of GENERAL MOTORS COMPANY

9. Release the tabs that are holding the wiredress cover to the connector body.
10. Remove the nose piece by inserting a small flat-blade tool into the slots on both ends of the connector body. Gently pry the nose piece out of the connector. J-38125-216 can also be used to remove the nose piece.

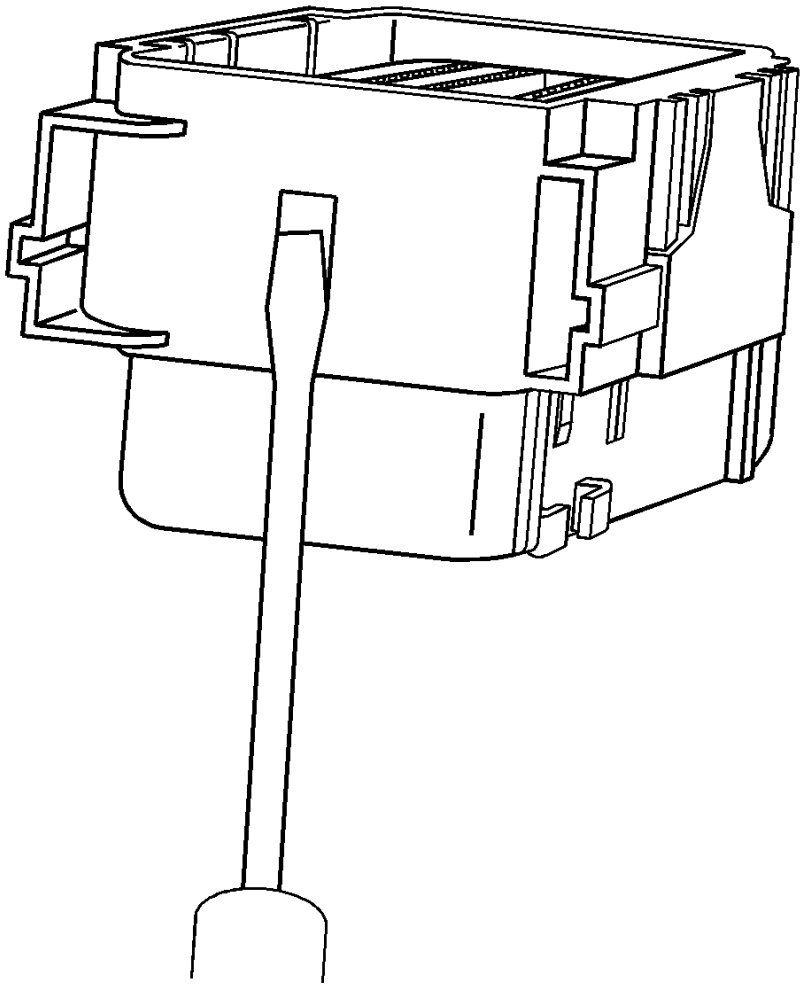

Fig. 41: Lifting Terminal Retaining Tabs
Courtesy of GENERAL MOTORS COMPANY

11. Use the J-38125-12A tool to release the terminals by lifting the terminal retaining tabs on the inside of the connector.

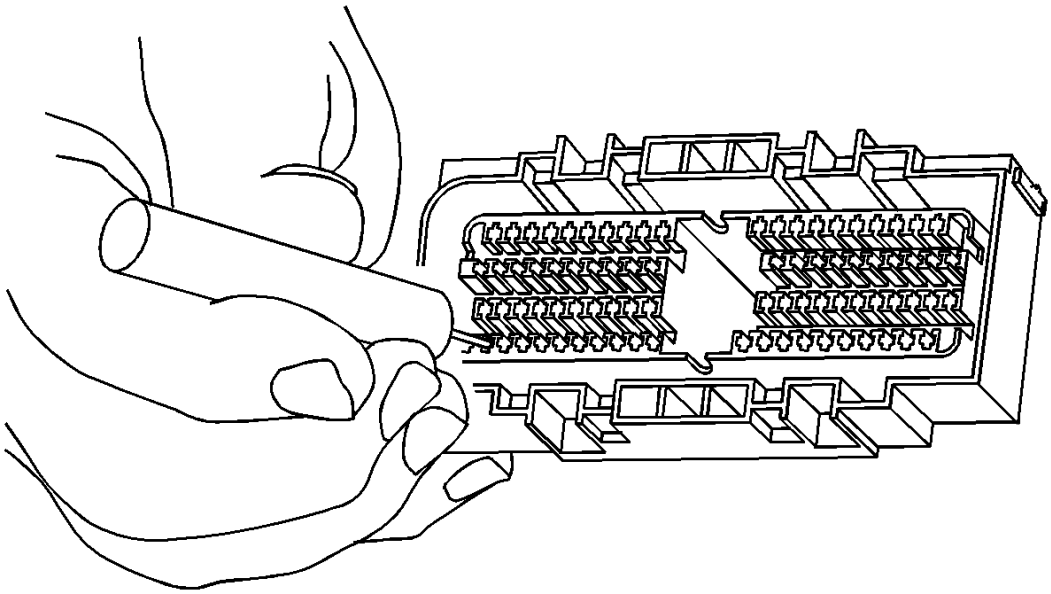

Fig. 42: Pulling Wire Out Of Back Of Connector
Courtesy of GENERAL MOTORS COMPANY

12. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
13. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
14. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

BOSCH CONNECTORS (BSK)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-561** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

1. Disconnect the connector from the component.
2. Remove the wire dress cover, if necessary.
3. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

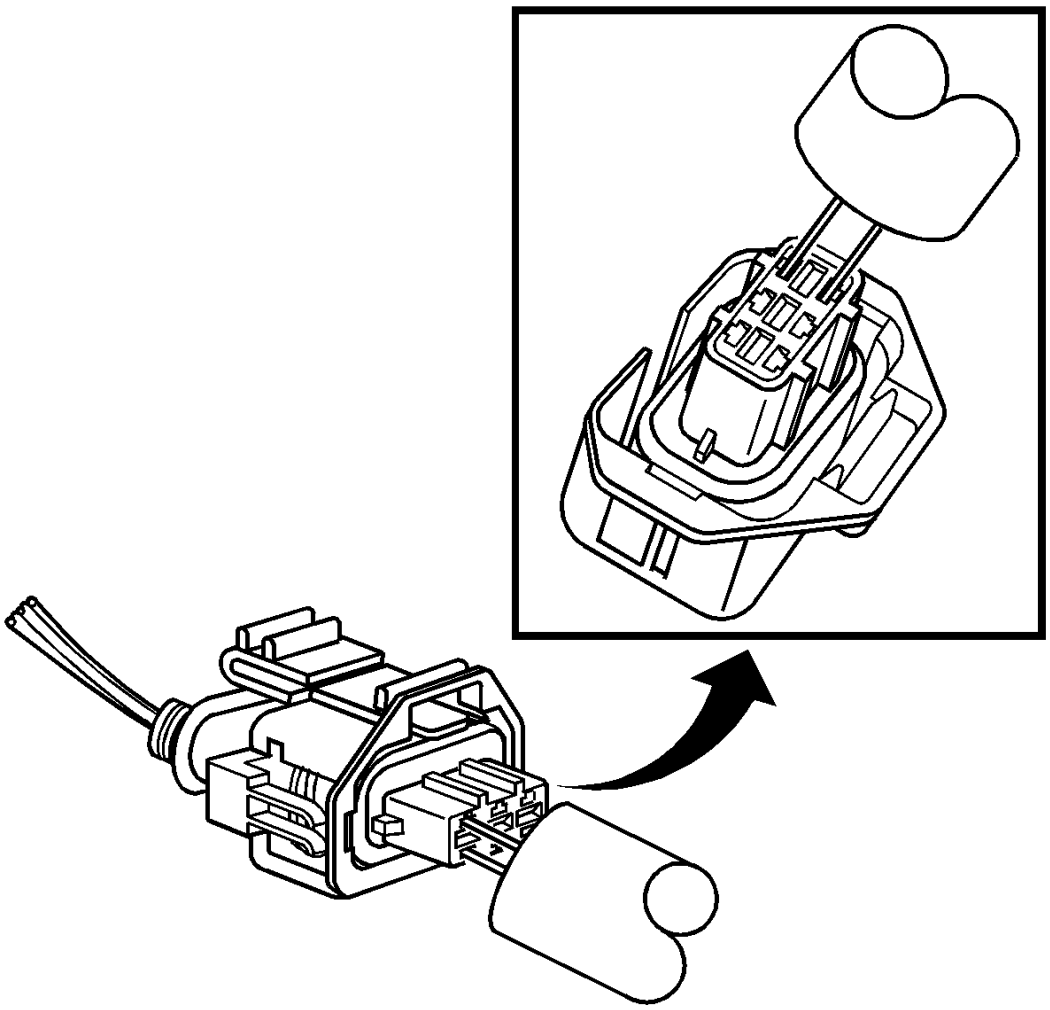

Fig. 43: View Of Bosch Connector Terminals (BSK)
Courtesy of GENERAL MOTORS COMPANY

4. Insert the J-38125-561 tool into the 2 cavities on each side of the terminal at the front of the connector and push until you feel the tool disengage the terminal retainers.
5. Carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
6. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

BOSCH CONNECTORS (0.64)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-560** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

1. Locate the lever lock on the wire dress cover. While pressing the lock, pull the lever over and past the lock until the lever is at the end of its travel.
2. Disconnect the connector from the component.
3. Pull the rubber boot that covers the wires back to expose the end of the connector dress cover.
4. Place the connector locking lever in the center of the connector.

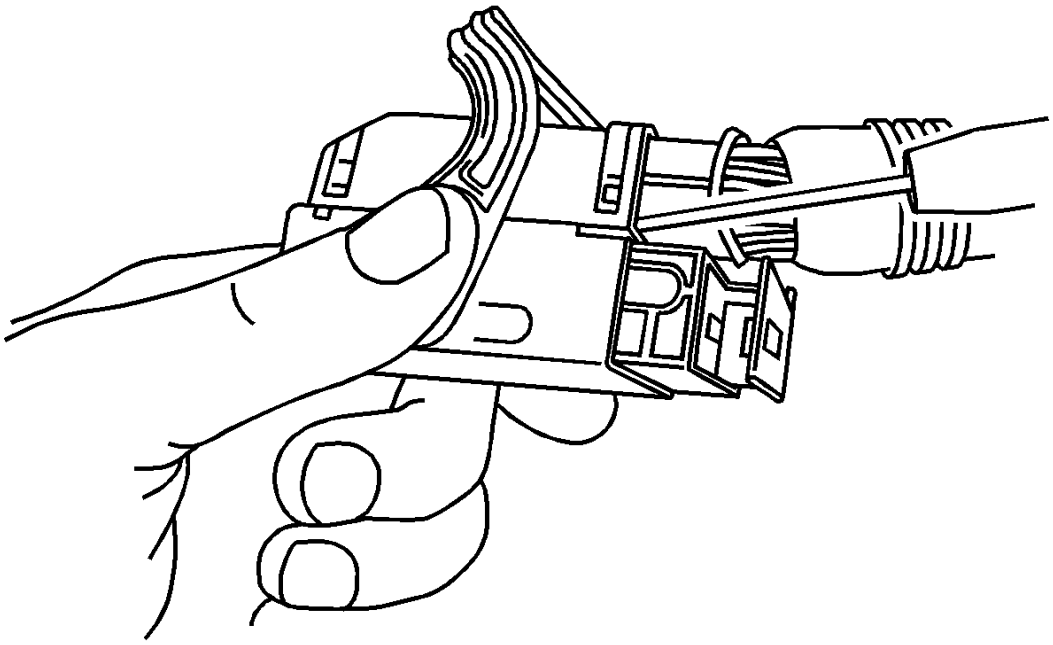

Fig. 44: View Of Flat-Bladed Tool Being Inserted Between Cover & Connector Body
Courtesy of GENERAL MOTORS COMPANY

5. Locate the 2 dress cover locking tabs that are on the wire end of the connector. Insert a small flat-bladed

tool between the cover and connector body and pry up.

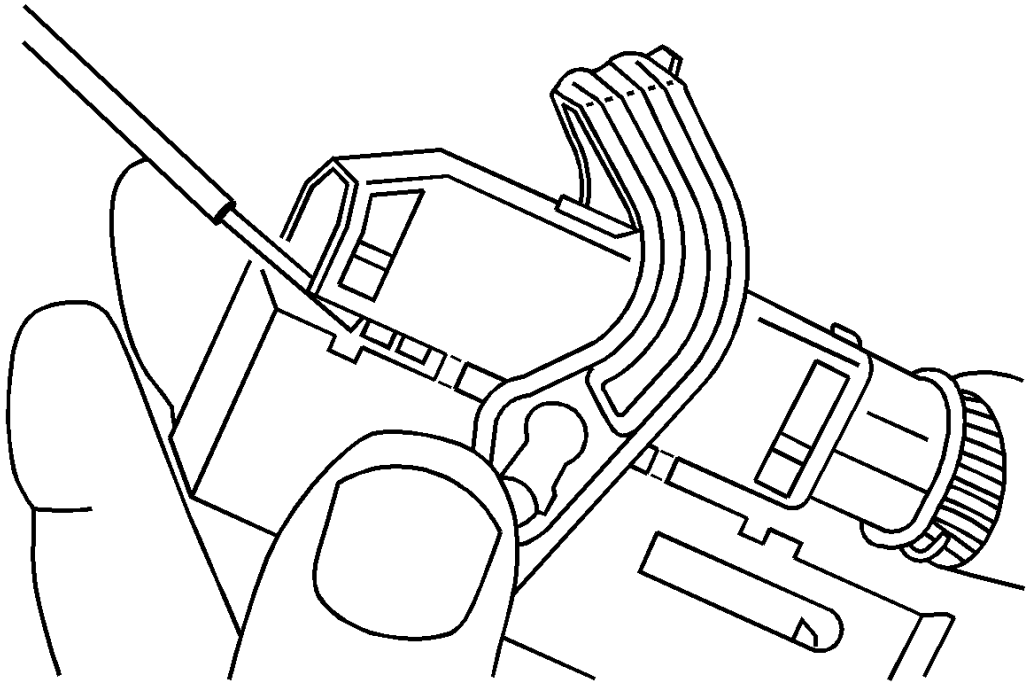

Fig. 45: View Of Flat-Bladed Tool Between Cover & Connector End
Courtesy of GENERAL MOTORS COMPANY

6. Locate the 2 dress cover locking tabs located on the opposite side of the connector. Insert a small flat-bladed tool between the cover at the connector end and pry up.
7. Remove the dress cover.
8. Cut the tie wrap on the wire bundle.

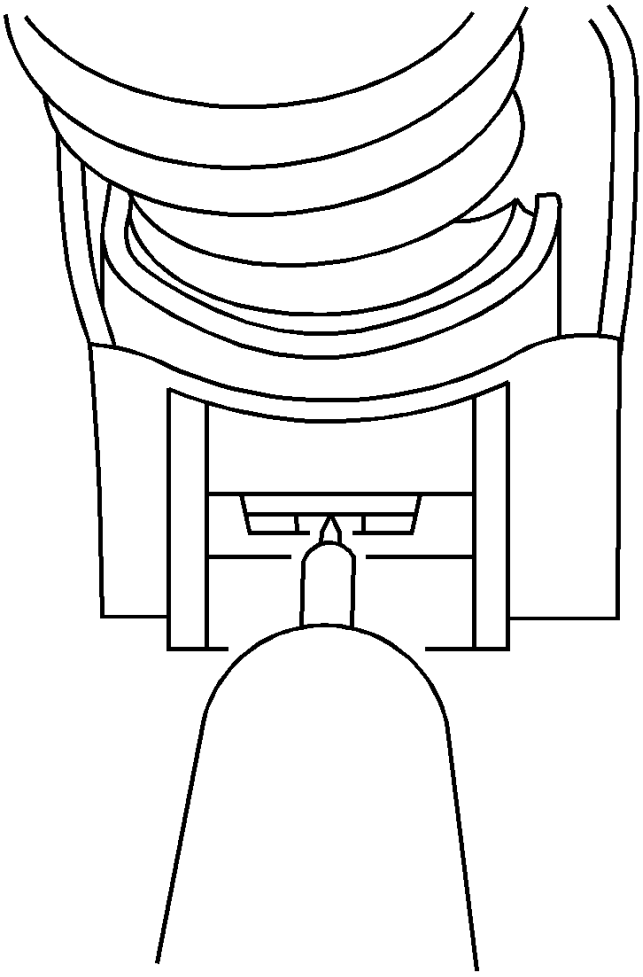

Fig. 46: View Of Terminal Position Assurance (TPA)
Courtesy of GENERAL MOTORS COMPANY

9. Remove the terminal position assurance (TPA) by inserting a small flat-bladed tool into the small slot in the end of the slider and pushing on the TPA until it comes out of the connector. When the TPA exits the opposite side of the connector, gasp the TPA and pull it completely out of the connector.
10. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

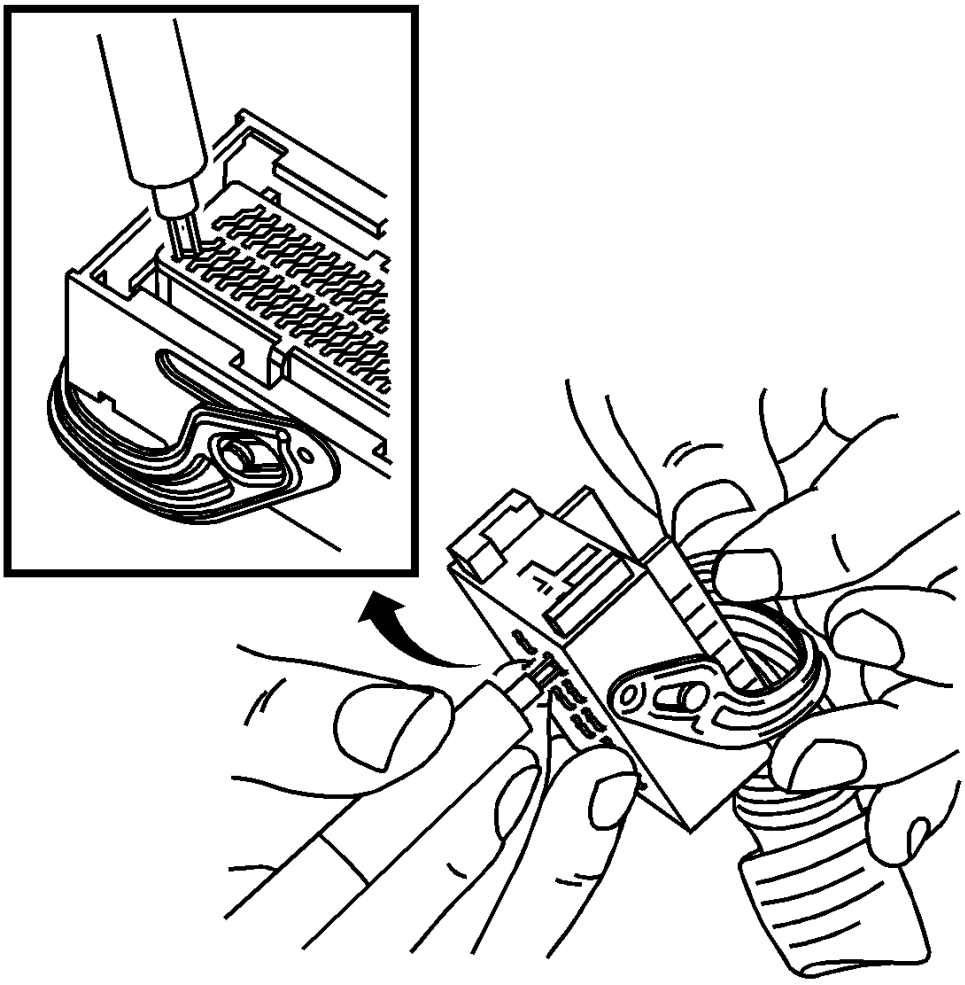

Fig. 47: Pulling Terminal Out Of Connector
Courtesy of GENERAL MOTORS COMPANY

11. Insert the J-38125-560 into the 2 triangular cavities on each side of the terminal at the front of the connector.
12. Carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
13. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
14. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminal Insertion Procedure

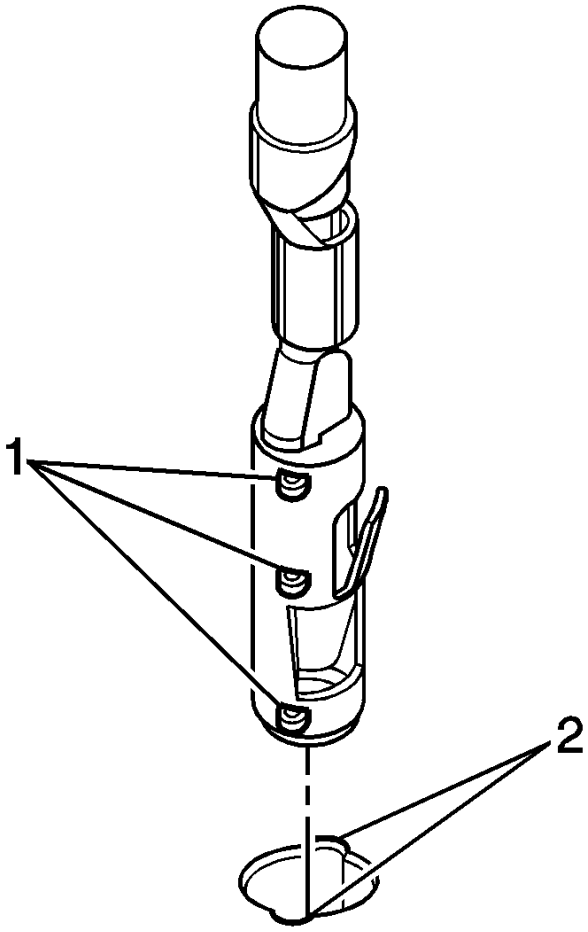

Fig. 48: Aligning Coding Lugs With Connector Coding Grooves
Courtesy of GENERAL MOTORS COMPANY

1. Prior to installation the terminal must be aligned so the (1) coding lugs align with the (2) coding grooves on the connector.
2. Once the terminal is aligned, slide the terminal into the cavity until the retainer has engaged in the cavity of the connector.
3. Slide the TPA in the connector body and seat it using a small flat bladed tool. The TPA is seated when it is flush with the contact housing.
4. Secure the wires to the connector body using a tie wrap and replace the dress cover and grommet.

BOSCH CONNECTORS (2.8 JPT)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-557** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

1. Pull out the slider on the connector position assurance (CPA) until it is at the end of its travel.
2. Disconnect the connector from the component.
3. Remove the wire dress cover, if necessary.
4. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

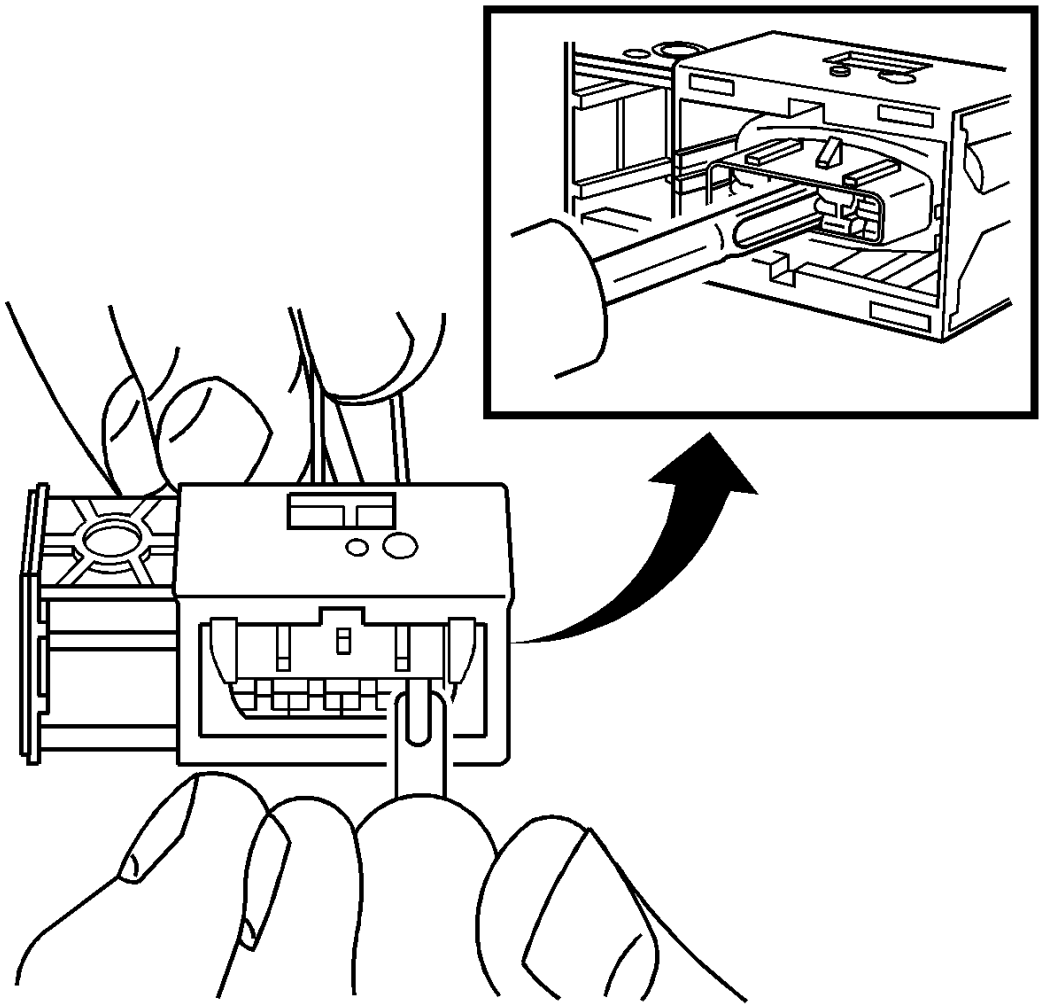

Fig. 49: View Of Bosch Connector Terminals (2.8 JPT)
Courtesy of GENERAL MOTORS COMPANY

5. Insert the J-38125-557 into the 2 cavities on each side of the terminal at the front of the connector and push until you feel the tool disengage the terminal retainers.
6. Carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
7. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
8. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and

reconnect the connector bodies.

BOSCH CONNECTORS (ECM)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-213** Terminal Release Tool
- **J-38125-556** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

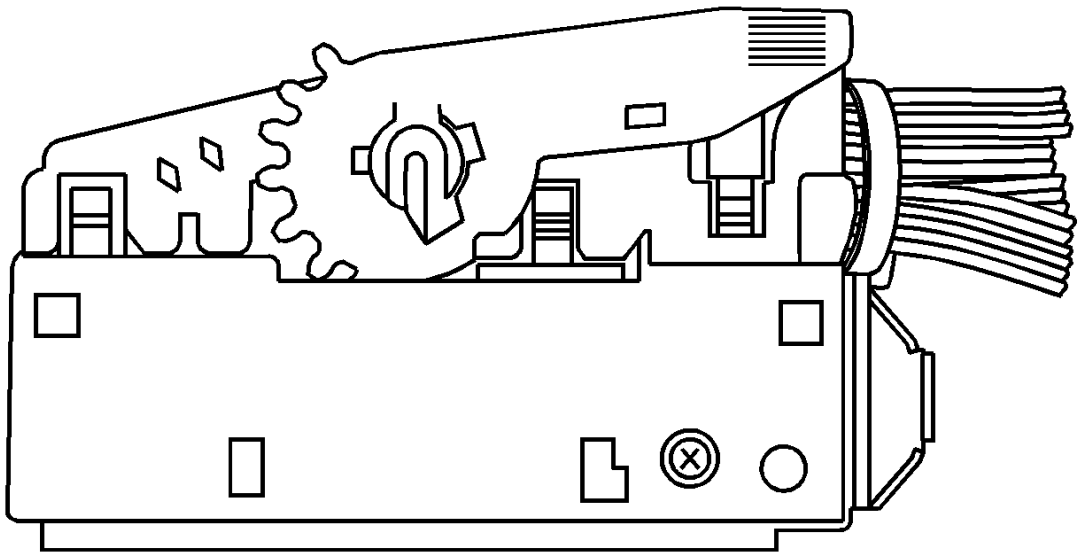

Fig. 50: View Of Bosch Connectors
Courtesy of GENERAL MOTORS COMPANY

1. Locate the assist lever on the top of the connector. Move the assist lever to the forward position.

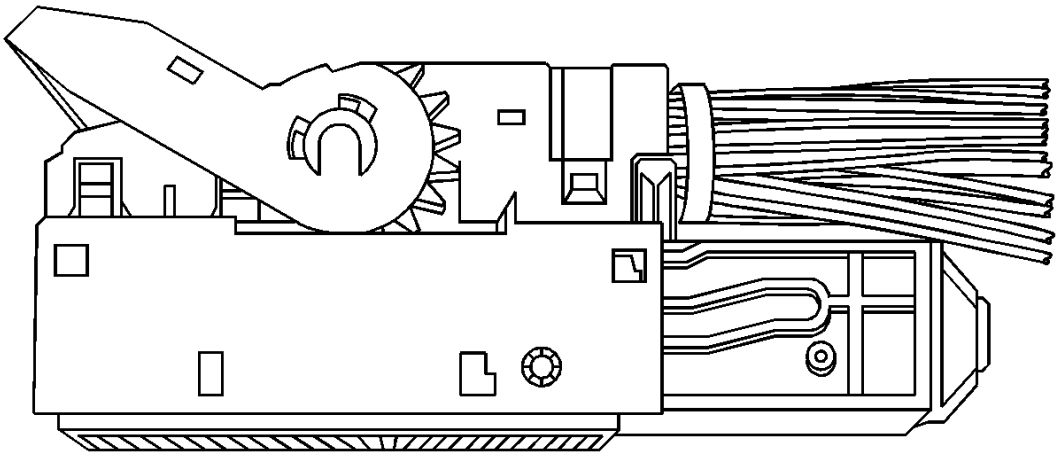

Fig. 51: Identifying Assist Lever In Forward Position
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the connector from the component.

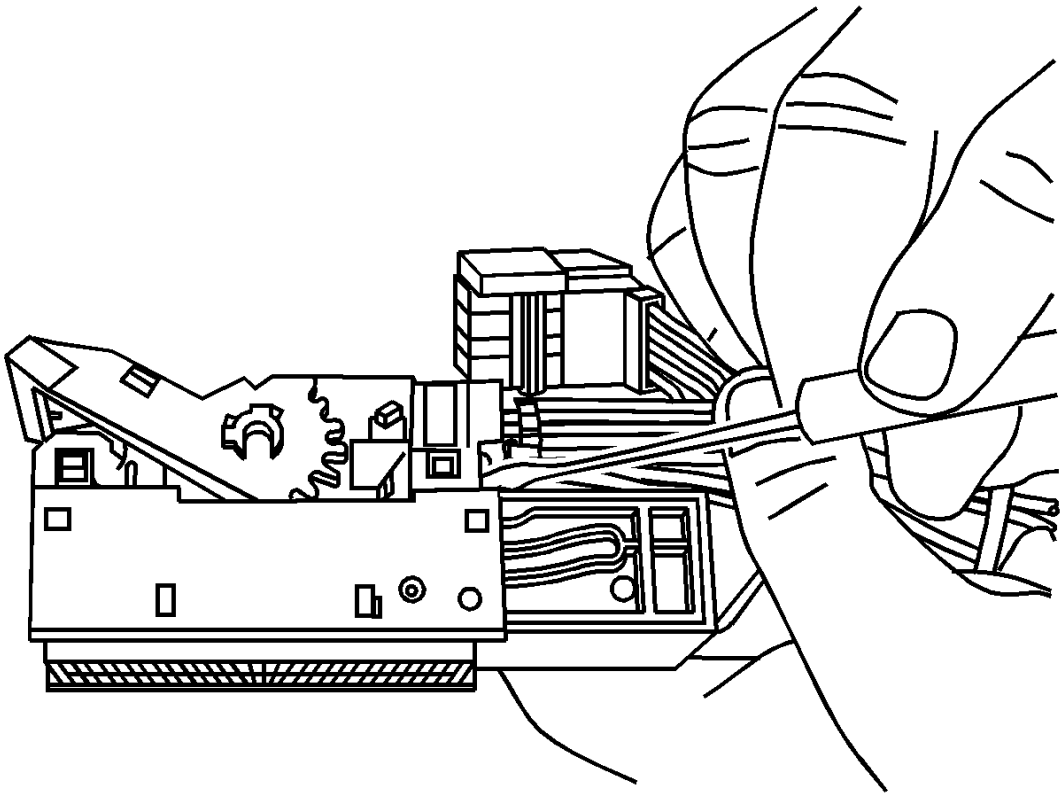

Fig. 52: View Of Releasing Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

3. Locate the dress cover locking tabs at the corners of the connector. Use a small flat-blade tool to release the locking tabs and remove the dress cover.

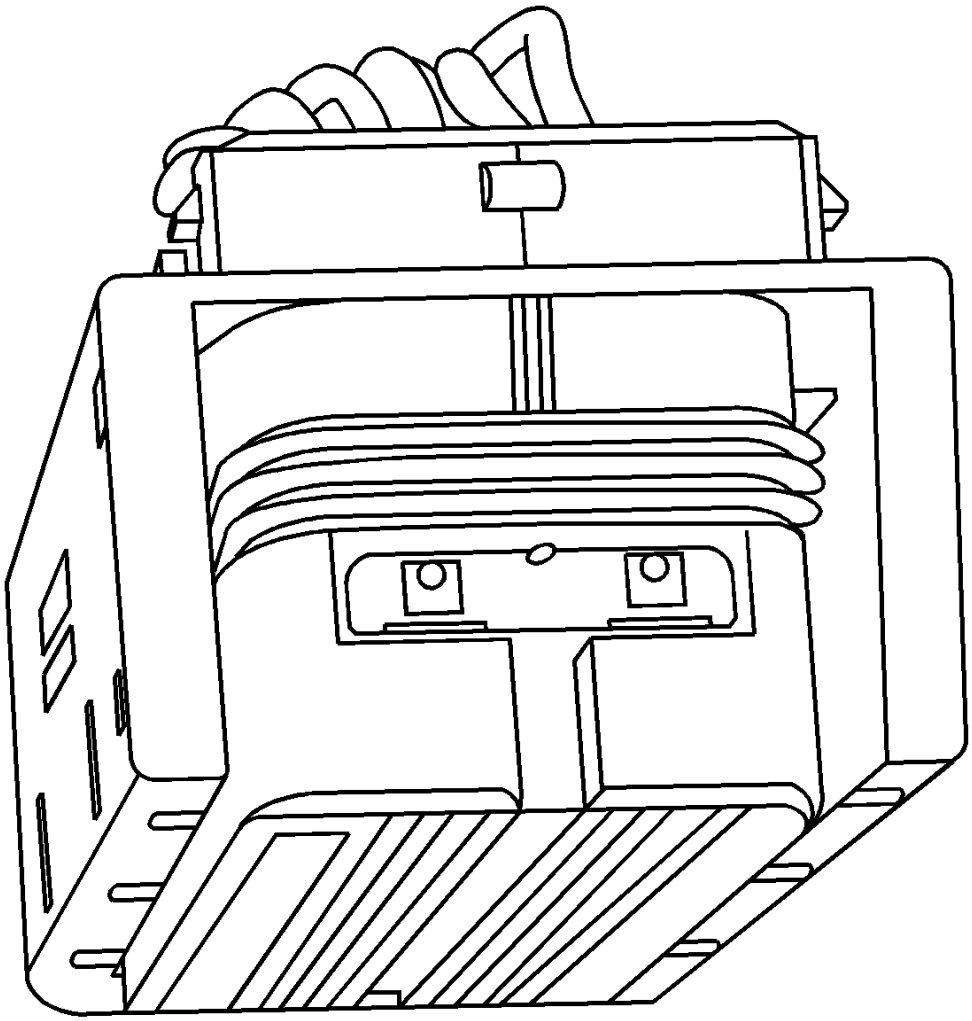

Fig. 53: View Of Terminal Positive Assurance (TPA) Connector
Courtesy of GENERAL MOTORS COMPANY

4. The terminal positive assurance (TPA) is located in the front of the connector.

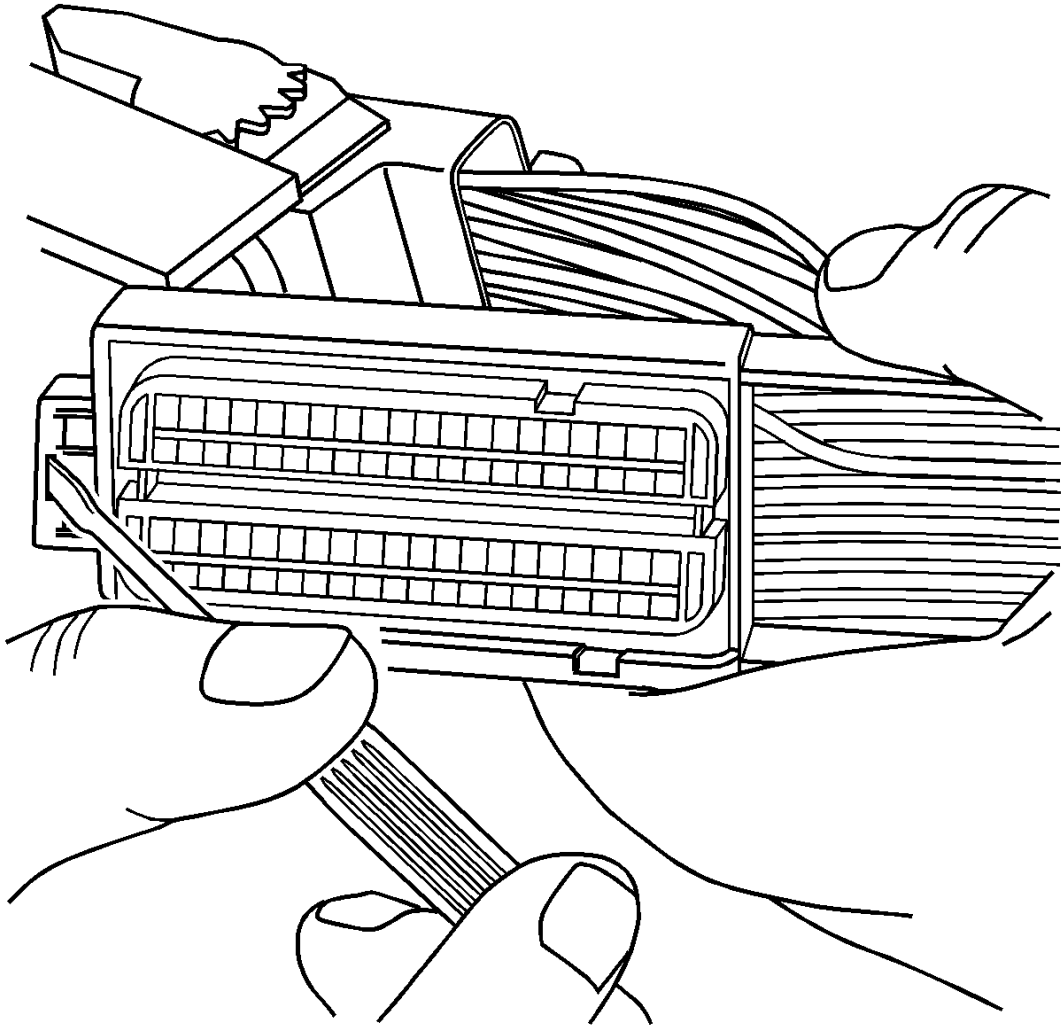

Fig. 54: View Of Removing TPA From Connector
Courtesy of GENERAL MOTORS COMPANY

5. Use a small flat-blade tool to remove TPA from the connector.

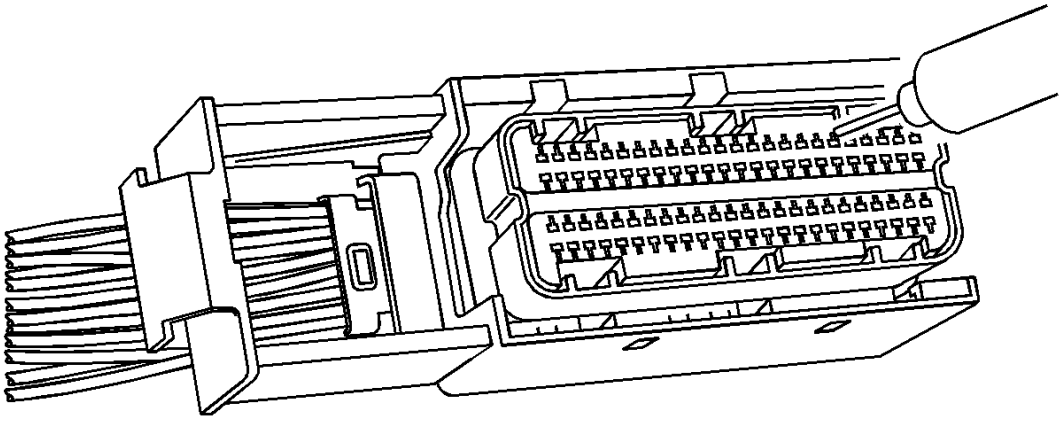

Fig. 55: View Of Special Tools And Terminals
Courtesy of GENERAL MOTORS COMPANY

6. Use the J-38125-213 or the J-38125-556 tool to release the terminals by inserting the tool into the terminal release cavity.
7. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
8. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
9. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

NOTE: **Ensure that the dress cover and connector body are both in the released position before reassembling. Failure to do so may cause damage to the connector and component.**

10. Reconnect the connector bodies.

DELPHI CONNECTORS (WEATHER PACK)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-10A** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

The following is the proper procedure for the repair of Weather PackÂ® Connectors.

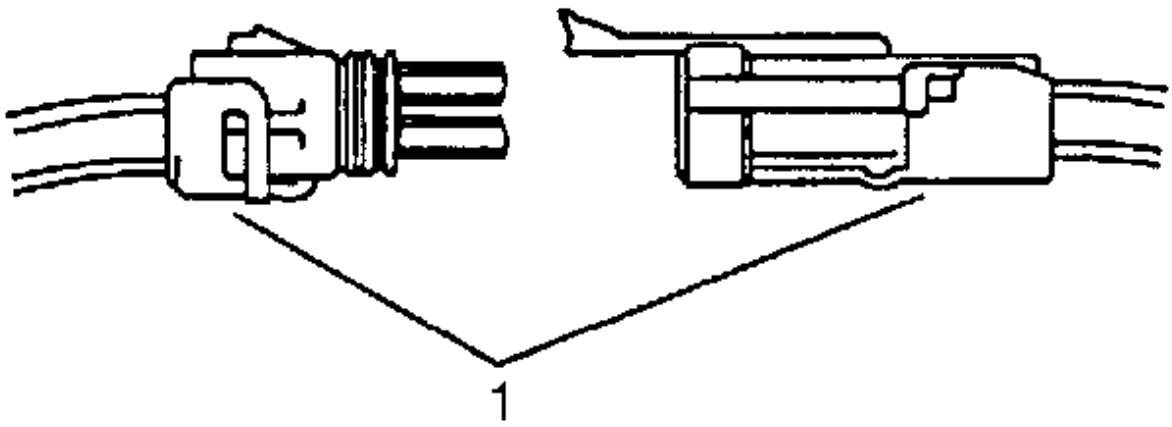

Fig. 56: View Of Connector Halves
Courtesy of GENERAL MOTORS COMPANY

1. Separate the connector halves (1).
2. Open the secondary lock. A secondary lock aids in terminal retention and is usually molded to the

connector (1).

3. Grasp the wire and push the terminal to the forward most position. Hold the wire in this position.

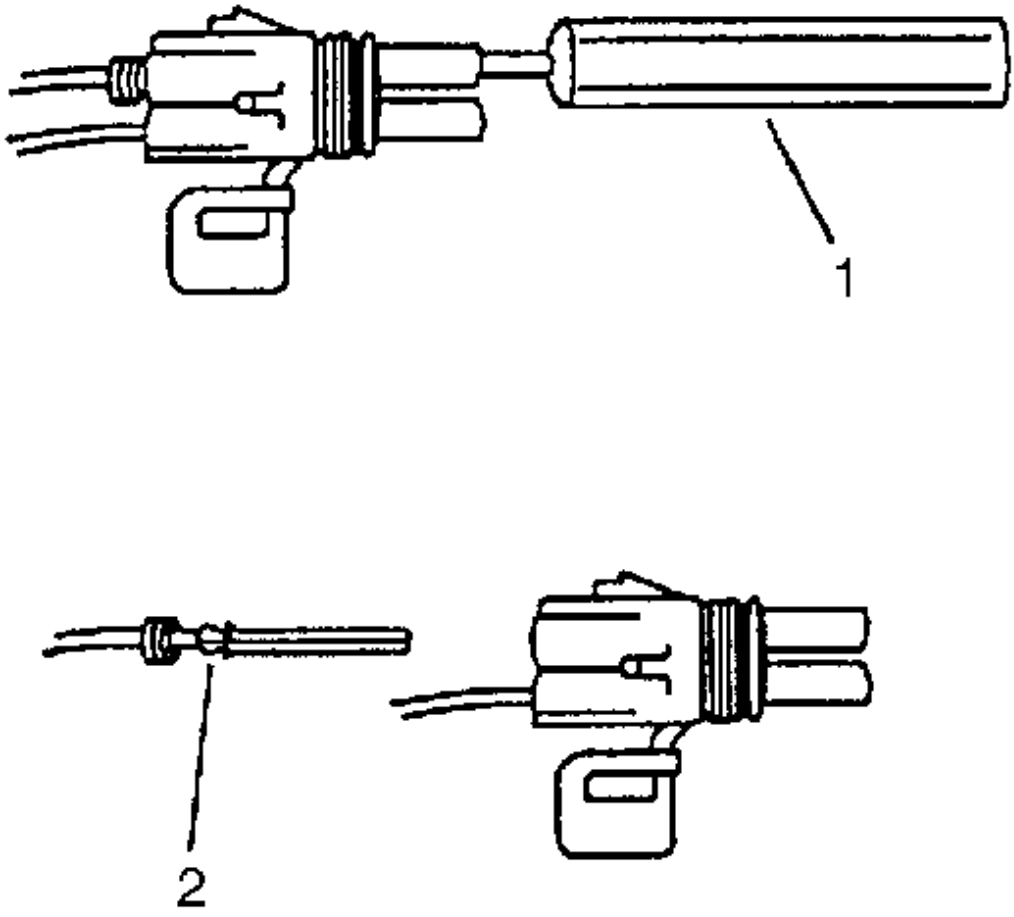

Fig. 57: Identifying Removal Tool & Terminal
Courtesy of GENERAL MOTORS COMPANY

4. Insert the Weather PackÂ® terminal removal tool J-38125-10A into the front (mating end) of the connector cavity until it rests on the cavity shoulder (1).
5. Gently pull on the wire to remove the terminal through the back of the connector (2).

NOTE: **Never use force to remove a terminal from a connector.**

6. Inspect the terminal and connector for damage. Repair as necessary. Refer to **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)**.
7. Reform the lock tang (2) and reset terminal in connector body.
8. Close secondary locks and join connector halves.

9. Verify that circuit is complete and working satisfactorily.
10. Perform system check.
11. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
12. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

DELPHI CONNECTORS (PUSH TO SEAT)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

Follow the steps below in order to repair push to seat connectors.

1. Remove the terminal position assurance (TPA) device, the connector position assurance (CPA) device, and/or the secondary lock.

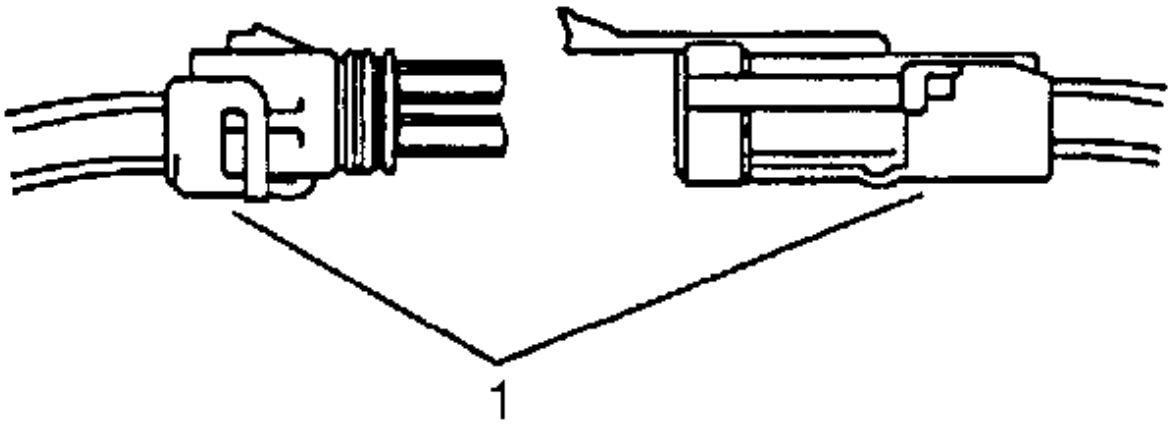

Fig. 58: View Of Connector Halves
Courtesy of GENERAL MOTORS COMPANY

2. Separate the connector halves (1).

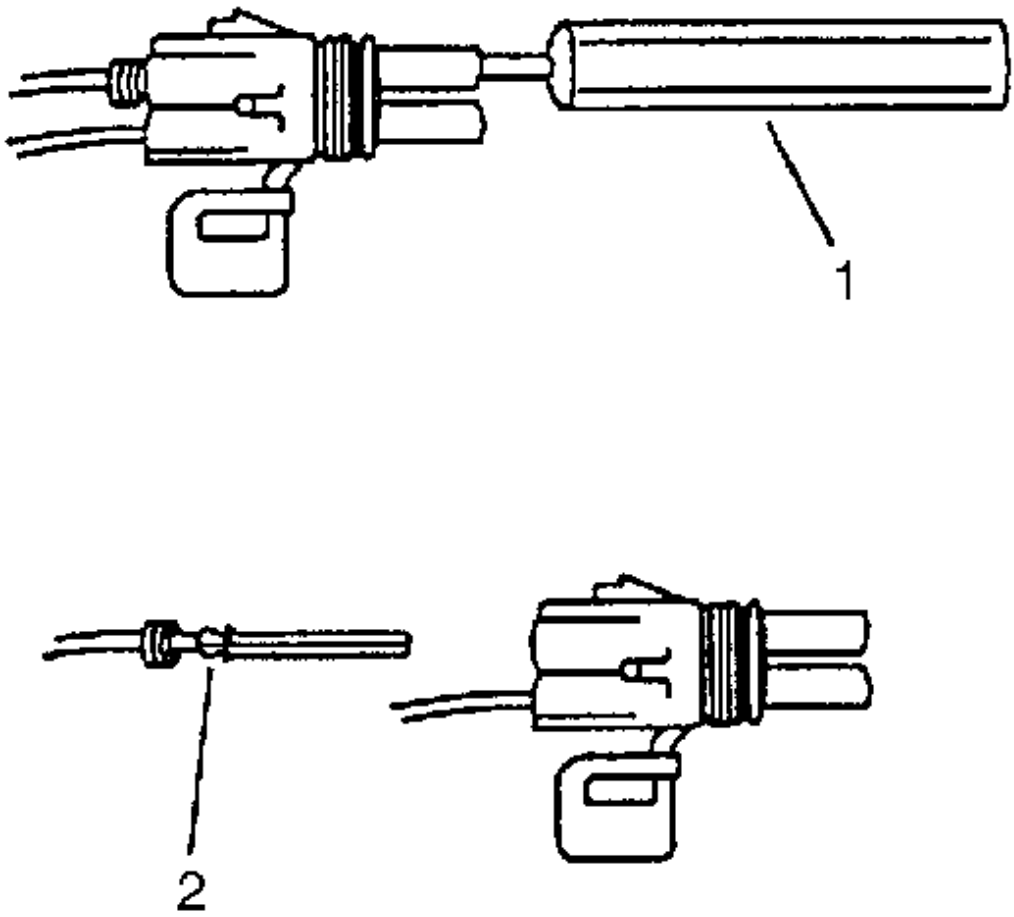

Fig. 59: Identifying Removal Tool & Terminal
Courtesy of GENERAL MOTORS COMPANY

3. Use the proper pick or removal tool (1) in order to release the terminal.
4. Gently pull the cable and the terminal (2) out of the back of the connector.

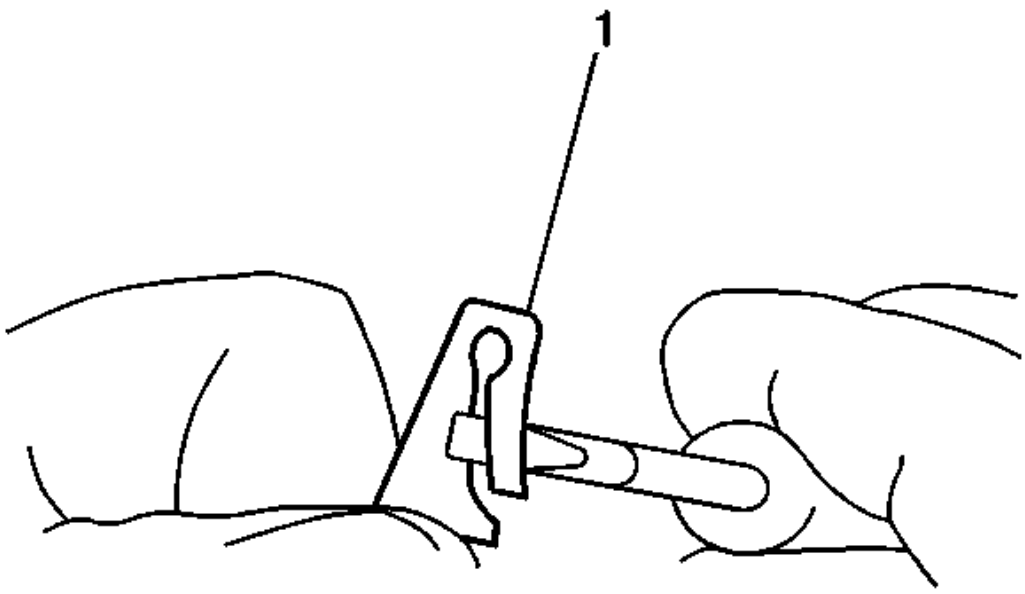

Fig. 60: Identifying Locking Device
Courtesy of GENERAL MOTORS COMPANY

5. Re-form the locking device if you are going to reuse the terminal (1).
6. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminal Insertion Procedure

1. In order to reuse a terminal or lead assembly, refer to **Wiring Repairs**.
2. Ensure that the cable seal is kept on the terminal side of the splice.
3. Insert the lead from the back until it catches.
4. Install the TPA, CPA, and/or the secondary locks.

DELPHI CONNECTORS (PULL TO SEAT)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

If the terminal is visibly damaged or is suspected of having a faulty connection, the terminal should be replaced.

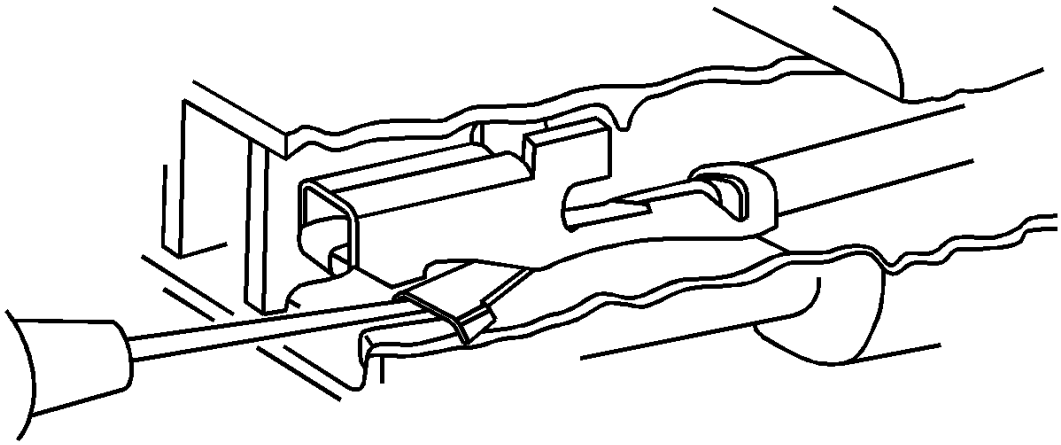

Fig. 61: Aligning Removal Tool - Delphi (Pull To Seat)
Courtesy of GENERAL MOTORS COMPANY

Follow the steps below in order to repair pull-to-seat connectors:

1. Remove the connector position assurance (CPA) device and/or the secondary lock.
2. Disconnect the connector from the component or separate the connectors for in-line connectors.
3. Remove the terminal position assurance (TPA) device.
4. Review the connector end view to determine the proper test probe and release tool.
5. Insert the release tool into the front of the connector body.
6. Grasp the wire at the back of the connector body and gently push the terminal out the front of the

connector body.

7. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
8. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminal Insertion Procedure

1. Align the terminal and pull the wire from the back of the connector in order to seat the terminal.
2. If the connector is outside of the passenger compartment, apply dielectric grease to the connector.
3. Install the TPA, CPA, and/or the secondary locks.

DELPHI CONNECTORS (MICRO-PACK 100W)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-12A** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

There are 2 styles of Micro-Pack 100W connectors. These connectors are very similar but use different terminals and have some minor physical differences also.

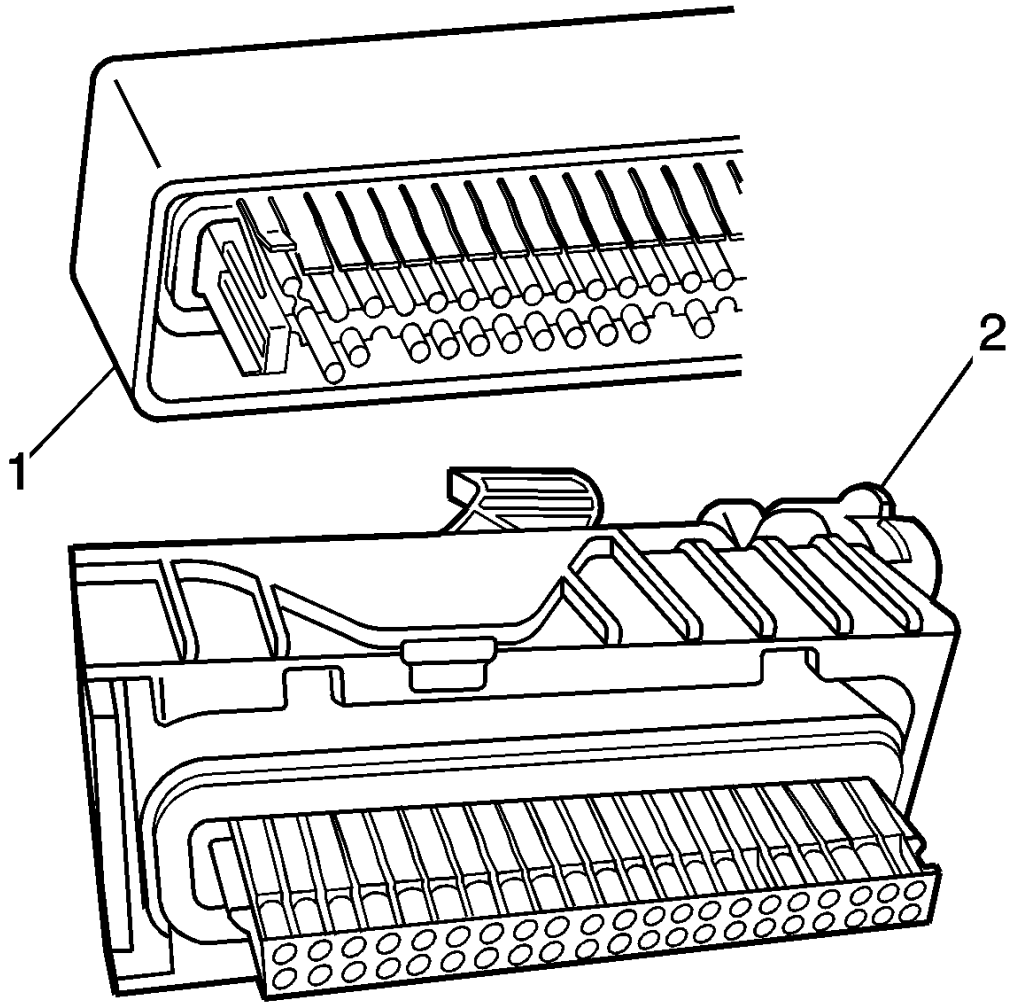

Fig. 62: Identifying Micro-Pack 100W First & Second Connector Designs
Courtesy of GENERAL MOTORS COMPANY

The first connector design of the Micro-Pack 100W (1) has a white connector interface that holds the terminals. The second design of the Micro-Pack 100W (2) has a gray interface to hold the terminals. Also, the first design has terminal cavities that are further apart (3 mm centerline) and offset from the other row of terminal cavities in the connector. The second design has terminals cavities that are closer together (2.54 mm centerline) and aligned vertically. One other way to identify the second design is the thin strip of material that runs along the outside of the cavities.

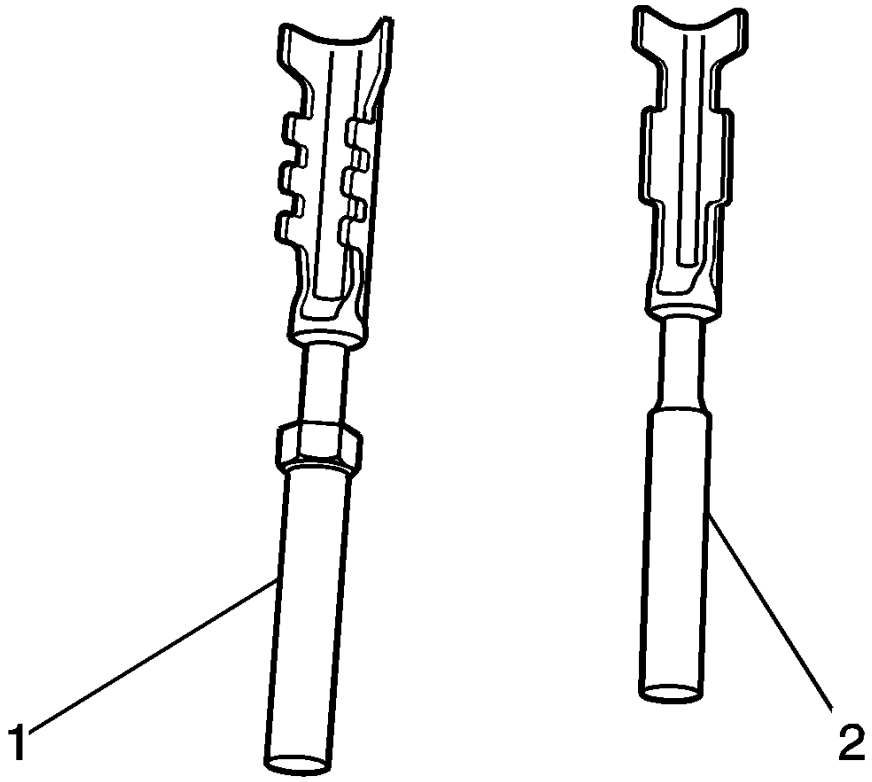

Fig. 63: Identifying Micro-Pack 100W Short & Long Terminals
Courtesy of GENERAL MOTORS COMPANY

NOTE: **There are 2 styles of Micro-Pack 100W terminals which are very similar. Ensure that you have the correct terminal before crimping the new terminal to the wire. The first design connector uses the longer terminal (1) that has a raised area in front of the recess in the terminal. The second design connector uses the shorter terminal without the raised area.**

Follow the steps below in order to remove terminals from Micro-Pack 100W connectors. Some Micro-Pack 100W connector disassembly procedures will vary. Use this procedure as a guide.

1. Disconnect the connector from the component.

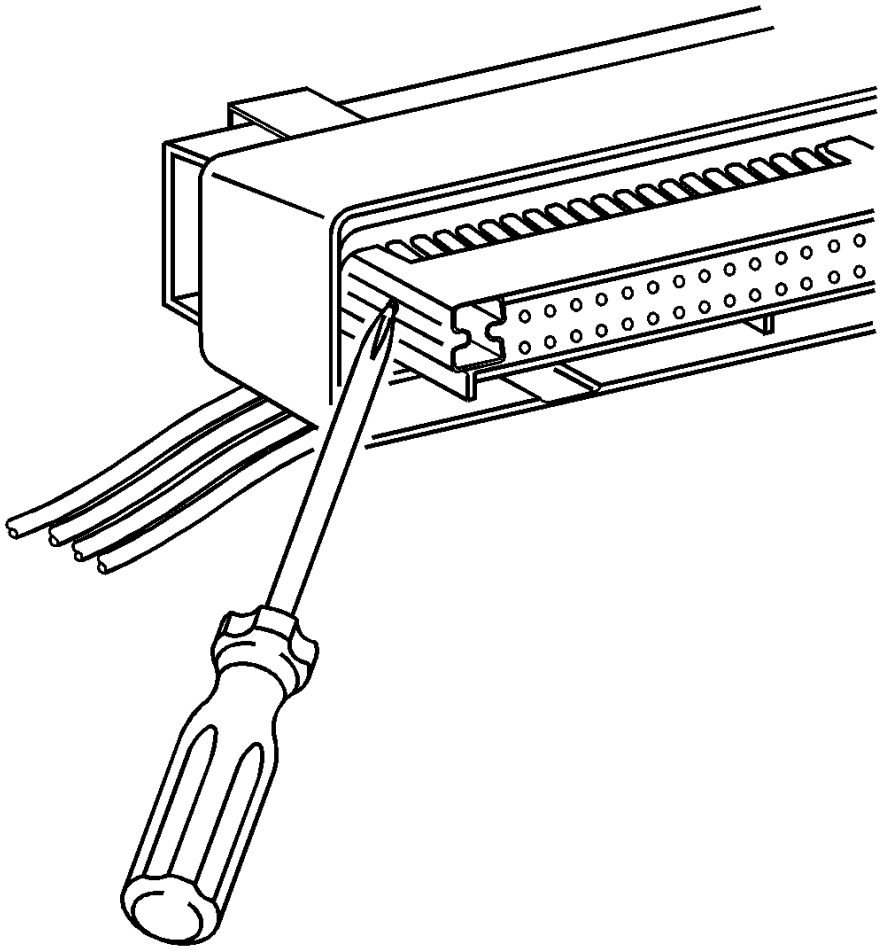

Fig. 64: Locating Nose Piece Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

2. Locate the nose piece locking tabs that are positioned on the side of the connector nose piece. The connector nose piece acts as a terminal positive assurance (TPA) and may be referred to as such.

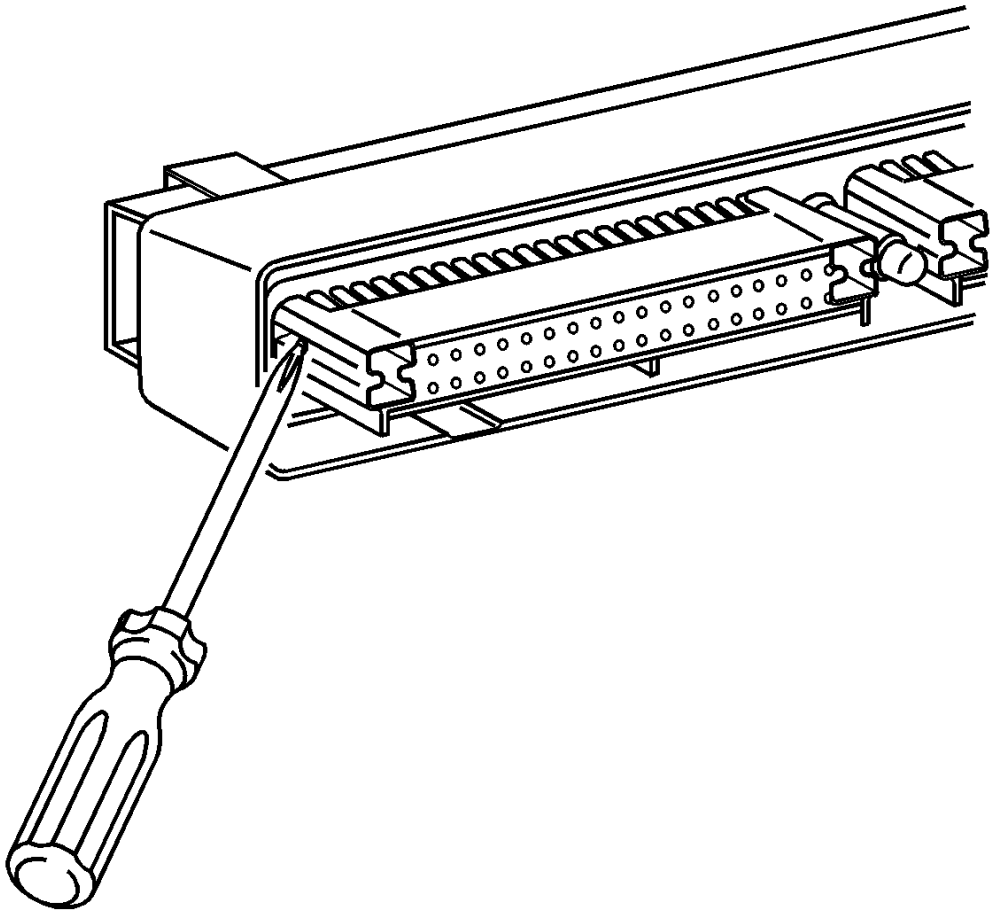

Fig. 65: Loosening Nose Piece Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

3. Use a small flat-blade tool to push in one of the locking tabs while gently pulling on the same side of the nose piece.
4. Repeat the procedure for the other locking tab and remove the nose piece.
5. Remove the wire dress cover. The following is a general procedure for wire dress cover removal. Use this procedure as a guide, some dress cover removal procedures may vary.

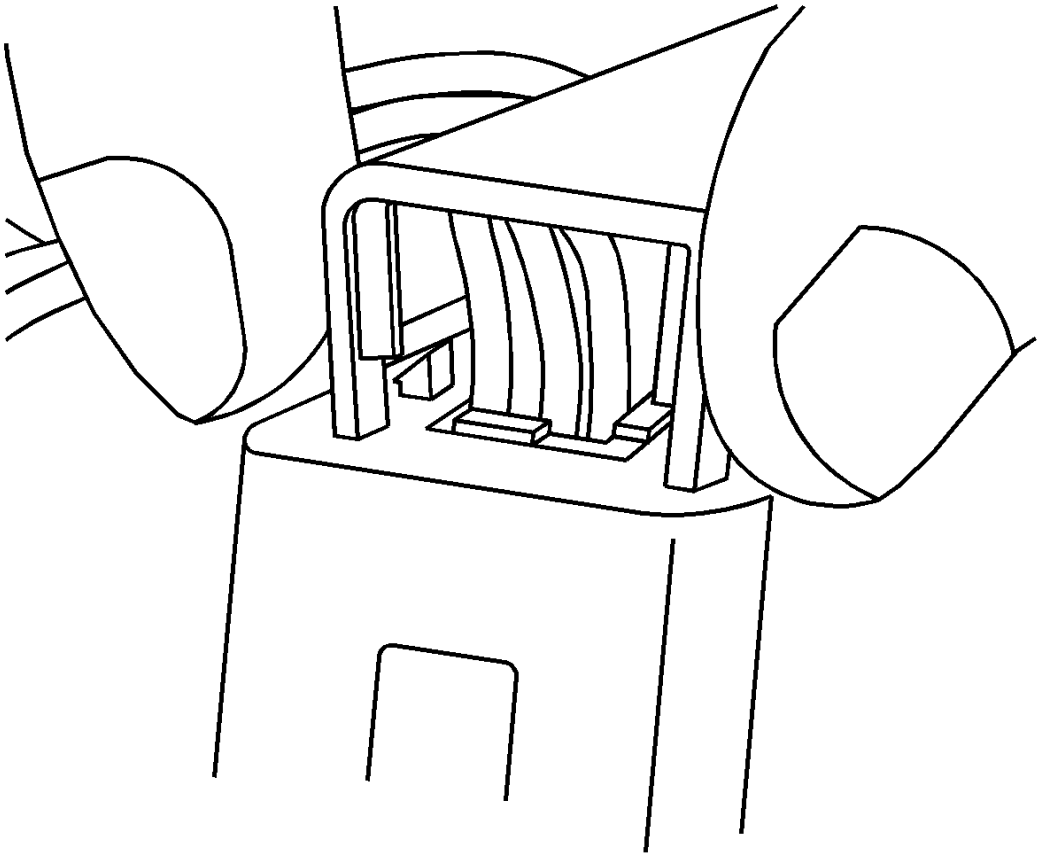

Fig. 66: Squeezing Cover Locking Legs
Courtesy of GENERAL MOTORS COMPANY

6. Use fingers to squeeze the 2 locking legs of the cover.

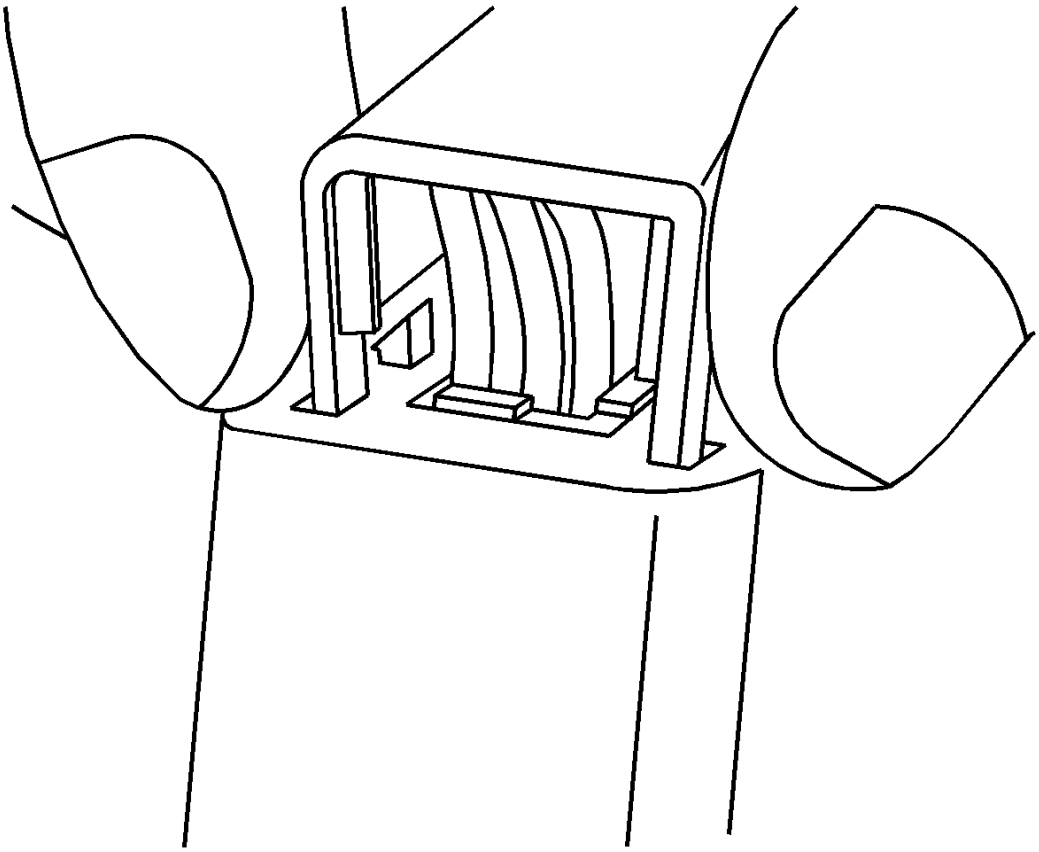

Fig. 67: Unseating Locking Leg
Courtesy of GENERAL MOTORS COMPANY

7. Apply pressure and gently rock the cover until one locking leg is unseated.

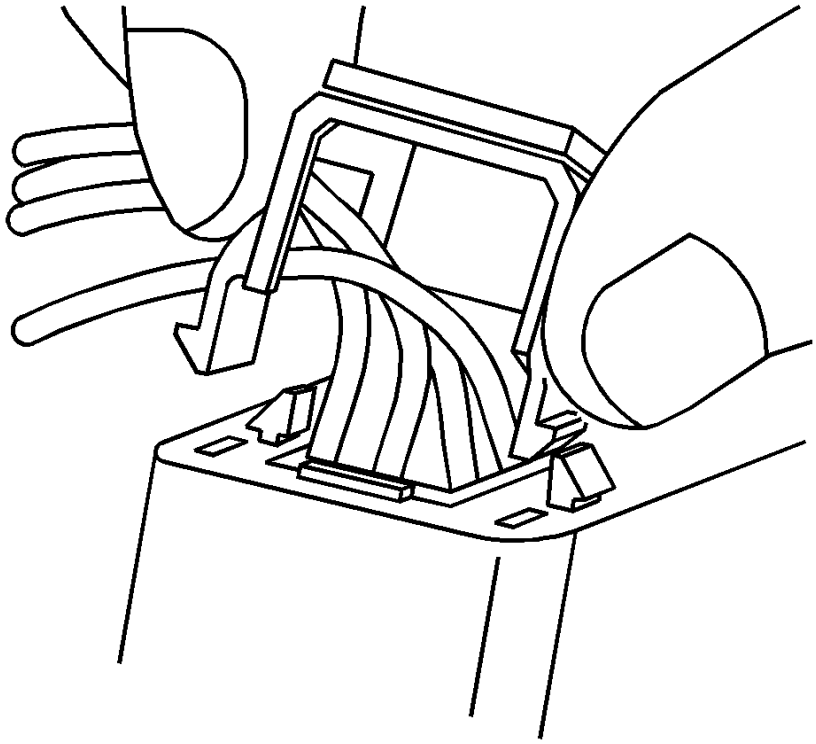

Fig. 68: Removing Cover
Courtesy of GENERAL MOTORS COMPANY

8. Continue to apply pressure and rock the cover until the second locking leg is unseated. Repeat procedure for the other side of the dress cover and remove the cover.

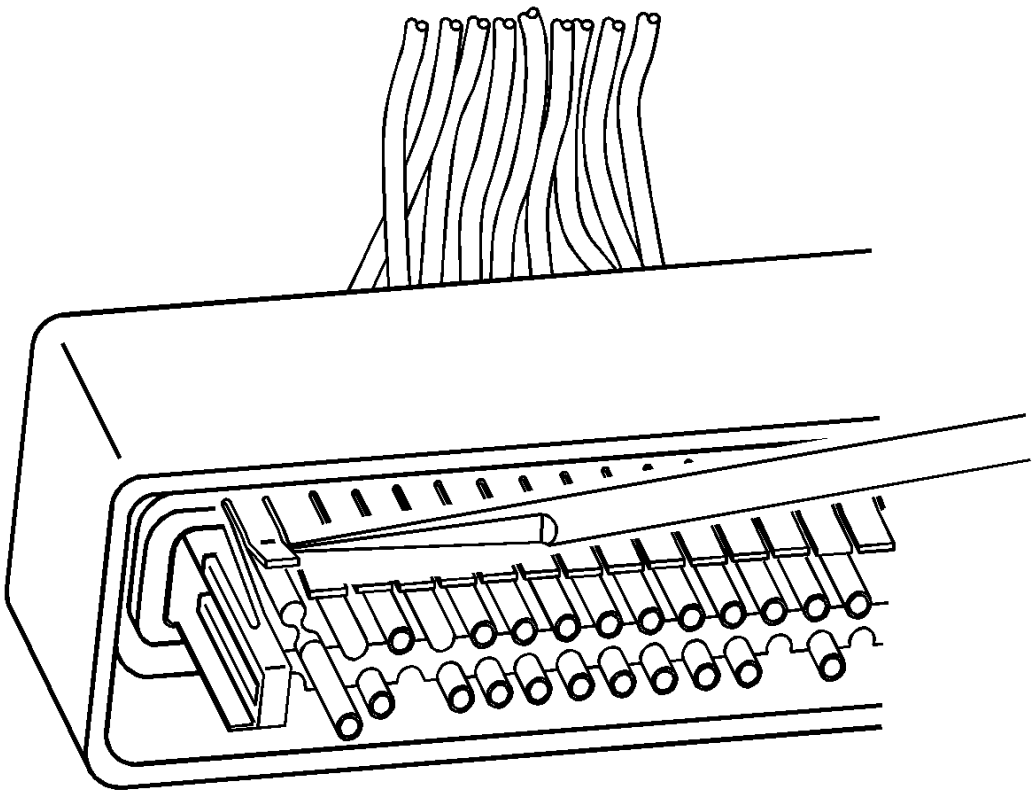

Fig. 69: Identifying Terminal Retaining Tab
Courtesy of GENERAL MOTORS COMPANY

9. Use J-38125-12A to gently lift the terminal retaining tab while gently pulling the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
10. If the terminal is severely bent or damaged, it may be possible on some connectors to push the wire out of the front of the connector instead of pulling it through. This will prevent damage to the internal seals of the connector. Once the terminal is pushed out of the connector, cut the wire as close to the terminal as possible and pull the wire through the connector.
11. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
12. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminal Insertion Procedure

After the terminal is crimped to the wire perform the following procedure in order to replace Micro-Pack 100 terminals.

1. Slide the new terminal into the correct cavity at the back of the connector.

2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Ensure that the terminal is locked in place by gently pulling on the wire.
3. To assemble the connector, reverse the Terminal Removal Procedure.

DELPHI CONNECTORS (MICRO .64)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-21** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

Follow the steps below in order to remove terminals from Micro .64 connectors.

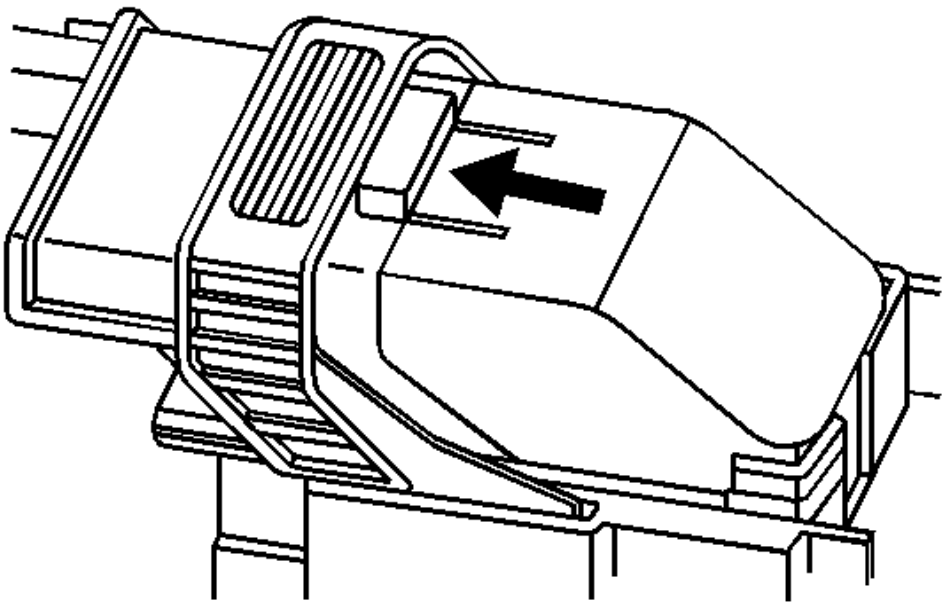

Fig. 70: Identifying Wire Dress Cover Lever Lock
Courtesy of GENERAL MOTORS COMPANY

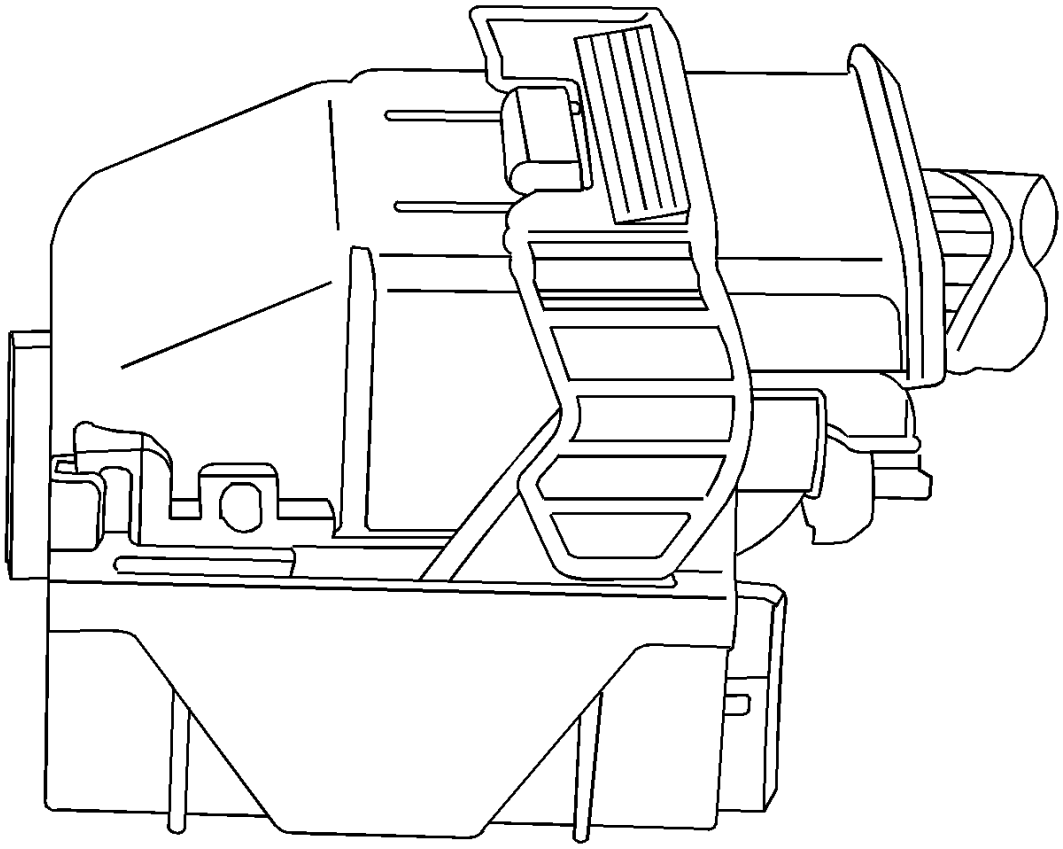

Fig. 71: View Of Typical Micro 64 Connector
Courtesy of GENERAL MOTORS COMPANY

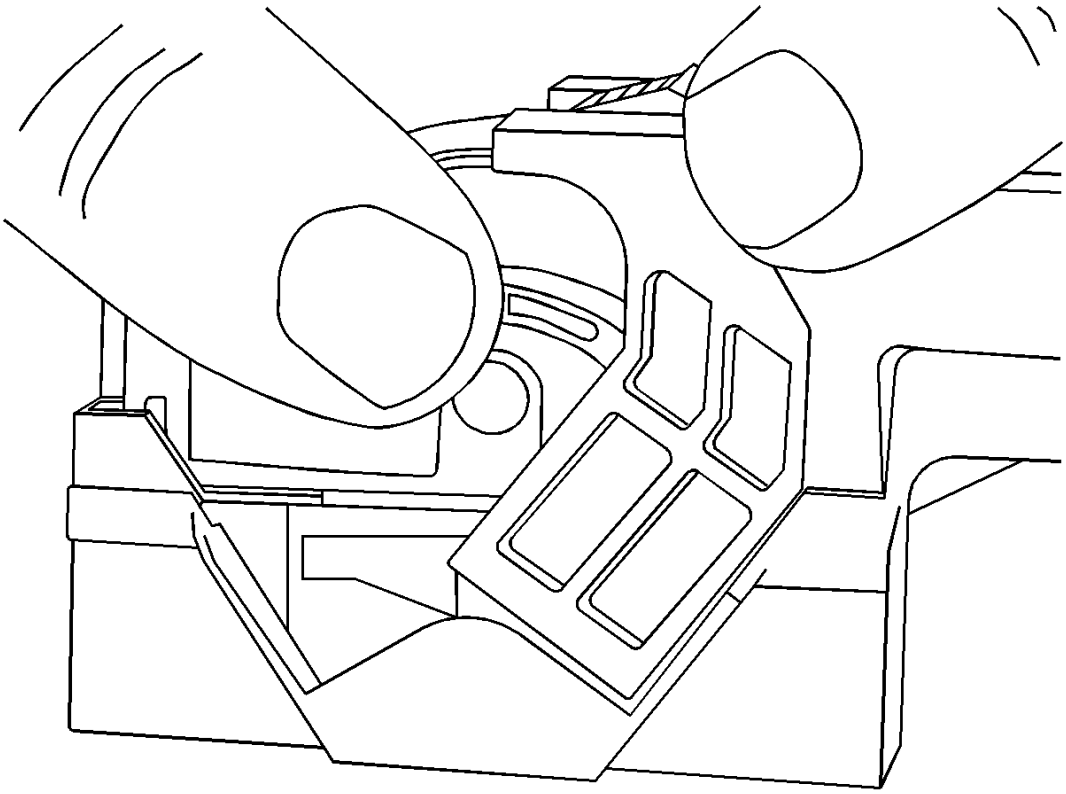

Fig. 75: Locating Locks On Both Sides Of Wiredress Cover
Courtesy of GENERAL MOTORS COMPANY

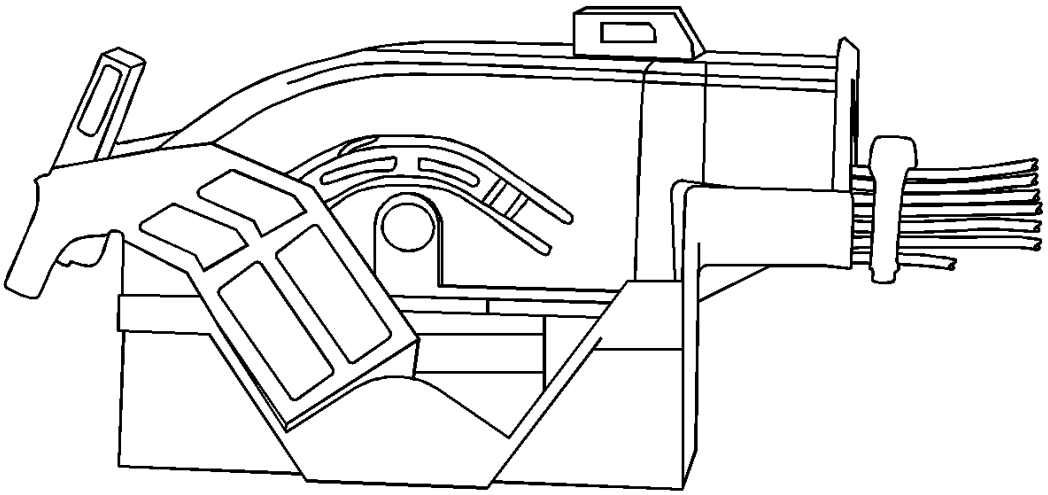

Fig. 76: View Of Connector When Released From Component
Courtesy of GENERAL MOTORS COMPANY

1. Locate the lever lock on the wire dress cover. While depressing the lock, pull the lever over and past the lock. The lever lock may be located on the top or sides of the wire dress cover.

   View of a typical Micro 64 connector.

   Depress the lock and pull the lever over and past the lock.

   View of the connector when released from the component.

   View of another type of Micro 64 connector.

   Depress the locks that are located on both sides of the wire dress cover and pull the lever over and past the locks.

   View of the connector when released from the component.

2. Disconnect the connector from the component.

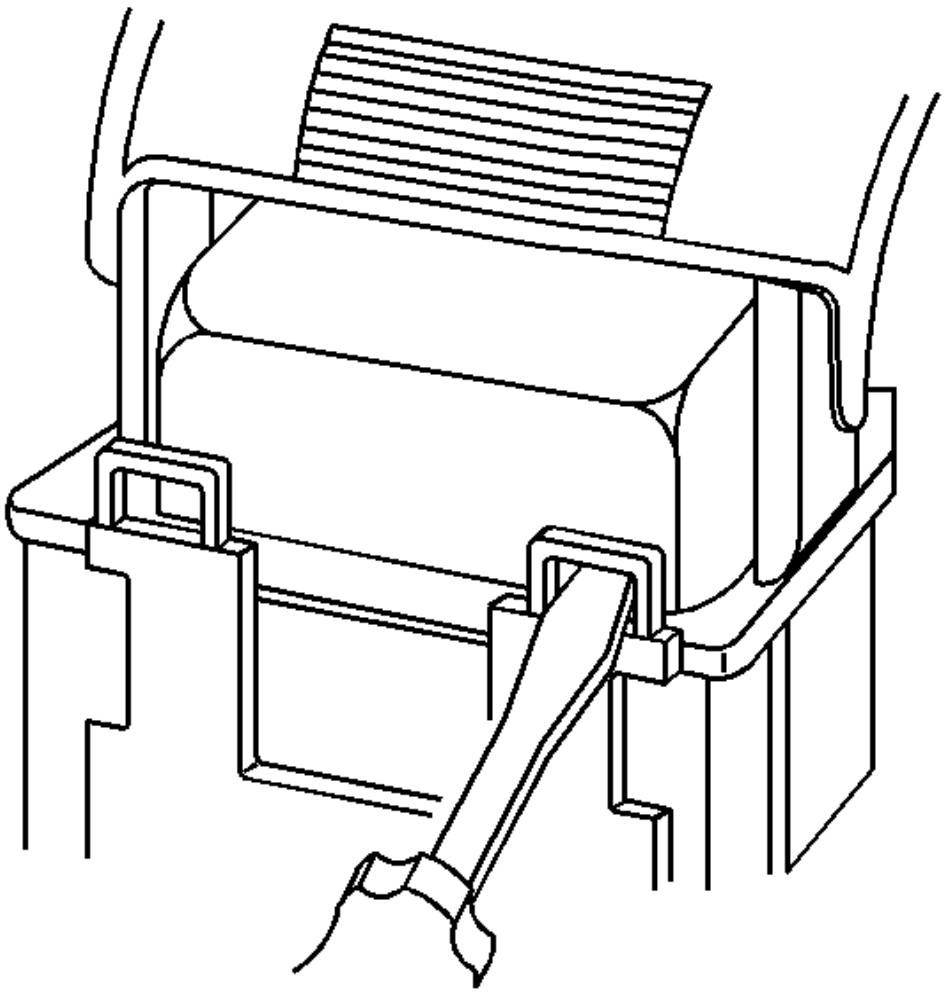

Fig. 77: View Of Releasing Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

3. Locate the dress cover locking tabs at the front of the connector. Using a small flat-blade tool push down on one of the locking tabs and pull the cover up until the dress cover releases. Repeat this procedure for the other locking tab.
4. Once the front 2 locks are unlocked, lift the front of the dress cover and pull it forward.

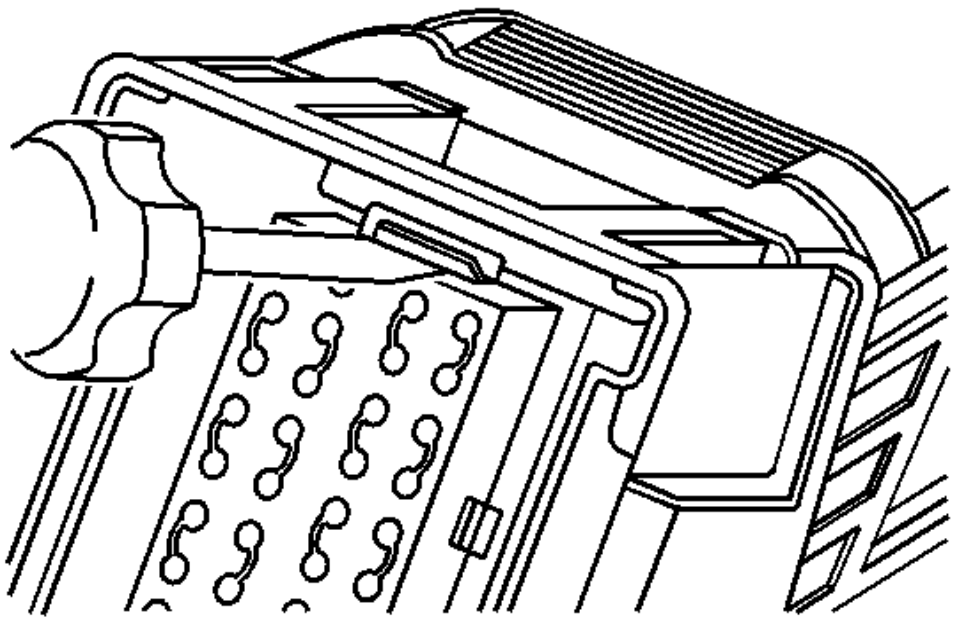

Fig. 78: View Of Removing Terminal Position Assurance
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Always use care when removing a terminal position assurance (TPA) in order to avoid damaging it.**

5. Remove the TPA by inserting a small flat-blade tool into the small slot on the TPA and pushing down until the TPA releases. Gently pry the TPA out of the connector.

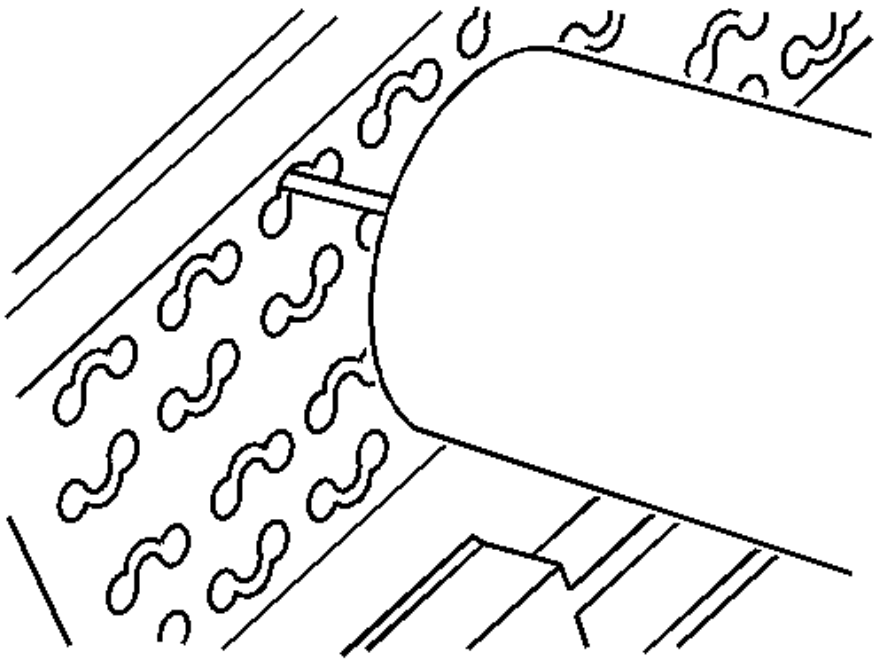

Fig. 79: Identifying Terminal Release Tool
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Be careful not to angle or rock the J-38125-21 tool when inserting it into the connector or the tool may break.**

6. Insert the J-38125-21 tool into the round canal between the terminals cavities at the front of the connector.

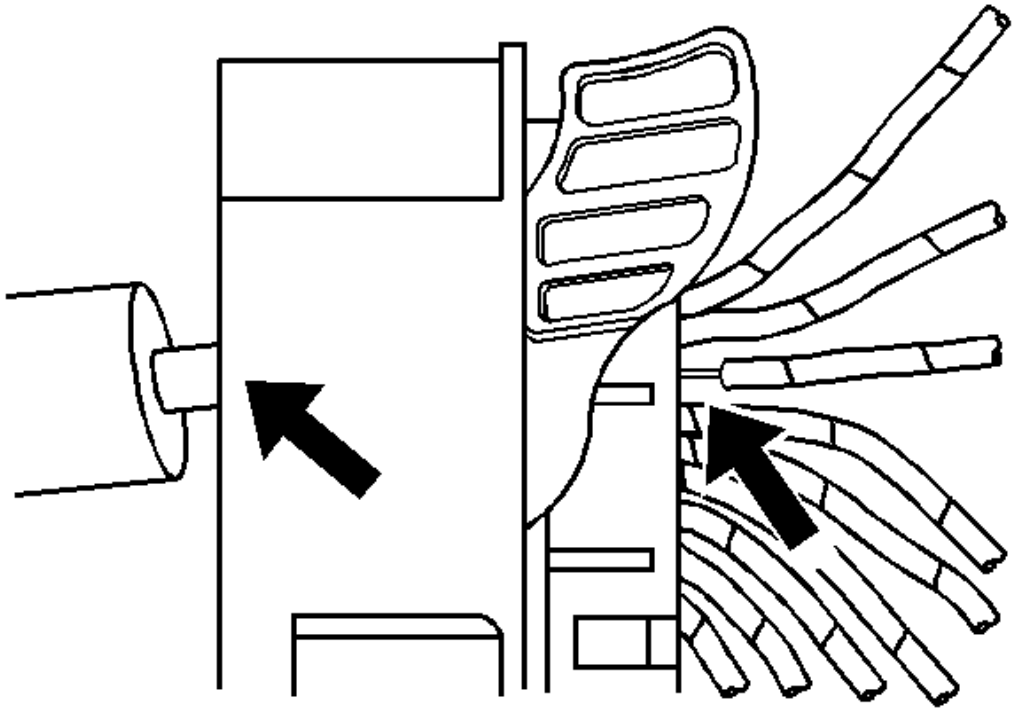

Fig. 80: Removing Wire From Back Of Connector
Courtesy of GENERAL MOTORS COMPANY

7. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
8. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
9. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

DELPHI CONNECTORS (12-WAY)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-12A** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

Follow the steps below in order to remove terminals from the connector.

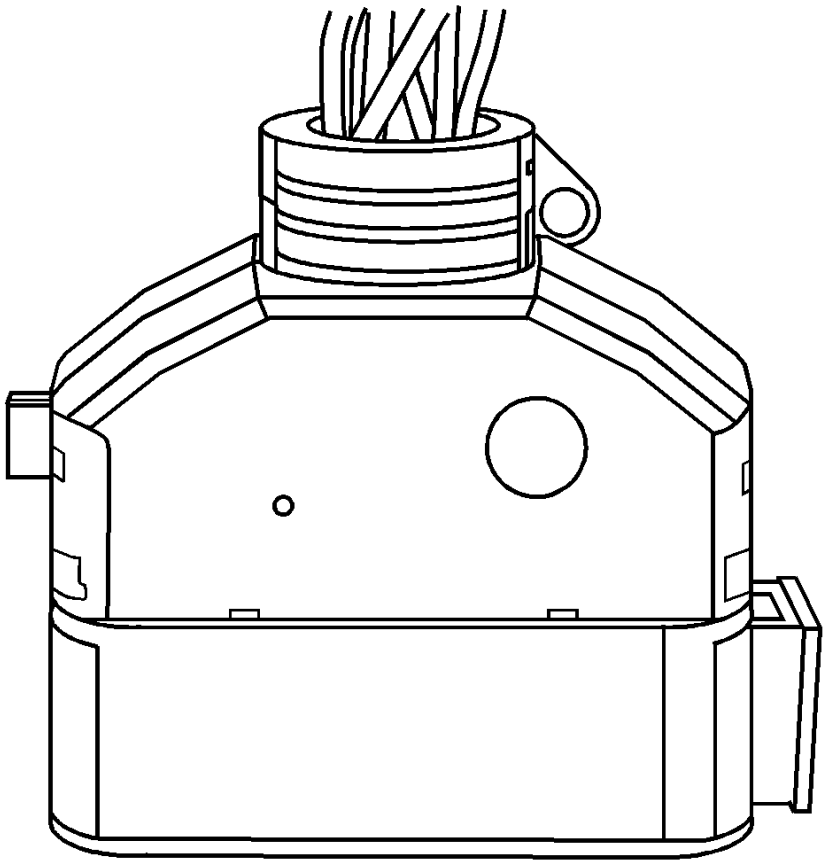

Fig. 81: Identifying Lever Lock
Courtesy of GENERAL MOTORS COMPANY

1. Locate the lever lock on the wire dress cover. Remove the connector position assurance (CPA) and slide the lever lock away from the connector body.
2. Disconnect the connector from the component.

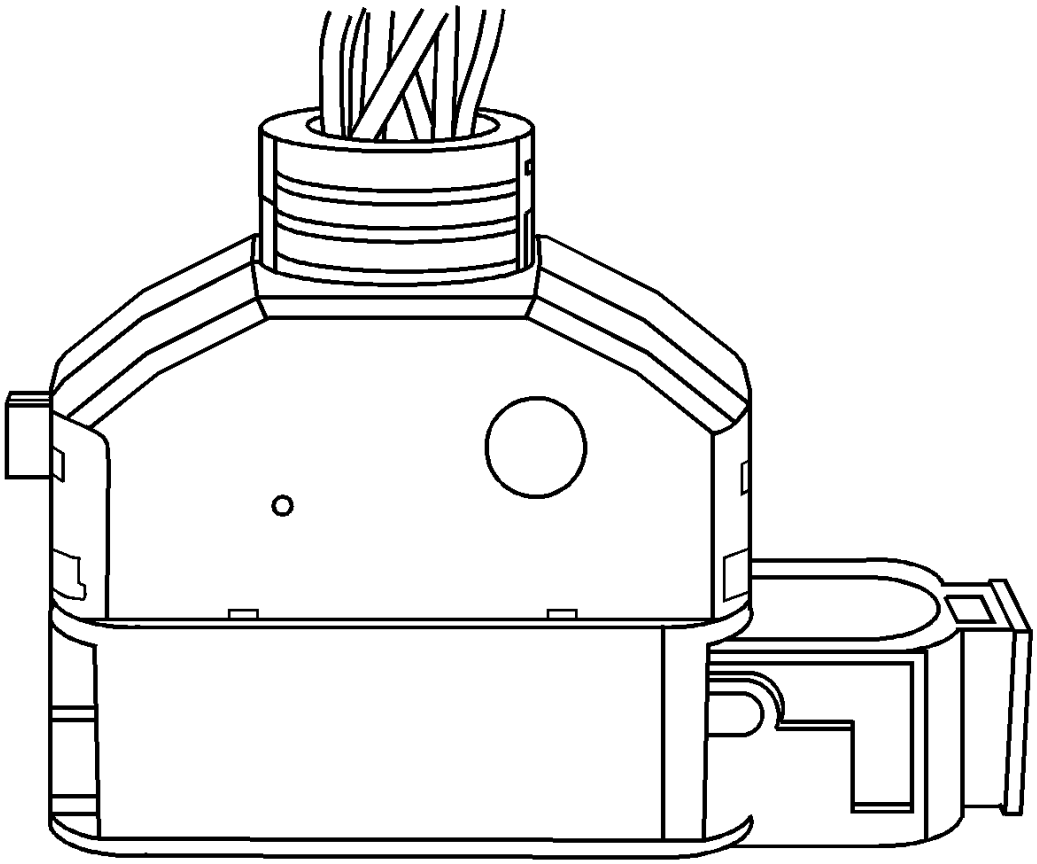

Fig. 82: Identifying Dress Cover Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

3. Locate the dress cover locking tabs on the dress cover of the connector. Using a small flat-blade tool release all of the locking tabs.

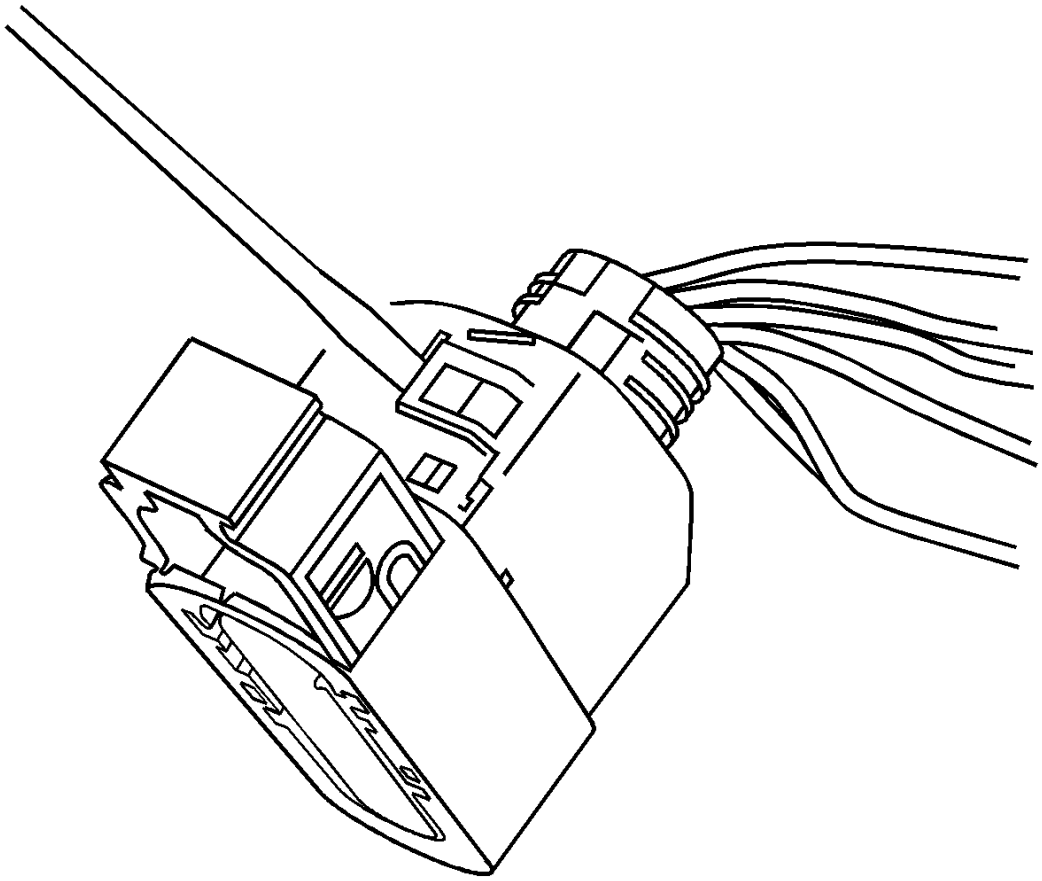

Fig. 83: Identifying Lower Wire Dress Cover Locking Tab
Courtesy of GENERAL MOTORS COMPANY

4. Release the lower wire dress cover locking tab.

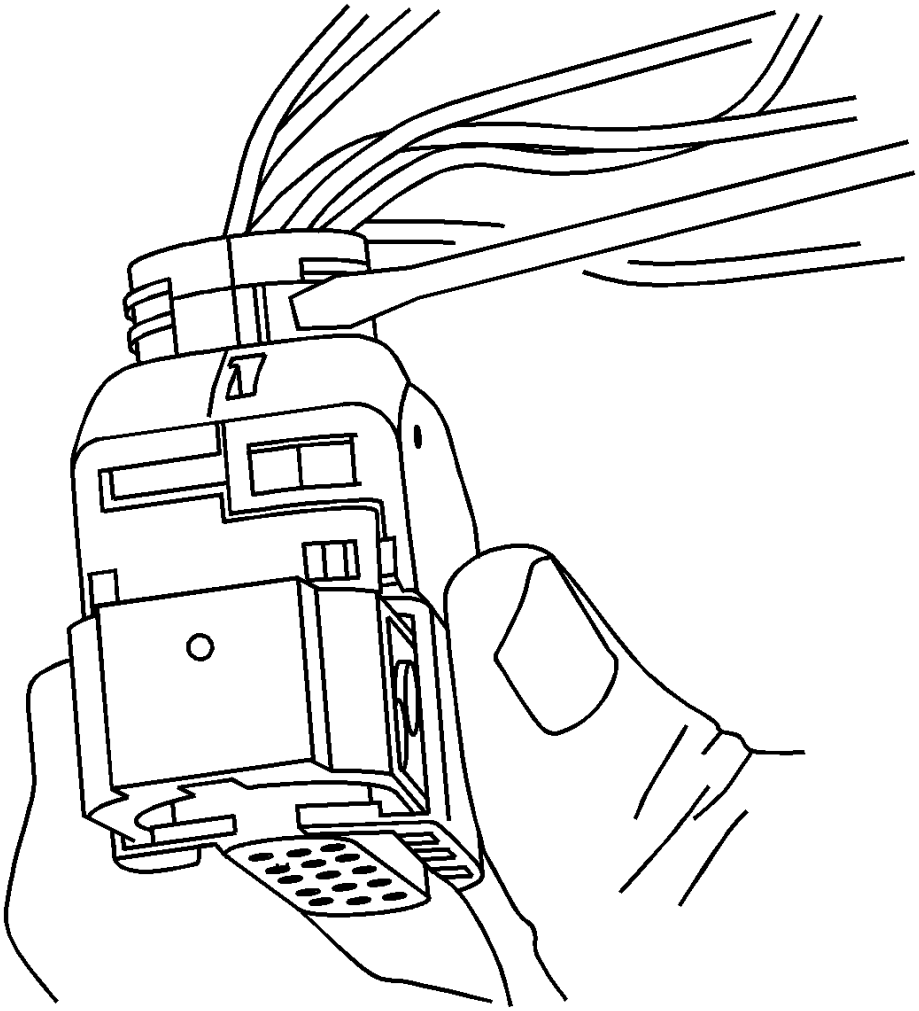

Fig. 84: Identifying Upper Wire Dress Cover Locking Tab
Courtesy of GENERAL MOTORS COMPANY

5. Release the upper wire dress cover locking tab.
6. Once the locks are unlocked, lift the dress cover off.

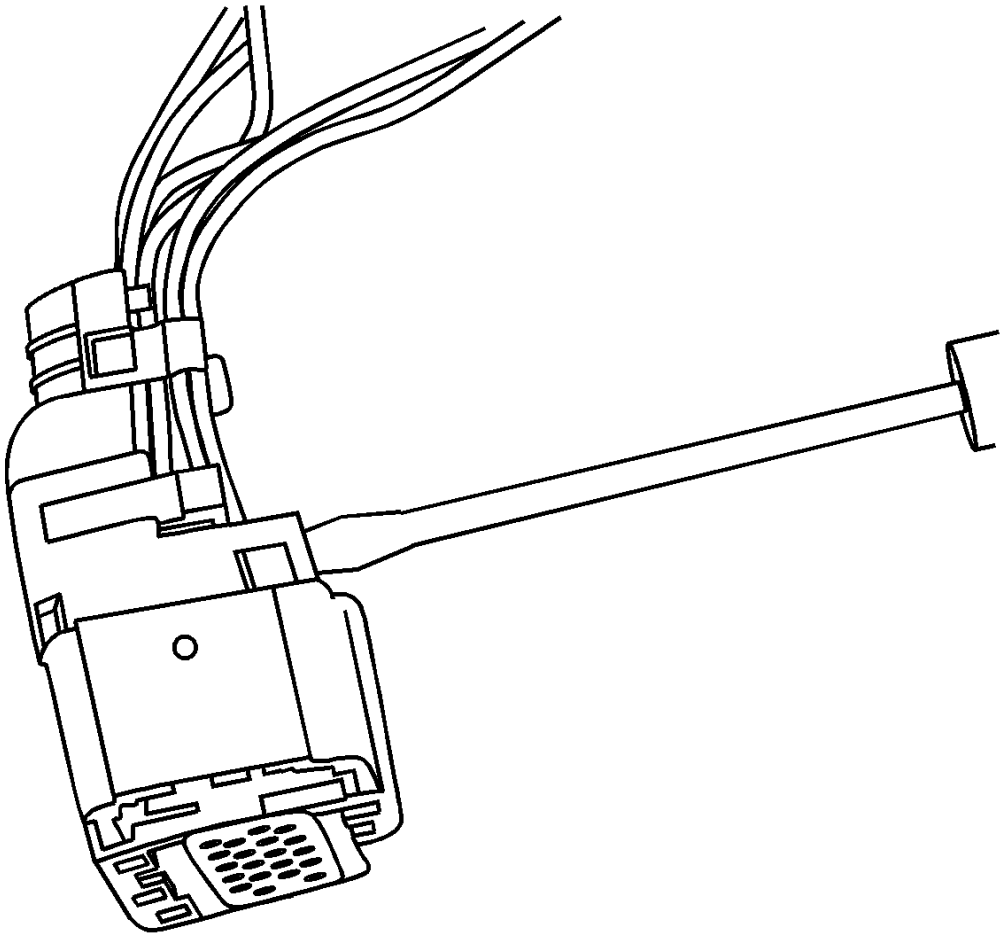

Fig. 85: View Of TPA Being Pried Out Of Connector
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Always use care when removing a terminal position assurance (TPA) in order to avoid damaging it.**

7. Remove the TPA by inserting a small flat-blade tool into the locking tabs on both sides of the TPA . Gently pry the TPA out of the connector.

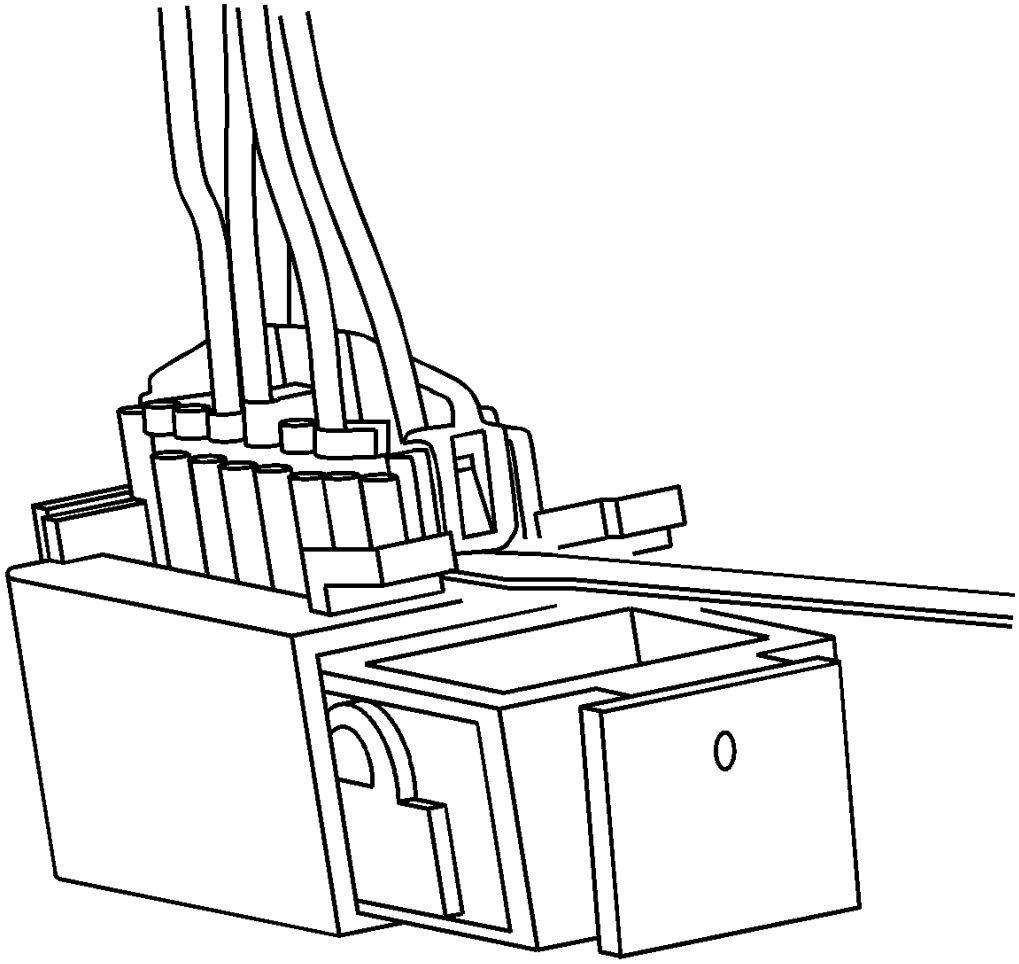

Fig. 86: Removing Nose Piece
Courtesy of GENERAL MOTORS COMPANY

8. Remove the nose piece by inserting a small flat-blade tool into the locking tabs on both sides of the nose piece. Gently pry the nose piece out of the connector.

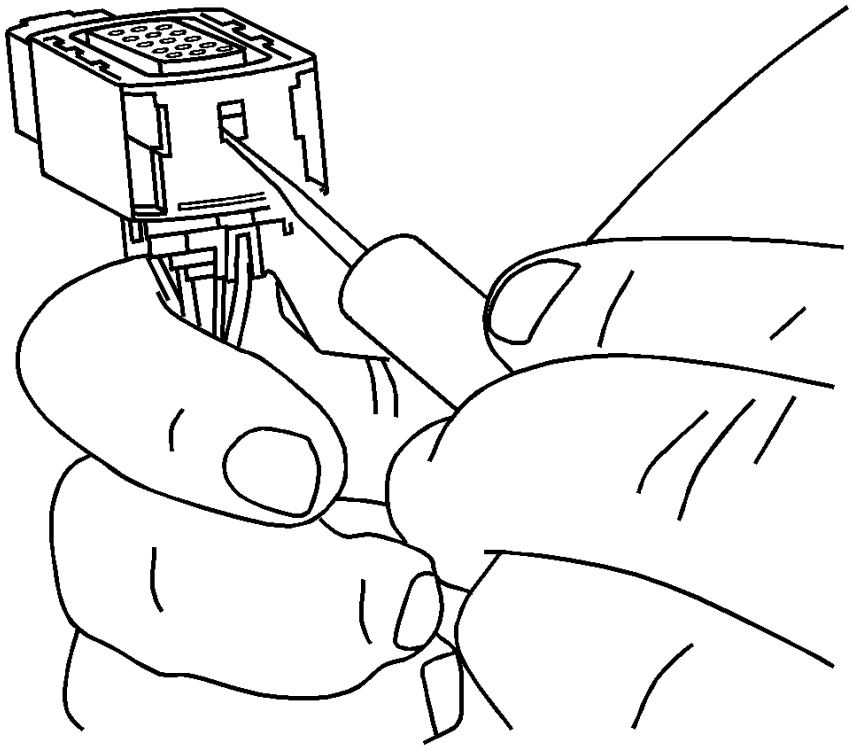

Fig. 87: Inserting Special Tool Into Terminal Release Cavity
Courtesy of GENERAL MOTORS COMPANY

9. Insert the J-38125-12A tool to release the terminals by inserting the tool into the terminal release cavity.

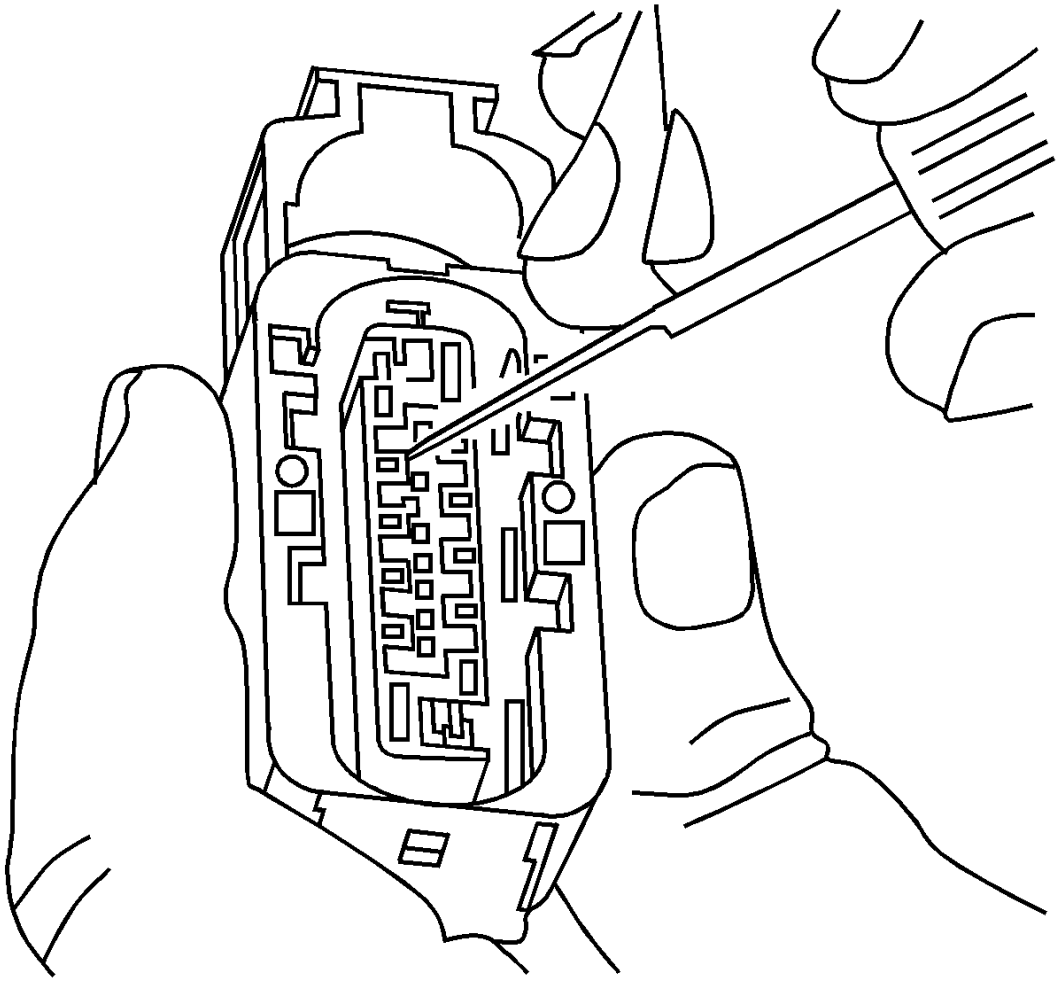

Fig. 88: Pulling Wire Out Of Back Of Connector
Courtesy of GENERAL MOTORS COMPANY

10. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
11. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
12. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

DELPHI CONNECTORS (STEERING GEAR)

Removal Procedure

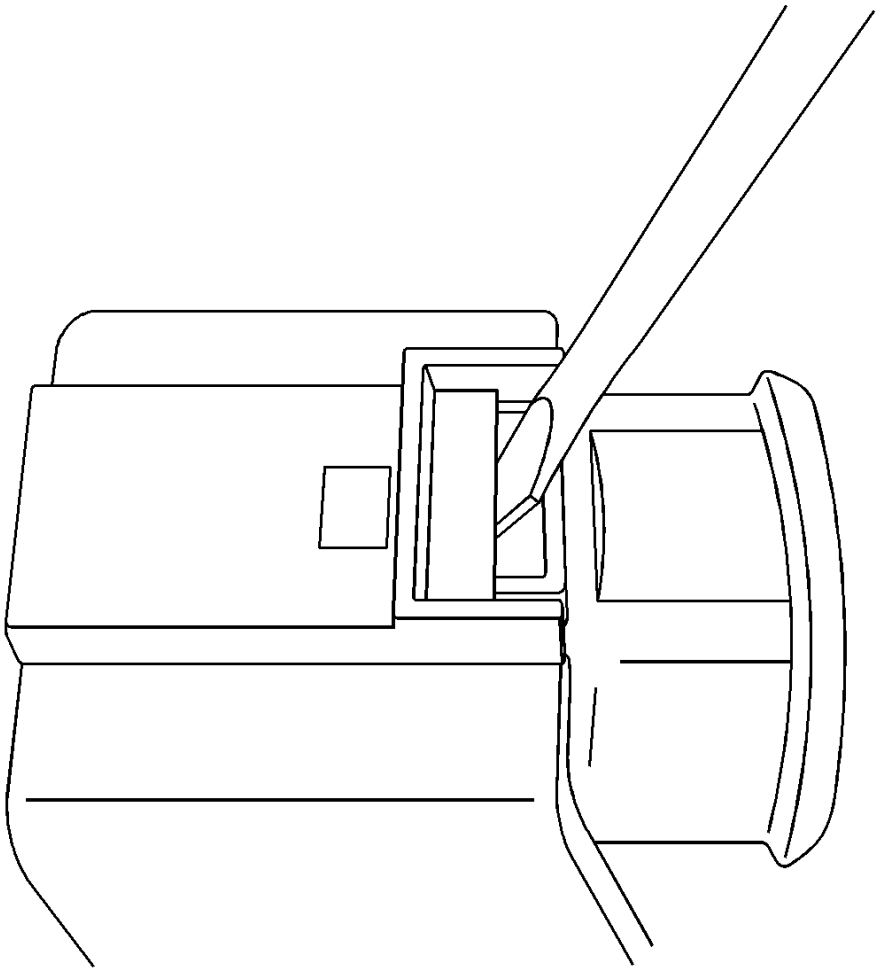

Fig. 89: Releasing Locking Tab On Connector
Courtesy of GENERAL MOTORS COMPANY

1. Use a small flat-bladed tool to release the locking tab on the connector.

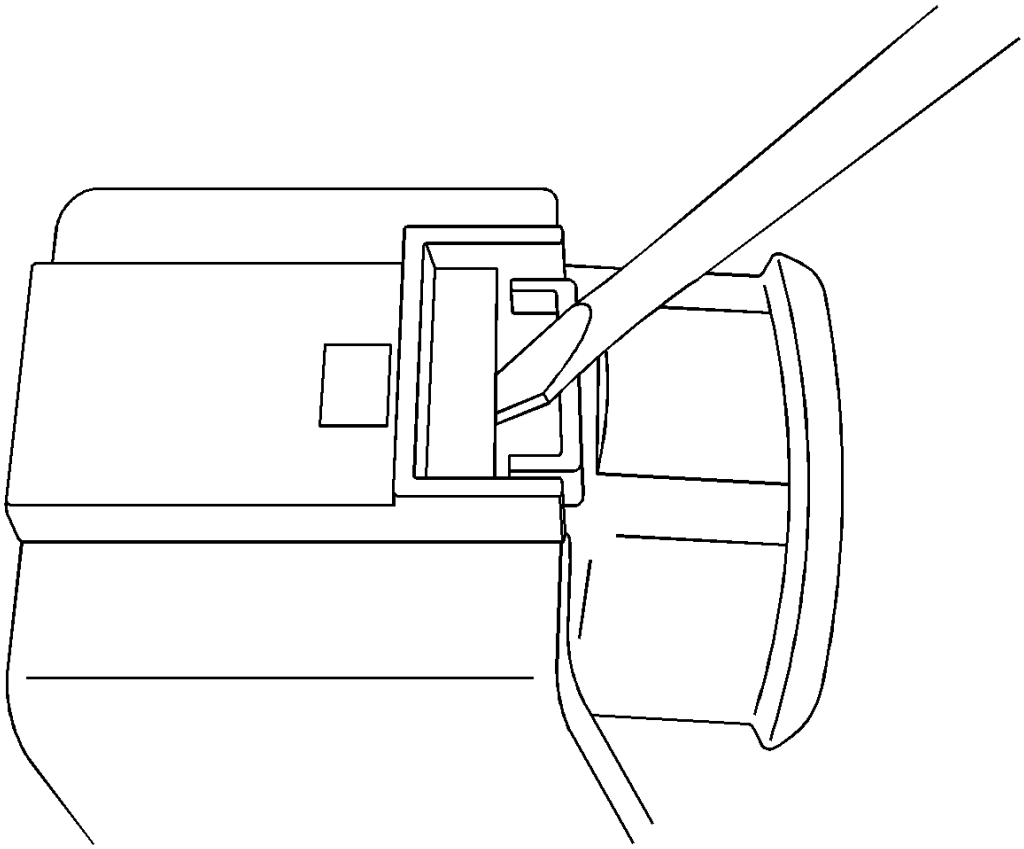

Fig. 90: Releasing Connector
Courtesy of GENERAL MOTORS COMPANY

2. Push down the locking tab to release the connector. The small flat-bladed tool may need to be pushed down and angled back slightly to depress the locking tab. Pull on the connector body while releasing the locking tab to disconnect the connector.

FCI CONNECTORS (LEVER LOCK)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-556** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

Follow the steps below in order to remove terminals from the connector.

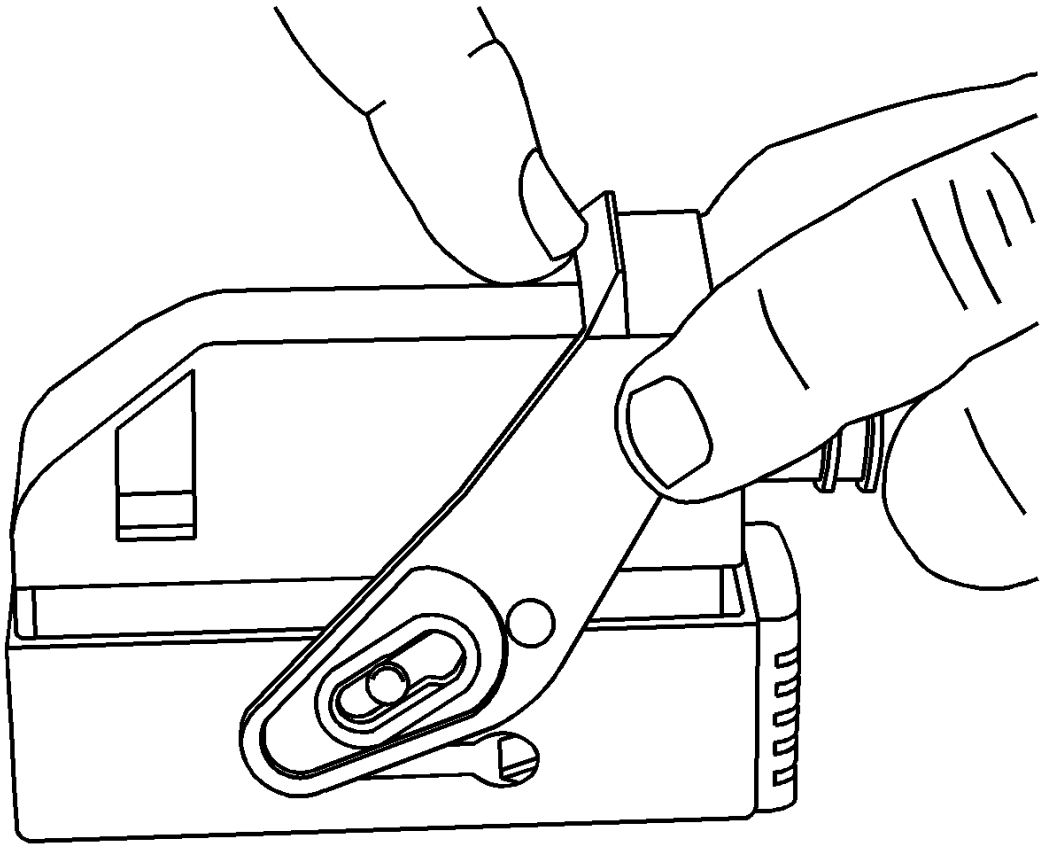

Fig. 91: Identifying Release Tab
Courtesy of GENERAL MOTORS COMPANY

1. Slide the lever lock forward while pressing down on the lever lock release tab.
2. The release tab is located on the top of the wiredress cover.

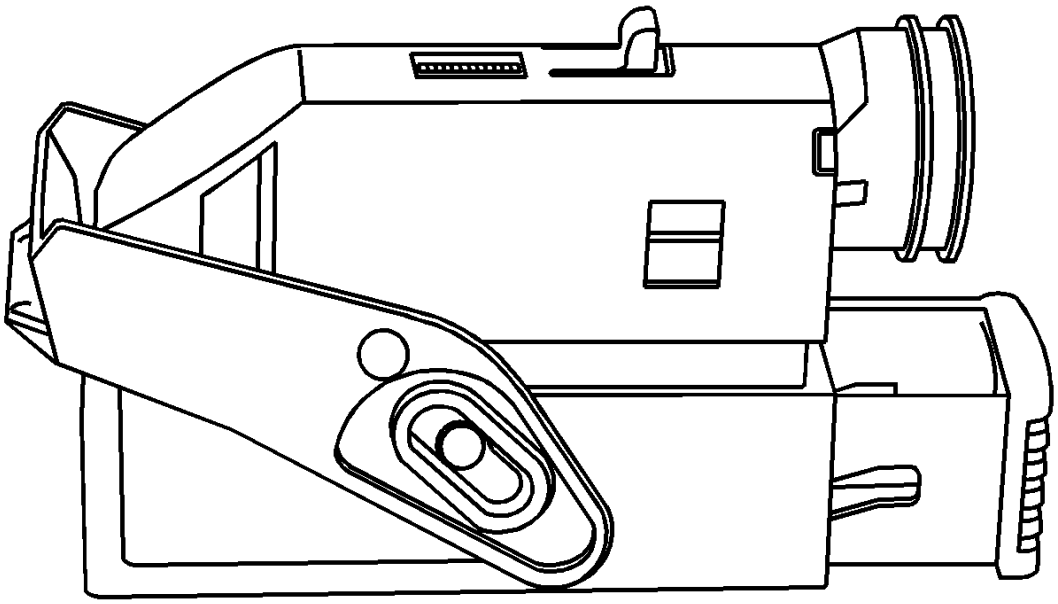

Fig. 92: View Of Connector In Released Position
Courtesy of GENERAL MOTORS COMPANY

3. View of connector in released position.
4. Disconnect the connector from the component.
5. Locate the dress cover locking tabs at the corners of the dress cover. Use a small flat-blade tool to release the locking tabs and remove the dress cover.

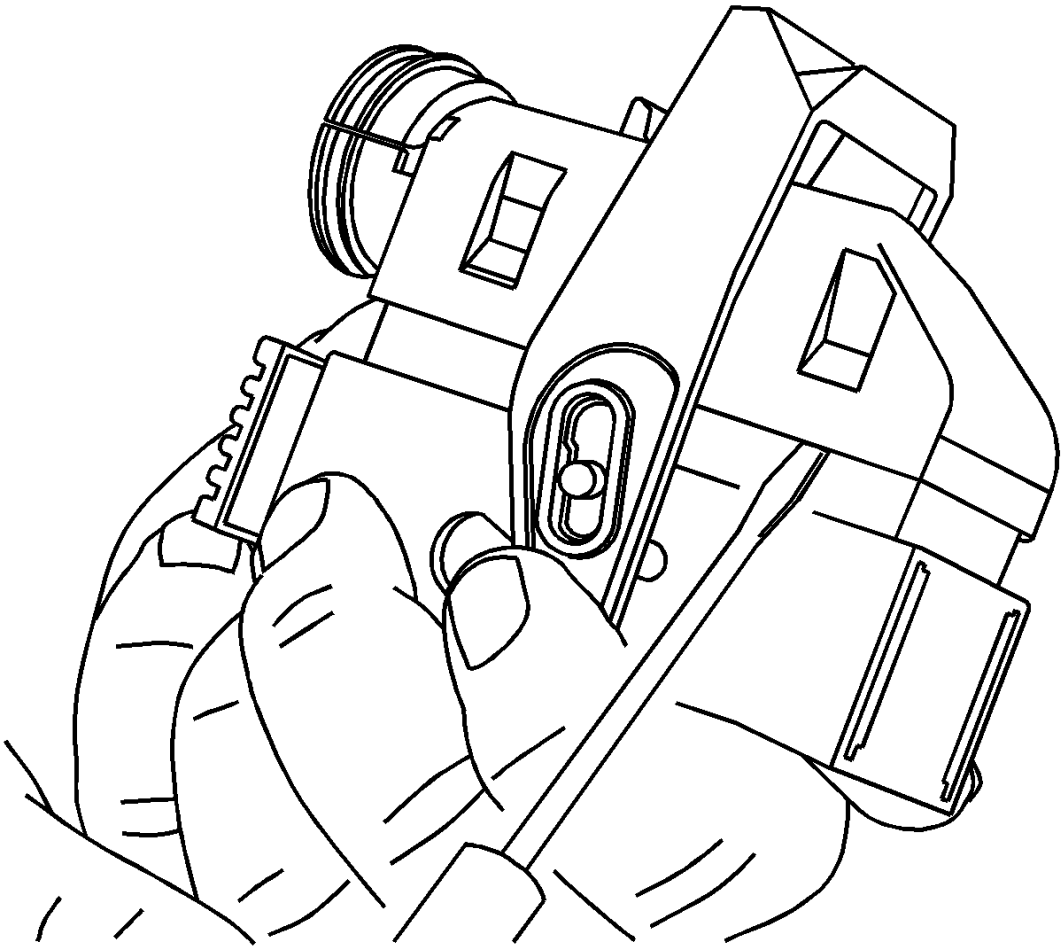

Fig. 93: View Of Sliding Terminal Position Assurance (TPA) Up One Notch
Courtesy of GENERAL MOTORS COMPANY

6. Use a small flat-blade tool to slide the terminal position assurance (TPA) up one notch on both ends of the connector. The TPA is located underneath the wire dress cover.

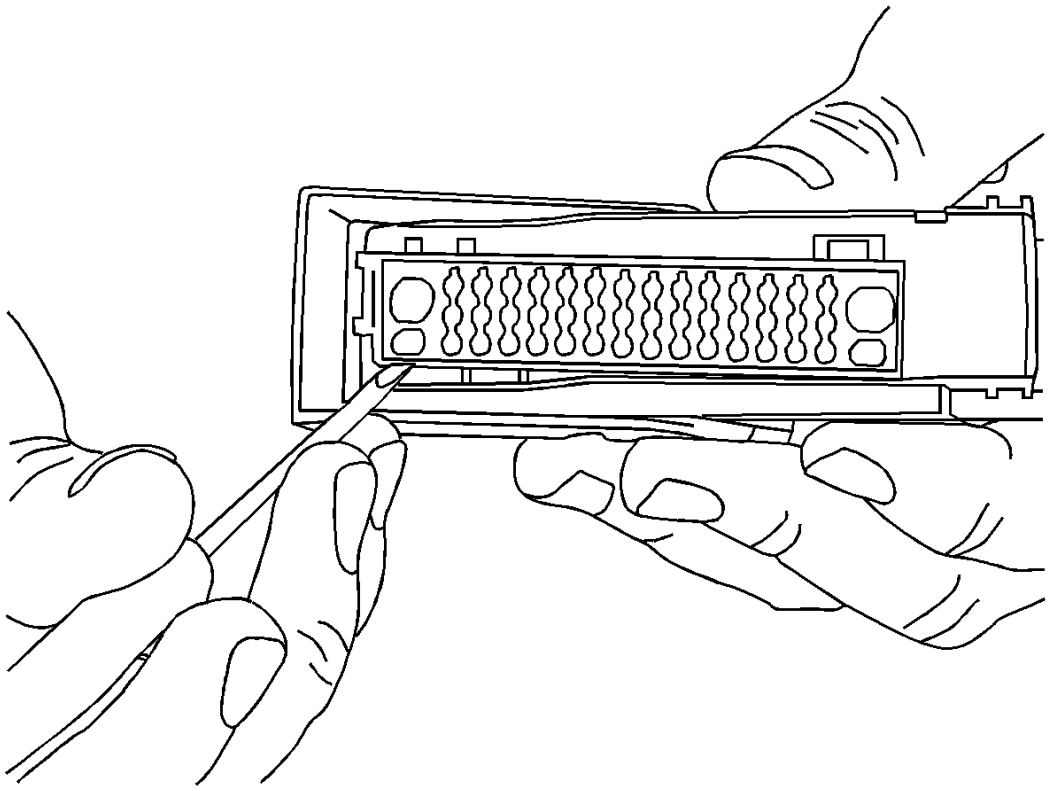

Fig. 94: View Of Releasing Terminals
Courtesy of GENERAL MOTORS COMPANY

7. For the larger terminals insert the J-38125-556 tool to release the terminals by inserting the tool into the terminal release cavity. For the smaller terminals insert the J-38125-560 tool to release the terminals by inserting the tool into the terminal release cavity.

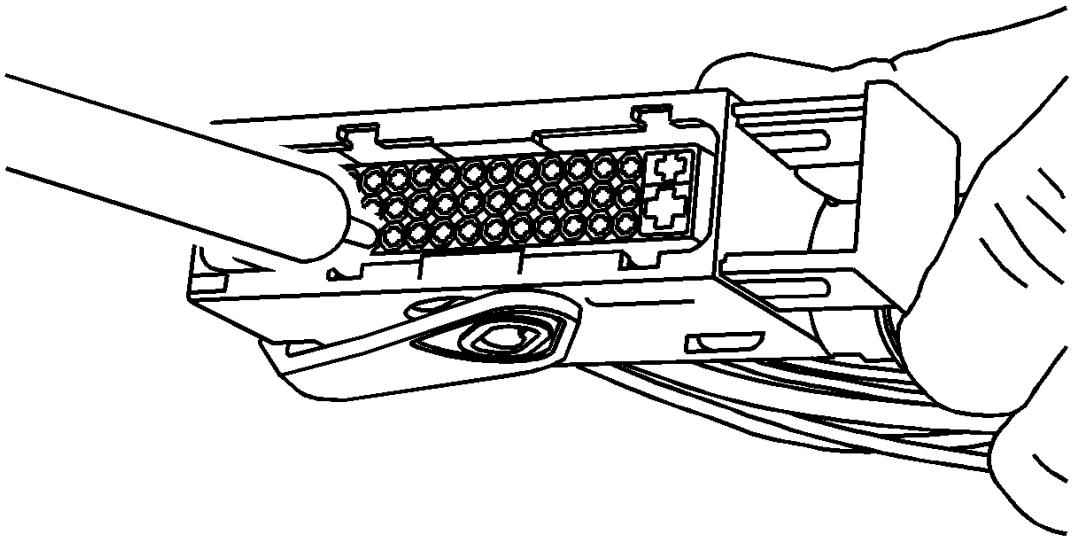

Fig. 95: View Of Wire Being Pulled Out Of Back Of Connector While Holding Removal Tool In Place
Courtesy of GENERAL MOTORS COMPANY

8. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
9. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
10. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

FCI CONNECTORS (SIR)

Removal Procedure

NOTE: **The orange or yellow connector position assurance (CPA) must be released first to disconnect or to connect the connector.**

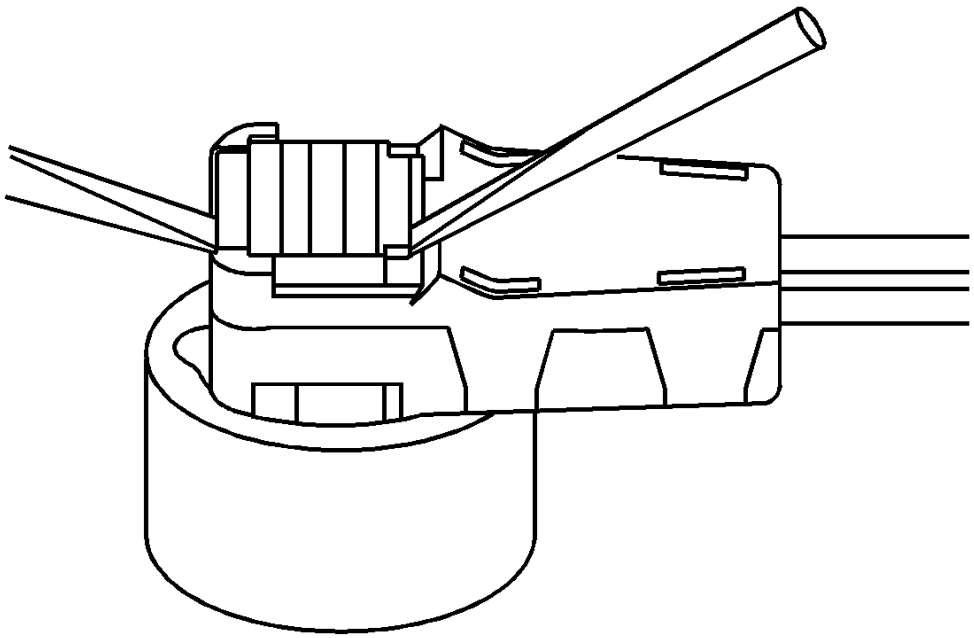

Fig. 96: Lifting Orange CPA
Courtesy of GENERAL MOTORS COMPANY

1. Lift the orange or yellow CPA vertically (avoid lifting on an angle to the connector) approximately 4 mm to release the connector. Use a small flat-bladed tool to help release the CPA. The CPA may also be released manually without any tools.

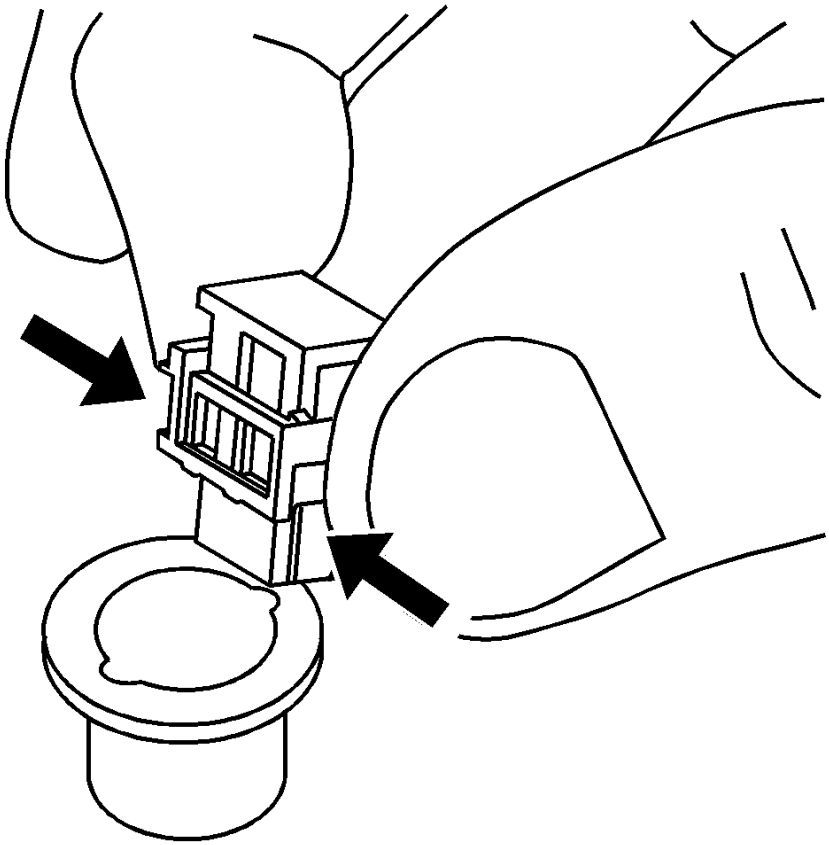

Fig. 97: Grabbing Connector On Both Sides
Courtesy of GENERAL MOTORS COMPANY

2. Grab the connector on both sides and lift vertically to disconnect the connector.

Installation Procedure

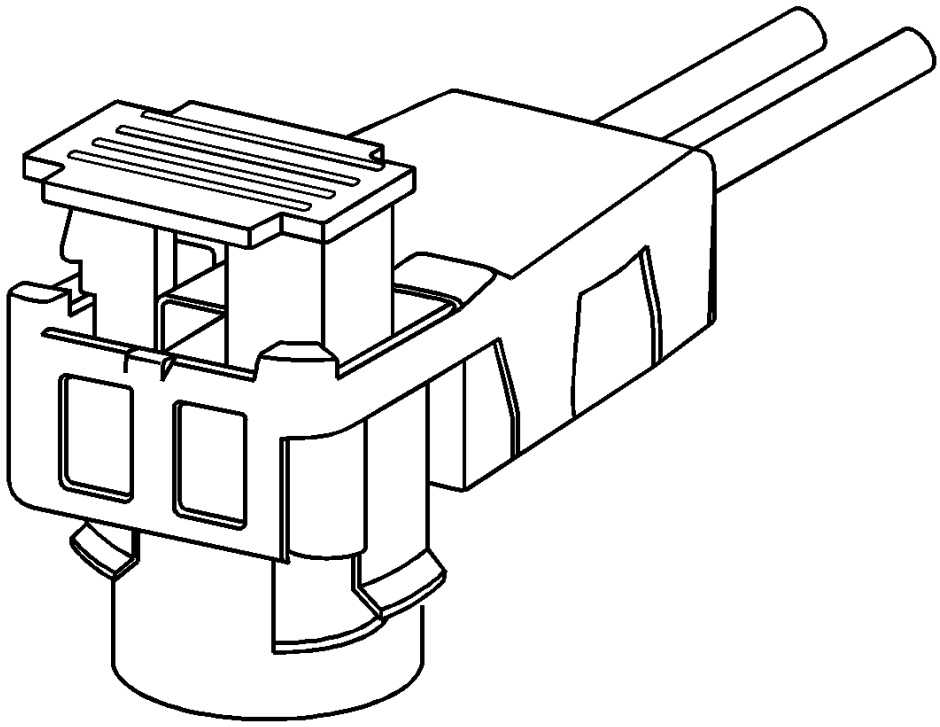

Fig. 98: Lifting Orange CPA
Courtesy of GENERAL MOTORS COMPANY

1. The CPA should be approximately 4 mm above the yellow cover before installing the connector. If not, use a small flat-bladed tool to help release the CPA. The CPA may also be released manually without any tools.

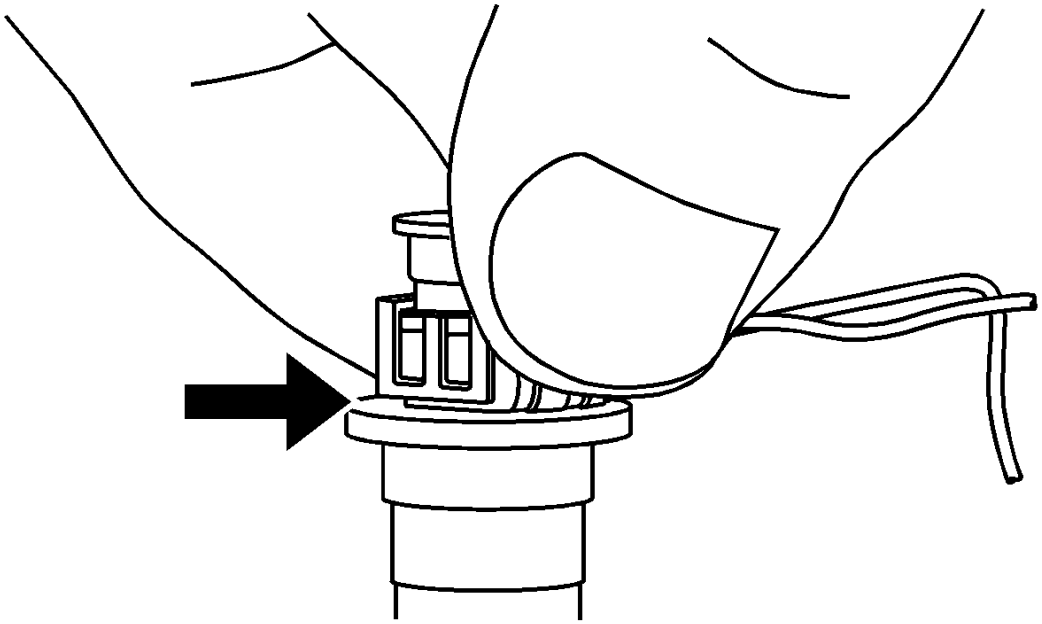

Fig. 99: Seating Connector Sub-Assembly
Courtesy of GENERAL MOTORS COMPANY

2. Line up the connector key tabs with the initiator key slots. Grab the connector on both sides and push down into the initiator connector sub assembly until fully seated.

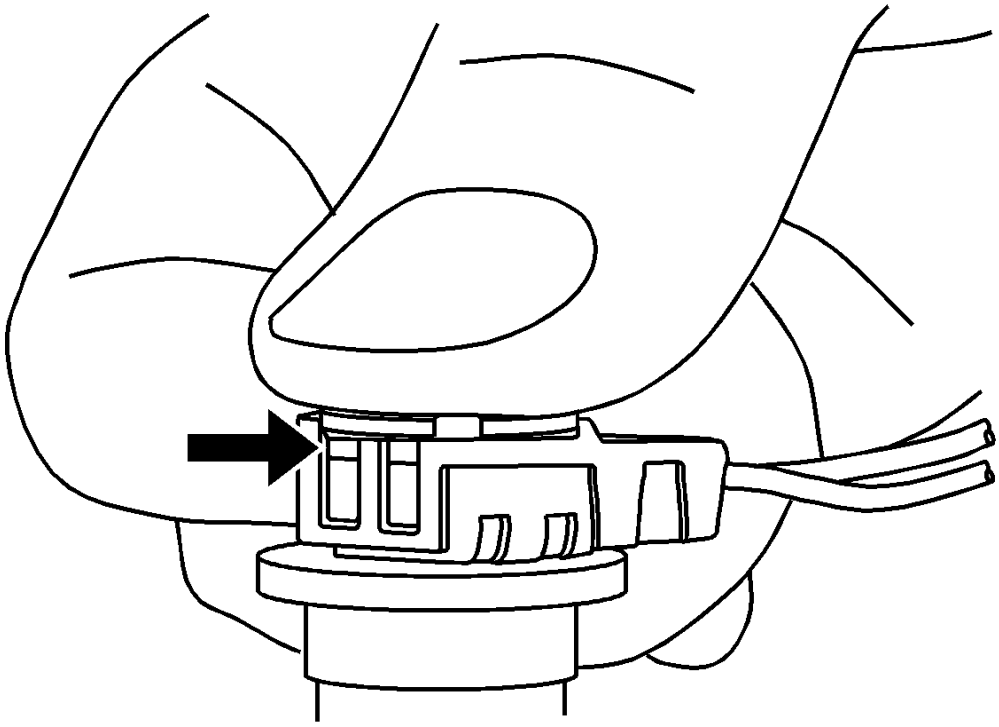

Fig. 100: Pushing CPA Down
Courtesy of GENERAL MOTORS COMPANY

3. After the connector is fully seated, push the CPA down with your thumb until the CPA is touching the yellow cover on the connector.

FEP CONNECTORS (STEERING GEAR)

Removal Procedure

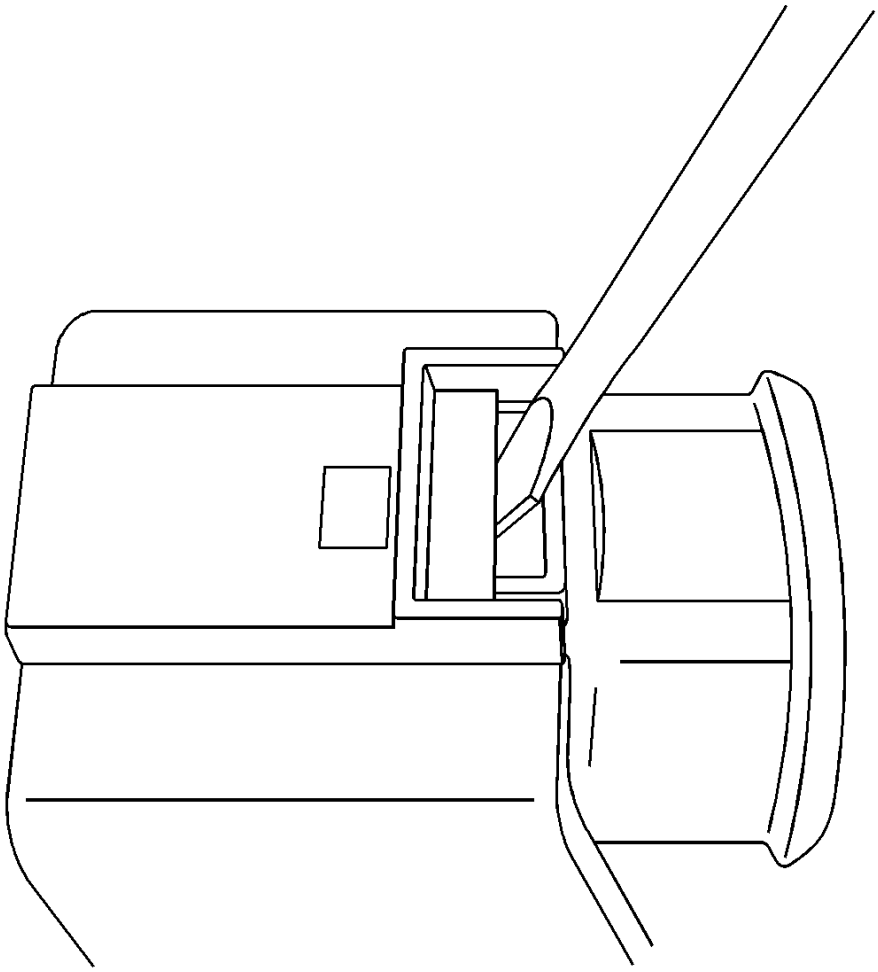

Fig. 101: Releasing Locking Tab On Connector
Courtesy of GENERAL MOTORS COMPANY

1. Use a flat-bladed tool to release the locking tab on the connector.

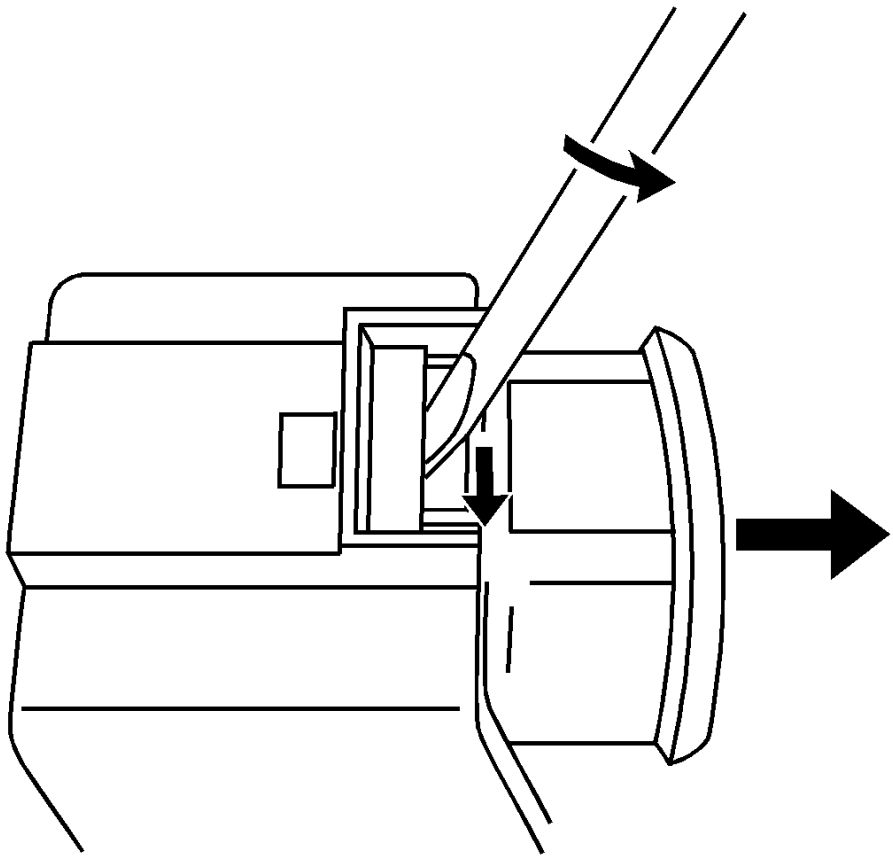

Fig. 102: Twisting Flat-Bladed Tool To Push Top Of Locking Tab Inward
Courtesy of GENERAL MOTORS COMPANY

2. Option 1: Twist the flat-bladed tool to push the top of the locking tab inward while pulling the connector body out.

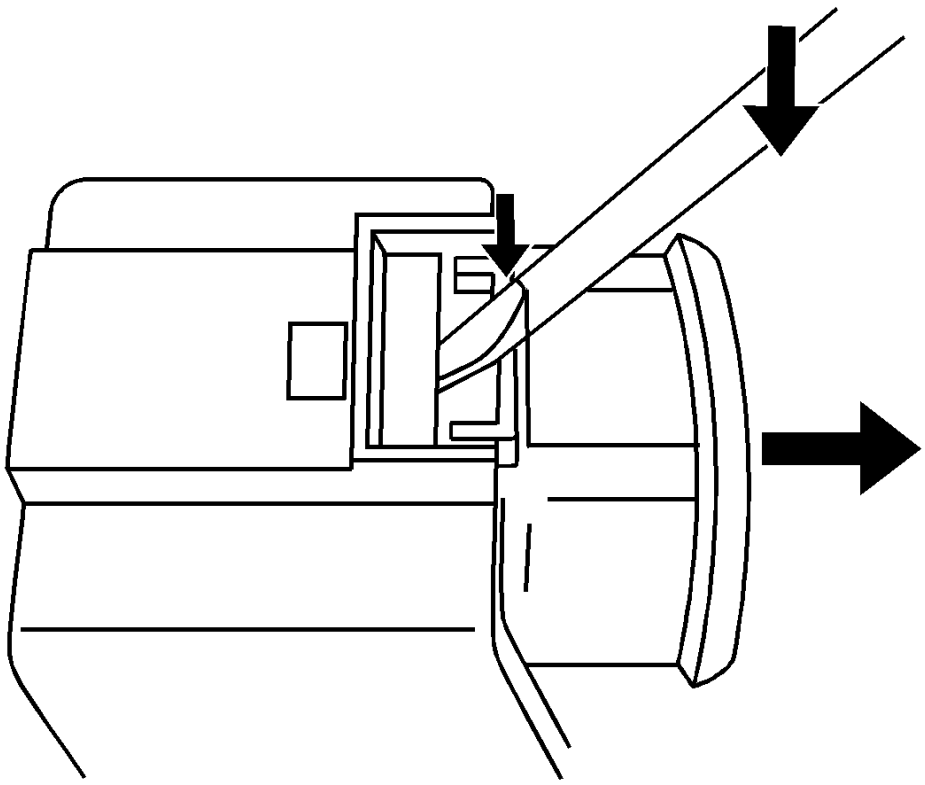

Fig. 103: Using Flat-Bladed Tool To Depress Locking Tab
Courtesy of GENERAL MOTORS COMPANY

3. Option 2: Pry using the flat-bladed tool to depress the locking tab while pulling the connector body out.

JST CONNECTORS

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-553** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

The JST connector family consists of seven unique connector housings differentiated by color and keying. This connector family is designed to use both 0.64 and 2.8 sized terminals.

JST BCM Connector

GM Service Part #	Color
88988806	Gray
88988837	Brown
88988838	Lt Green
88988839	Natural
88988840	Lt Blue
88988841	Black
88988842	Pink

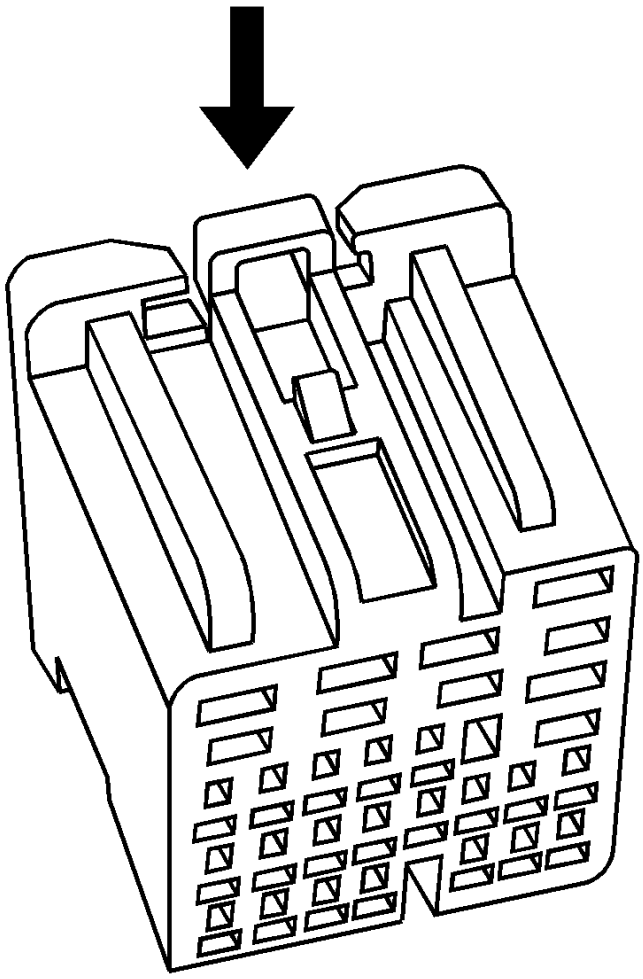

Fig. 104: Identifying Terminal Position Assurance (TPA)
Courtesy of GENERAL MOTORS COMPANY

1. While depressing the lock, remove the connector from the component.

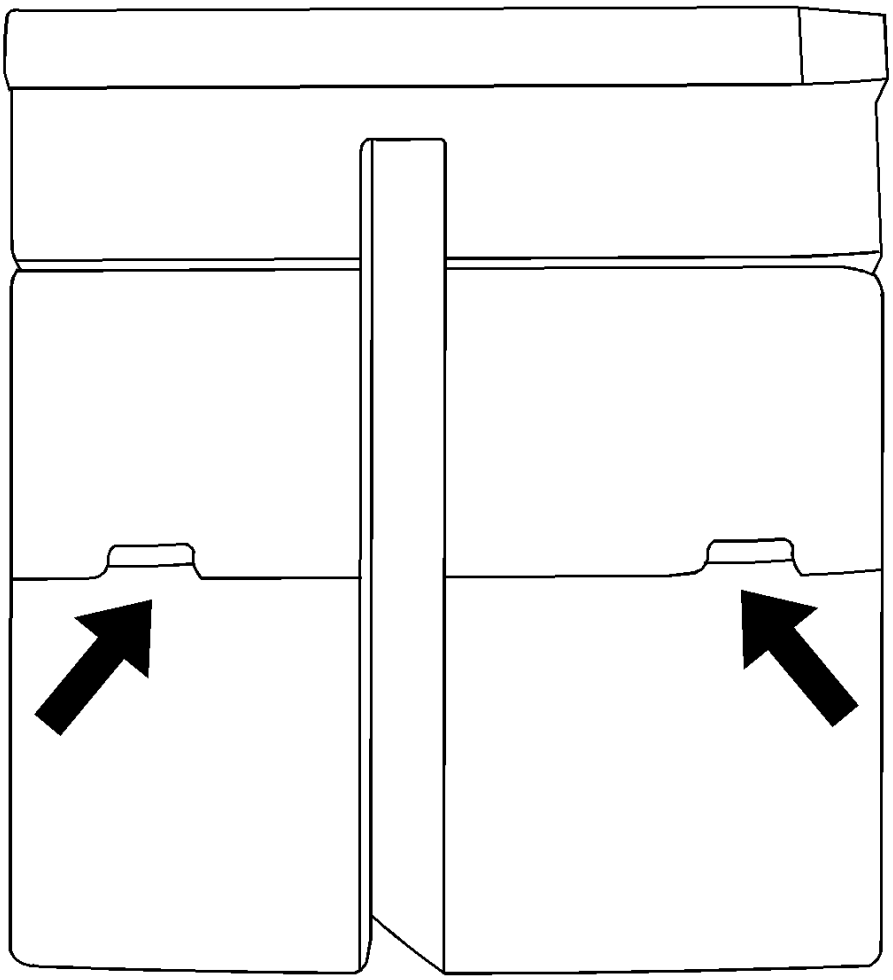

Fig. 105: Identifying TPA On Both Sides Of Connector
Courtesy of GENERAL MOTORS COMPANY

2. Unlock the terminal position assurance (TPA):
    - Position connector as shown (above) and locate TPA staging cavities.

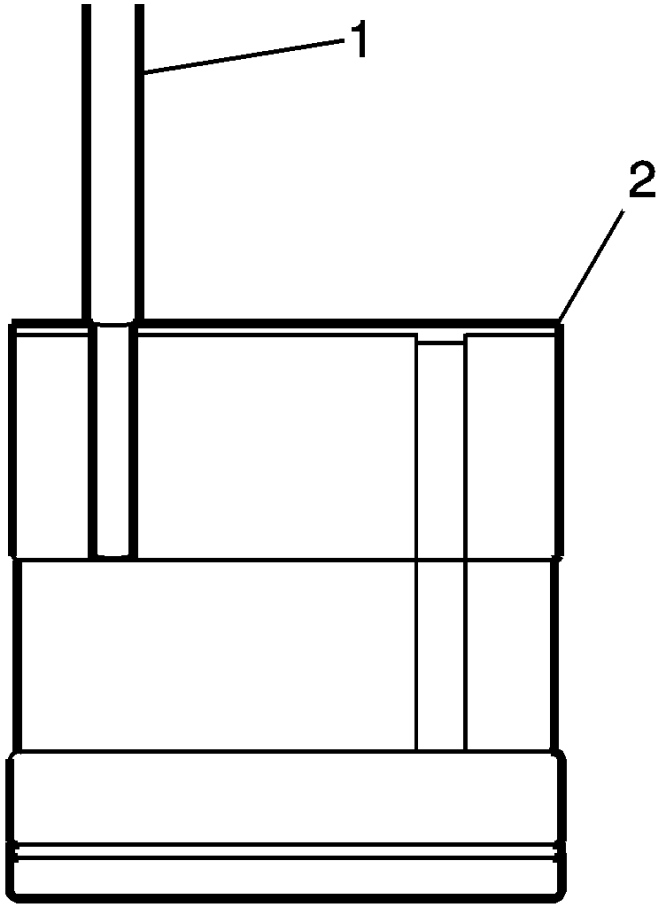

Fig. 106: Terminal Release Tool
Courtesy of GENERAL MOTORS COMPANY

- Using connector terminal release tool J-38125-553 (1) lift the TPA into the staged position. Perform this step on both sides of the TPA.

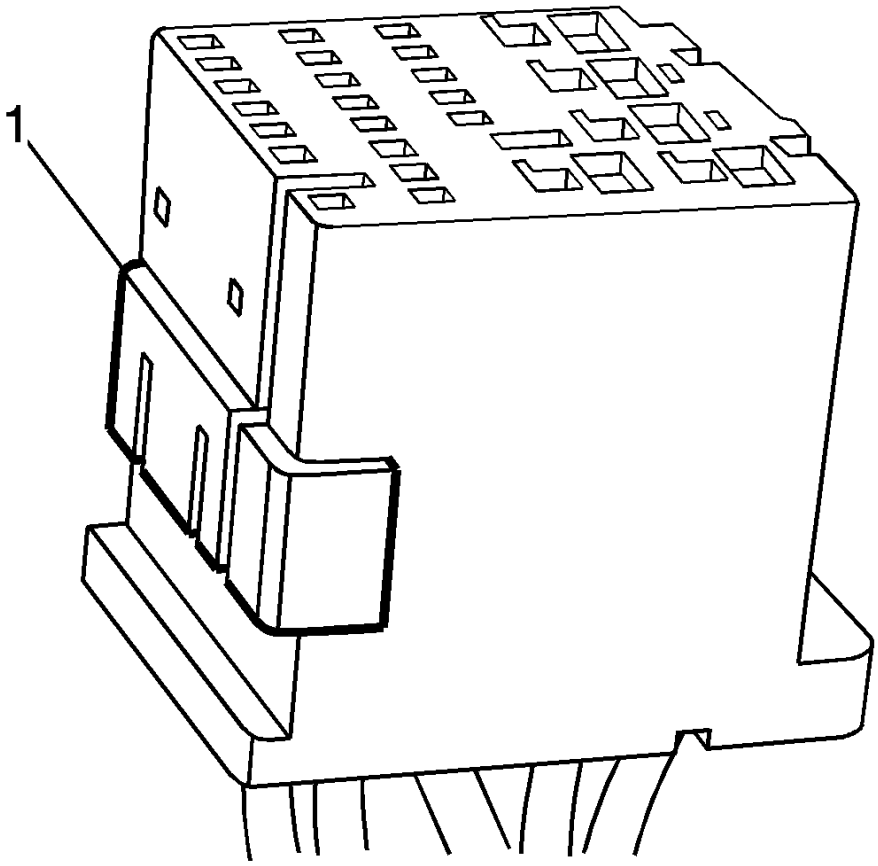

Fig. 107: TPA In Staged Position
Courtesy of GENERAL MOTORS COMPANY

- You will feel the TPA click into place when fully extended into the staged position. The figure above shows the TPA (1) in the staged position.

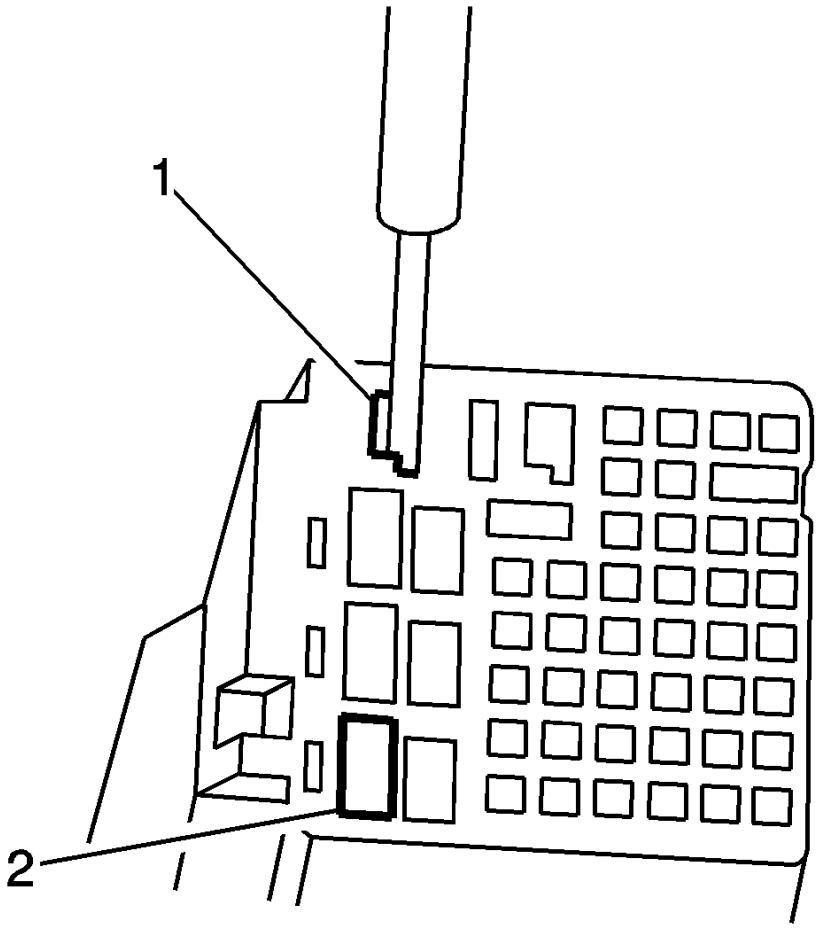

Fig. 108: Connector Terminal Release Tool
Courtesy of GENERAL MOTORS COMPANY

3. Release the terminal from the connector:
    - Position the connector as shown (above) and locate the terminal release entry canal (1) of the suspect terminal.
    - Insert the connector terminal release tool J-38125-553 into the entry canal with the angled side of the tool facing the connector wall containing cavity 4 (2).

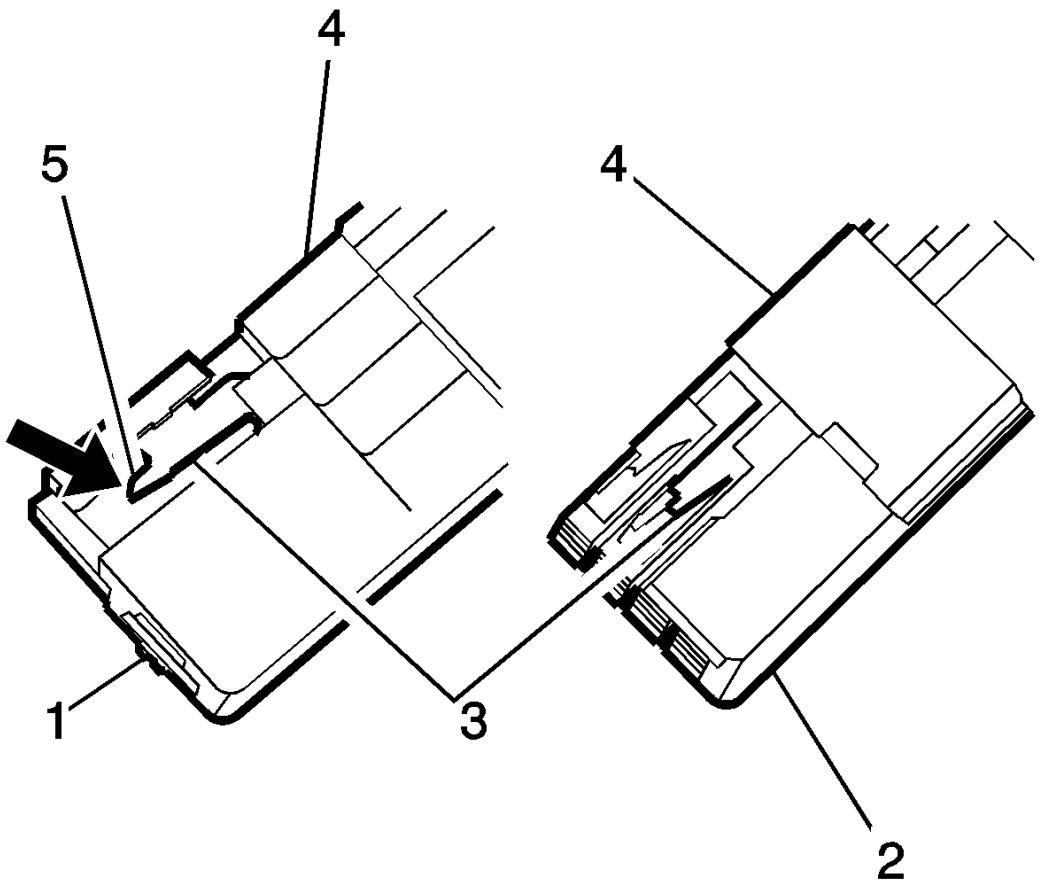

Fig. 109: Connector Lance And TPA
Courtesy of GENERAL MOTORS COMPANY

- The cavity on the left (1) is a 2.8 mm^2 cavity and the cavity on the right (2) is a 0.64 mm^2 cavity.
- Place the tip of the connector terminal release tool onto the connector lance (3) and deflect the lance to the right (5) to release the lock. Hold this released position.
- Holding the lance in the released position, slightly pull on the suspect terminal to remove it from the connector housing. The side TPA (4) is a secondary lock.

4. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
5. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

KOSTAL CONNECTORS (GLOW PLUG CONTROL MODULE)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit

View of connector in released position.

1. Locate the assist lever at the back of the connector. Move the assist lever to the rear position.
2. Disconnect the connector from the component.

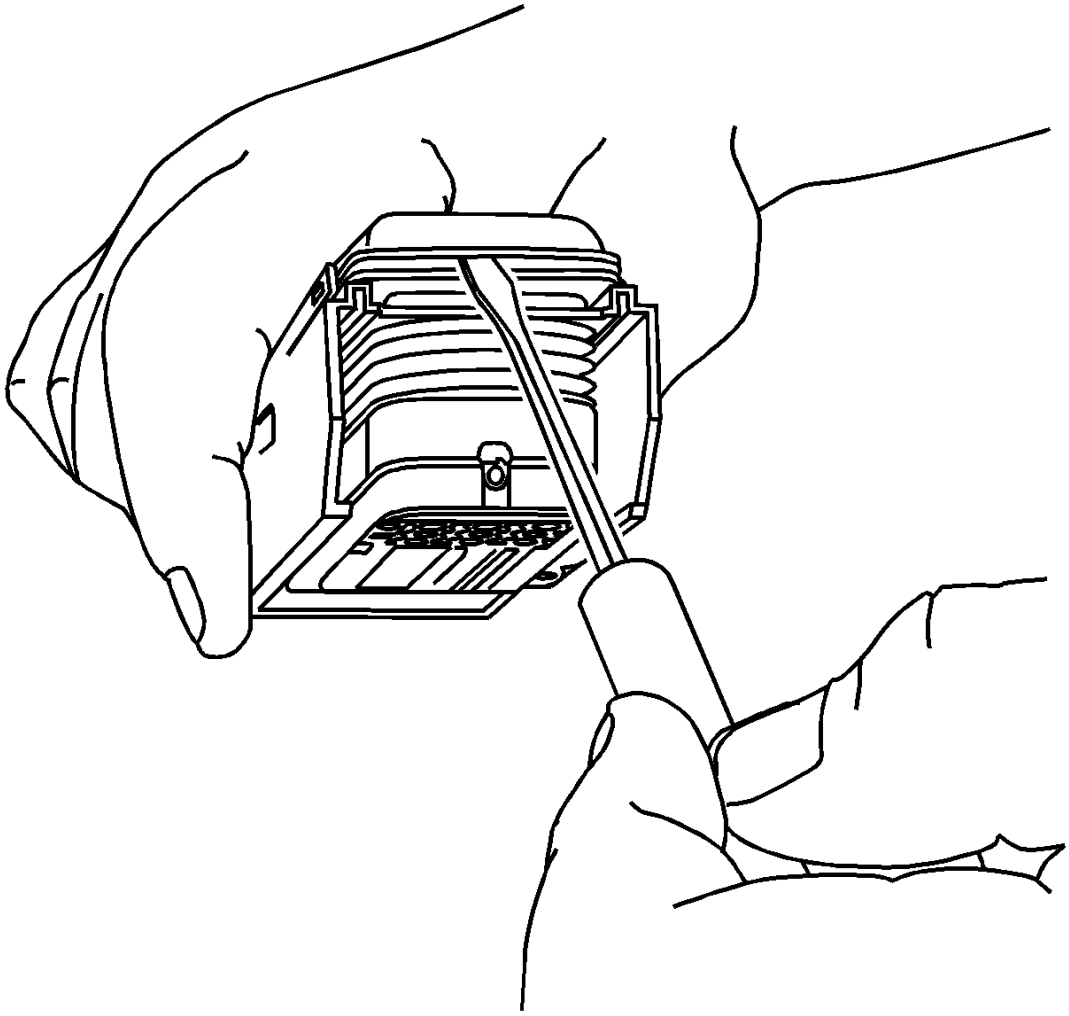

Fig. 112: Using Small Flat-Blade Tool To Remove Dress Cover
Courtesy of GENERAL MOTORS COMPANY

3. Use a small flat-blade tool to remove the dress cover.

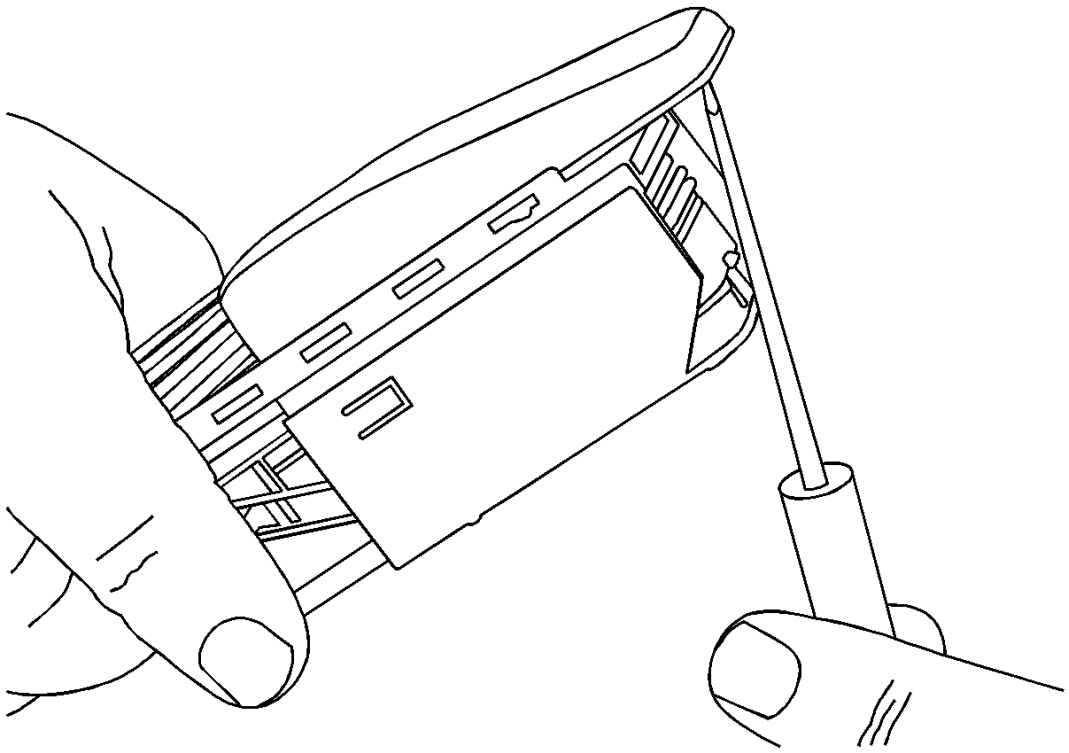

Fig. 113: Sliding Dress Cover Forward & Off Of Kostal Connector (Glow Plug Control Module)
Courtesy of GENERAL MOTORS COMPANY

4. Slide the dress cover forward and off of the connector.

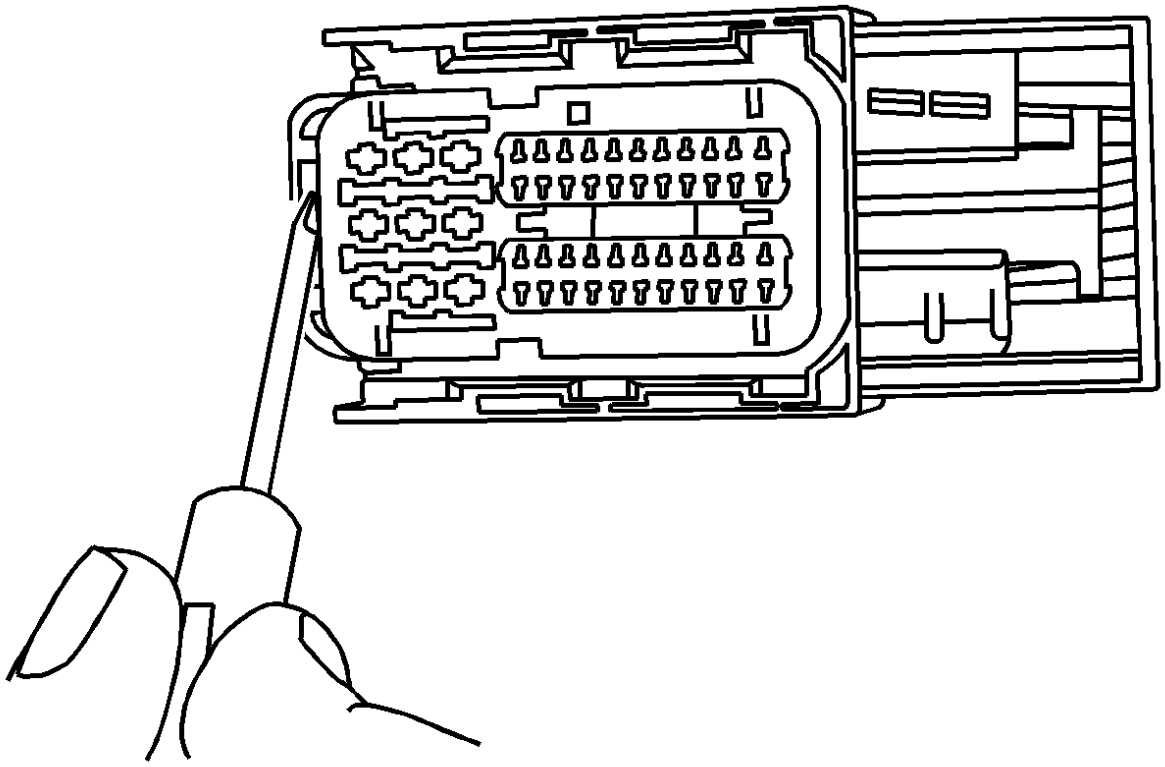

Fig. 114: Locating TPA In Front & Rear Of Connector
Courtesy of GENERAL MOTORS COMPANY

5. The terminal positive assurance (TPA) is located in the front and rear of the connector.

NOTE: **The front TPA cannot be removed from the connector. Only move it to the preset position.**

6. Use a small flat-blade tool to move the front TPA to the preset position, outboard approximately 0.125 in. (3 mm).

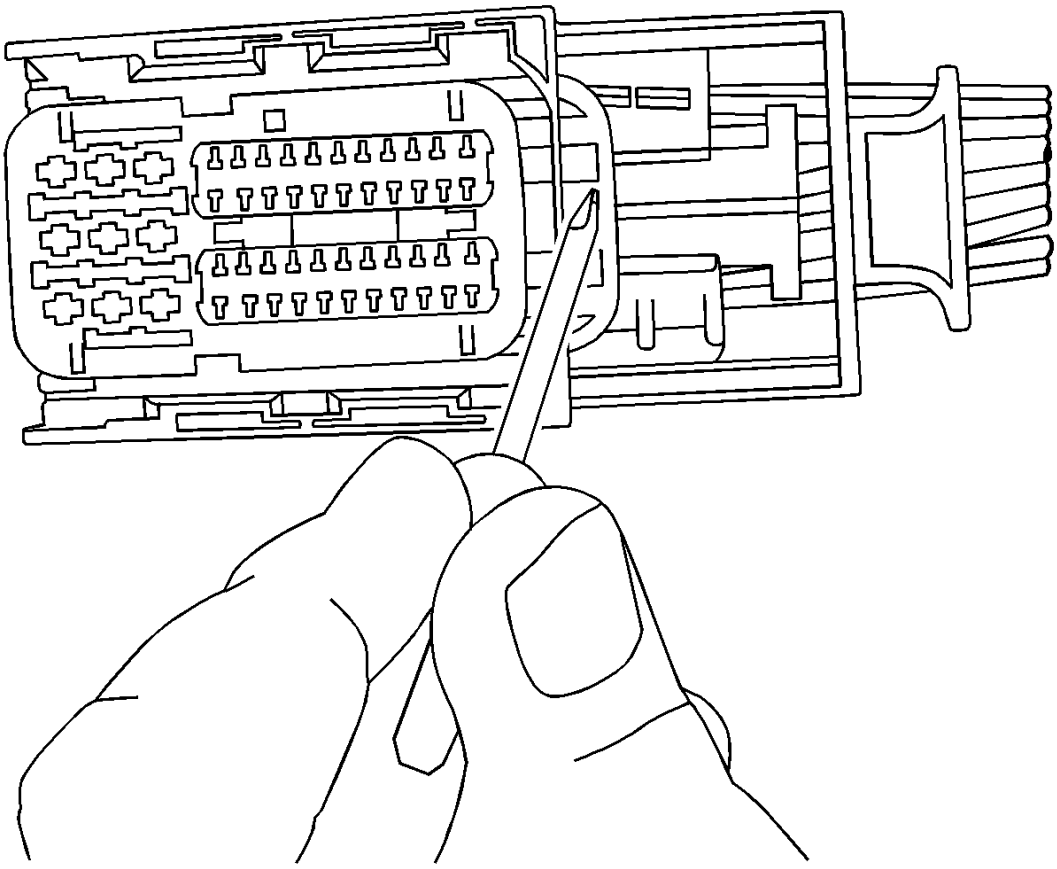

Fig. 115: Using Small Flat-Blade Tool To Remove Rear TPA
Courtesy of GENERAL MOTORS COMPANY

7. Use a small flat-blade tool to completely remove the rear TPA from the connector.

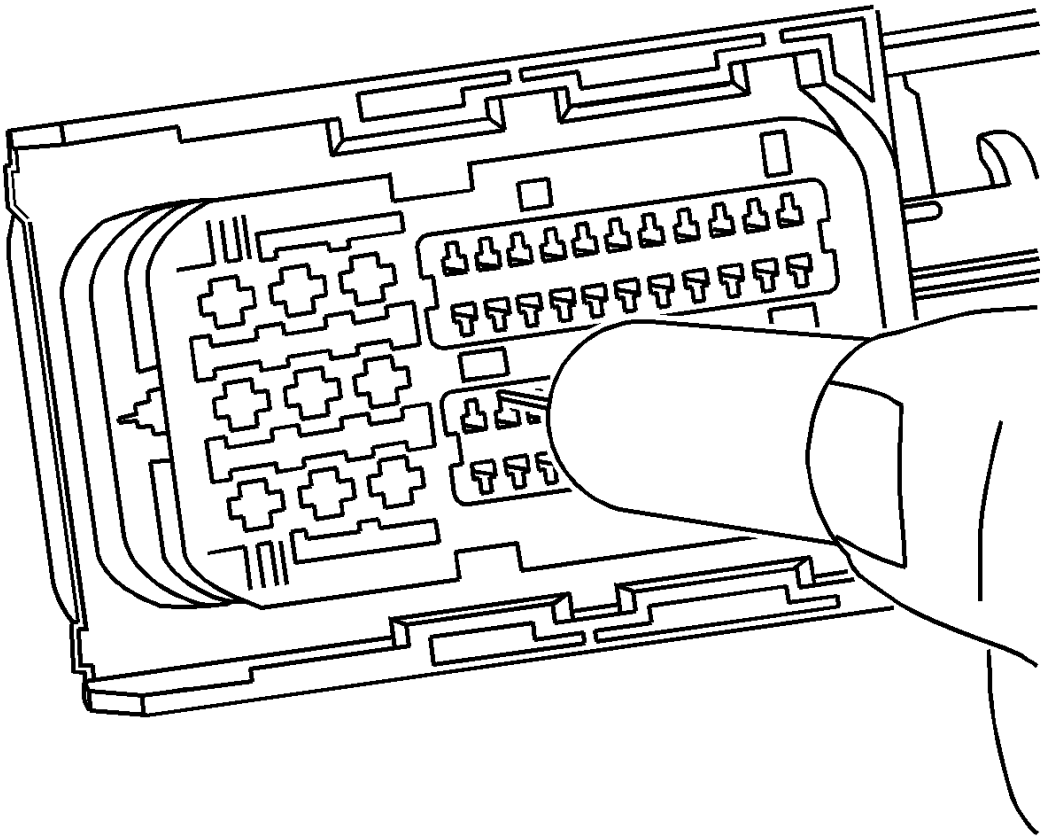

Fig. 116: Using Special Tool To Release Terminals
Courtesy of GENERAL MOTORS COMPANY

8. Use the J-38125-24 or the J-38125-560 tool to release the terminals by inserting the tool into the terminal release cavity.
9. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
10. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.

KOSTAL CONNECTORS (TRANSMISSION)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-28** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

2. Locate the terminal position assurance (TPA).

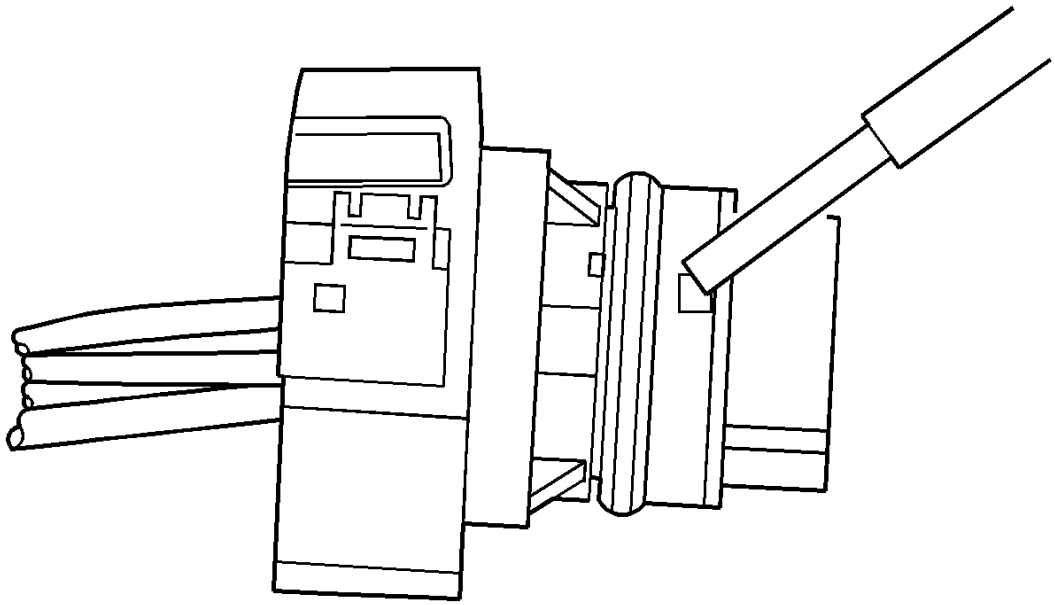

Fig. 119: View Of TPA & Flat-Bladed Tool
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The TPA cannot be removed from the connector while there are terminals present in the connector body.**

3. Use a small flat-blade tool to push the TPA until it bottoms out.

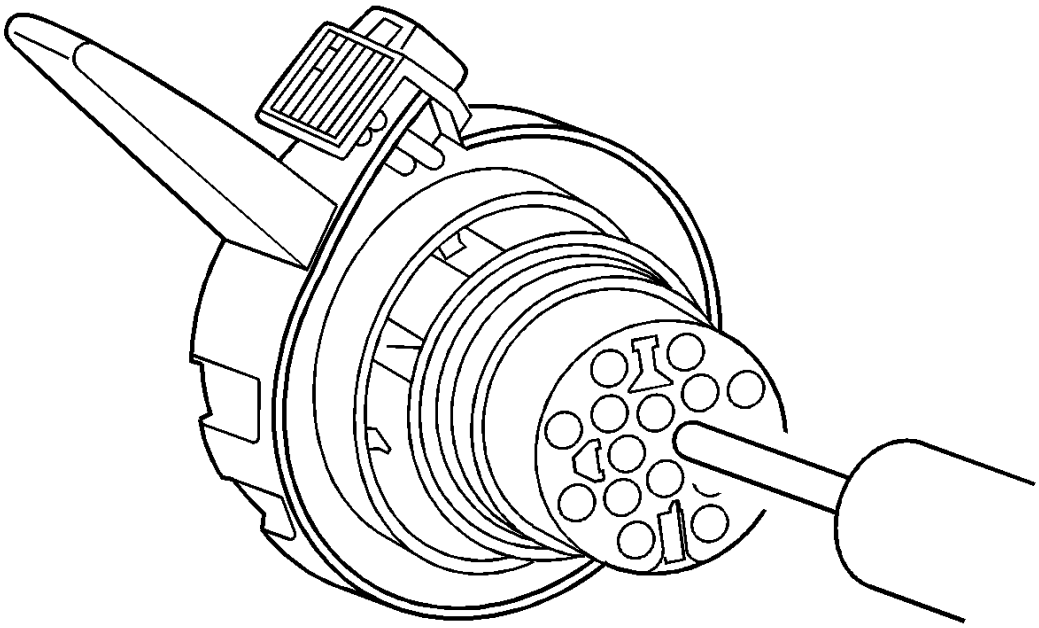

Fig. 120: Releasing Terminals
Courtesy of GENERAL MOTORS COMPANY

4. Use the J-38125-28 tool to release the terminals by inserting the tool into the terminal cavity as shown in the graphic.
5. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
6. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.

Terminal Insertion Procedure

After the terminal is replaced, perform the following procedure in order to insert the terminal.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Ensure that the terminal is locked in place by gently pulling on the wire.

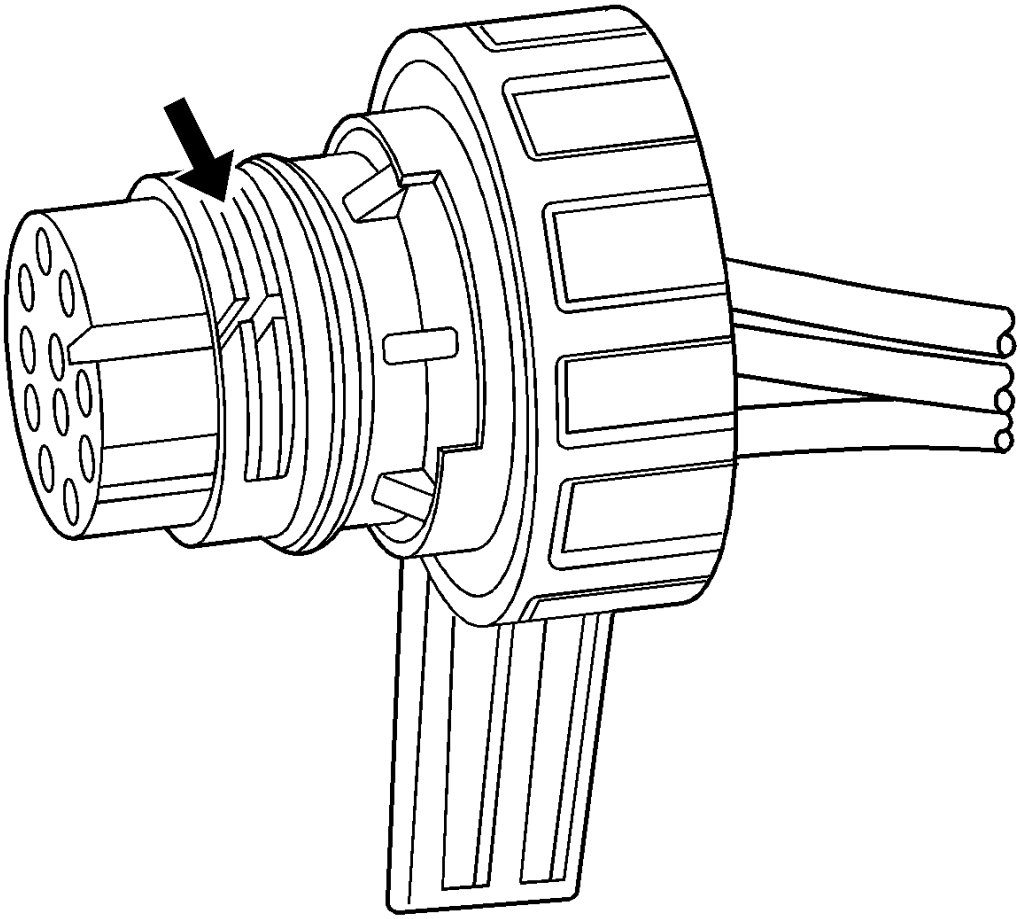

Fig. 121: Locating Terminal Position Assurance (TPA)
Courtesy of GENERAL MOTORS COMPANY

3. Locate the TPA.

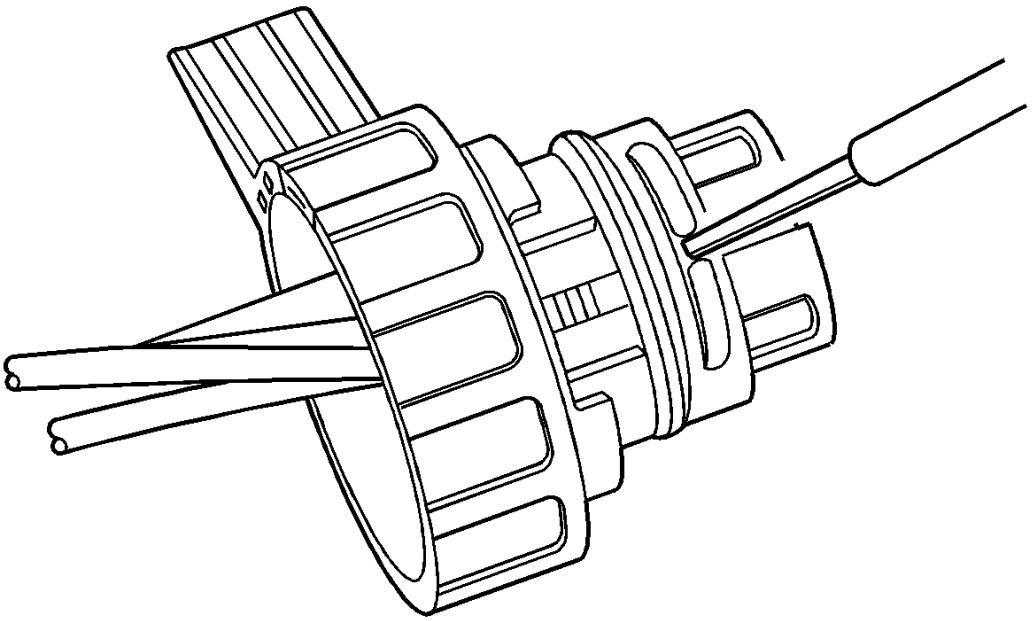

Fig. 122: View Of TPA & Flat-Bladed Tool
Courtesy of GENERAL MOTORS COMPANY

4. Use a small flat-blade tool to push the TPA until it bottoms out.

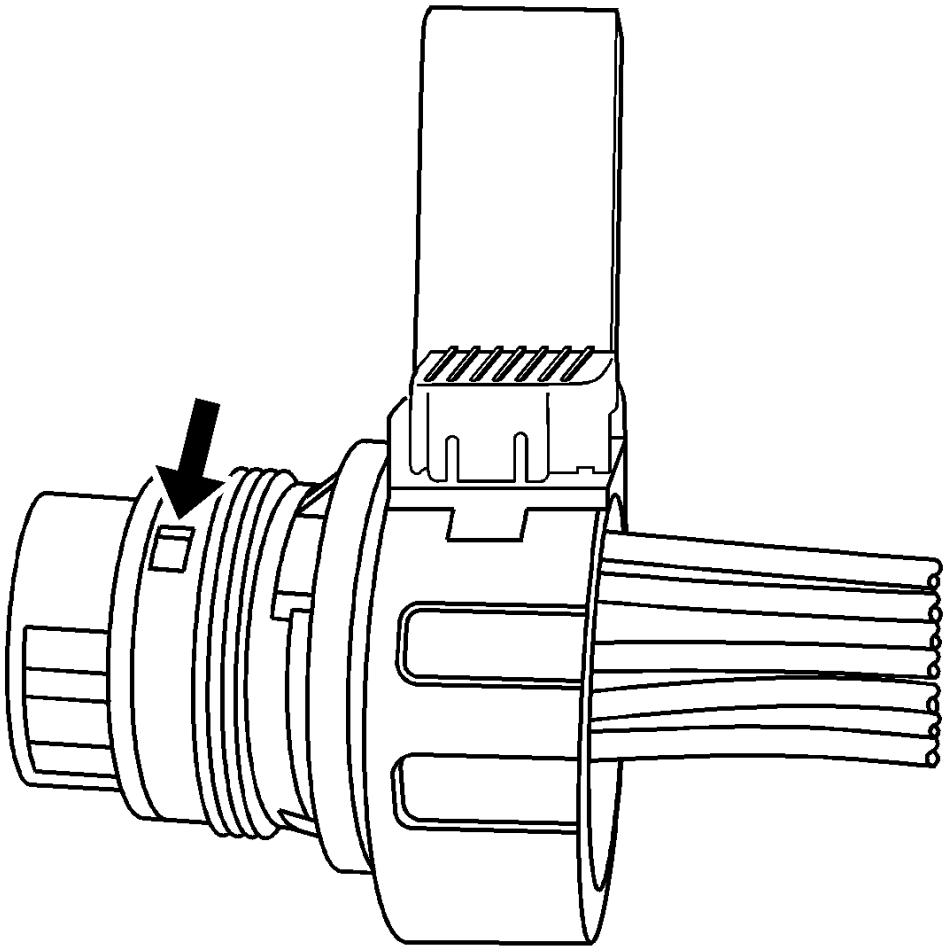

Fig. 123: View Of Terminal Position Assurance (TPA)
Courtesy of GENERAL MOTORS COMPANY

5. Ensure the TPA is fully seated. The TPA should be centered and flush with the connector body when viewed.

MOLEX CONNECTORS

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-213** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

1. Locate the connector position assurance (CPA) on the top of the wire dress cover. Slide the CPA forward.

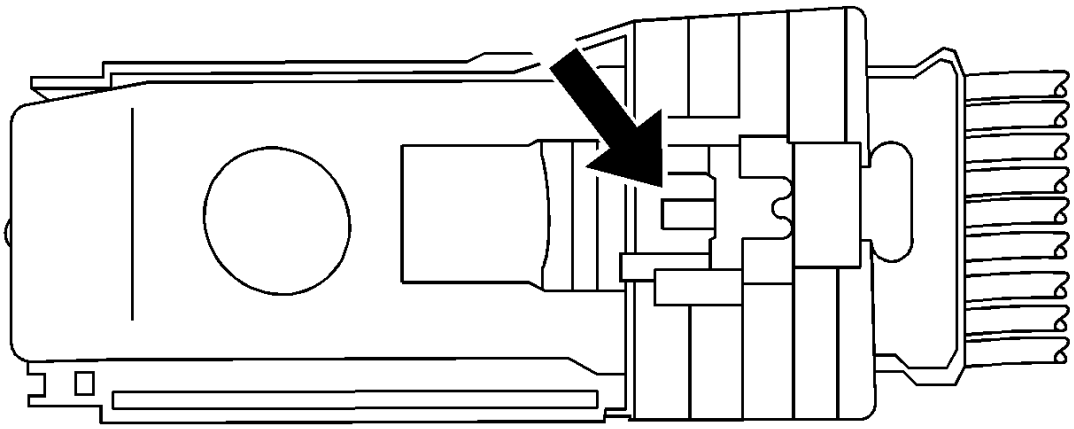

Fig. 124: Identifying Lever Lock Release Tab
Courtesy of GENERAL MOTORS COMPANY

2. Slide the lever lock forward while pressing down on the lever lock release tab.

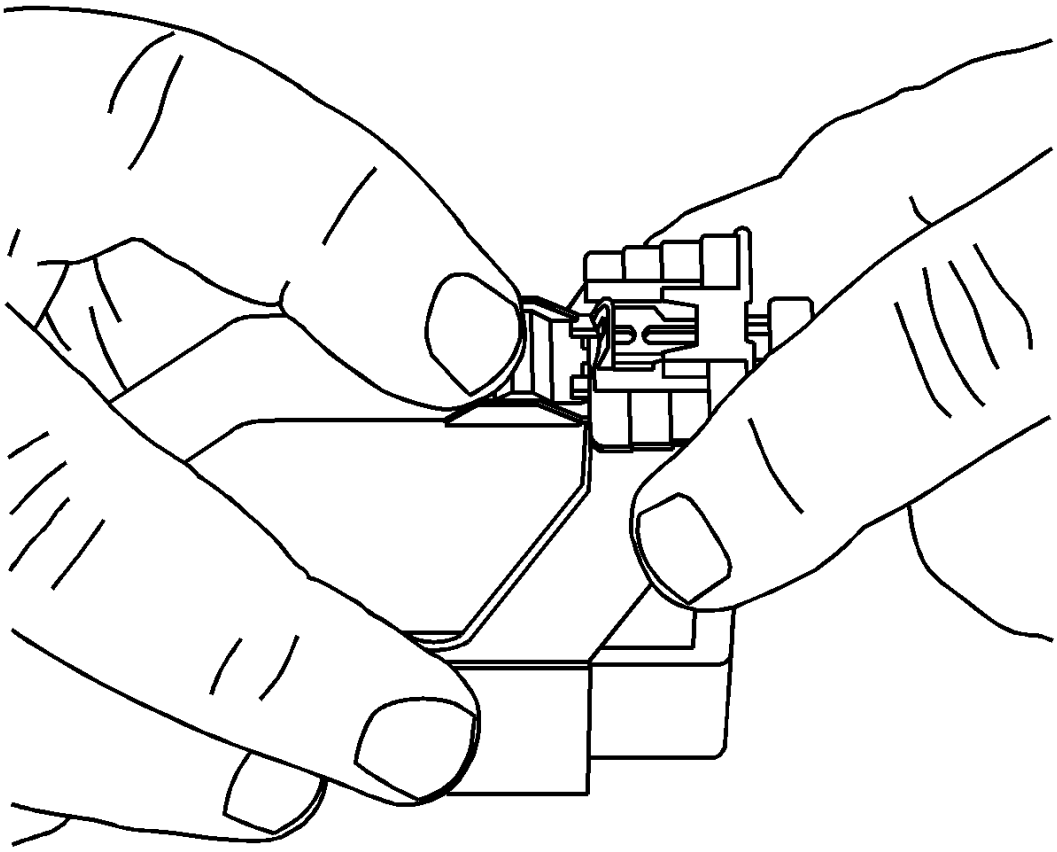

Fig. 125: View Of Lever In Full Forward Position
Courtesy of GENERAL MOTORS COMPANY

3. The lever should be in the full forward position.

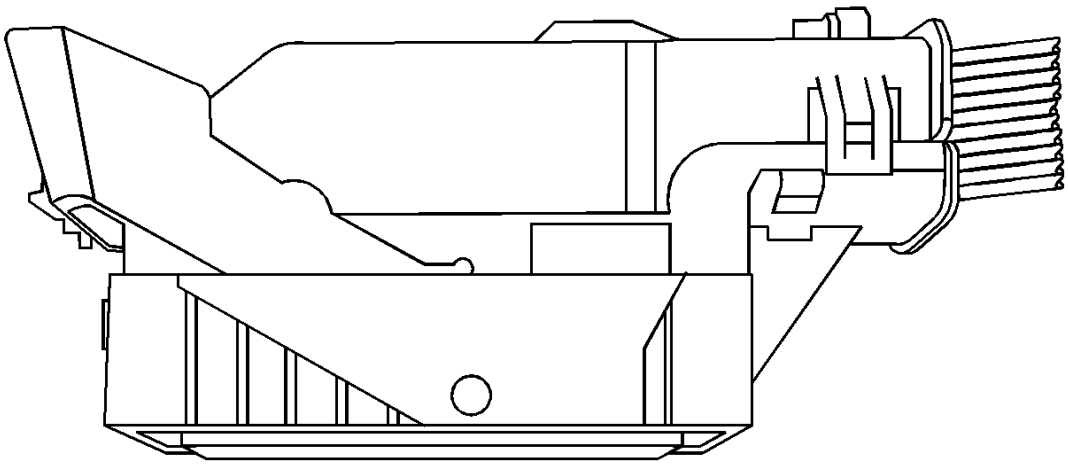

Fig. 126: View Of CPA Connector
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the connector from the component.

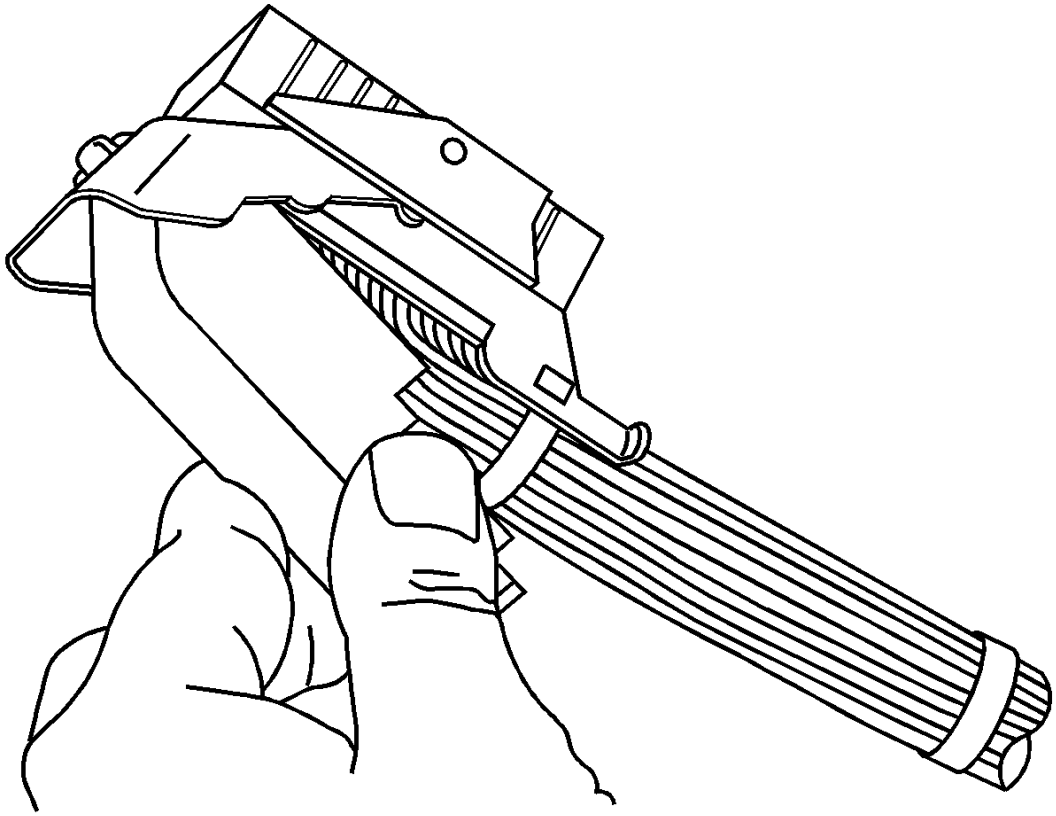

Fig. 127: View Of Dress Cover
Courtesy of GENERAL MOTORS COMPANY

5. Remove the dress cover by using a flat bladed tool to release the dress cover locking tabs and lift up on the dress cover.
6. Cut the tie wrap that holds the wires to the connector body.

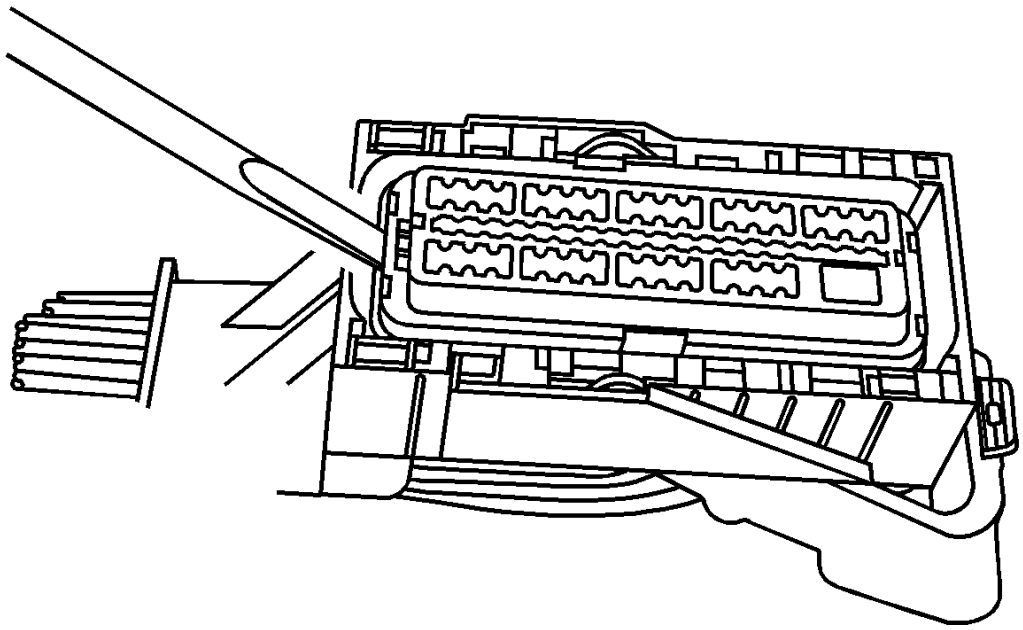

Fig. 128: Prying One Side Of Nose Piece
Courtesy of GENERAL MOTORS COMPANY

7. Use a small flat-blade tool to pry one side of the nose piece up to the pre-stage position. When the nose piece is in the pre-staged position, the nose piece will be raised above the connector body the length of the step in the nose piece.

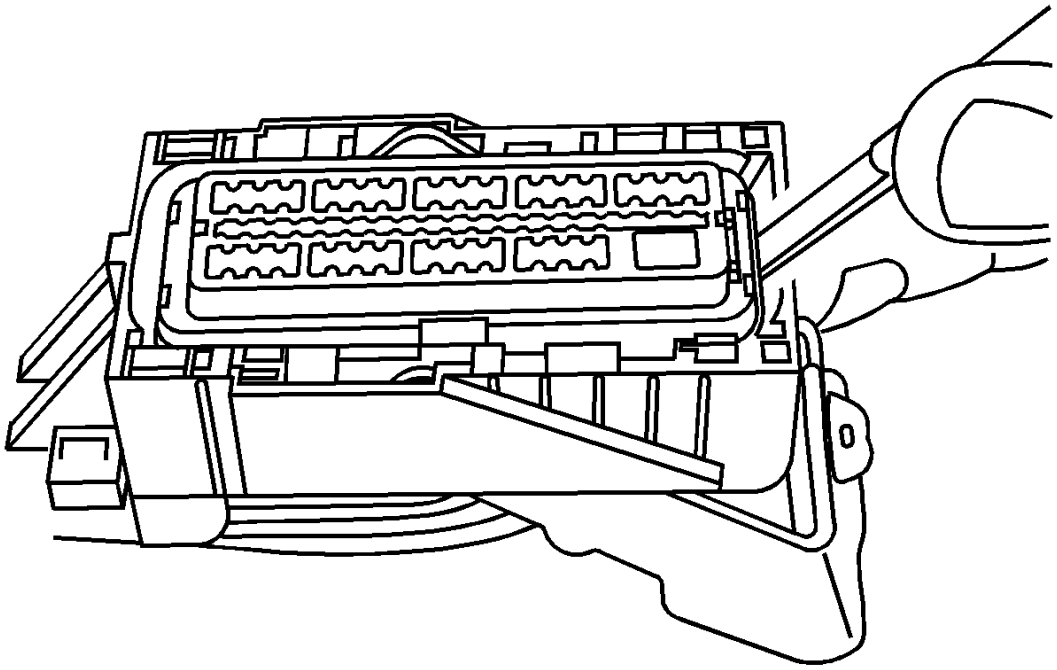

Fig. 129: Prying Side Of Nose Piece
Courtesy of GENERAL MOTORS COMPANY

8. Use a small flat-blade tool to pry the other side of the piece to the pre-stage position. If the nose piece is higher than the first step in the nose piece, gently push down on the nose piece until it meets with resistance from the connector body, you should feel the nose piece click into position.

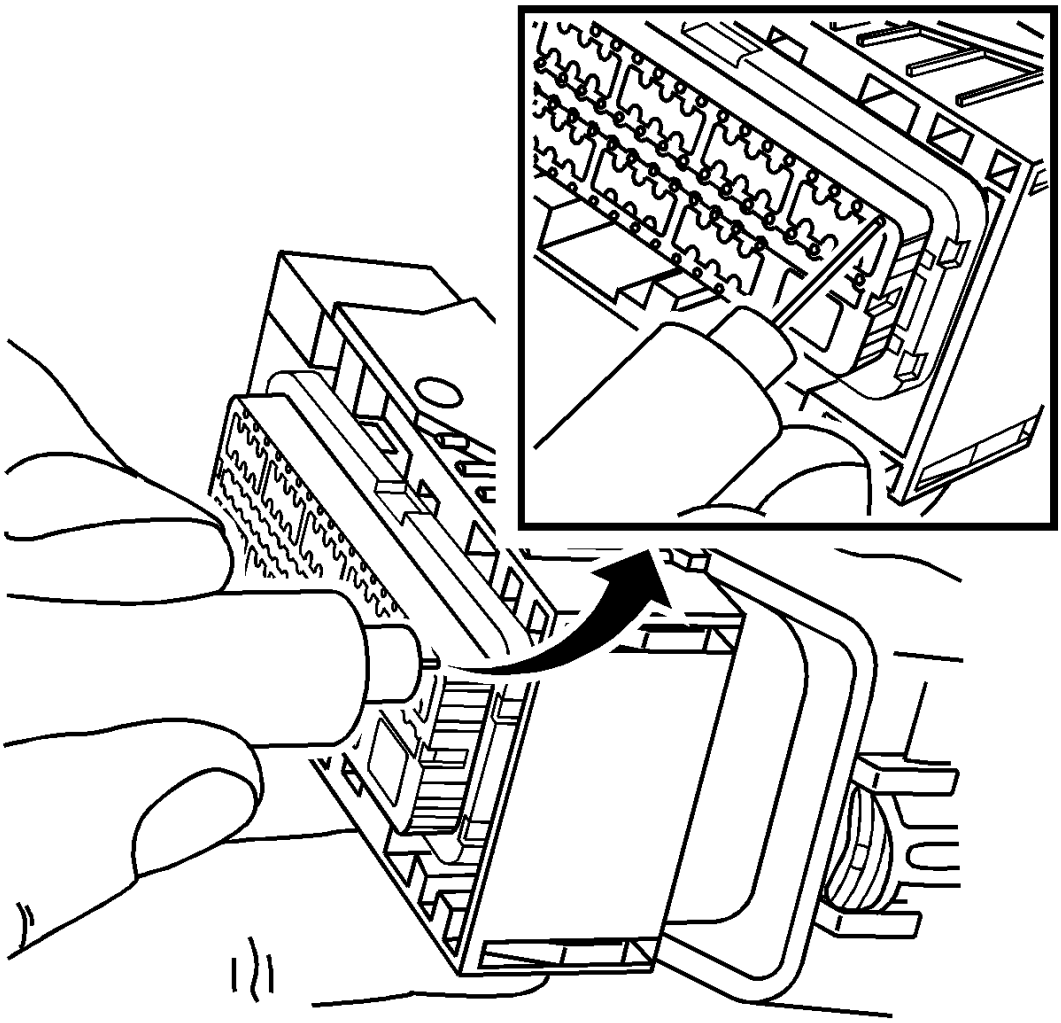

Fig. 130: Releasing Terminal
Courtesy of GENERAL MOTORS COMPANY

9. Insert the J-38125-213 into the small terminal release hole on the nose piece and gently pull on the back of the wire.
10. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
11. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gauge size.
4. Refer to **Splicing Copper Wire Using Splice Sleeves**.

Terminal Insertion Procedure

After the terminal is replaced, perform the following procedure in order to insert the terminal.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Insure that the terminal is locked in place by gently pulling on the wire.
3. To assemble the connector, reverse the connector disassembly procedure.

MOLEX CONNECTORS (SIR)

Removal Procedure

NOTE: **The orange or yellow connector position assurance (CPA) must be released first to disconnect or to connect the connector.**

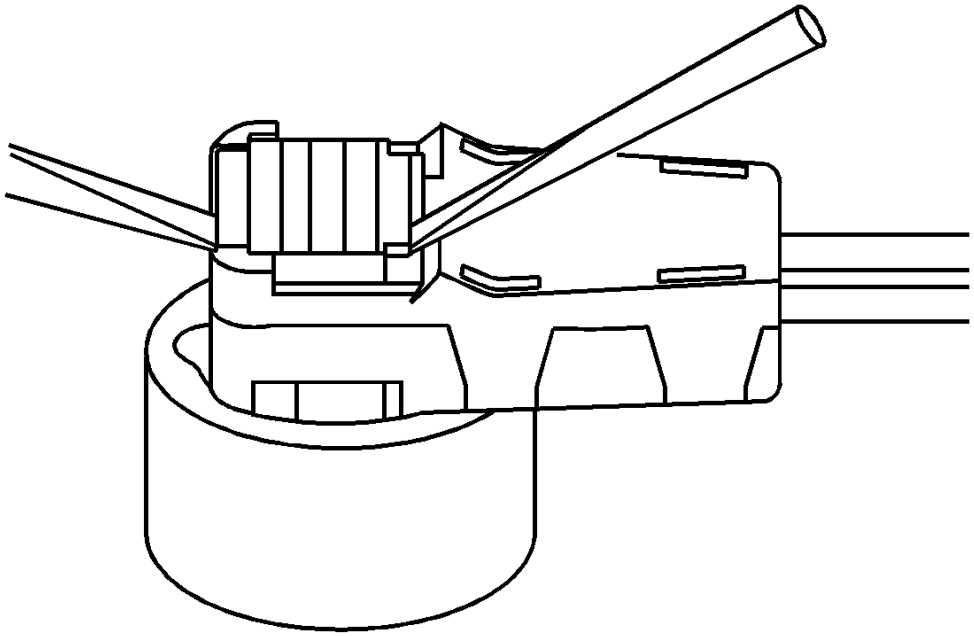

Fig. 131: Lifting Orange CPA
Courtesy of GENERAL MOTORS COMPANY

1. Lift the orange or yellow CPA vertically (avoid lifting on an angle to the connector) approximately 4 mm to release the connector. Use a small flat-bladed tool to help release the CPA. The CPA may also be released manually without any tools.

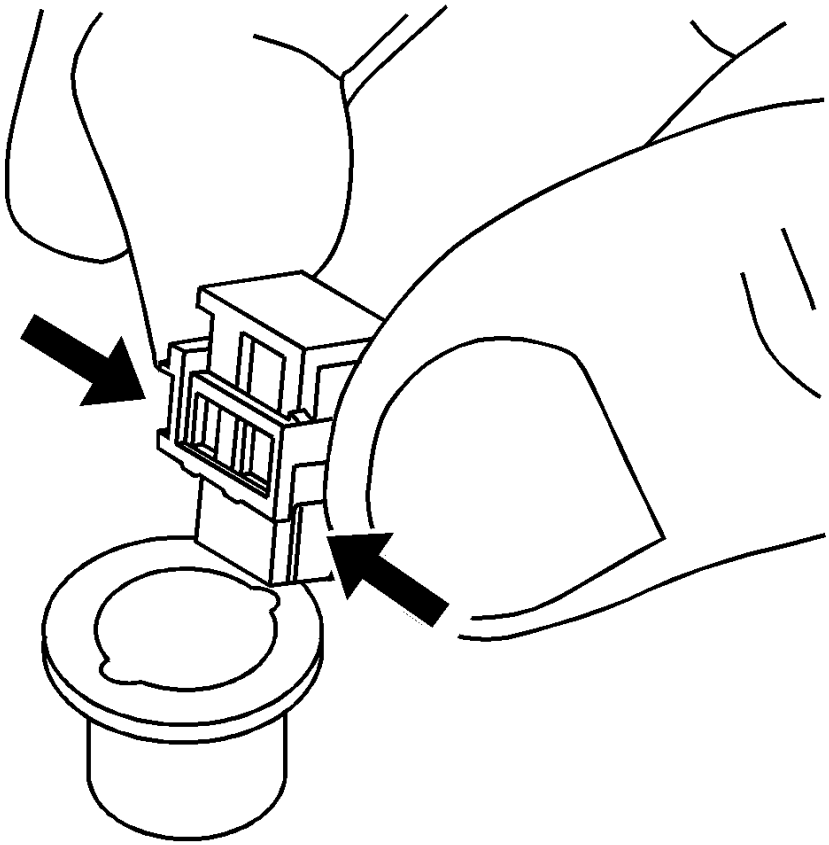

Fig. 132: Grabbing Connector On Both Sides
Courtesy of GENERAL MOTORS COMPANY

2. Grab the connector on both sides and lift vertically to disconnect the connector.

Installation Procedure

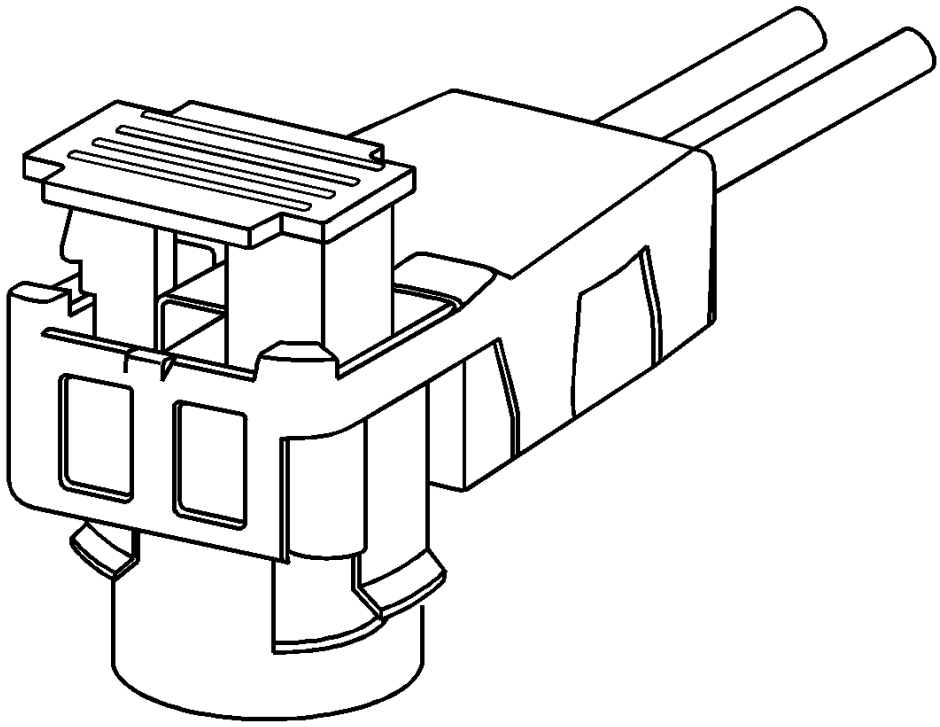

Fig. 133: Lifting Orange CPA
Courtesy of GENERAL MOTORS COMPANY

1. The CPA should be approximately 4 mm above the yellow cover before installing the connector. If not, use a small flat-bladed tool to help release the CPA. The CPA may also be released manually without any tools.

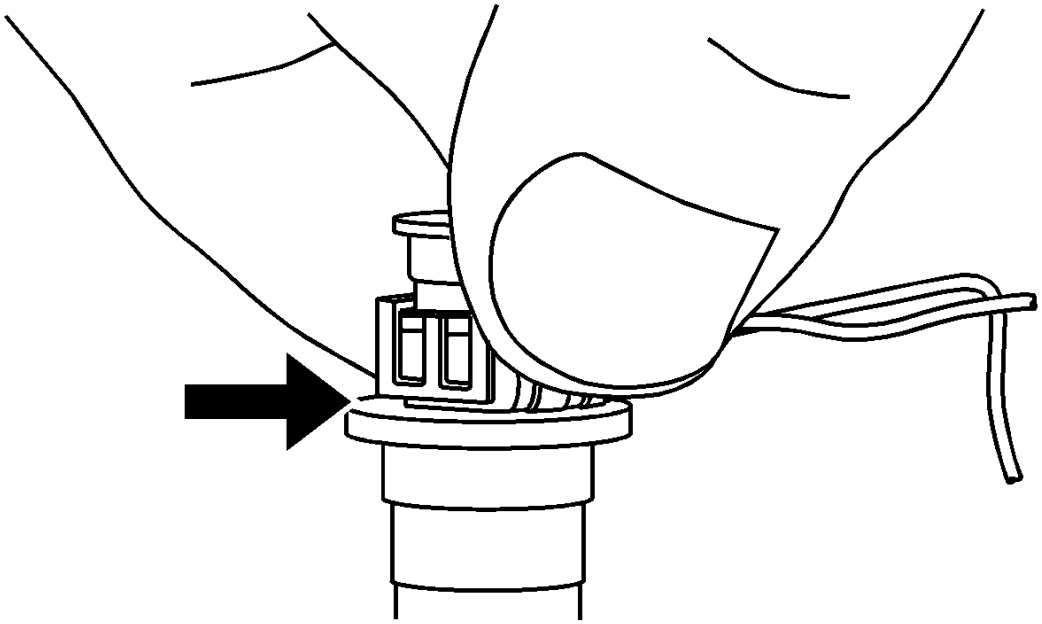

Fig. 134: Seating Connector Sub-Assembly
Courtesy of GENERAL MOTORS COMPANY

2. Line up the connector key tabs with the initiator key slots. Grab the connector on both sides and push down into the initiator connector sub assembly until fully seated.

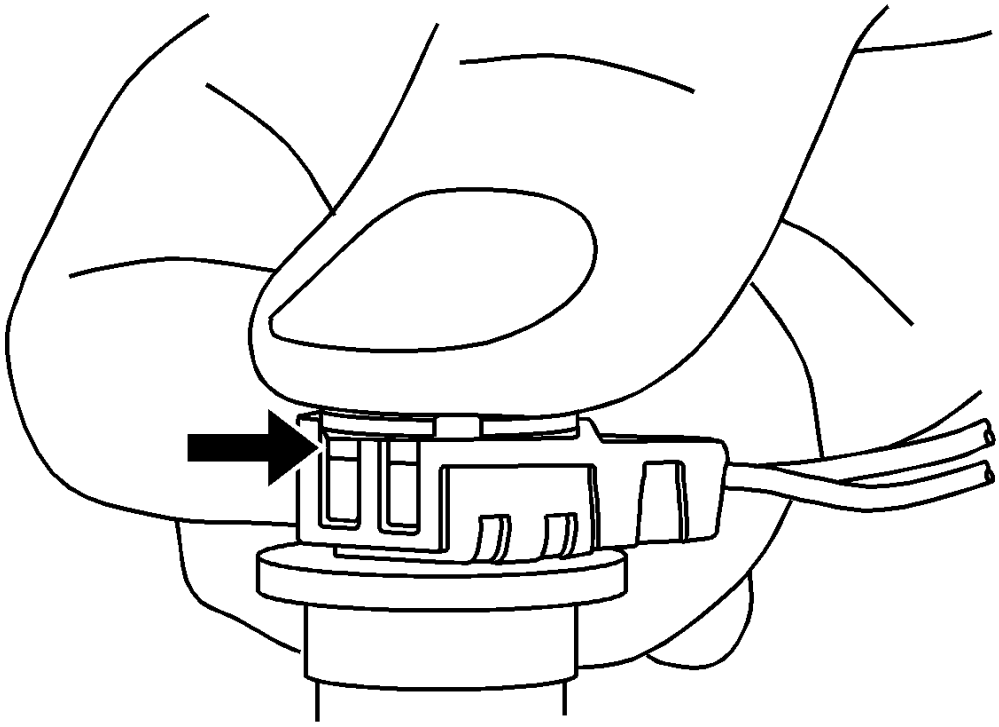

Fig. 135: Pushing CPA Down
Courtesy of GENERAL MOTORS COMPANY

3. After the connector is fully seated, push the CPA down with your thumb until the CPA is touching the yellow cover on the connector.

SUMITOMO CONNECTORS

Terminal Removal Procedure

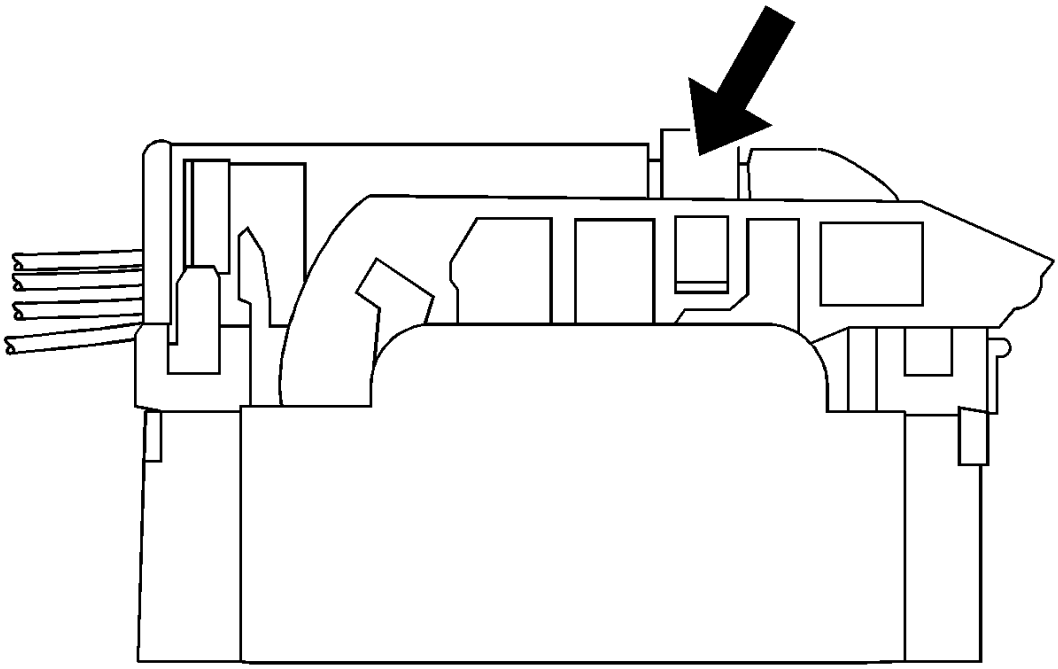

Fig. 136: Identifying Lever Lock
Courtesy of GENERAL MOTORS COMPANY

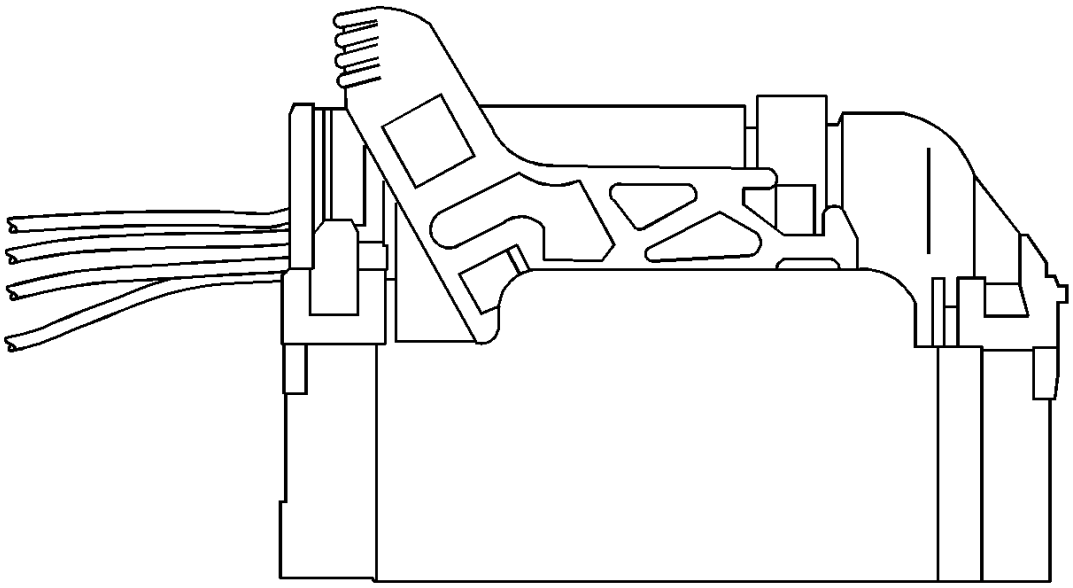

Fig. 137: View Of Lever Lock In Forward Position
Courtesy of GENERAL MOTORS COMPANY

1. Slide the lever lock forward while pressing down on the lever lock release tab.
2. Disconnect the connector from the component.

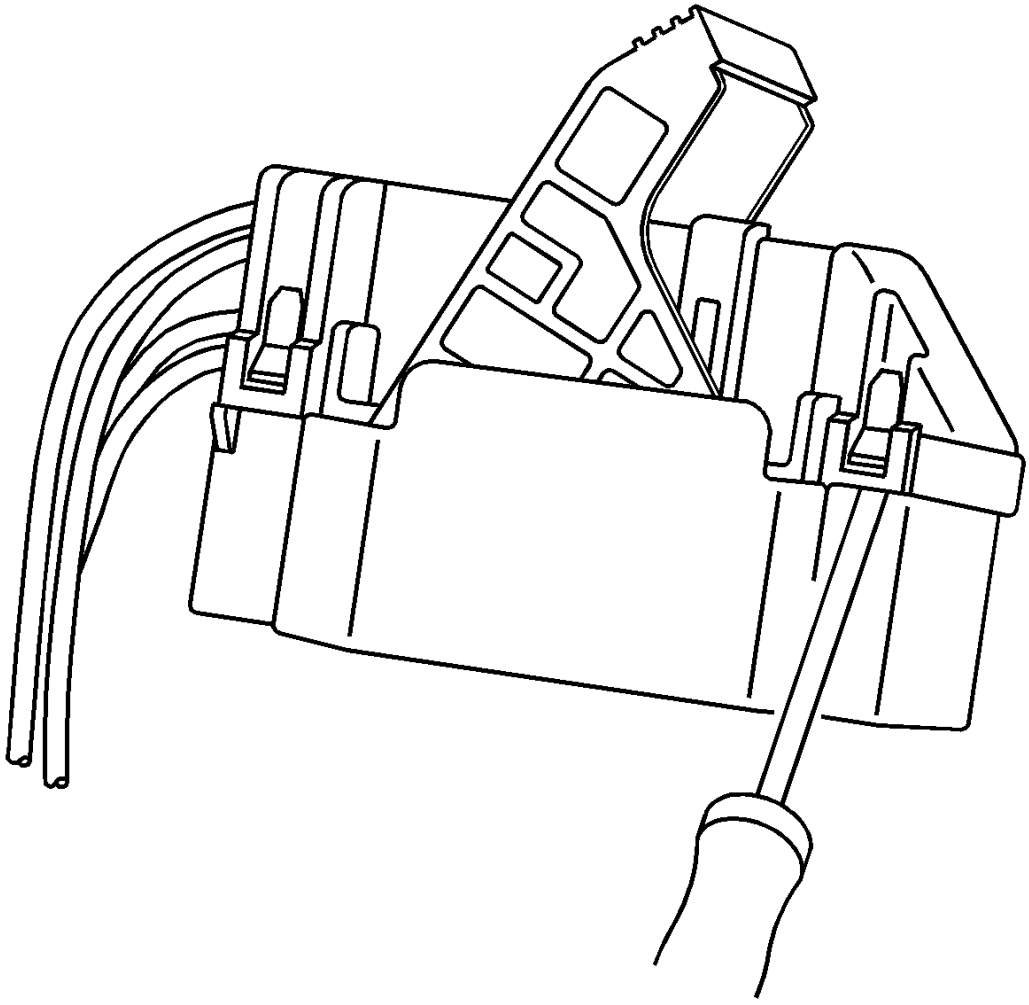

Fig. 138: View Of Connector Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

3. Remove the dress cover by using a flat-blade tool to release the connector locking tabs and pulling off the dress cover.

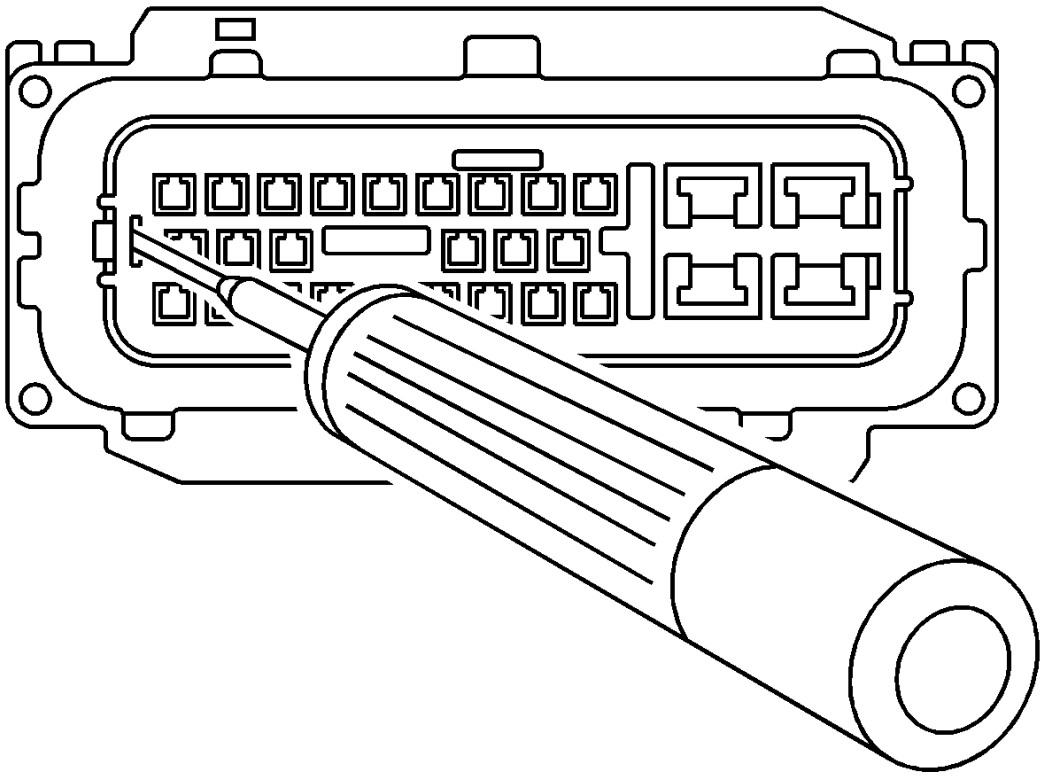

Fig. 139: Identifying Nose Piece Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

4. Relieve the tension on the nose piece retainers by inserting J-38125-12A into the single retainer slot on the end of the nose piece and gently prying out the locking tab. Repeat the process for both of the nose piece locking tabs on the opposite side of the nose piece.

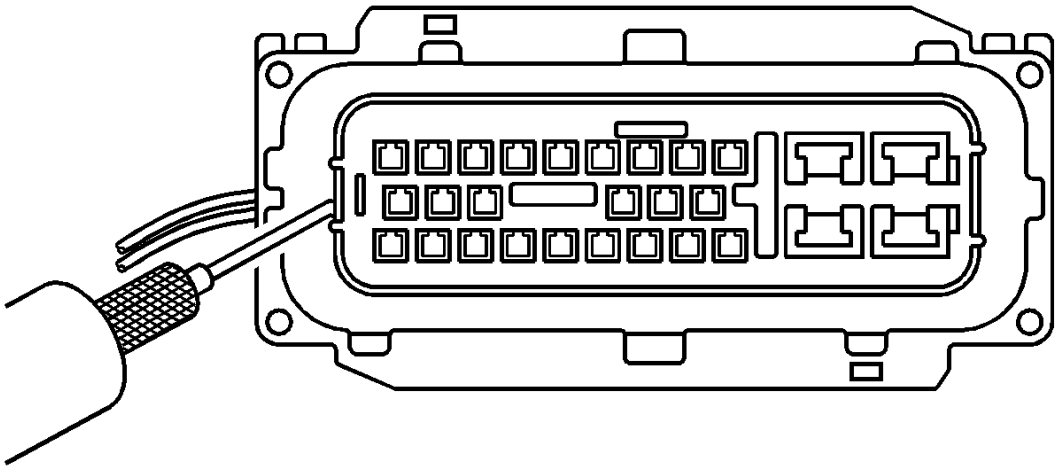

Fig. 140: Pulling Up One End Of Nose Piece (1st Side)
Courtesy of GENERAL MOTORS COMPANY

5. Once the nose piece retainers are relaxed, use the J-38125-552 to pull up the nose piece by hooking the tool under the nose piece and pulling up. The nose piece should raise slightly.

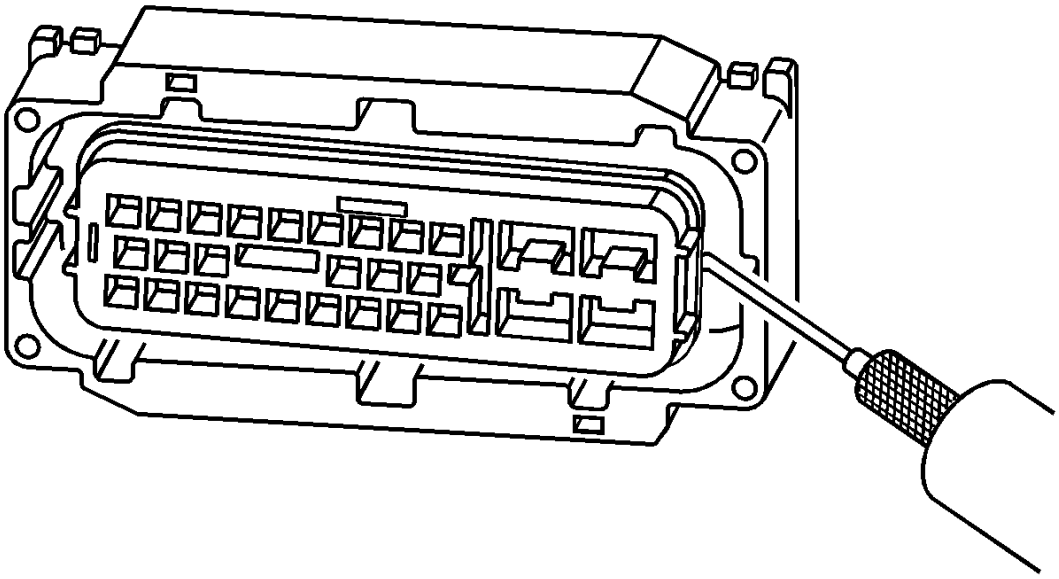

Fig. 141: Pulling Up One End Of Nose Piece (2nd Side)
Courtesy of GENERAL MOTORS COMPANY

6. On the opposite side of the nose piece, use the J-38125-552 pull up the nose piece by hooking the tool under the nose piece and pulling up. The nose piece should release completely. If the nose piece does not come off, repeat the procedure on the opposite side.

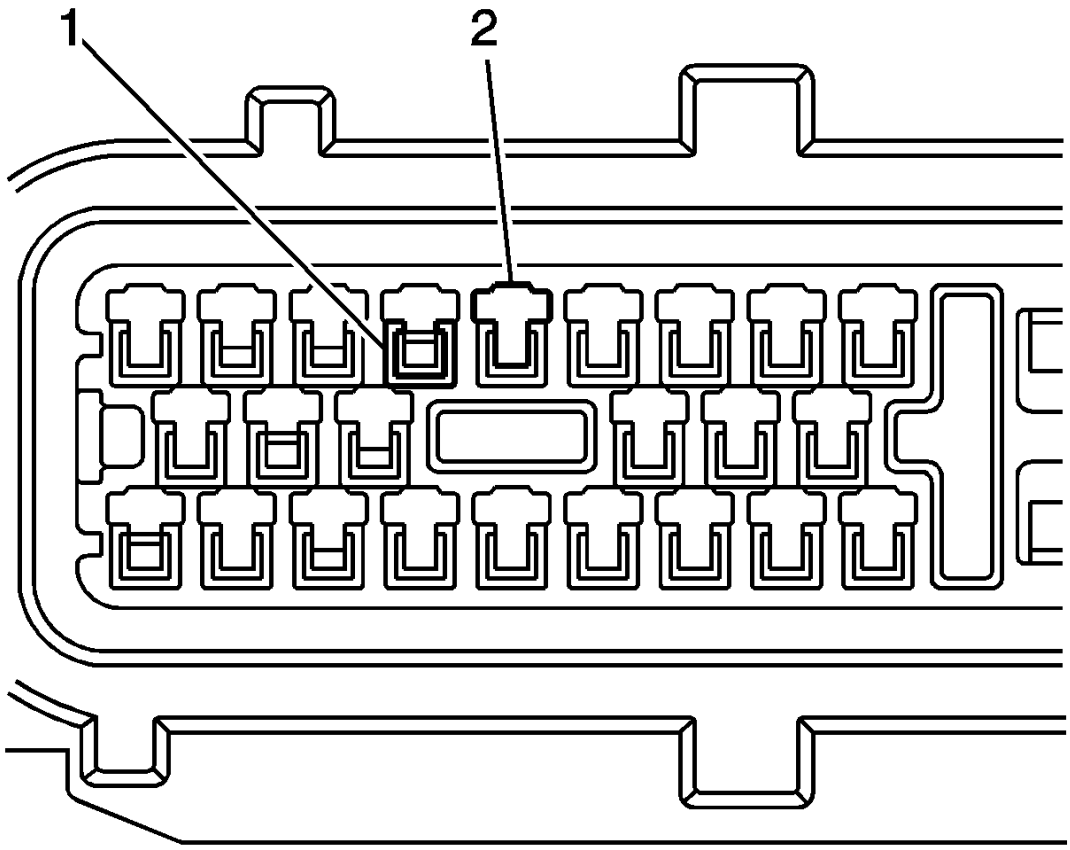

Fig. 142: View Of Terminal & Entry Canal
Courtesy of GENERAL MOTORS COMPANY

7. The illustration above identifies the entry canal where the terminal release tool will be inserted, and the terminal cavity.
    - Terminal (1)
    - Entry Canal (2)

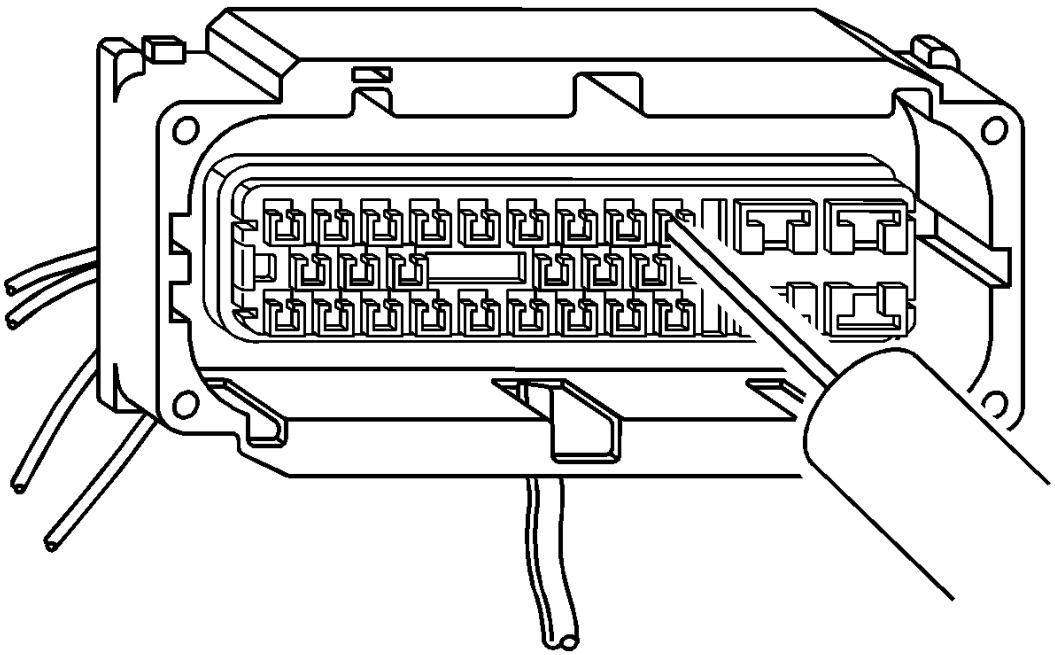

Fig. 143: Inserting Tool Into Entry Canal
Courtesy of GENERAL MOTORS COMPANY

8. Insert the J-38125-553 tool into the entry canal and pry up on the terminal retainer. The terminal retainer is a small plastic piece on the top of the terminal. The terminal retainer must be held up while the terminal is pulled out of the connector.

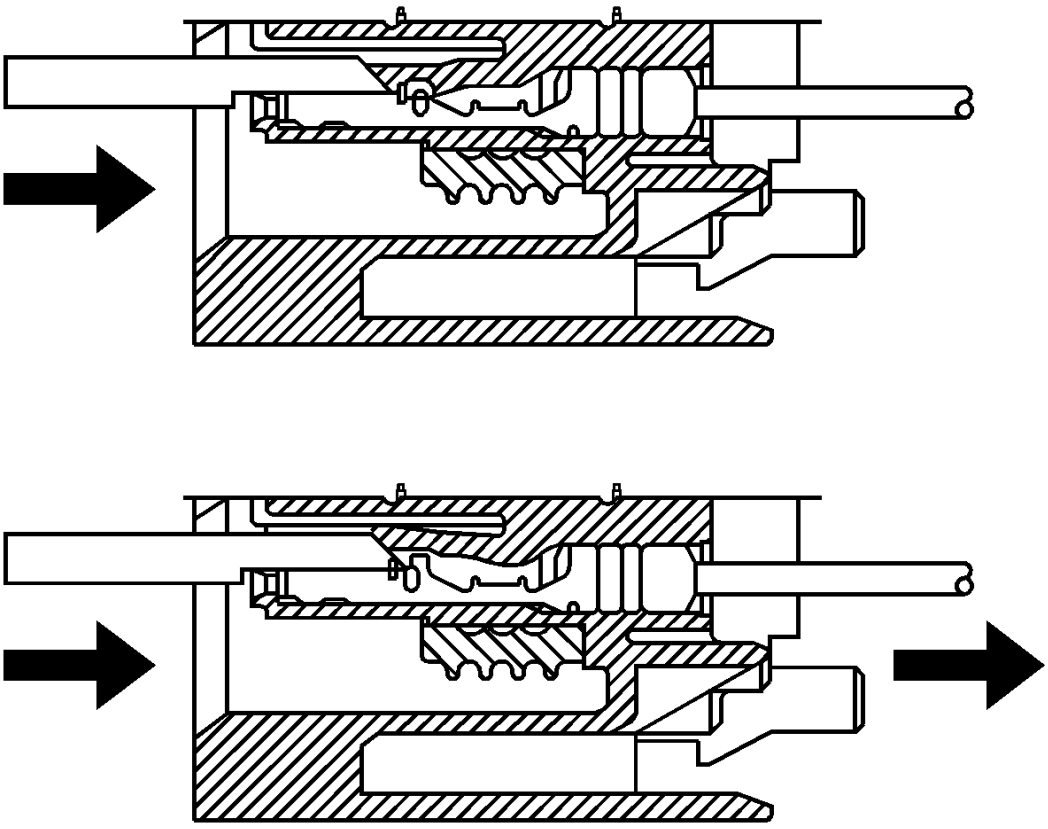

Fig. 144: Cutaway View Of Connector
Courtesy of GENERAL MOTORS COMPANY

9. The illustration shows a cutaway view of the connector to aid the technician in releasing the terminal retainer.
10. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
11. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminal Insertion Procedure

After the terminal is replaced, perform the following procedure in order to insert the terminal.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Ensure that the terminal is locked in place by gently pulling on the wire.
3. To assemble the connector, reverse the connector disassembly procedure.

TYCO/AMP CONNECTORS (CM 42-WAY)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-12A** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

1. Locate the connector position assurance (CPA) on the connector body and pull the CPA out. The CPA is on the wire harness side of connector.
2. Disconnect the connector from the component.

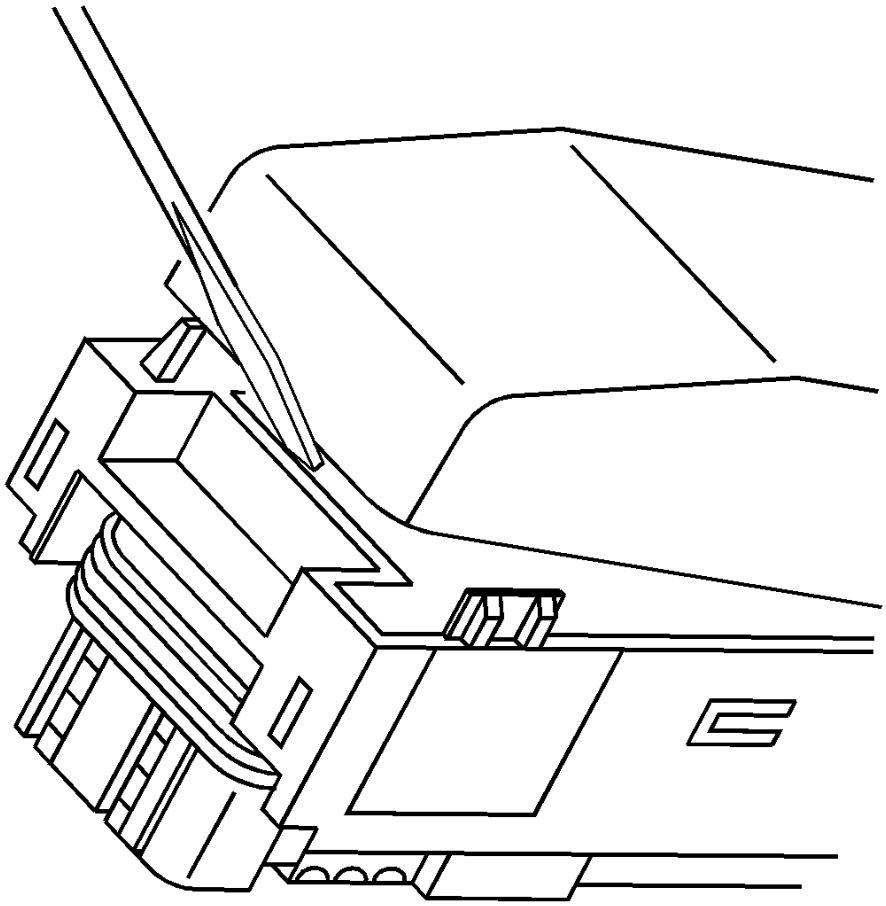

Fig. 145: View Of Dress Cover
Courtesy of GENERAL MOTORS COMPANY

3. Use a small flat-bladed tool to gently pry off the dress cover by inserting the tool under the cover opposite the harness side and prying up.
4. Remove the cover.

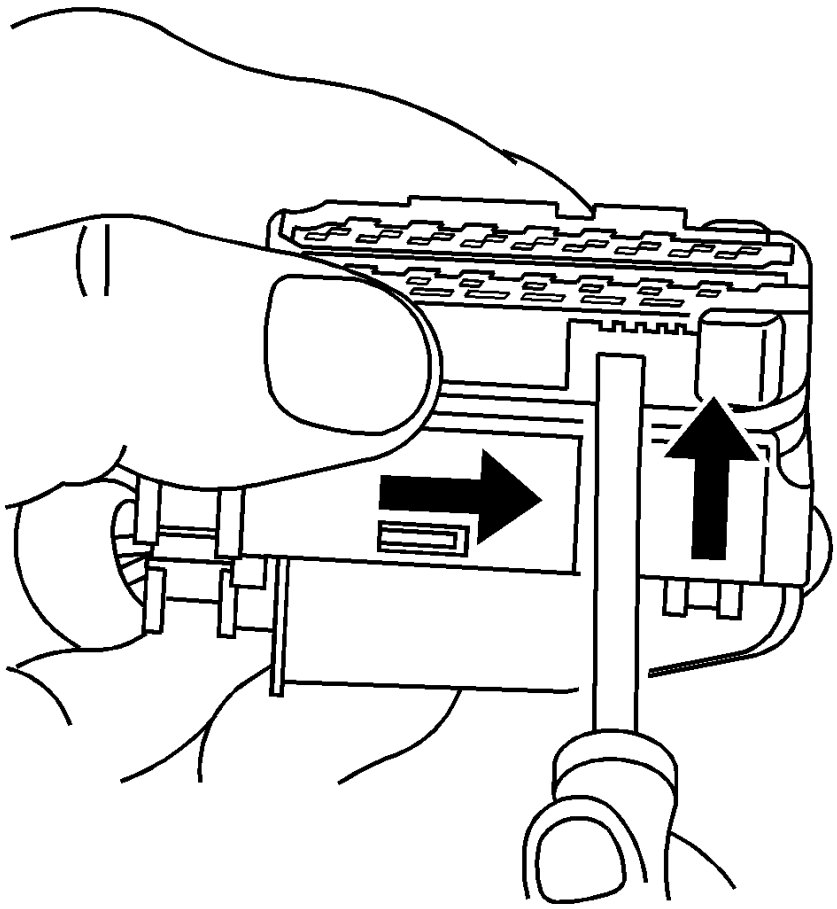

Fig. 146: View Of Terminal Position Assurance (TPA)
Courtesy of GENERAL MOTORS COMPANY

5. Using a small flat-bladed tool, push on the side of the nose piece retainer while pushing the nose piece forward with your thumb. This will release the terminal position assurance (TPA).

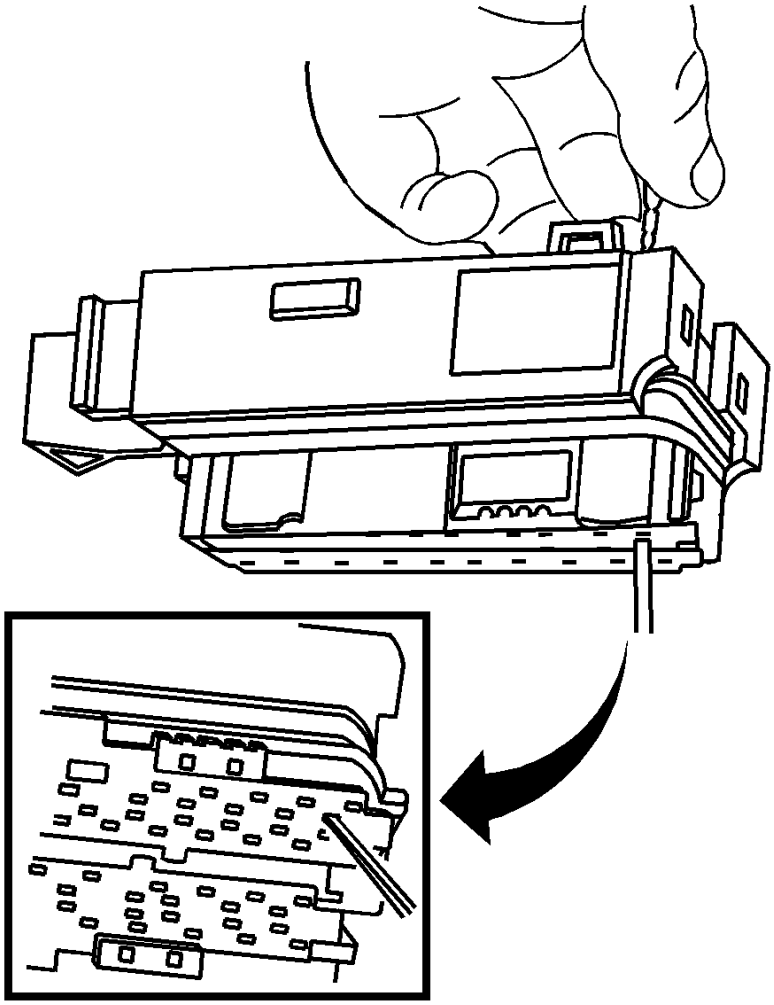

Fig. 147: Inserting Special Tool Into Terminal Release Cavity
Courtesy of GENERAL MOTORS COMPANY

6. Insert the **J-38125-12A** tool into the corresponding terminal release cavity. The release cavities are the 2 center rows of cavities on one half of the connector.

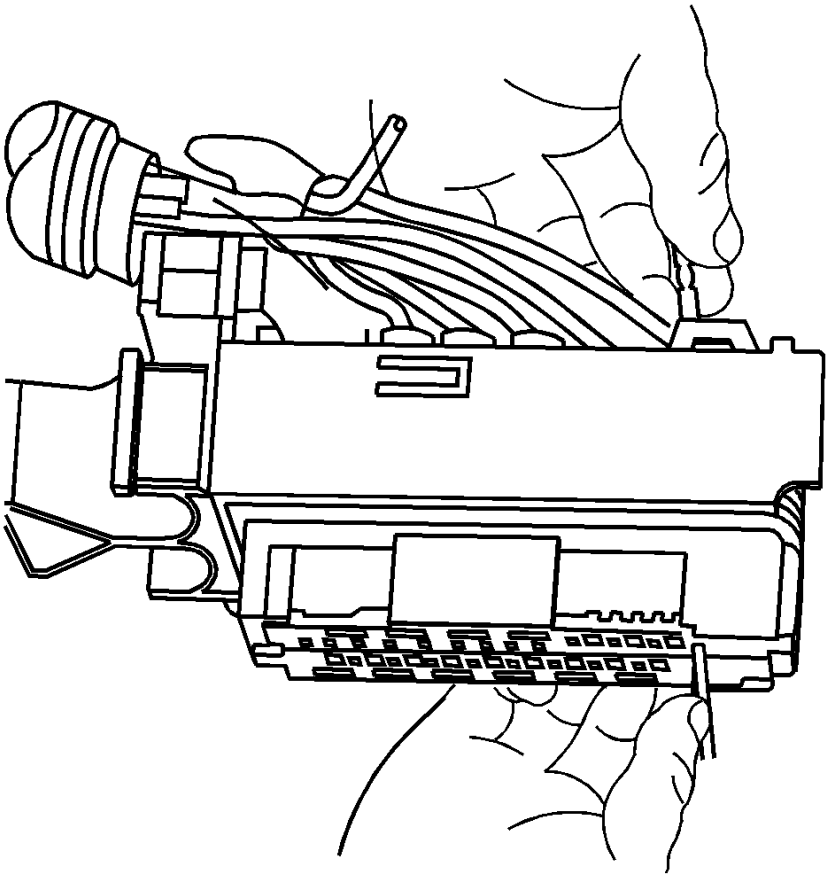

Fig. 148: Identifying Special Tool & Release Cavity
Courtesy of GENERAL MOTORS COMPANY

7. Pressing the **J-38125-12A** tool in the release cavity of the terminal you are removing, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
8. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
9. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

TYCO/AMP CONNECTORS (SENSOR)

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

1. Disconnect the connector from the component.

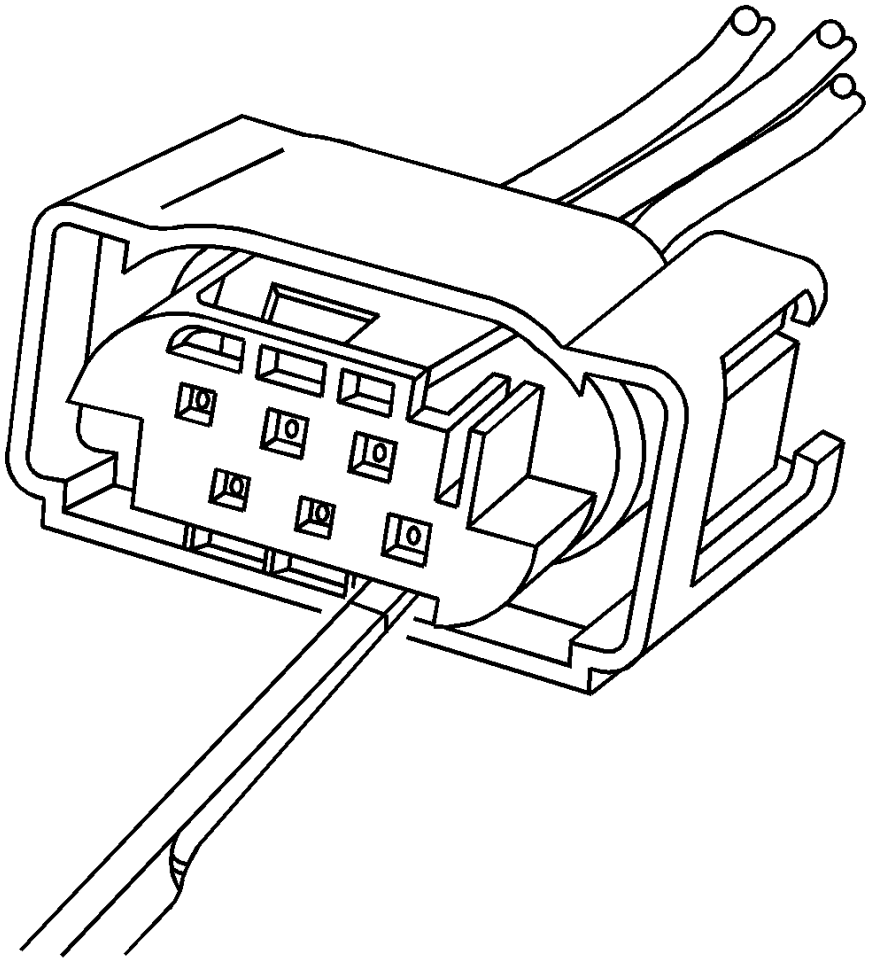

Fig. 149: View Of Inserting Special Tool Into Lower Right Face Cavity
Courtesy of GENERAL MOTORS COMPANY

2. Insert the J-38125-11A tool into the cavity on the lower right hand face of the connector until the terminal release tang access panel slides over.

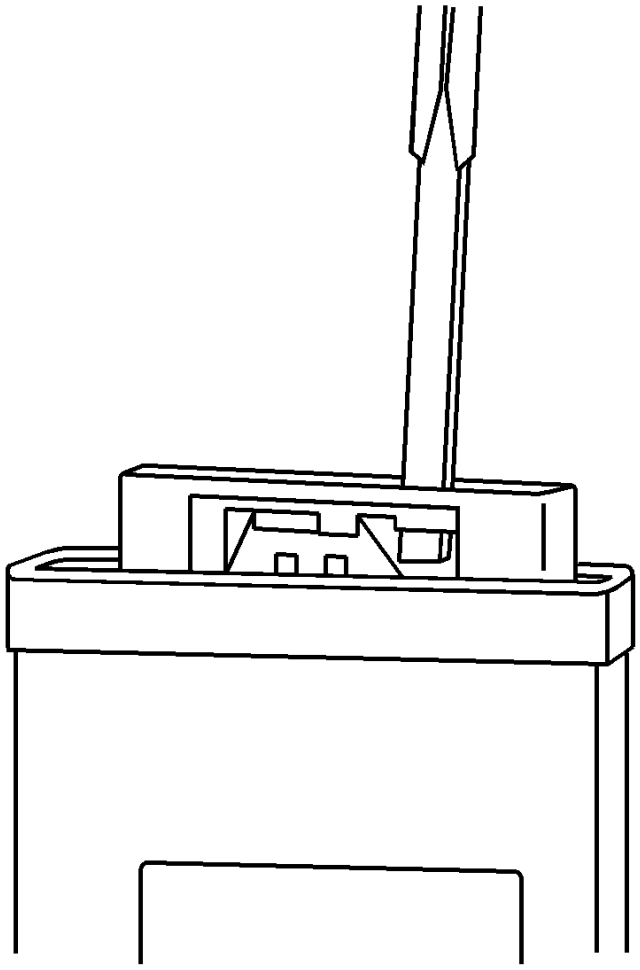

Fig. 150: Pushing Wire Side Of Terminal Toward Connector
Courtesy of GENERAL MOTORS COMPANY

3. Ensure that the terminal release tang access panel is in the correct location to access the terminals.
4. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

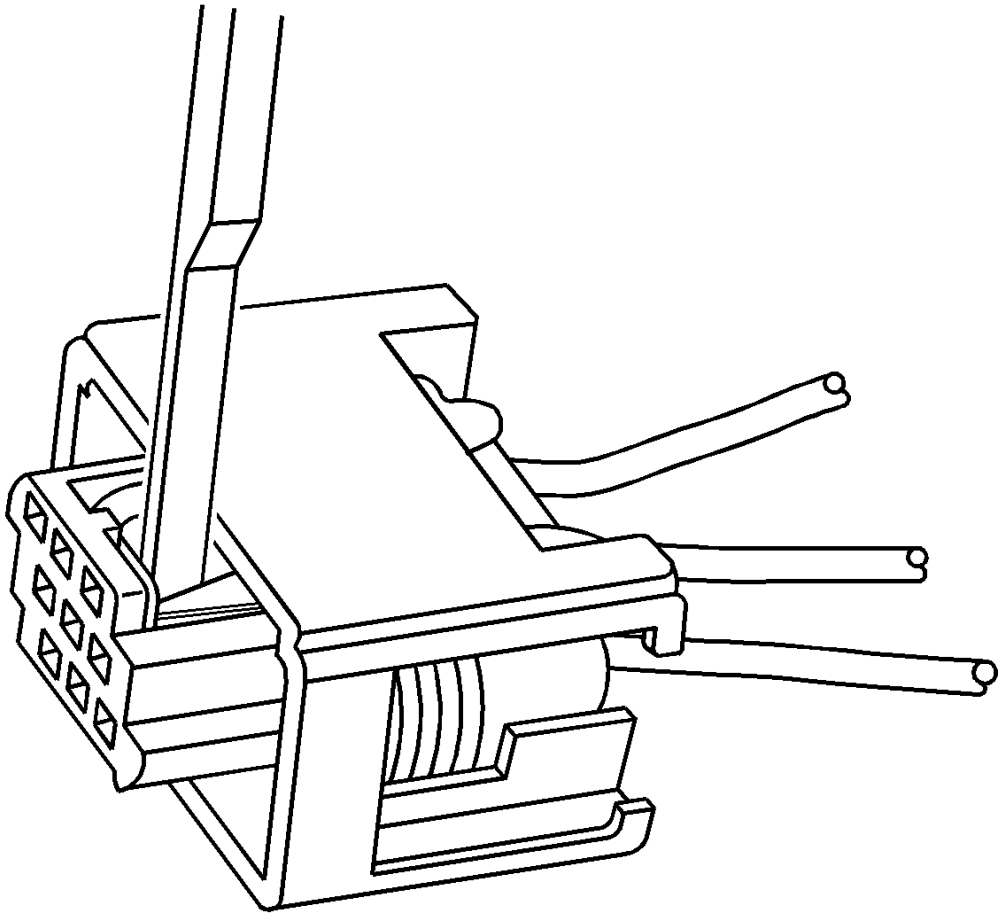

Fig. 151: View Of Inserting Tool Into Terminal Release Tang Access Slot (Sensor)
Courtesy of GENERAL MOTORS COMPANY

5. Insert the J-38125-11A into the terminal release tang access slot located behind the access panel of the connector and press down on the terminal while carefully pulling the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
6. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

TYCO/AMP CONNECTORS (0.25 CAP)

Special Tools

- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-24** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

1. Disconnect the connector from the component by pressing down on the connector position assurance (CPA).

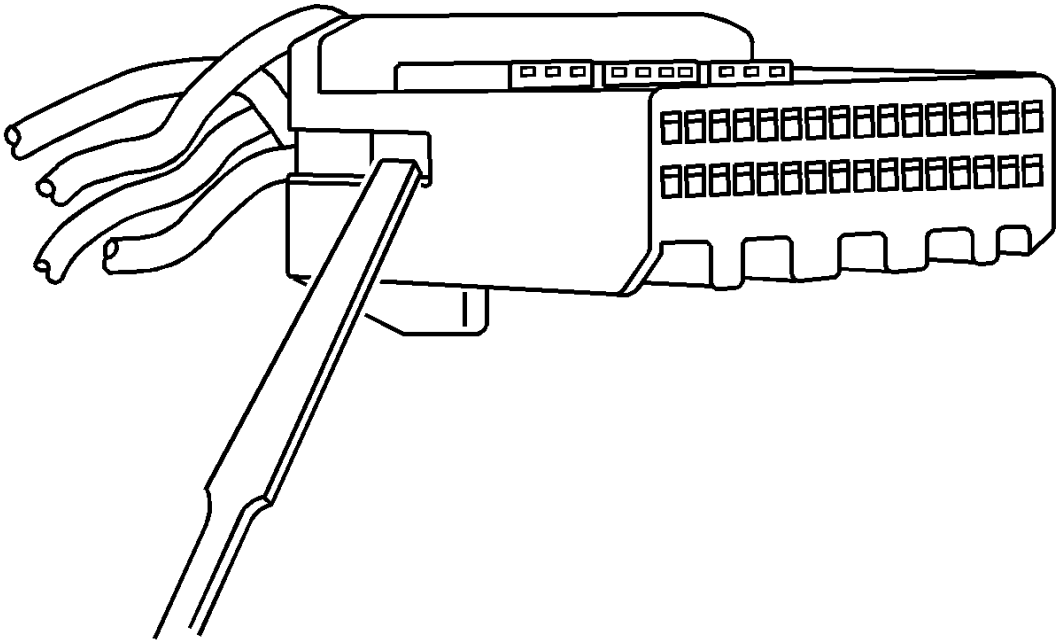

Fig. 152: Releasing TPA Using Small Flat-Bladed Tool
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The TPA on this connector cannot be removed unless the terminals are removed first. The TPA will come out of the connector body, but only slightly. When the TPA is slightly raised the terminals can be removed. Using excessive force to remove the TPA with the terminals still in the connector will damage the connector.**

2. Use a small flat-bladed tool to release the terminal position assurance (TPA) by inserting the tool in the small recess on the side of the connector and pushing up until the TPA releases from the connector body. The TPA should raise just slightly. Do not try to remove the TPA.
3. Repeat the process for the other side of the connector.

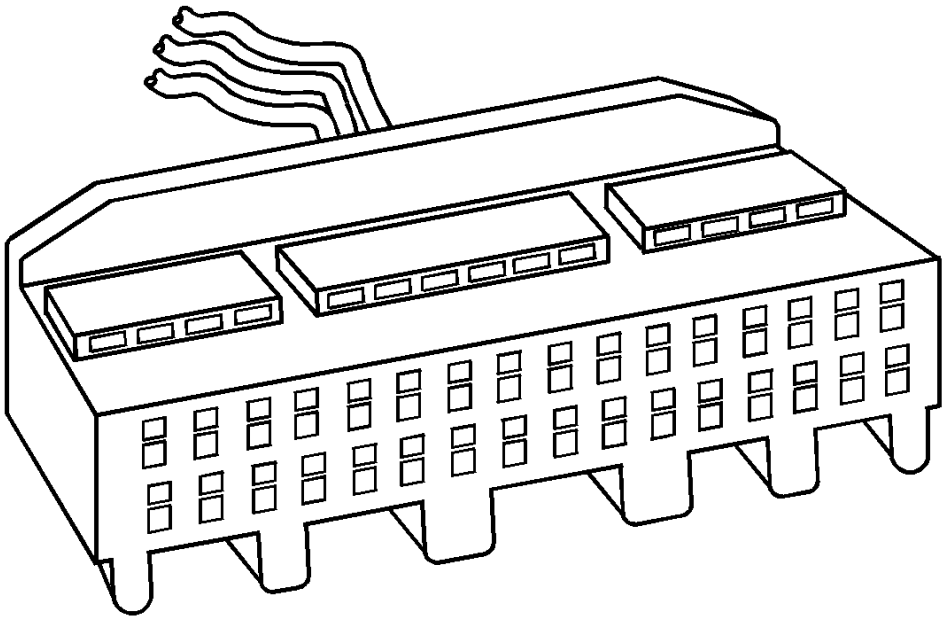

Fig. 153: View Of Terminal Position Assurance
Courtesy of GENERAL MOTORS COMPANY

4. Ensure that the TPA is in the proper position to remove the terminals.

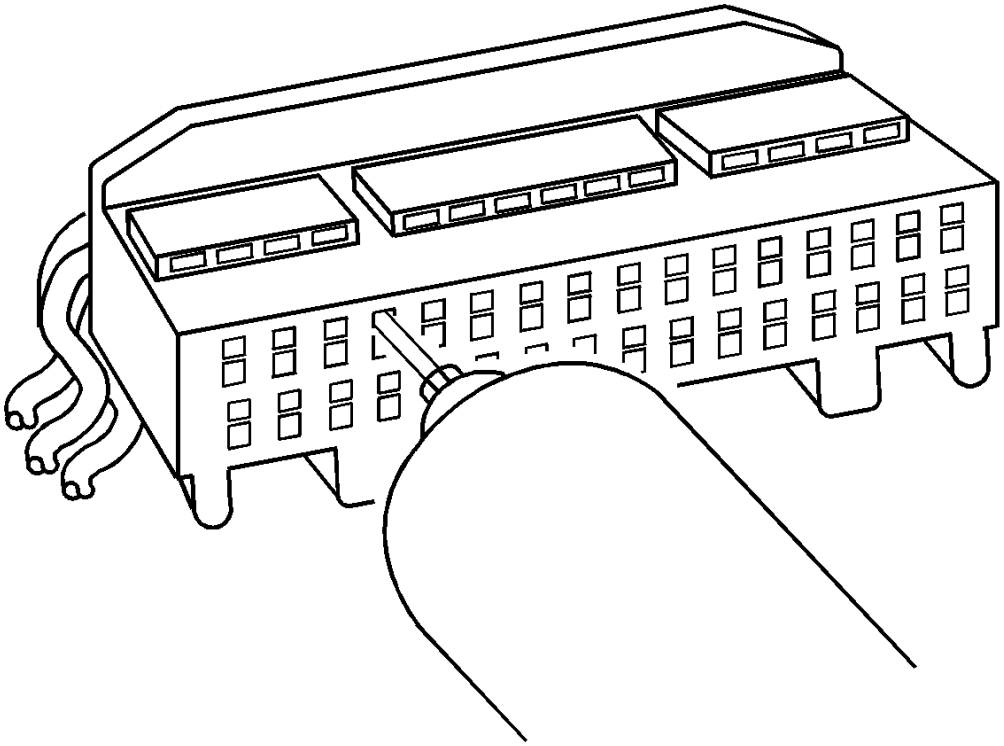

Fig. 154: Identifying Special Tool & Release Cavity
Courtesy of GENERAL MOTORS COMPANY

5. While pushing the terminal forward, insert the J-38125-24 in the release cavity above the terminal you are removing, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
6. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

TYCO/AMP CONNECTORS (43-WAY)

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

Follow the steps below in order to remove terminals from the connector.

1. Locate the lever lock on the wire dress cover. Slide the lever lock away from the connector body.
2. Disconnect the connector from the component.
3. Locate the dress cover locking tabs on the dress cover of the connector. Using a small flat-bladed tool release all of the locking tabs.
4. Once the locks are unlocked, lift the dress cover off.

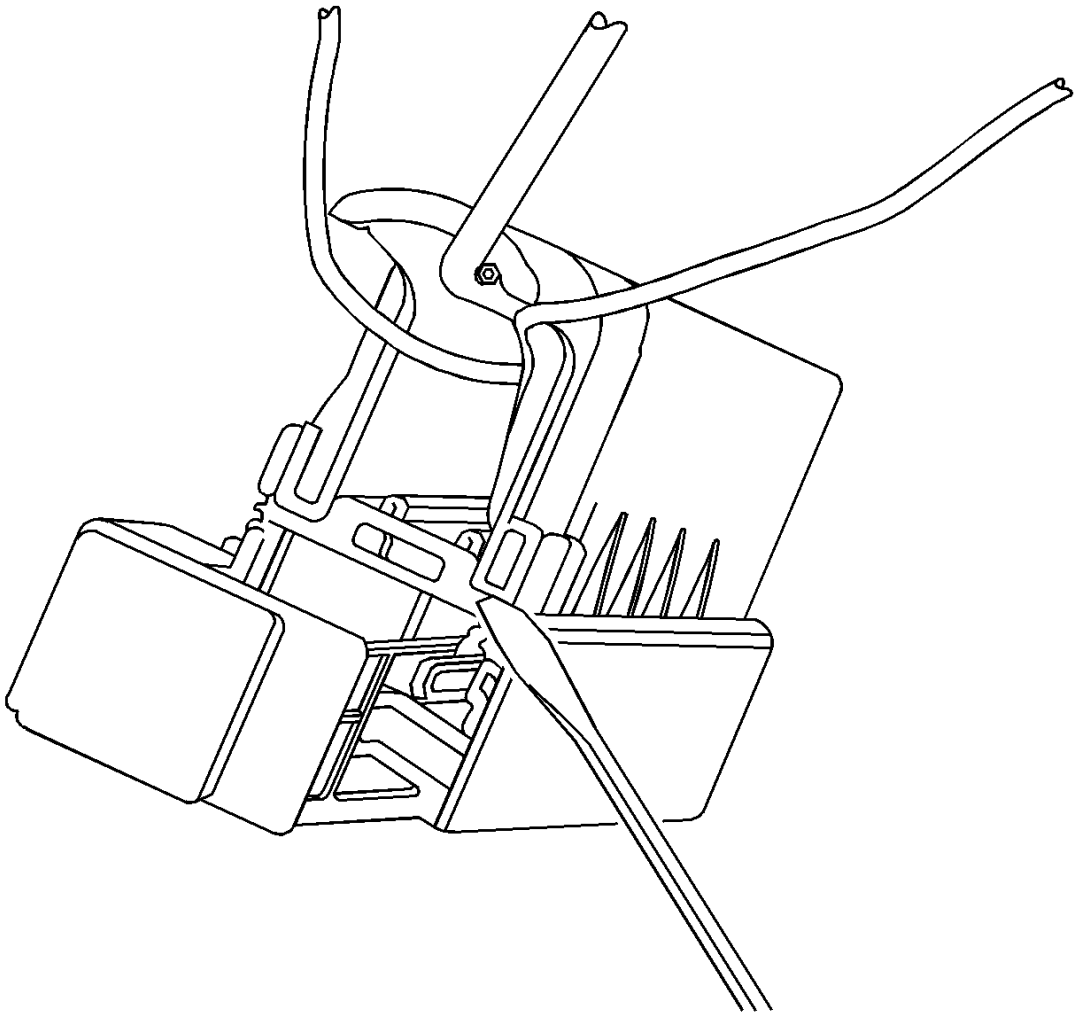

Fig. 155: Releasing TPA
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Always use care when removing a terminal position assurance (TPA) in order to avoid damaging it.**

5. Release the TPA by inserting a small flat-bladed tool into the blue locking tabs on both ends of the connector. Gently slide the TPA up to the released position on both ends.

4. Pull the TPA from the connector body.

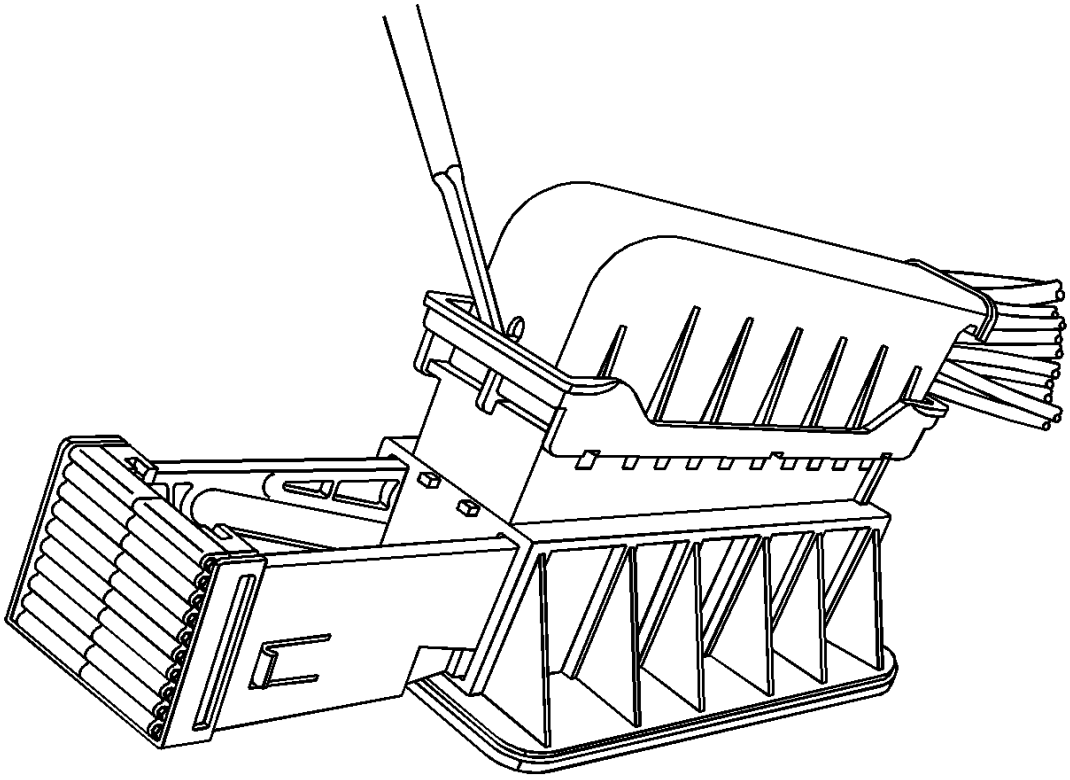

Fig. 171: Releasing Connector Wire Dress Cover Locking Tab
Courtesy of GENERAL MOTORS COMPANY

5. Using terminal release tool J-38125-11A or equivalent, release the connector wire dress cover locking tab.

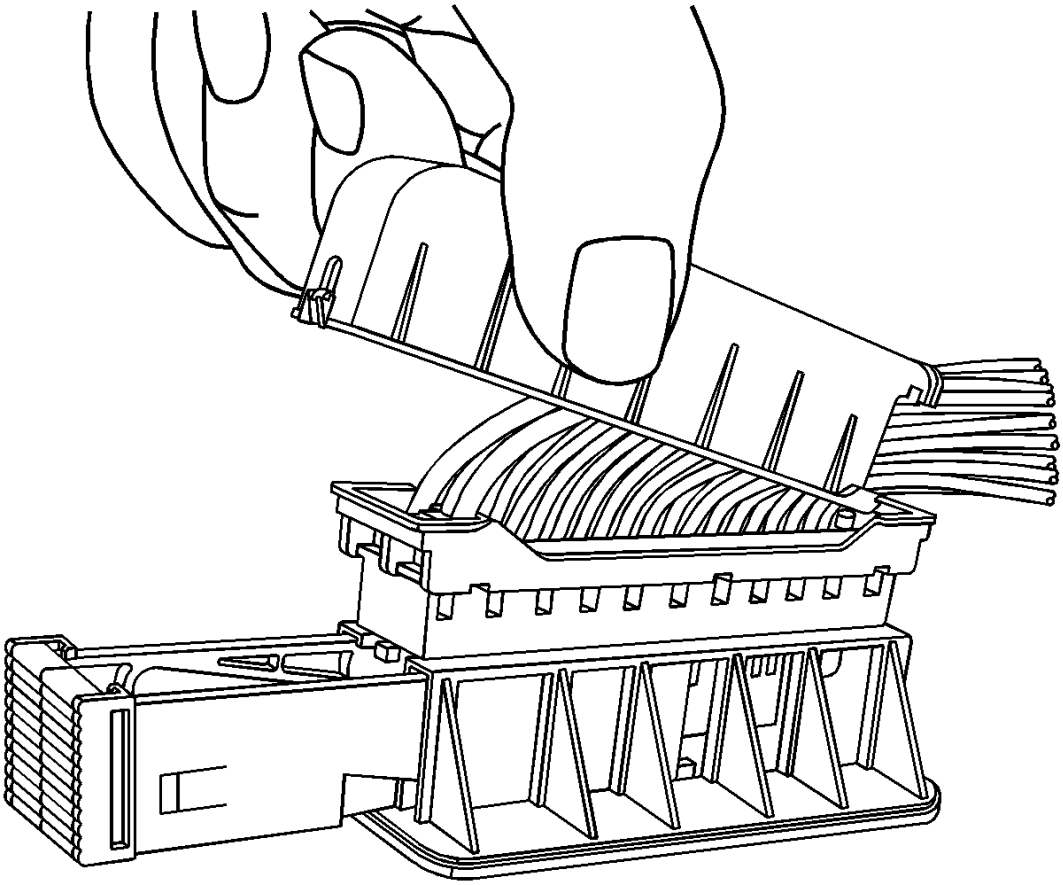

Fig. 172: Lifting Connector Wire Dress Cover From Connector Body
Courtesy of GENERAL MOTORS COMPANY

6. With the lock tab released, lift the connector wire dress cover from the connector body.

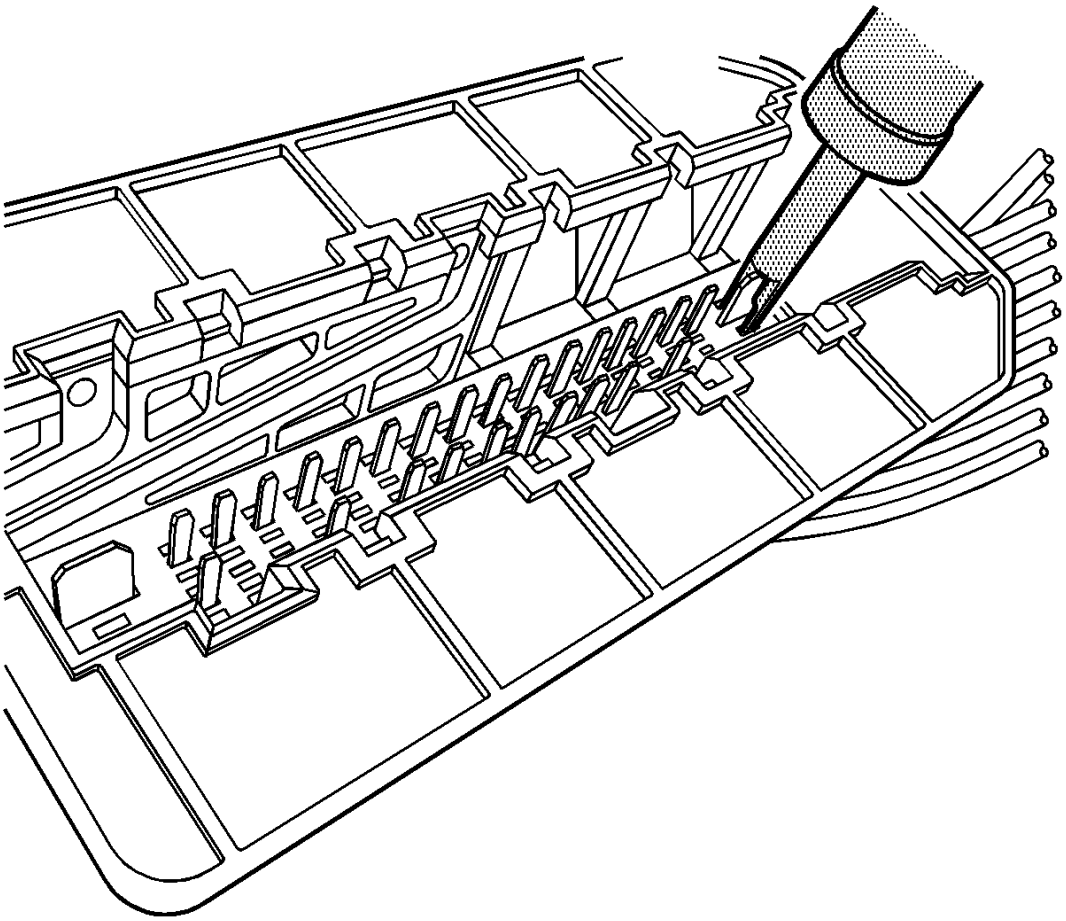

Fig. 173: Using Terminal Release Tool
Courtesy of GENERAL MOTORS COMPANY

7. Using terminal release tool J-38125-212, press the prongs into the holes each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

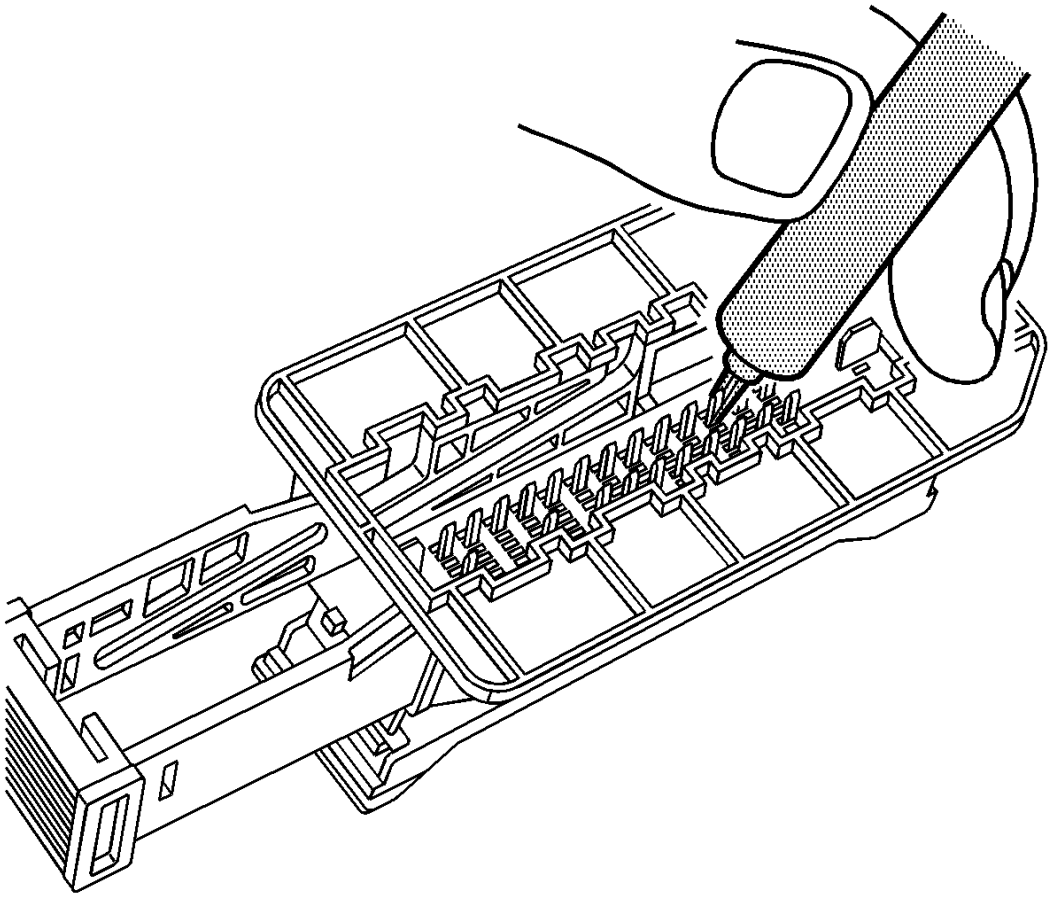

Fig. 174: Using Terminal Release Tool
Courtesy of GENERAL MOTORS COMPANY

8. Using terminal release tool J-38125-560, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

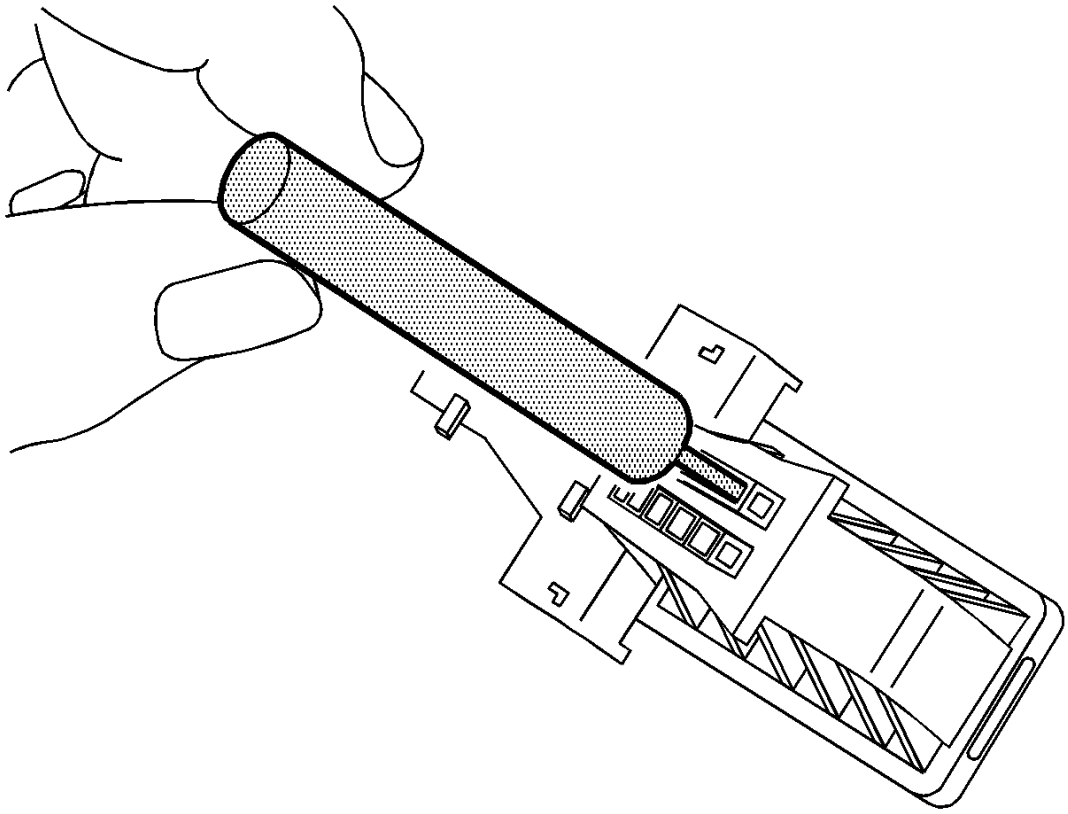

Fig. 175: Using Terminal Release Tool
Courtesy of GENERAL MOTORS COMPANY

9. Using terminal release tool J-38125-556, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.
10. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
11. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

TYCO/AMP CONNECTORS (102-WAY INLINE)

Special Tools

1. Pull the locking lever to the 90 degree position from the connector body.

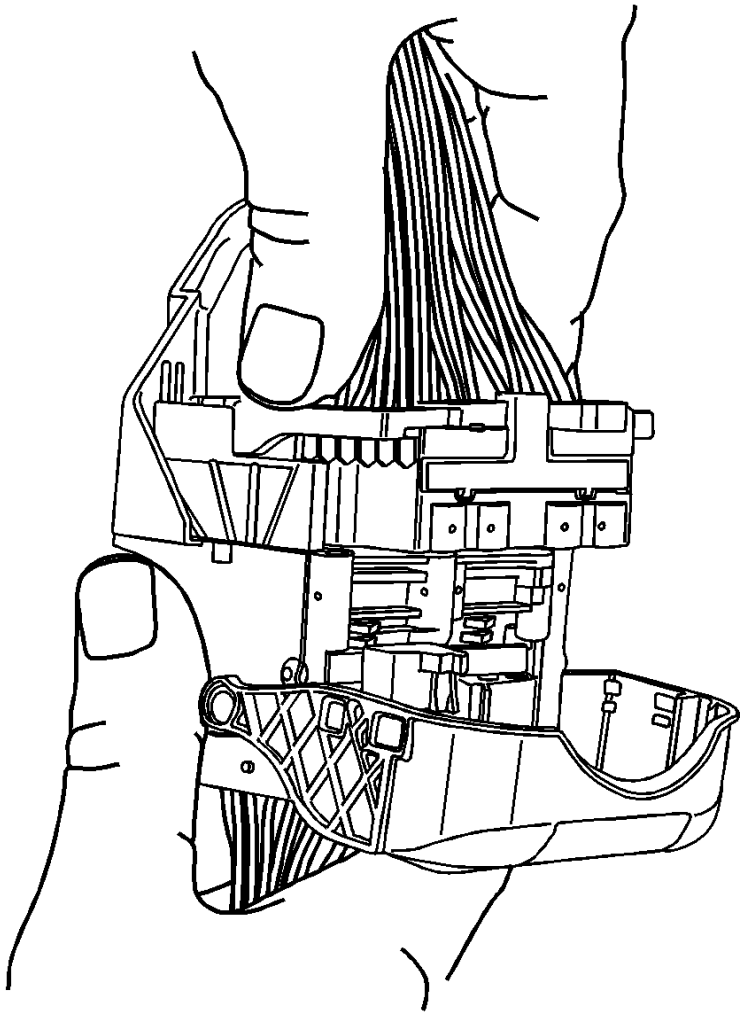

Fig. 178: Assembled View Of Connector - Tyco/AMP (102-Way Inline)
Courtesy of GENERAL MOTORS COMPANY

2. With the locking lever in the 90 degree position and the male connector body separated, it can be slid outward for removal.

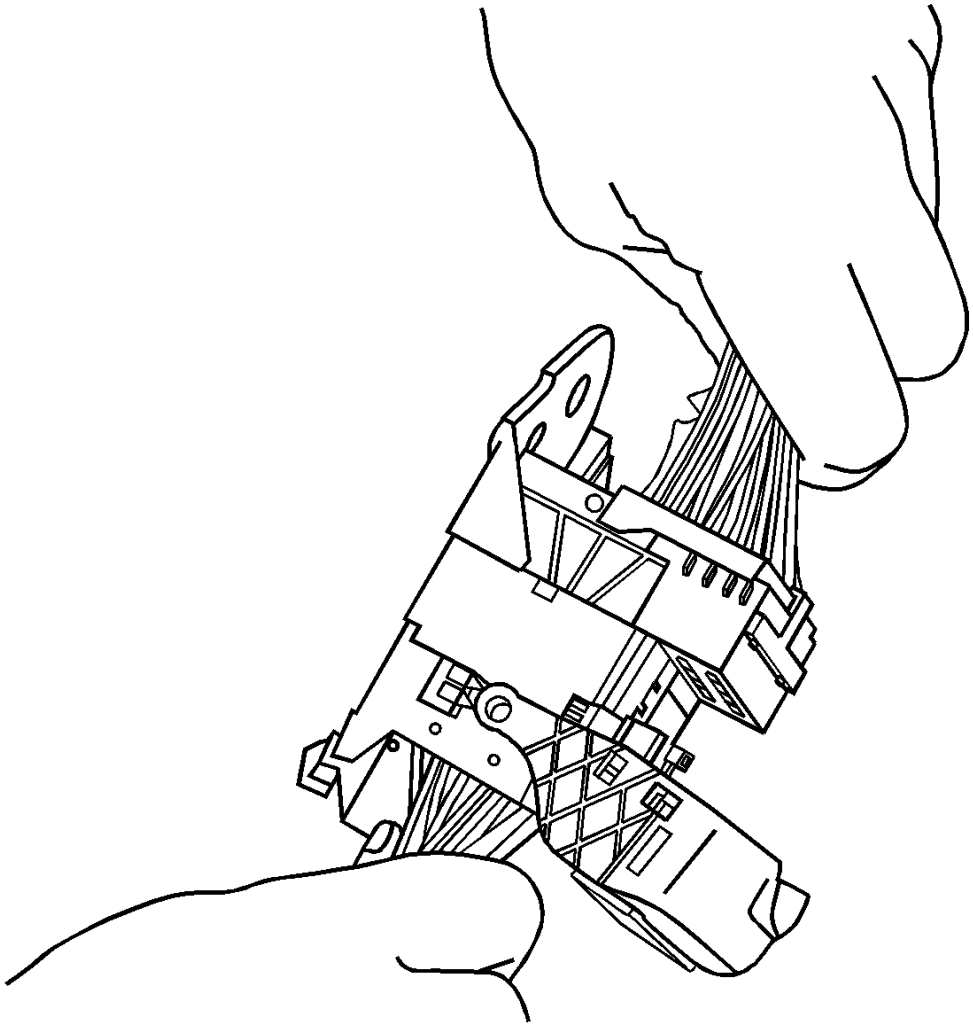

Fig. 179: Sliding Male Connector Body Away From Guide Plates
Courtesy of GENERAL MOTORS COMPANY

3. Slide the male connector body out away from the guide plates.

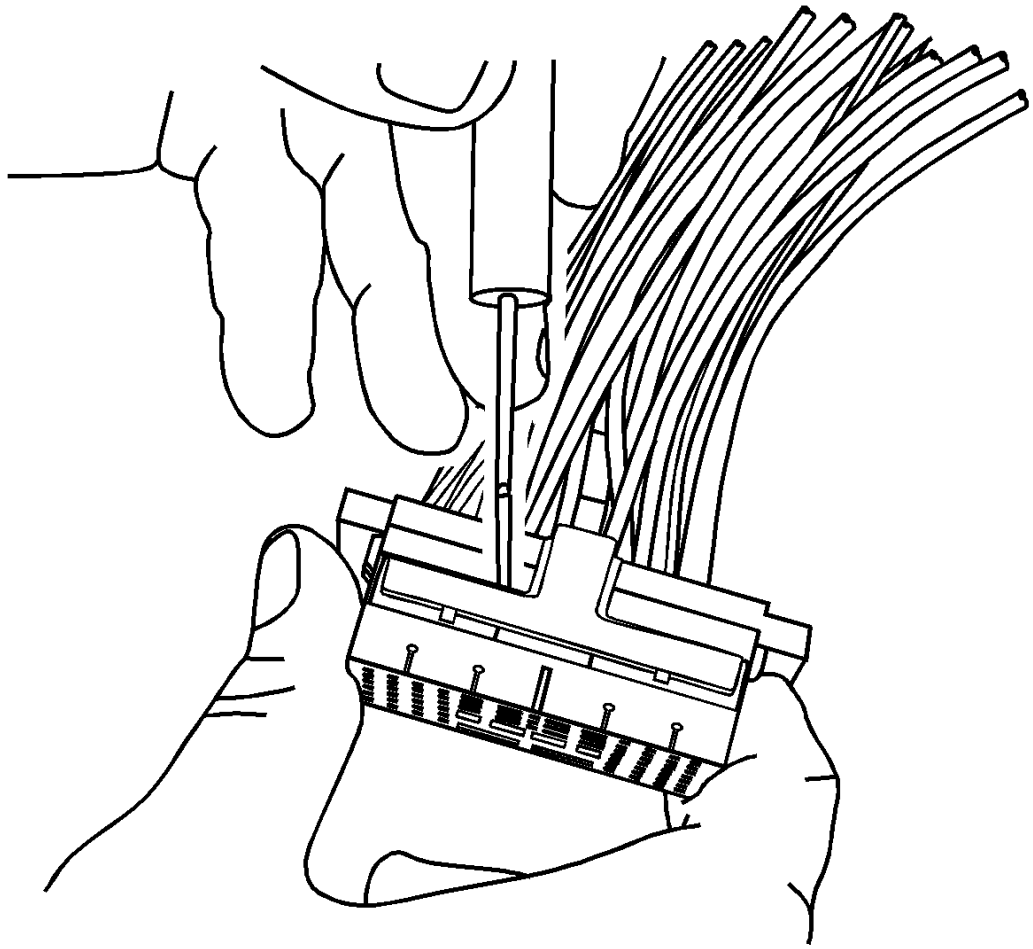

Fig. 180: View of Terminal Release Tool And TPA
Courtesy of GENERAL MOTORS COMPANY

NOTE: **During assembly the terminal position assurance (TPA) will not fully seat if any terminal is not fully seated.**

4. Using terminal release tool J-38125-11A or equivalent, remove the TPA from the connector body.

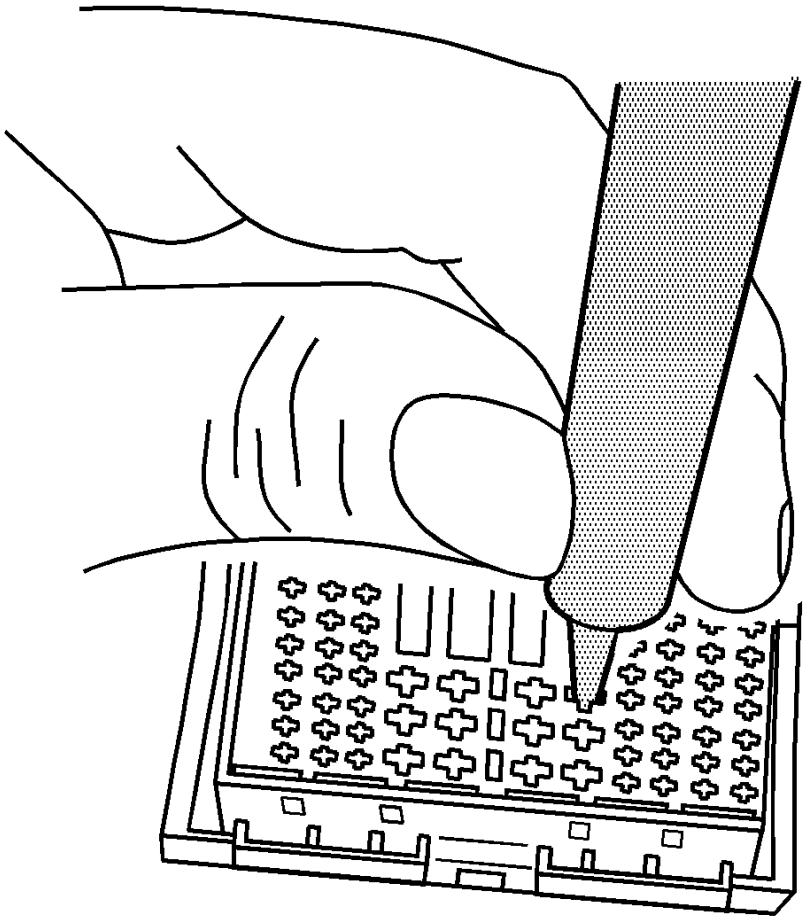

Fig. 181: Releasing Lock Tabs
Courtesy of GENERAL MOTORS COMPANY

5. Using terminal release tool J-38125-566, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

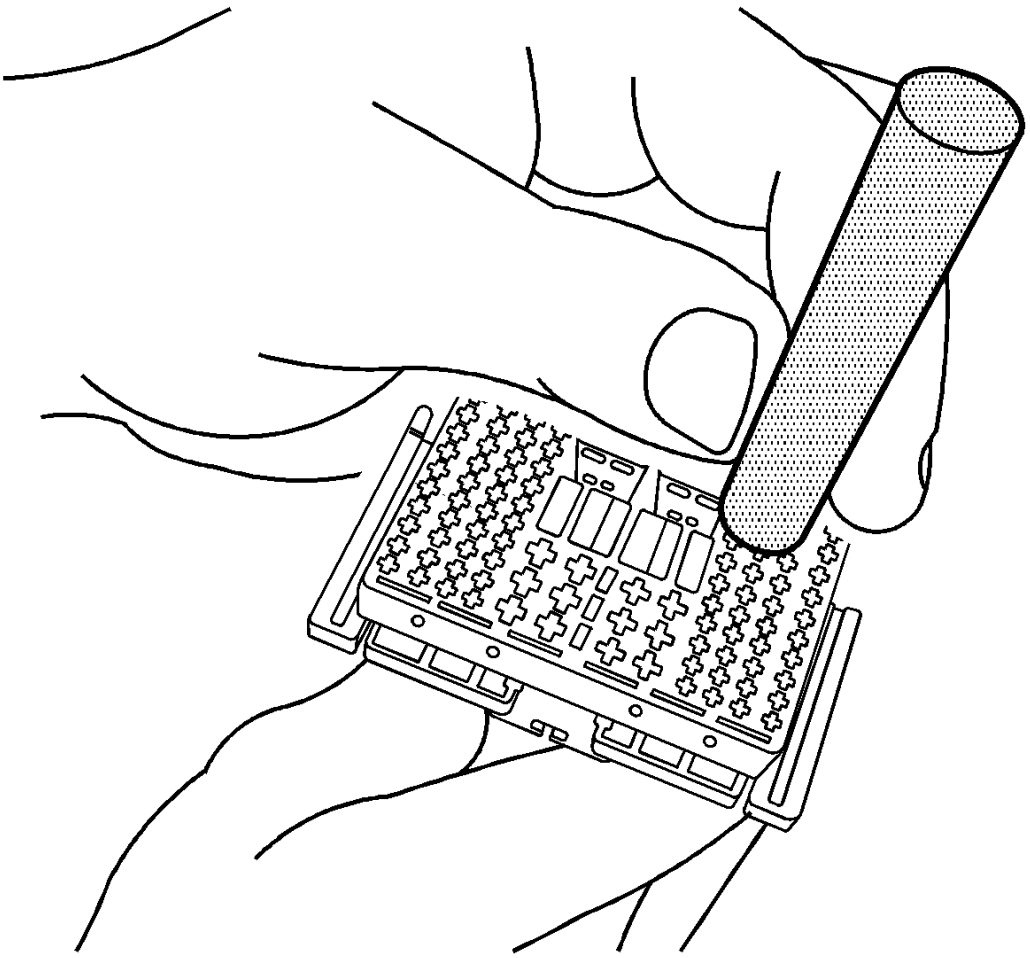

Fig. 182: Using Terminal Release Tool
Courtesy of GENERAL MOTORS COMPANY

6. Using terminal release tool J-38125-560, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

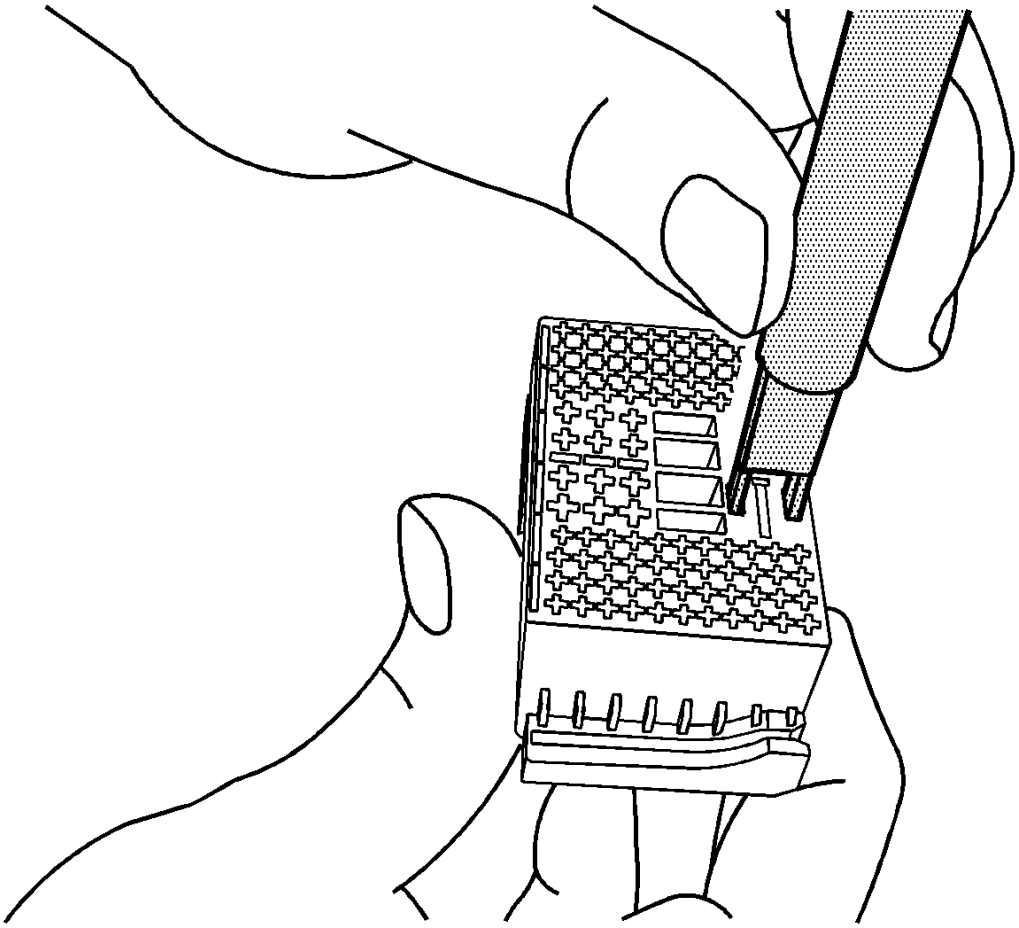

Fig. 183: Releasing Lock Tabs - Tyco/AMP (102-Way Inline)
Courtesy of GENERAL MOTORS COMPANY

7. Using terminal release tool J-38125-221, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

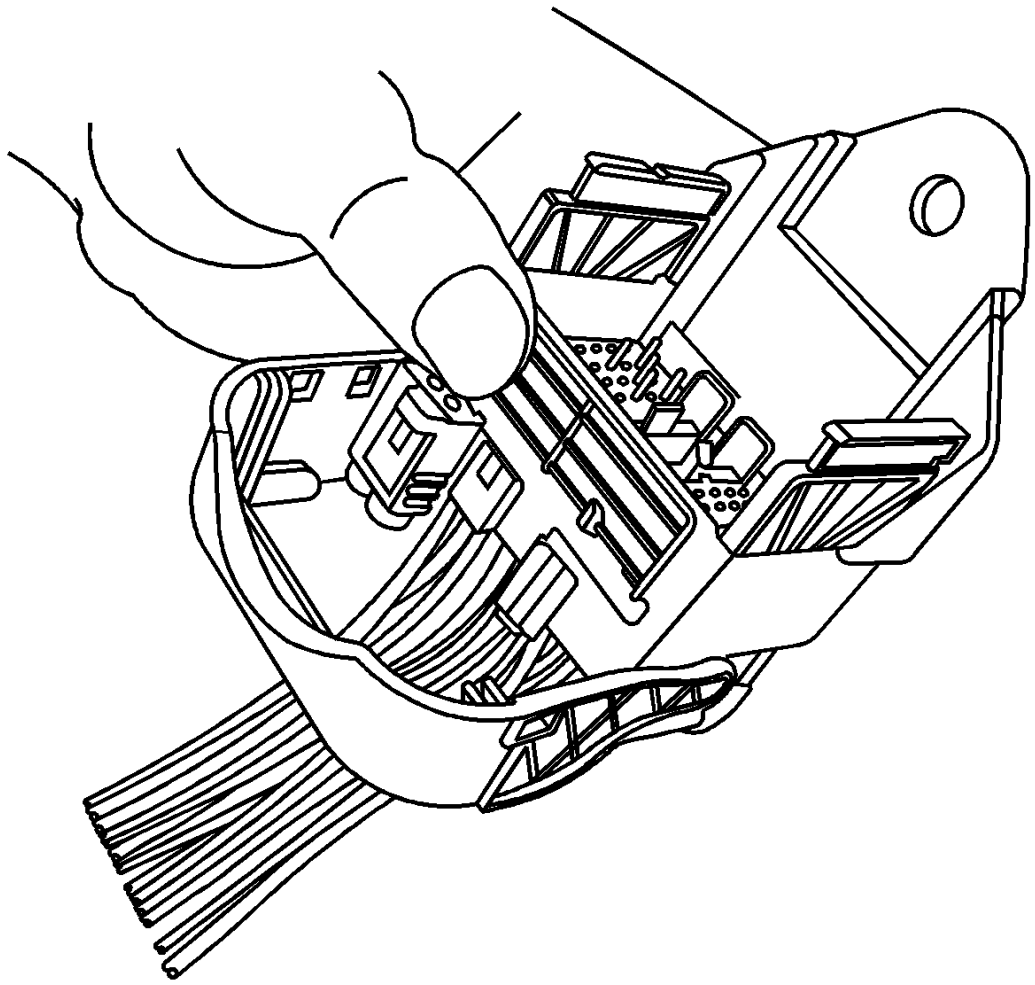

Fig. 184: View Of Female Connector Body - Tyco/AMP (102-Way Inline)
Courtesy of GENERAL MOTORS COMPANY

8. The female connector body may have an additional connector hooked to the edge of the body. Use terminal release tool J-38125-11A or equivalent to release the locking tab and slide the connector off the female body.

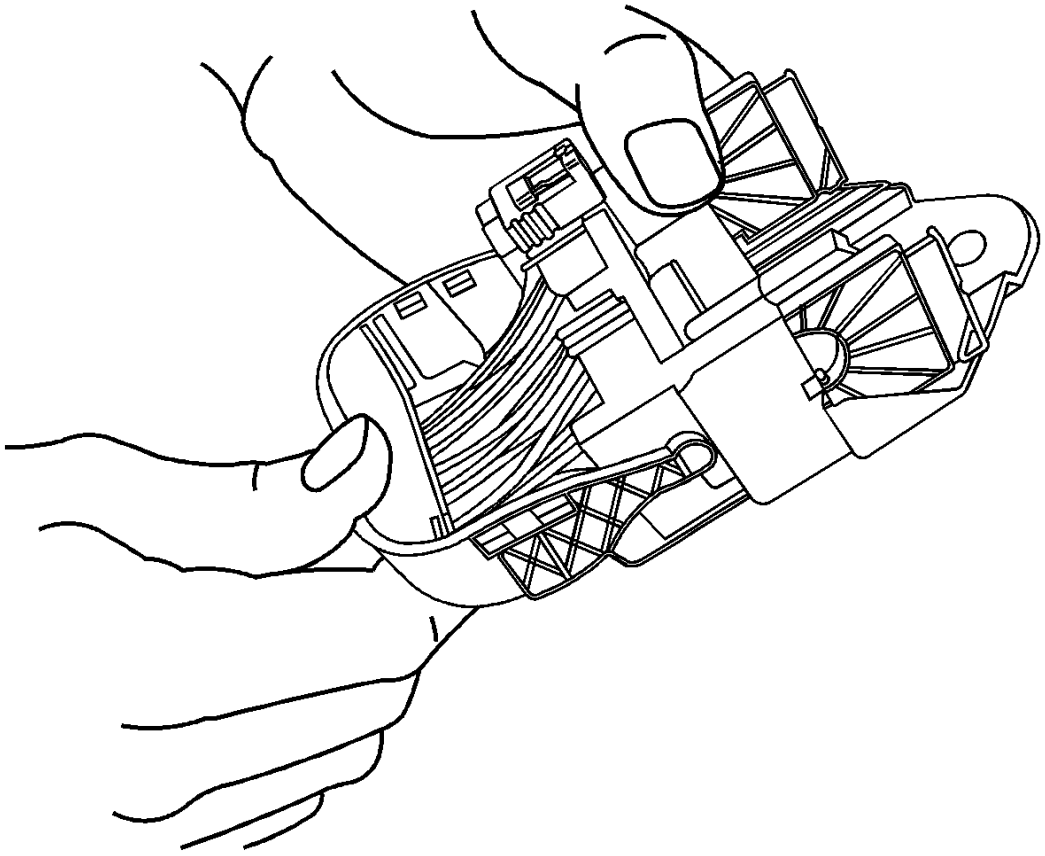

Fig. 185: Moving Locking Lever
Courtesy of GENERAL MOTORS COMPANY

9. Move the locking lever 180 degrees from the connected position.

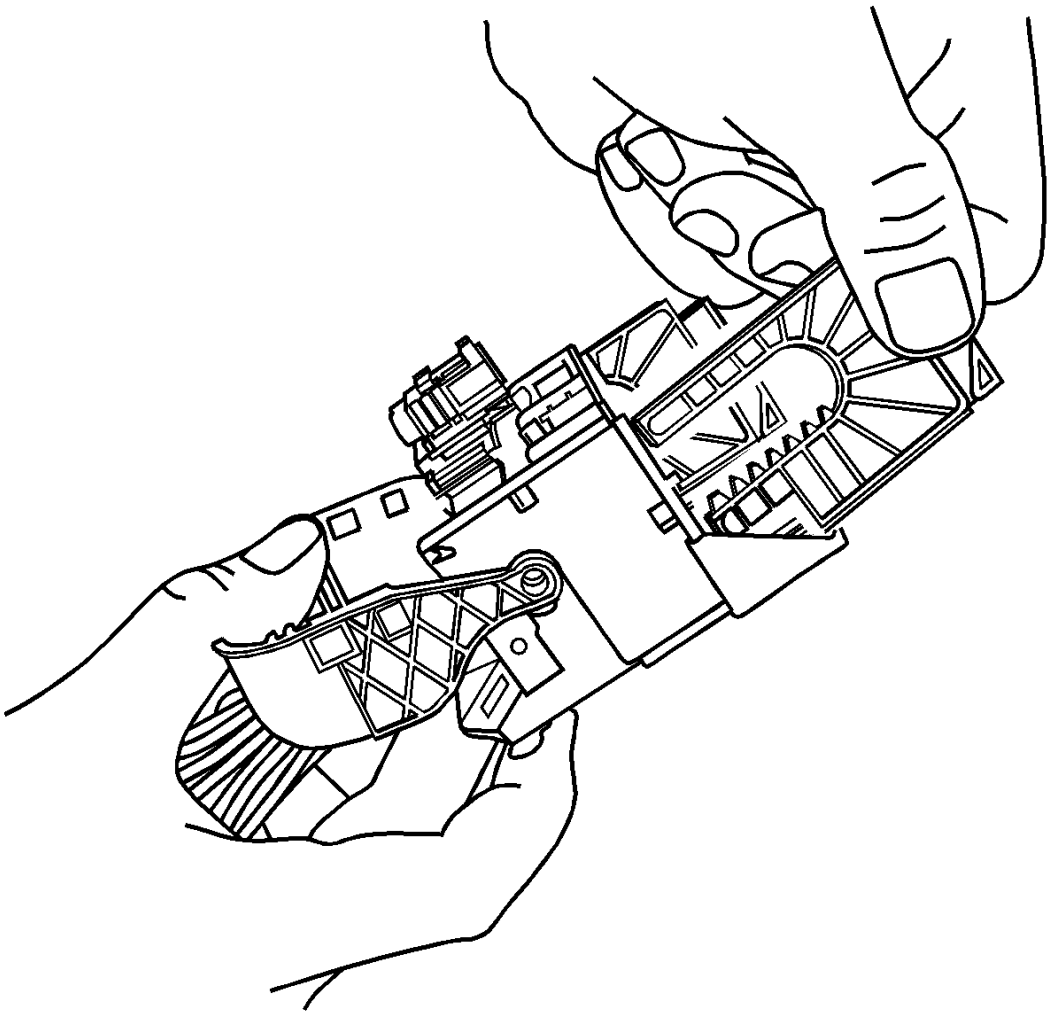

Fig. 186: Removing Guide Plates From Connector Body
Courtesy of GENERAL MOTORS COMPANY

10. With the locking lever in the 180 degree position the guide plates can be removed from the connector body.

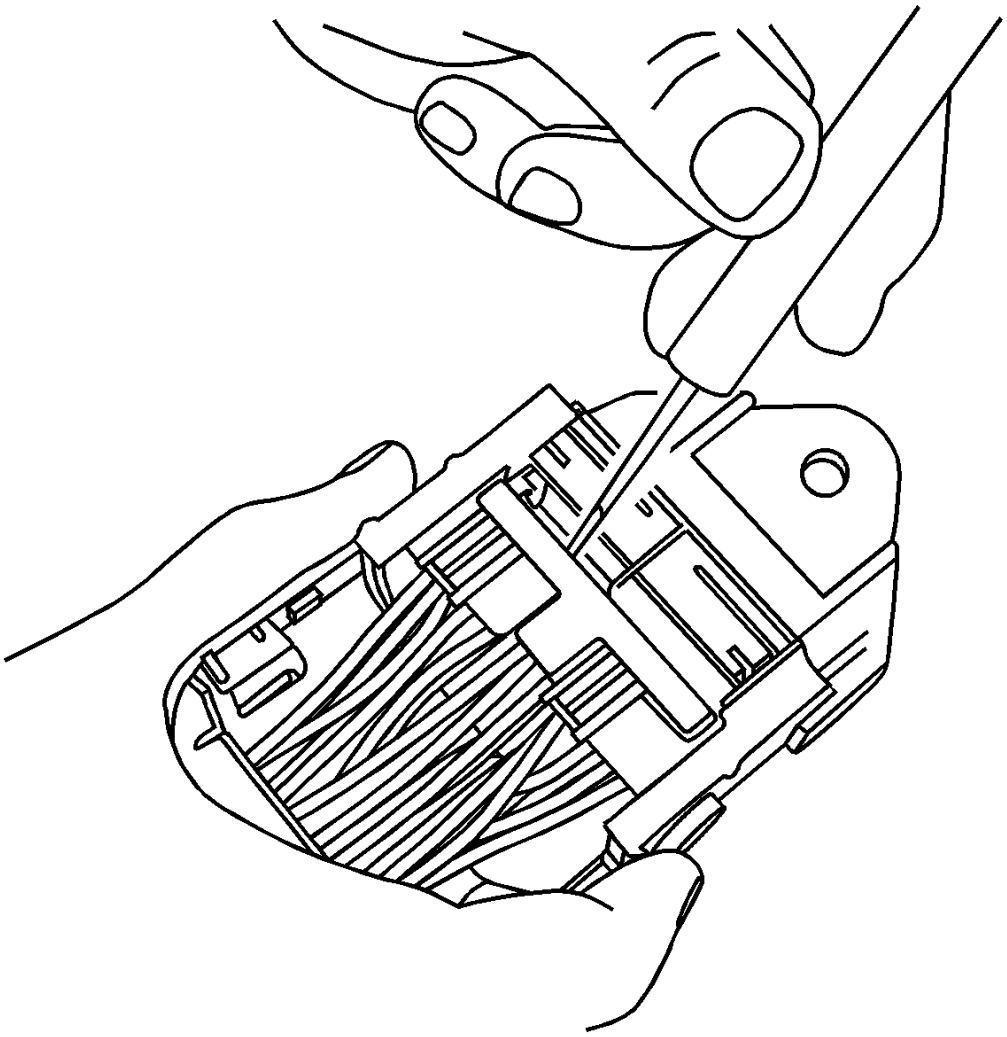

Fig. 187: Removing TPA
Courtesy of GENERAL MOTORS COMPANY

NOTE: **During assembly the TPA will not fully seat if any terminal is not fully seated.**

11. Using terminal release tool J-38125-11A or equivalent, remove the TPA from the connector body.

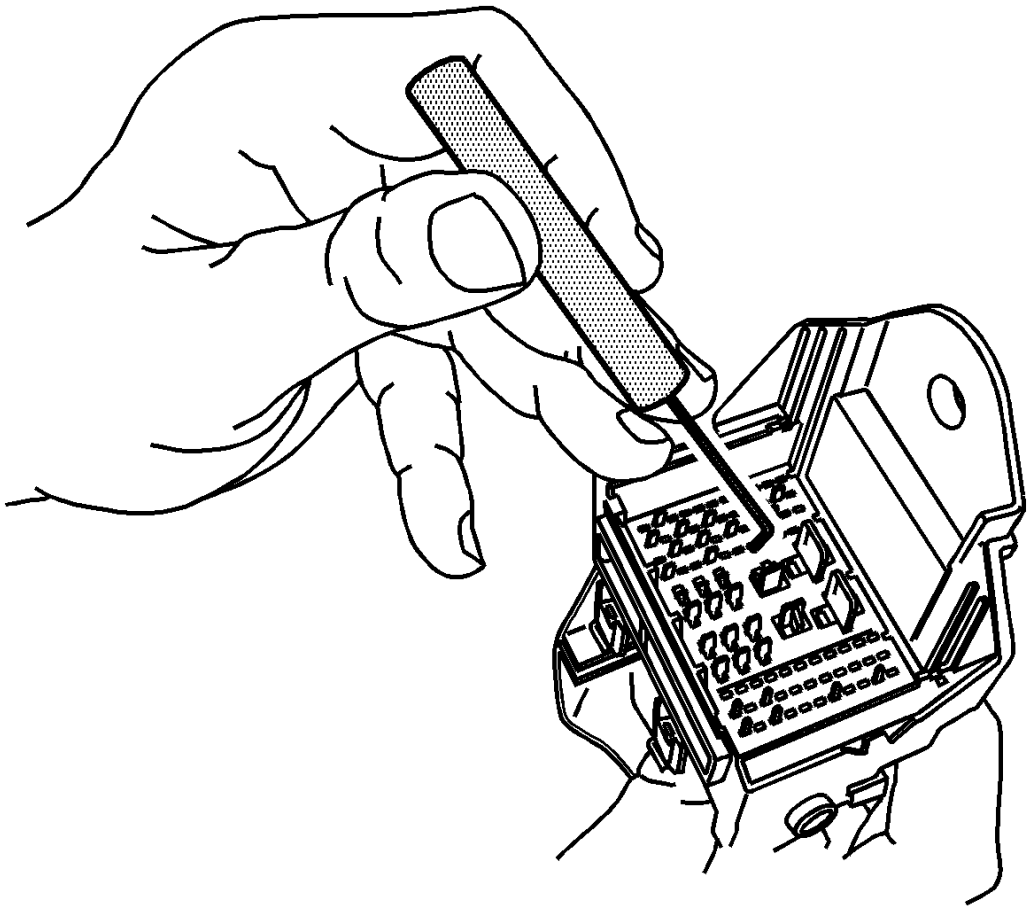

Fig. 188: Lifting Terminal Plate Past The Terminals
Courtesy of GENERAL MOTORS COMPANY

12. Using terminal release tool J-38125-216, lift the terminal plate past the terminals and out of the connector body cavity.

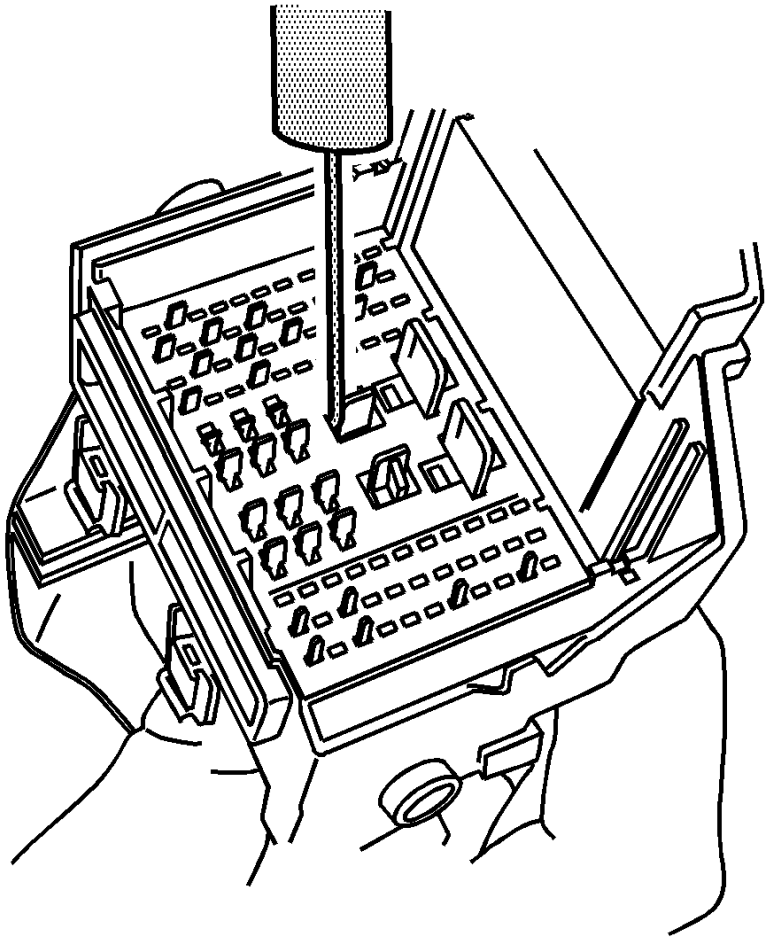

Fig. 189: View Of Terminal Plate
Courtesy of GENERAL MOTORS COMPANY

13. Terminal plate will bind slightly on each corner.

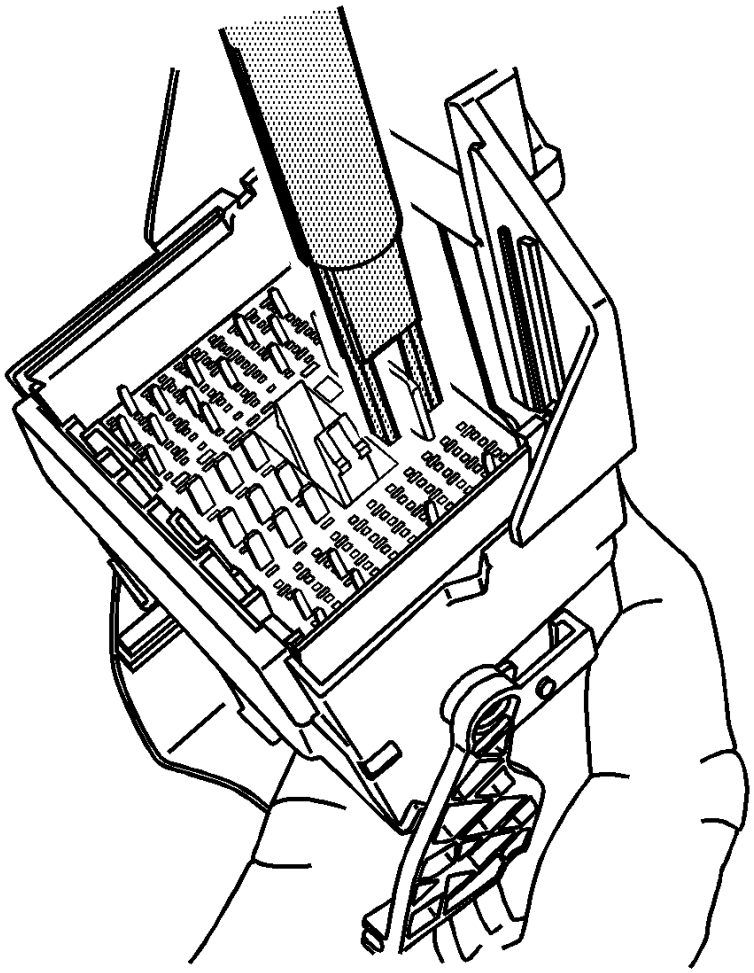

Fig. 190: Releasing Lock Tabs
Courtesy of GENERAL MOTORS COMPANY

14. Using terminal release tool J-38125-221, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

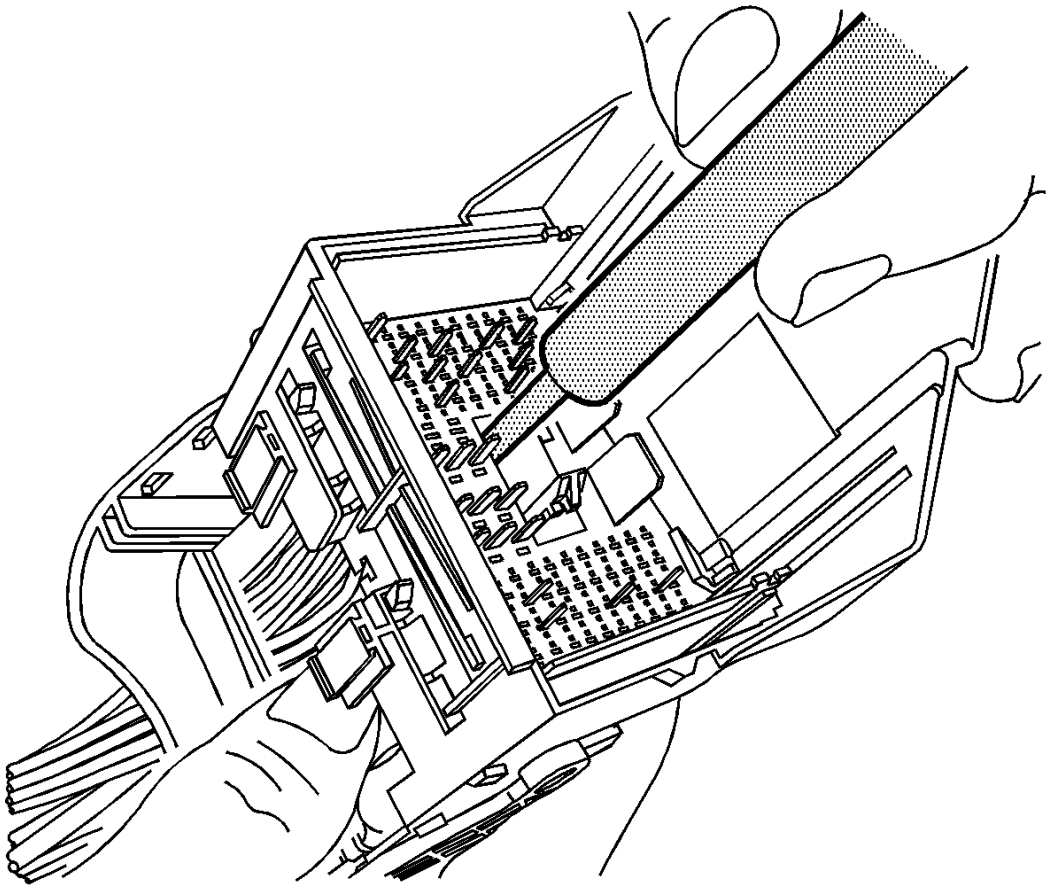

Fig. 191: View of Pressing Prongs On Each Side Of Terminal
Courtesy of GENERAL MOTORS COMPANY

15. Using terminal release tool J-38125-212, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

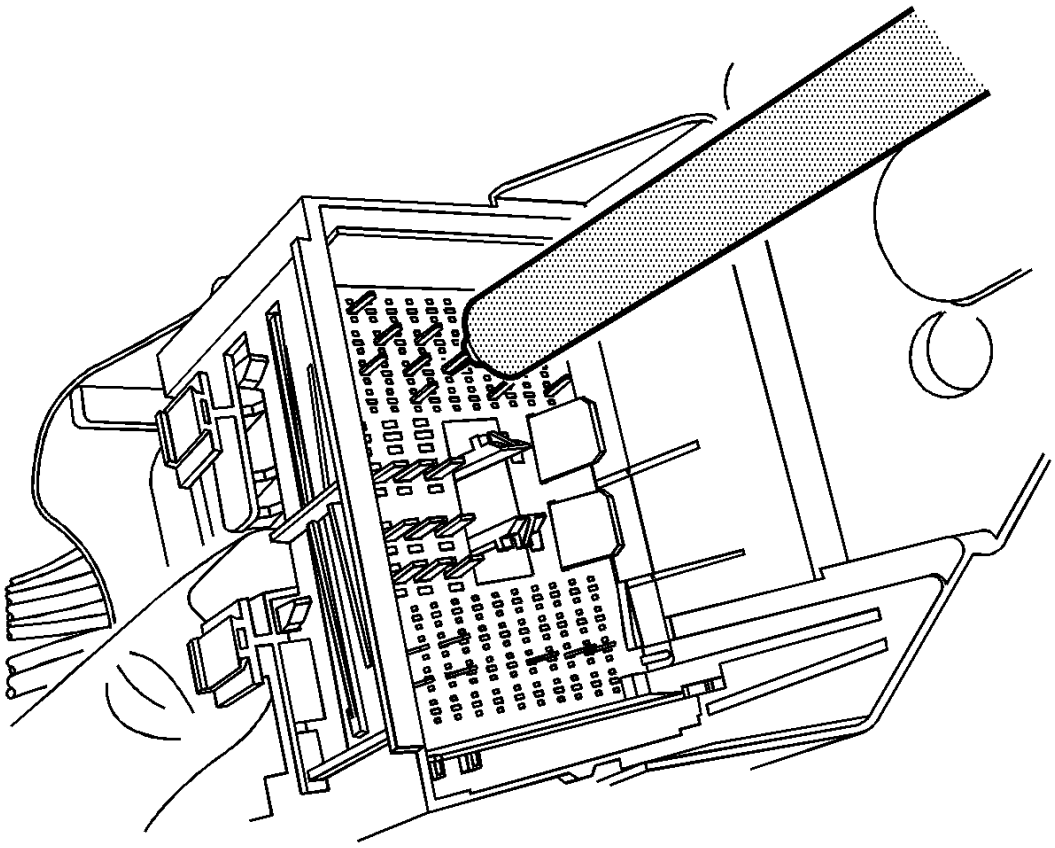

Fig. 192: Pressing Prongs On Each Side Of Terminal - Tyco/AMP (102-Way Inline)
Courtesy of GENERAL MOTORS COMPANY

16. Using terminal release tool J-38125-560, press the prongs into the holes on each side of the terminal to be removed to release the lock tabs and pull the terminal out of the connector body.

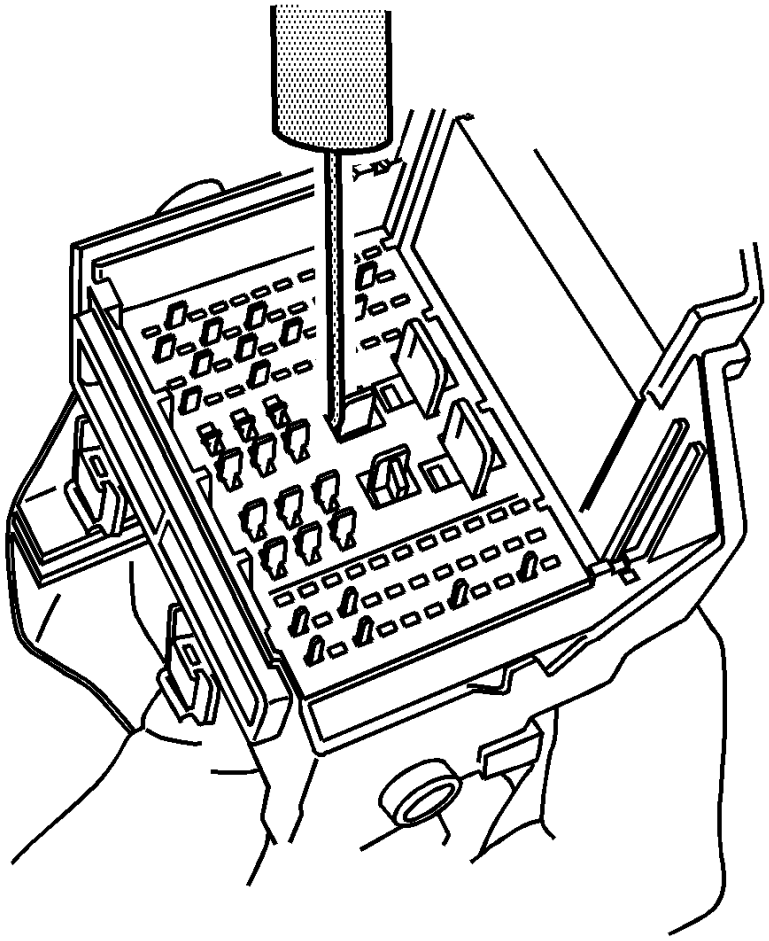

Fig. 193: View Of Terminal Plate
Courtesy of GENERAL MOTORS COMPANY

17. Press the terminal plate back into the female connector to the preset position. The plate will bind slightly on each corner.

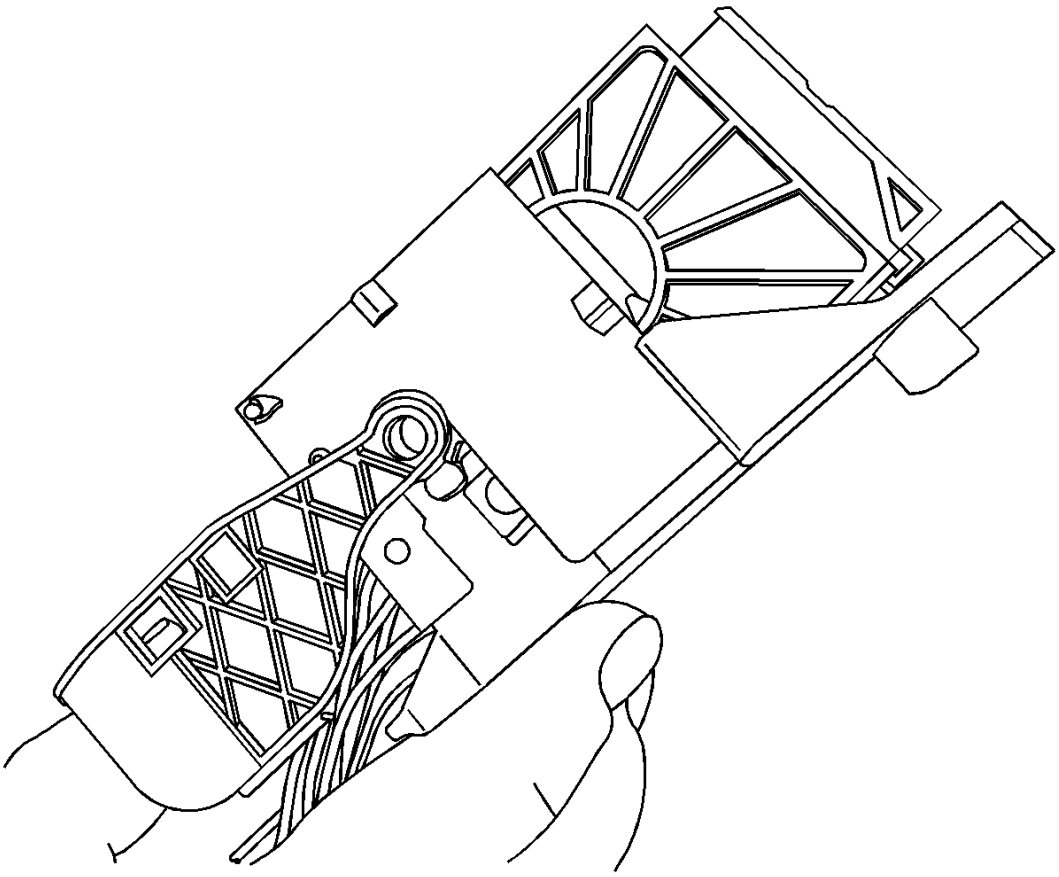

Fig. 194: Aligning Guide Plates To Mesh With Locking Lever Gears
Courtesy of GENERAL MOTORS COMPANY

18. With the locking lever in the 180 degree position, align the guide plates to mesh with the gears on the locking lever.

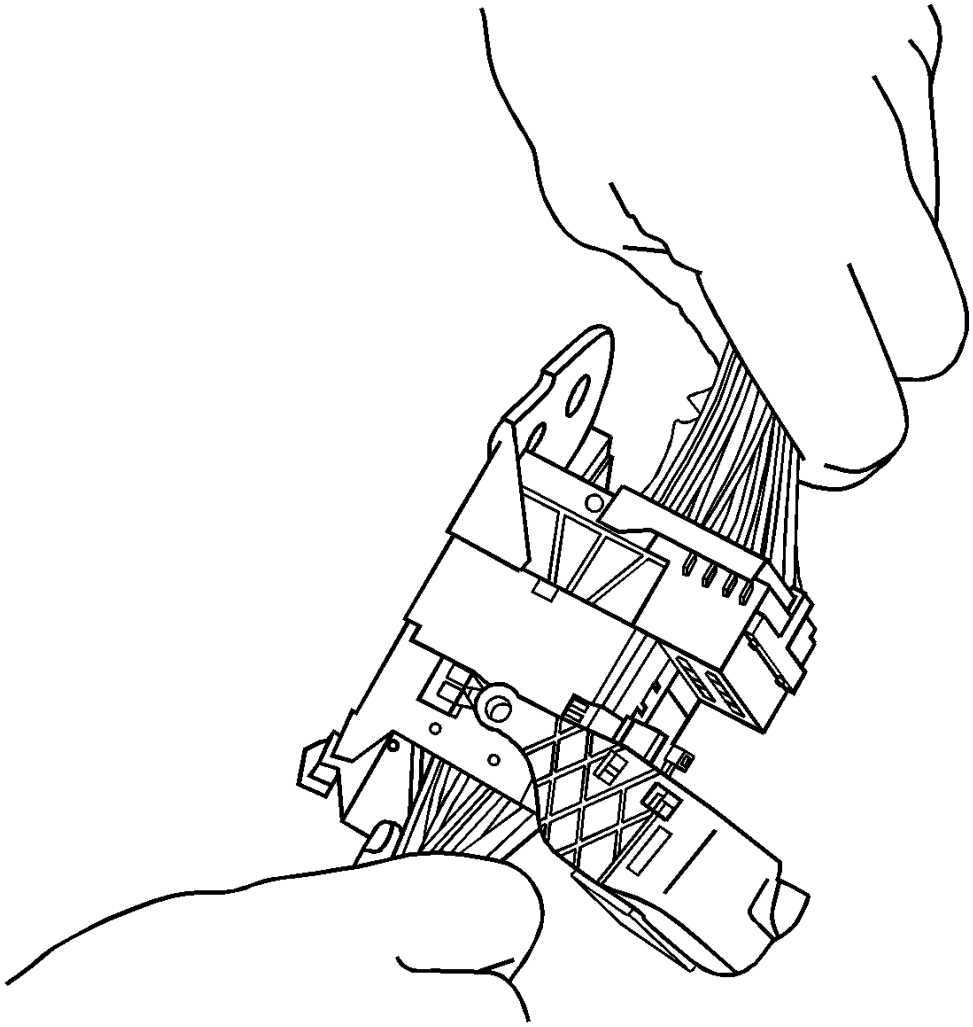

Fig. 195: Sliding Male Connector Body Away From Guide Plates
Courtesy of GENERAL MOTORS COMPANY

19. Slide the male connector body back inward toward the guide plates.

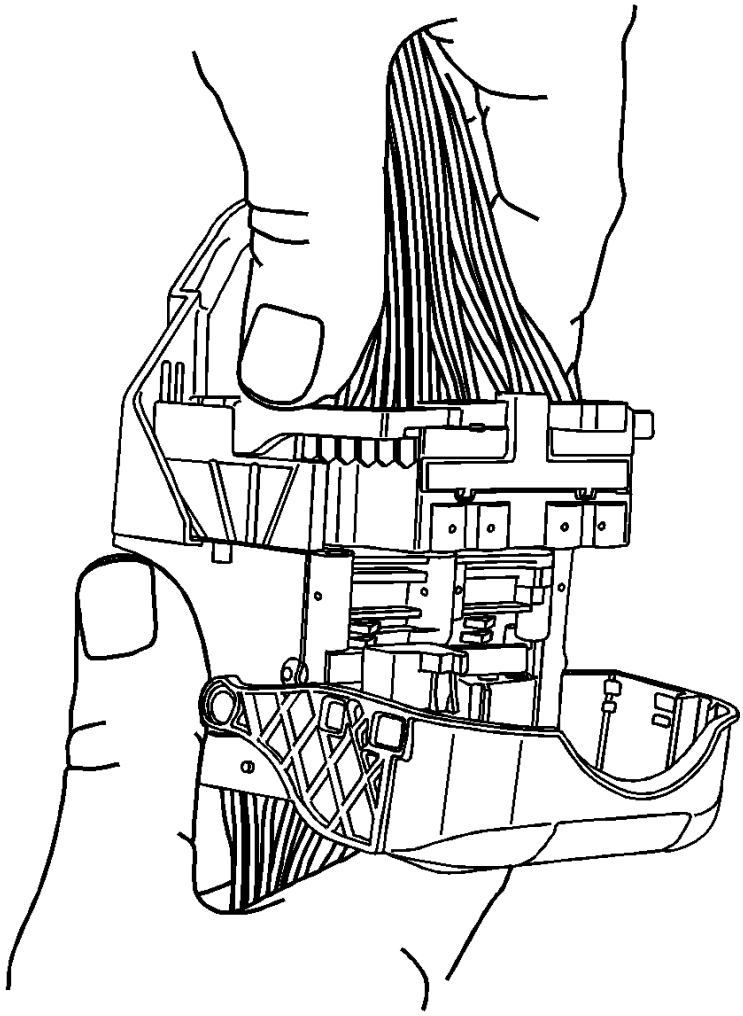

Fig. 196: Assembled View Of Connector - Tyco/AMP (102-Way Inline)
Courtesy of GENERAL MOTORS COMPANY

20. With the locking lever in the 90 degree position and the male connector body connected, it can be slid inward for assembly.

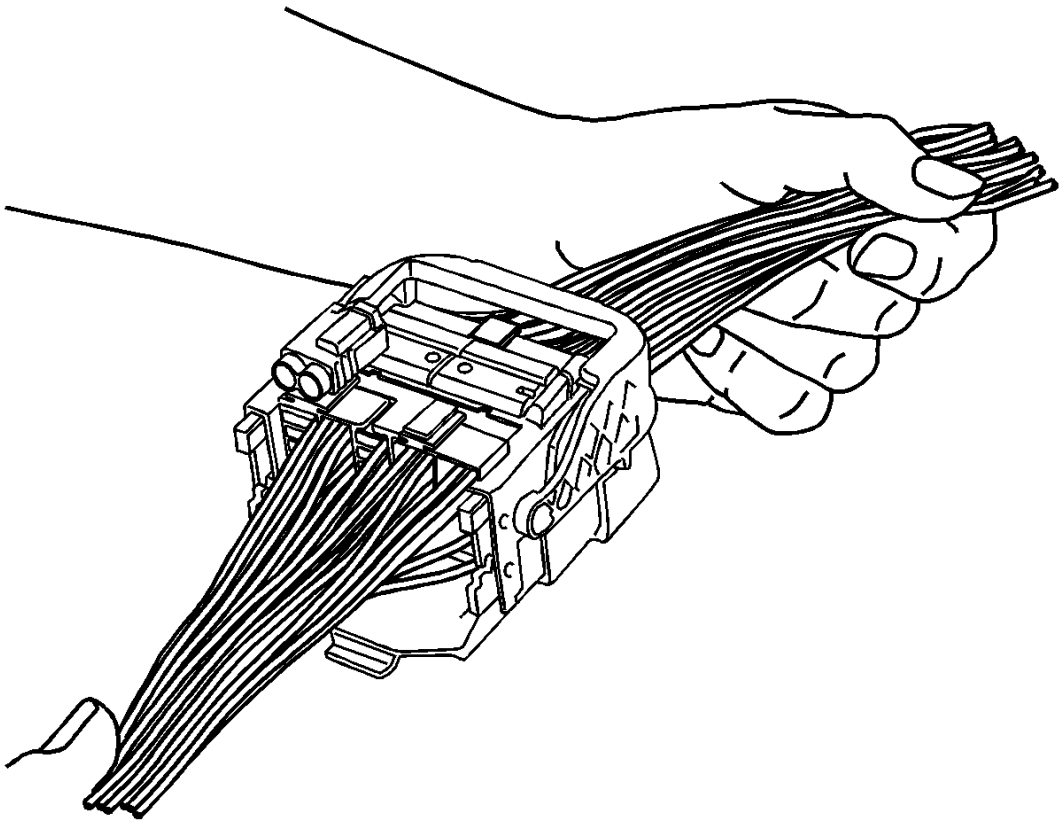

Fig. 197: View Of Typical Connector In Assembled Position
Courtesy of GENERAL MOTORS COMPANY

21. Move the lever into the locked position or in the assembled position. This will pull the male connector down into the female connector.
22. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
23. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

TYCO/AMP CONNECTORS (SIR)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-11A** Terminal Release Tool
- **J-38125-215A** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Removal Procedure

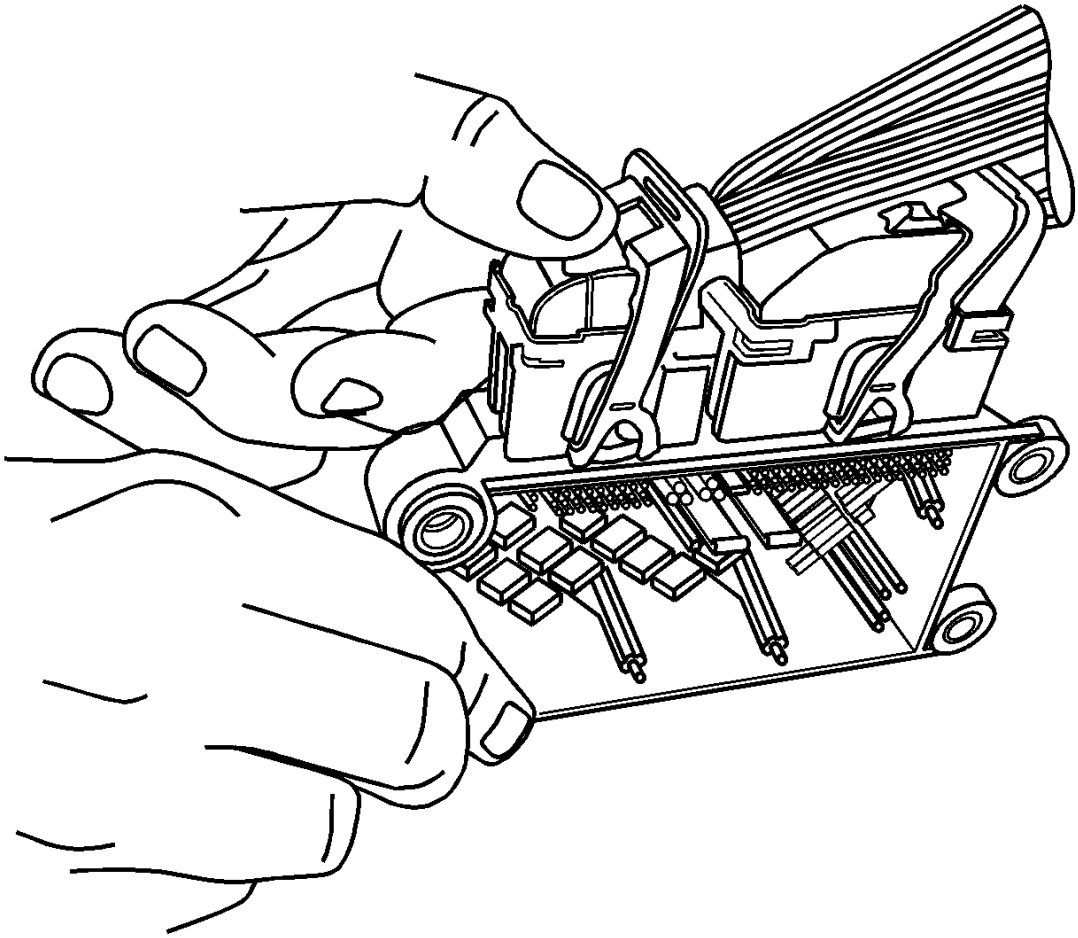

Fig. 198: Sliding Red CPA Away From Connector Lever
Courtesy of GENERAL MOTORS COMPANY

1. Using your thumbs press down and slide the red CPA away from the connector lever.

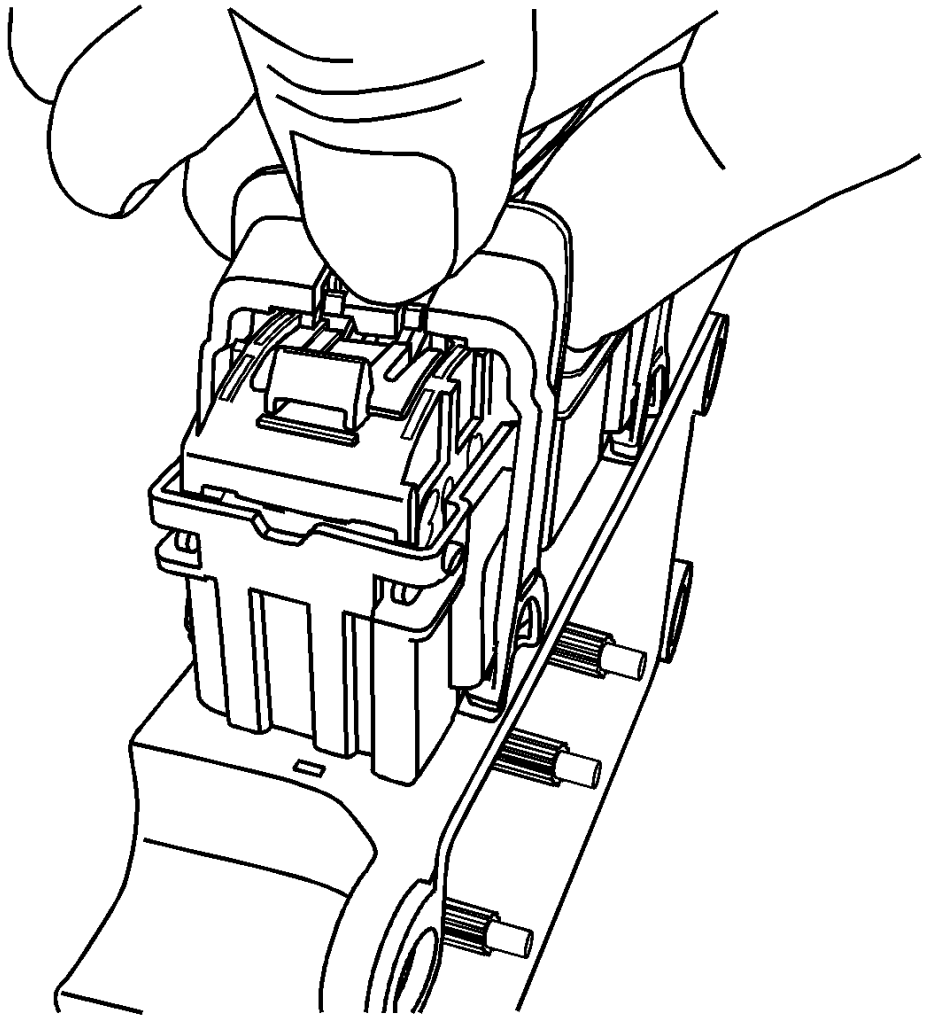

Fig. 199: Pressing Down On Locking Tab - Tyco/AMP Connectors (SIR)
Courtesy of GENERAL MOTORS COMPANY

2. Using your thumb press down on the locking tab and move the lever to the released position.

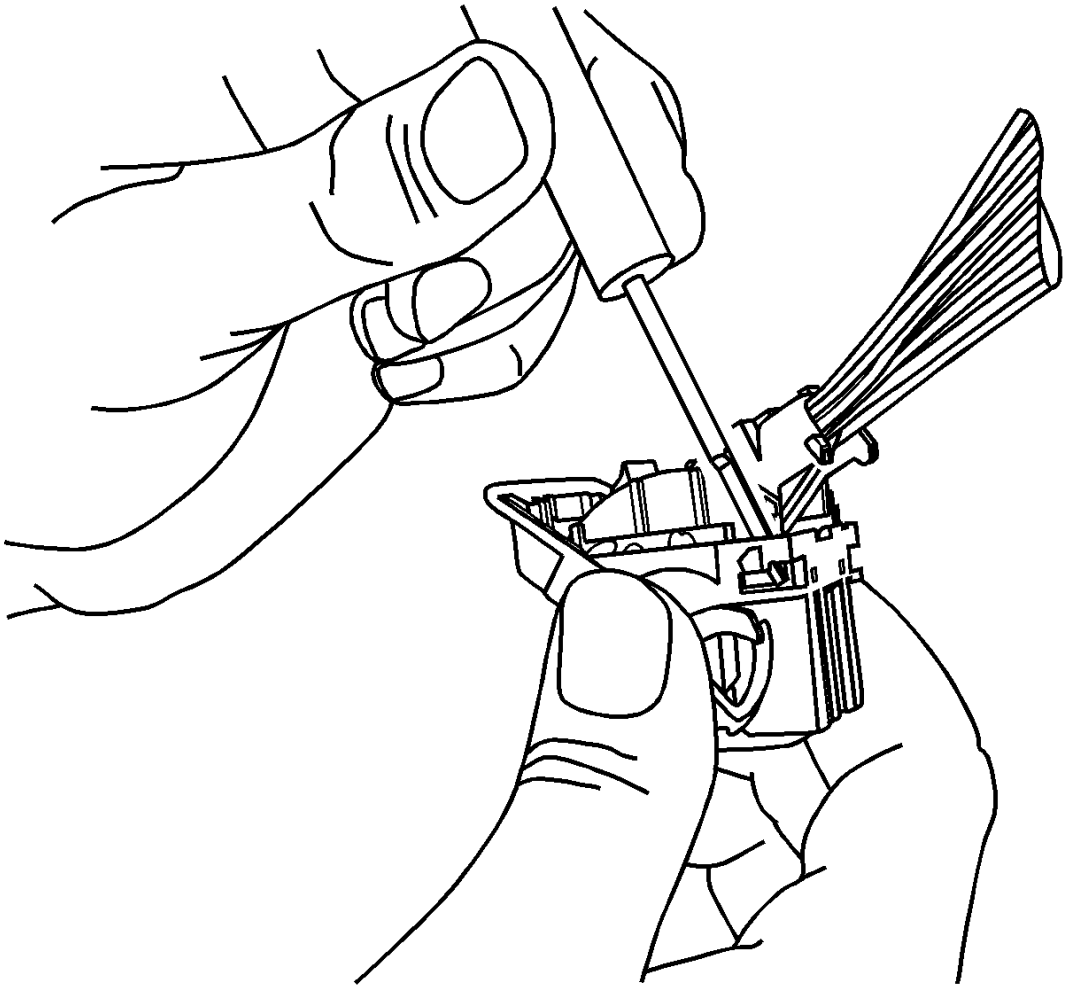

Fig. 200: Releasing Wire Dress Cover Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

3. Using terminal tool J-38125-11A or equivalent, release the wire dress cover locking tabs.

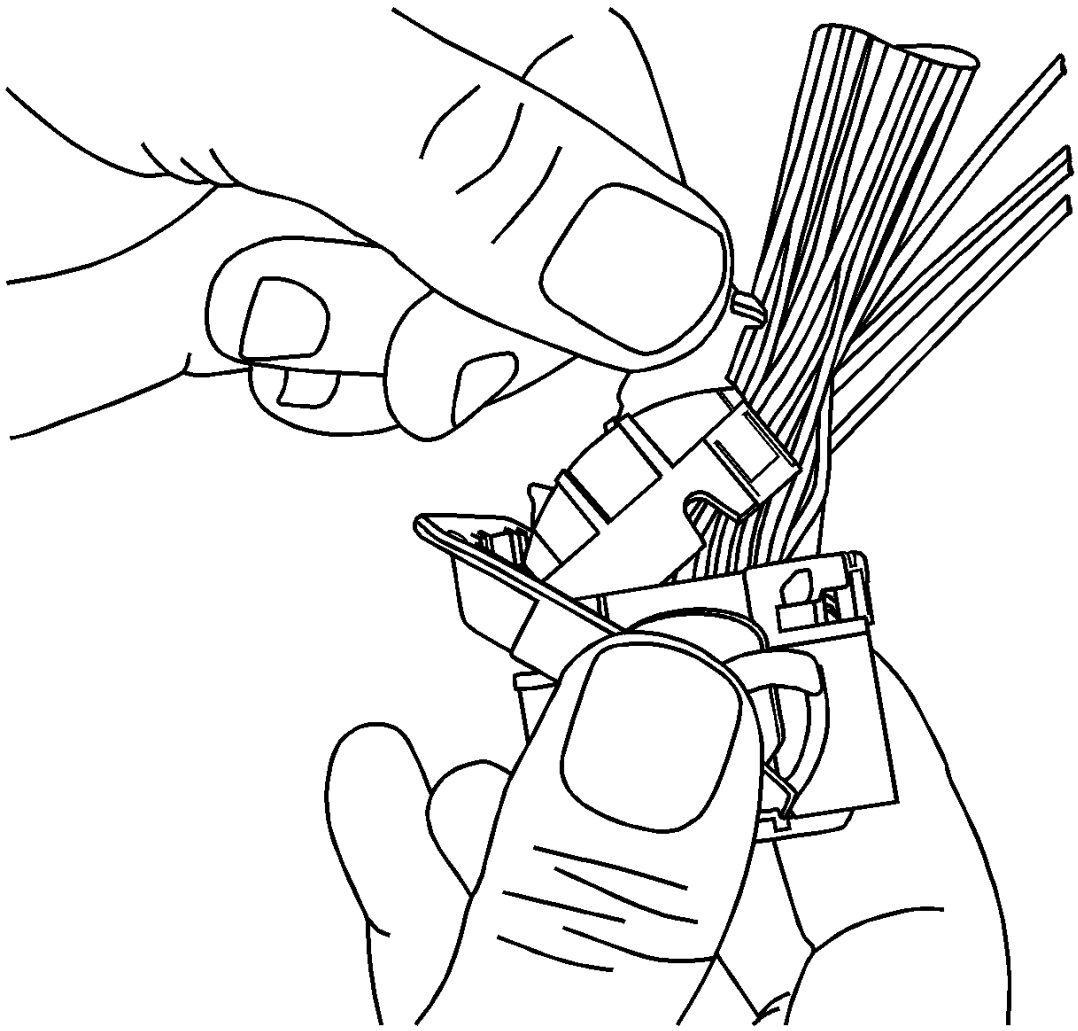

Fig. 201: Pivoting Connector Wire Dress Cover
Courtesy of GENERAL MOTORS COMPANY

4. Pivot connector wire dress cover while removing from the connector body.

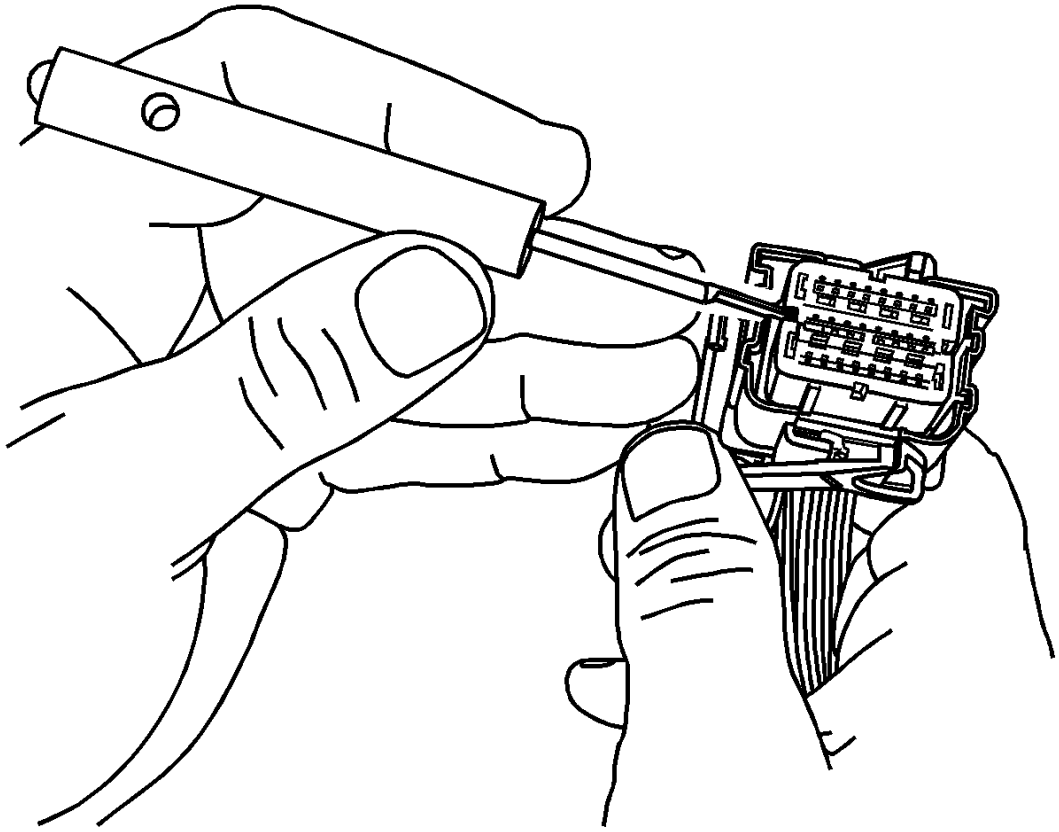

Fig. 202: Removing TPA
Courtesy of GENERAL MOTORS COMPANY

5. Using terminal tool J-38125-11A or equivalent, remove the TPA by lifting straight off the connector body.

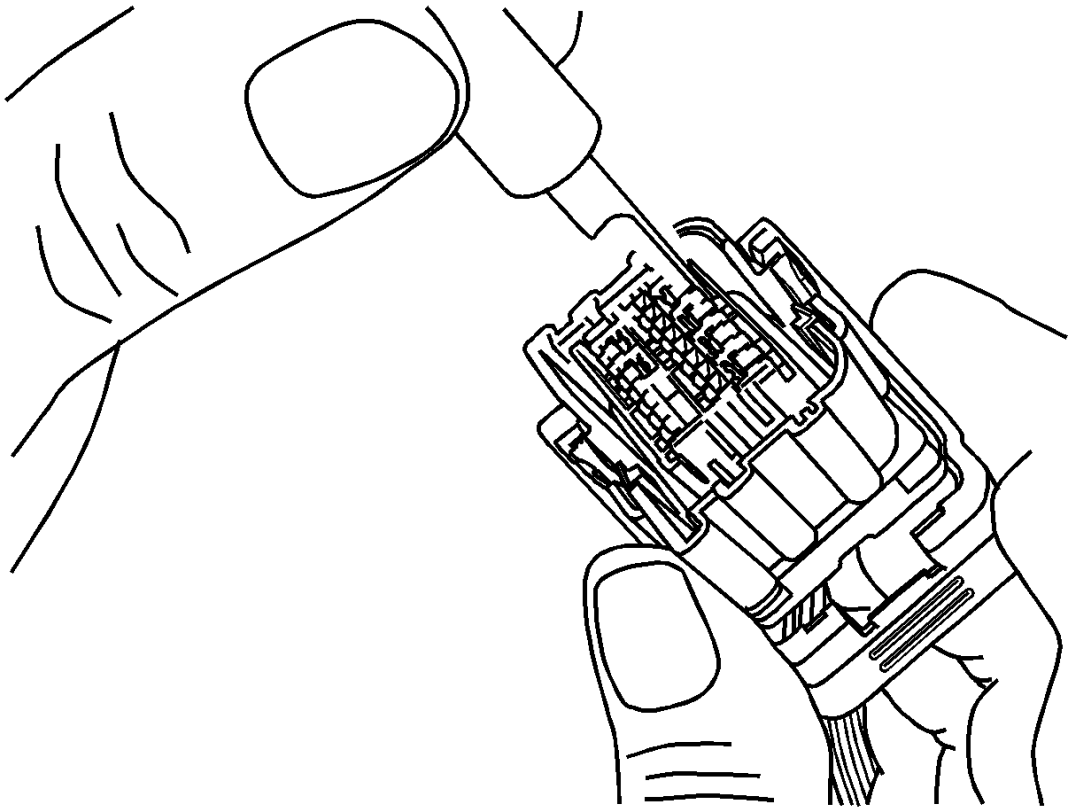

Fig. 203: View of Terminal Release Tool & Rear of Connector Body
Courtesy of GENERAL MOTORS COMPANY

6. Using terminal release tool J-38125-215A, place the tip of the tool on the outside edge next to the terminal and depress the lock tab and remove the rear of the connector body.

Terminal Repair Procedure

Use the appropriate terminal and crimper in order to replace the terminal.

YAZAKI CONNECTORS (2-WAY)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-553** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

Terminal Removal Procedure

1. Disconnect the connector from the component.

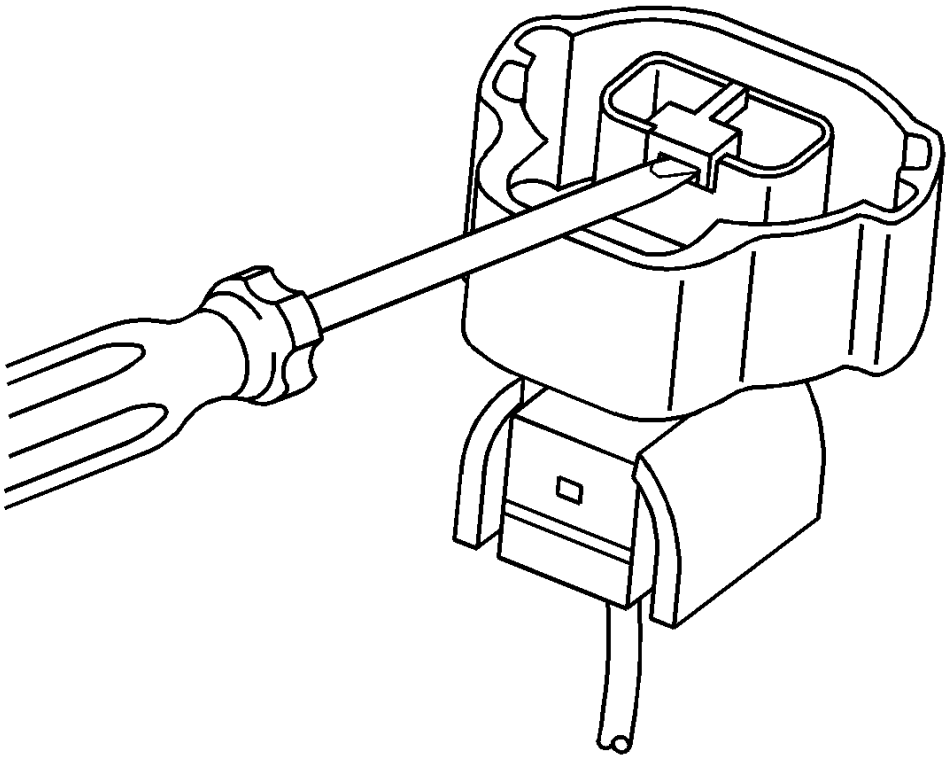

Fig. 204: Identifying Terminal Position Assurance (Yakazi)
Courtesy of GENERAL MOTORS COMPANY

2. Insert a small flat-blade tool in the slot below the front loaded terminal position assurance (TPA) and pry up.
3. Remove the TPA by pulling it out of the connector.
4. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

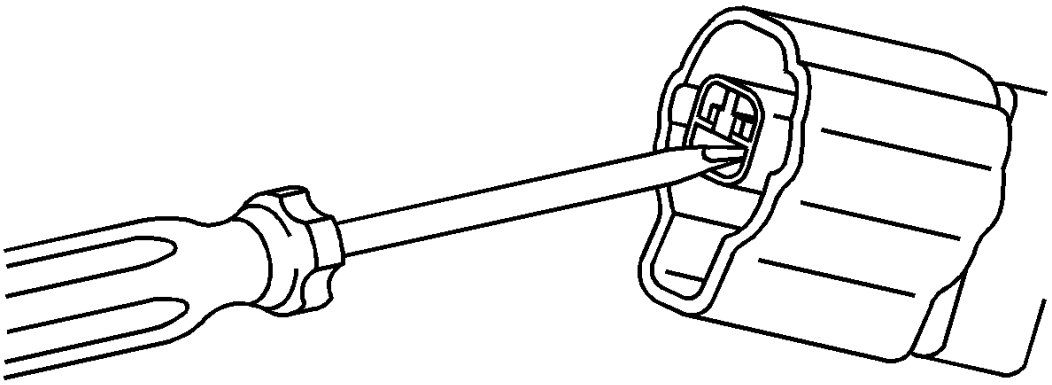

Fig. 205: View Of Inserting Tool Into Terminal Cavity (Yakazi)
Courtesy of GENERAL MOTORS COMPANY

5. Insert the J-38125-553 on a slight upward angle into the cavity below the terminal to be removed. Ensure that the pointed on the end of the tool is facing the bottom of the terminal and it stays in contact with the terminal until it stops on the plastic terminal retainer.

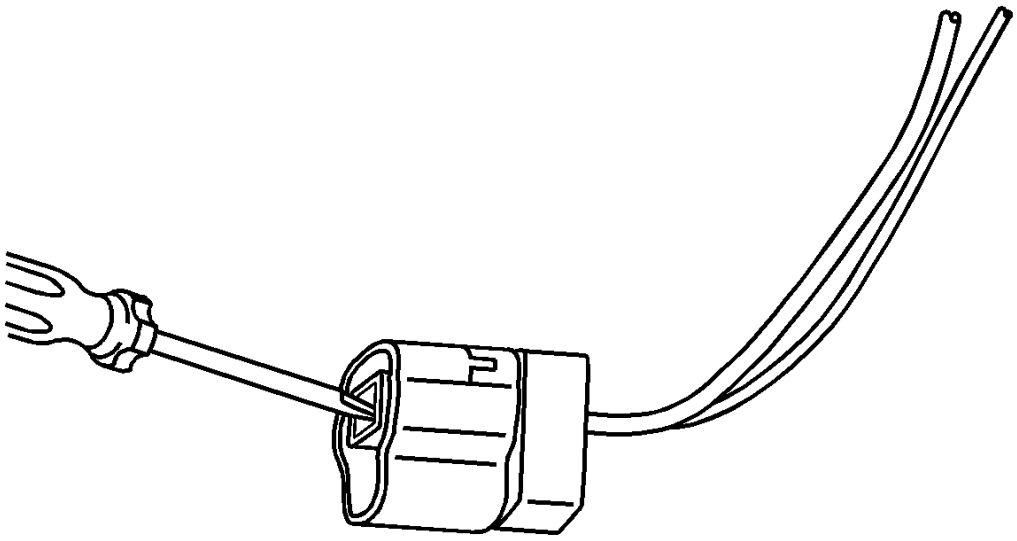

Fig. 206: View Of Pulling Terminal Out Of Connector (Yakazi)
Courtesy of GENERAL MOTORS COMPANY

6. Gently pry the plastic terminal retainer down and carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
7. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
8. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

YAZAKI CONNECTORS (16-WAY)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-215** Terminal Release Tool

For equivalent regional tools, refer to Special Tools .

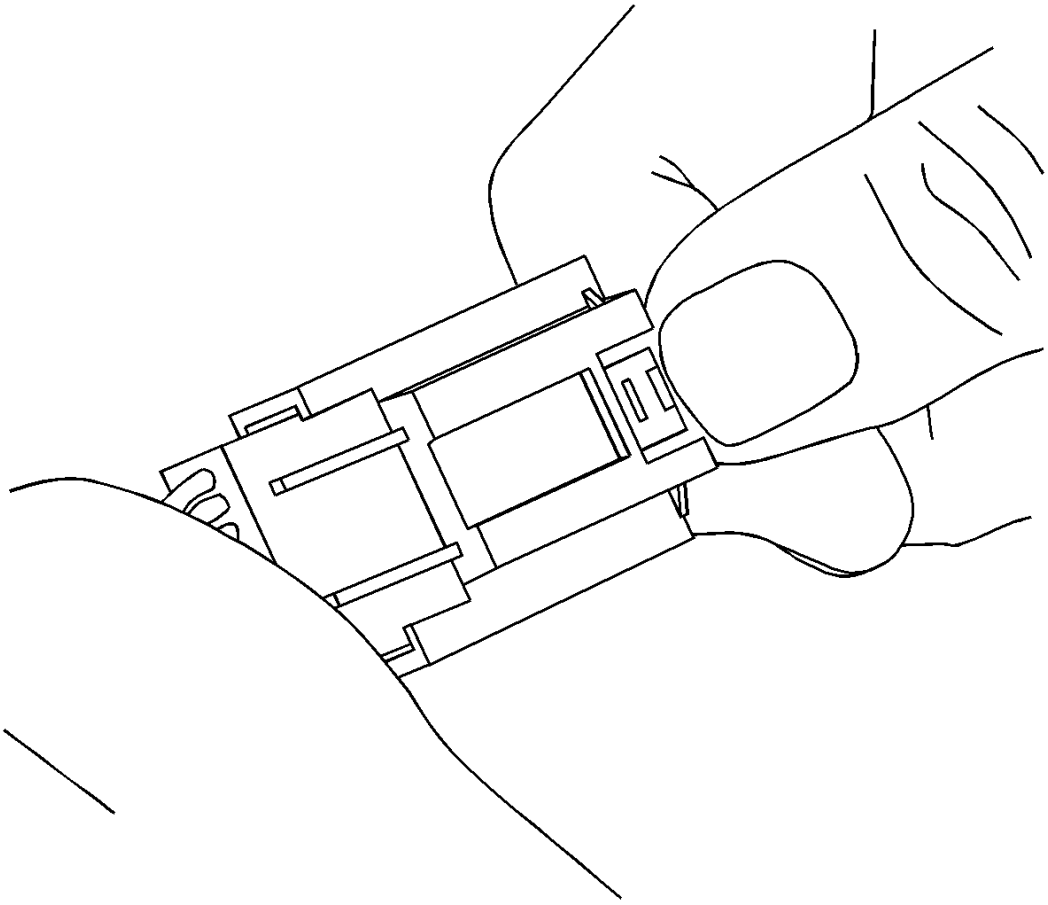

Fig. 207: Pulling Two Connector Halves Apart
Courtesy of GENERAL MOTORS COMPANY

1. While depressing the lock, pull the two connector halves apart.

NOTE: **The terminal position assurance (TPA) is fragile and may break if not done carefully.**

2. Use a small flat-blade tool to very carefully push the TPA towards the face of the connector on both sides of the connector.

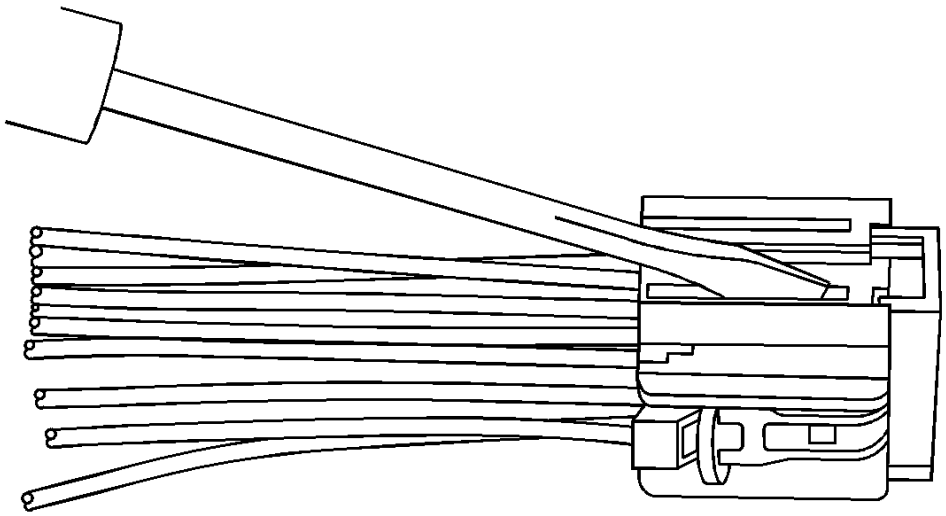

Fig. 208: View Of Male Connector Half & Female Terminals
Courtesy of GENERAL MOTORS COMPANY

3. View of the male half of the connector with female terminals.

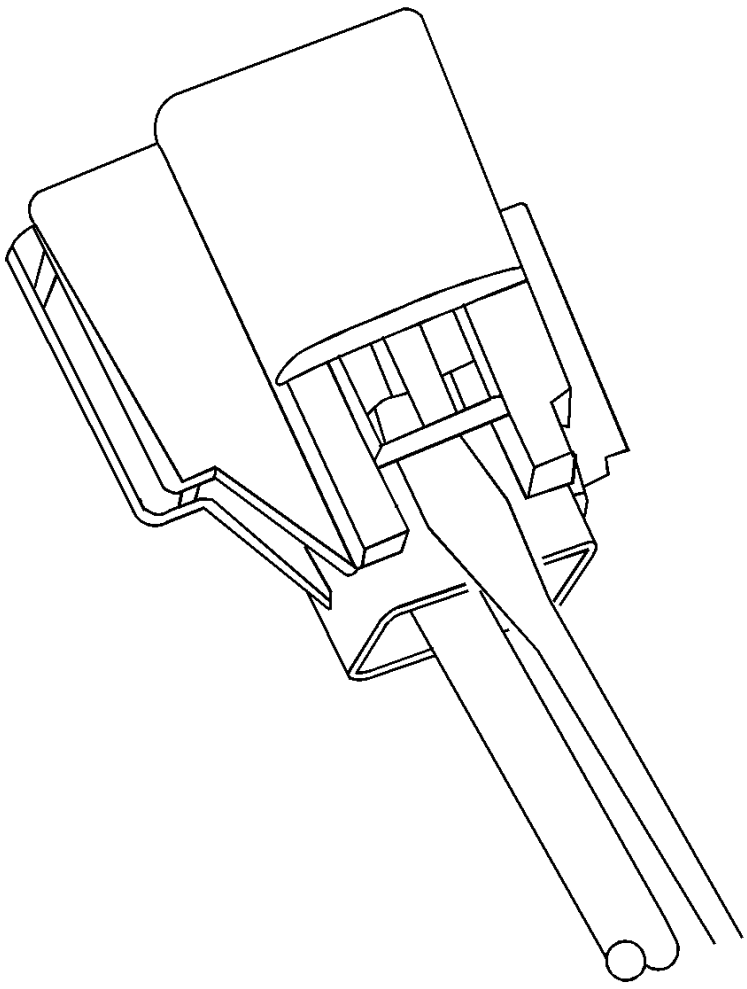

Fig. 209: View Of Female Half Of Connector With Male Terminals
Courtesy of GENERAL MOTORS COMPANY

4. View of the female half of the connector with male terminals.
5. Use the J-38125-215 tool to release the terminals by inserting the tool into the terminal release cavity.

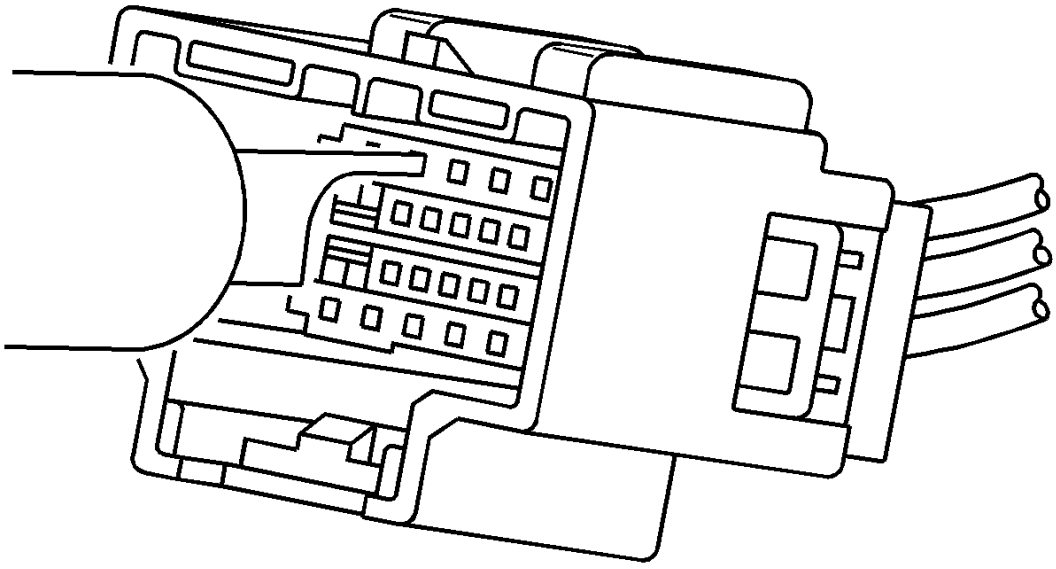

Fig. 210: Using Removal Tool On Female Half Of Connector
Courtesy of GENERAL MOTORS COMPANY

6. View of the female half of the connector with male terminals.

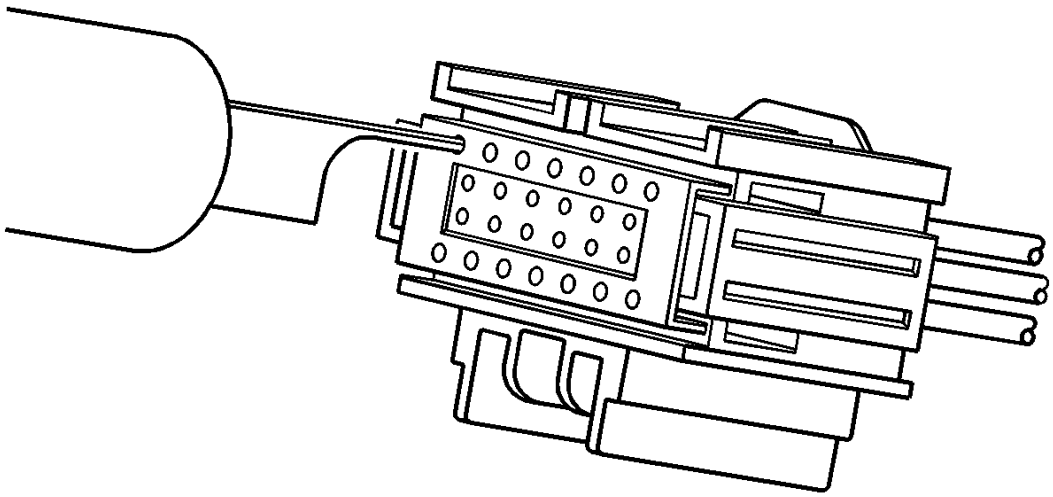

Fig. 211: Using Removal Tool On Male Half Of Connector
Courtesy of GENERAL MOTORS COMPANY

7. View of the male half of the connector with female terminals.
8. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
9. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
10. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

REPAIRING CONNECTOR TERMINALS (TERMINATED LEAD REPAIR)

Special Tools

EL-38125-10 Splice Sleeve Crimp Tool

For equivalent regional tools, refer to Special Tools .

NOTE: **All repairs near the engine manifold, turbo engine and all exhaust pipes should**

follow the High Temperature Wiring Repairs procedures.

For high temperature wiring repairs, refer to **High Temperature Wiring Repairs**.

Terminated leads are terminals that are crimped onto wires. The terminated lead can be used throughout the vehicle since it is designed for temperatures up to 150Â°C. The length of the wire is 450 mm.

1. Use the connector end view to identify the correct terminated lead.
2. The terminated lead package should include a DuraSeal splice sleeve. If not, use the chart to in Splicing Copper Wire Using Splice Sleeves to identify the correct DuraSeal splice sleeve, refer to **Splicing Copper Wire Using Splice Sleeves**.

REPAIRING CONNECTOR TERMINALS (TERMINAL REPAIR)

Special Tools

- **J-38125-580** Terminal Repair Kit
- **J-38125-6** Crimp Tool
- **J-38125-7** Crimp Tool
- **J-38125-8** Crimp Tool
- **J-38125-64** Crimp Tool
- **J-38125-101** Crimp Tool
- **J-38125-641** Crimp Tool
- **J-38125-642** Crimp Tool
- **J-38125-643** Crimp Tool

For equivalent regional tools, refer to Special Tools .

Use the following repair procedures to repair each type of terminal:

- For push to seat terminals, refer to **Delphi Connectors (Weather Pack)Delphi Connectors (Push To Seat)Delphi Connectors (Pull To Seat)Delphi Connectors (Micro-Pack 100W)Delphi Connectors (Micro .64)Delphi Connectors (12-Way)Delphi Connectors (Steering Gear)**.
- For pull to seat terminals, refer to **Delphi Connectors (Weather Pack)Delphi Connectors (Push To Seat)Delphi Connectors (Pull To Seat)Delphi Connectors (Micro-Pack 100W)Delphi Connectors (Micro .64)Delphi Connectors (12-Way)Delphi Connectors (Steering Gear)**.

NOTE: **The first step for all terminal repairs is to find the connector end view in SI.**

Cable Seal Terminals

1. Cut off the terminal between the core and the insulation crimp to minimize any wire loss.
2. Remove the old seal.
3. Apply the correct cable seal, per the wire gauge size, from the kit. Slide the seal back along the wire to enable removal of the insulation.
4. To minimize wire loss, remove only the insulation required.

5. Using the connector end view, determine the correct crimp tool and crimp jaw.
6. Align the seal with the end of the cable insulation.
7. Position the stripped wire and seal in the terminal.
8. Hand Crimp the core wings first.
9. Hand Crimp the insulation wings around the seal and the cable.

Unsealed Terminals

1. Cut off the terminal between the core and the insulation crimp to minimize any wire loss.
2. To minimize wire loss, remove only the insulation required.
3. Position the stripped wire in the terminal.
4. Hand Crimp the core wings first.
5. Hand Crimp the insulation wings around the cable.

Micro-Pack 100W Size Terminal

The Micro-Pack 100W connectors have small terminals that are difficult to handle and hold when crimping. In order to aid the technician when crimping these terminals, a new crimping tool was developed. The J 38125-101 (W jaw) crimping tool was developed to crimp Micro-Pack 100W terminals. The J 38125-101 (W jaw) crimping tool has a terminal holding block that will hold the terminal in place while the terminal is being crimped. After the terminal is removed from the connector perform the following procedure in order to repair Micro-Pack 100 terminals.

1. Cut the wire as close to the terminal as possible.

NOTE: **After cutting the damaged terminal from the wire, determine if the remaining wire is long enough to reach the connector without putting a strain on the wire. If the wire is not long enough, splice a small length of the same gauge wire to the existing wire, then crimp the new terminal on the added wire.**

2. Strip 5 mm (3/16 in) of insulation from the wire.

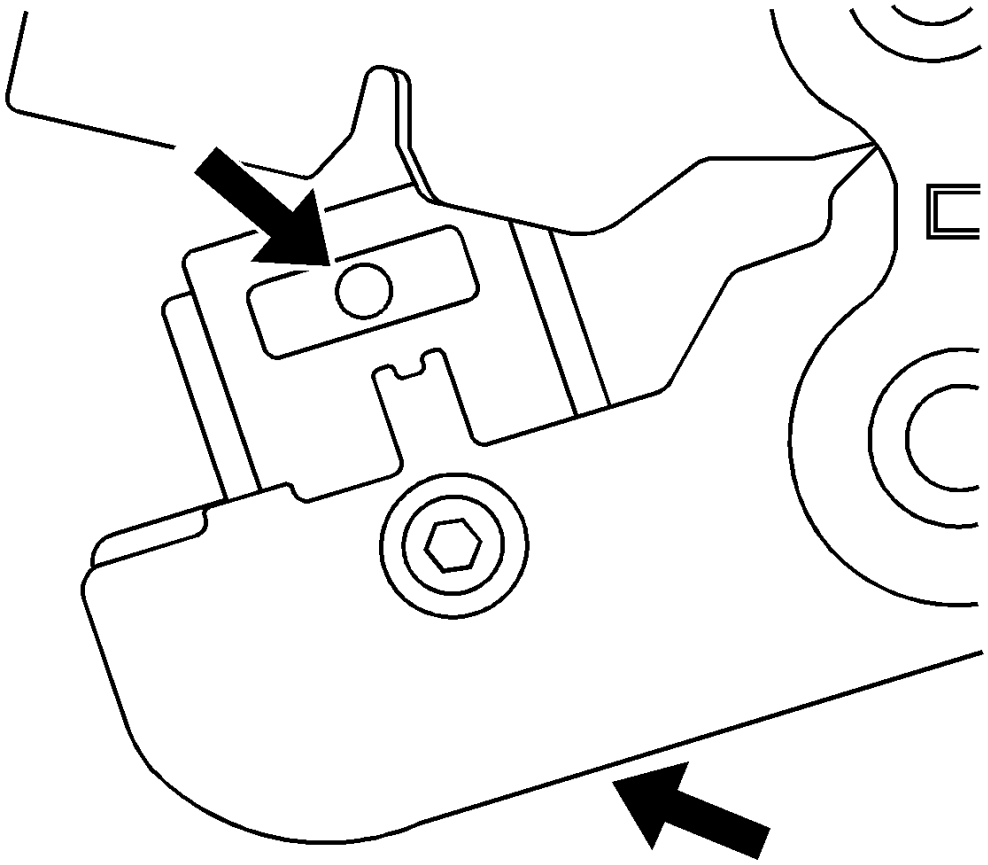

Fig. 212: Identifying Crimping Tool Spring Loaded Locator
Courtesy of GENERAL MOTORS COMPANY

3. Depress the spring loaded locator of the J 38125-101 (W jaw) crimping tool until the terminal holder is completely visible.

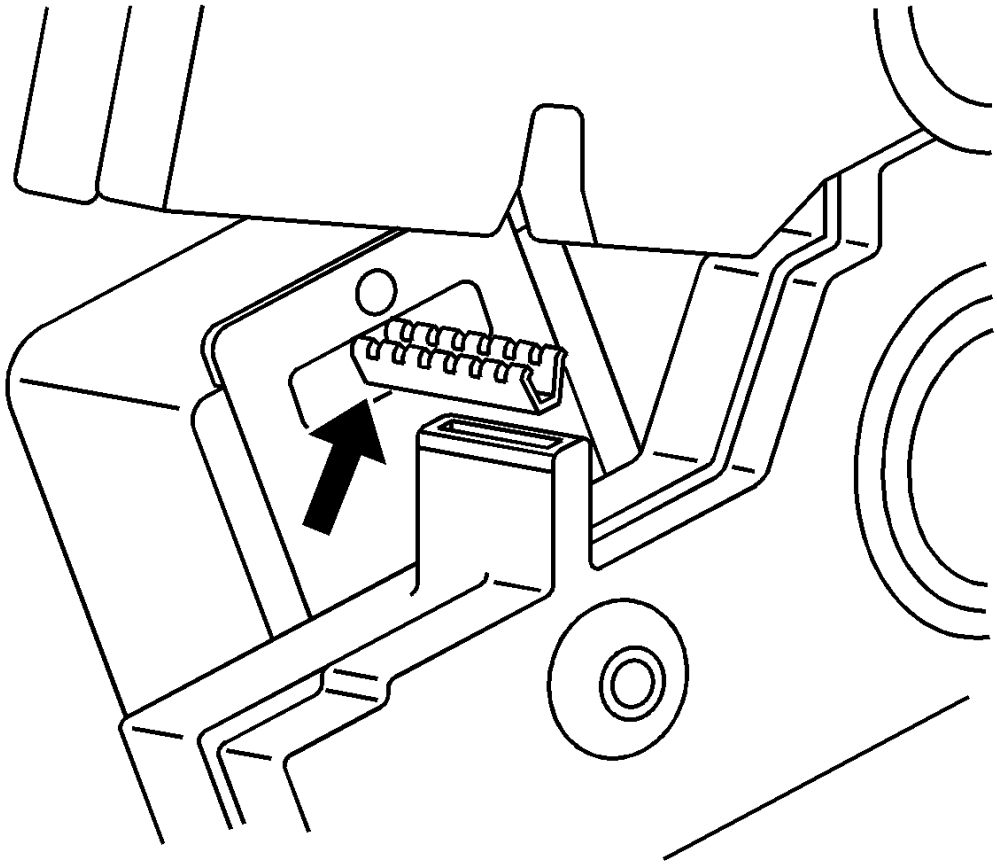

Fig. 213: Locating Terminal In Crimping Tool
Courtesy of GENERAL MOTORS COMPANY

4. Insert the terminal into the crimp tool until the core wings are flush with the anvil on the crimp tool. Be sure that the wings are pointed toward the crimp tool former and release the spring locator. The locator will hold the terminal in place. Inspect the alignment of the terminal wings with the crimp tool former. If the terminal wings are wider than the crimp tool former, remove the terminal and bend the terminal wings in slightly.
5. Place stripped wire into terminal.
6. Crimp the new terminal to the wire. If a jam occurs, press the emergency release to open applicator.

Micro 0.64 Size Terminal

The Micro 64 connectors have small terminals that are difficult to handle and hold when crimping. In order to aid the technician when crimping these terminals, a new crimping tool was developed. The J 38125-64 (M jaw) was developed to crimp Micro 64 terminals. The J-38125-64 crimping tool has a terminal holding block that will hold the terminal in place while the terminal is being crimped. The J-38125-64 crimping tool is also designed to crimp both the wire and the insulation at the same time.

After the terminal is removed from the connector perform the following procedure in order to repair Micro 64

terminals.

NOTE: **After cutting the damaged terminal from the wire, determine if the remaining wire is long enough to reach the connector without putting a strain on the wire. If the wire is not long enough, splice a small length of the same gauge wire to the existing wire, then crimp the new terminal on the added wire.**

1. Cut the wire as close to the damaged terminal as possible.
2. Strip 5 mm (3/16 in) of insulation from the wire.

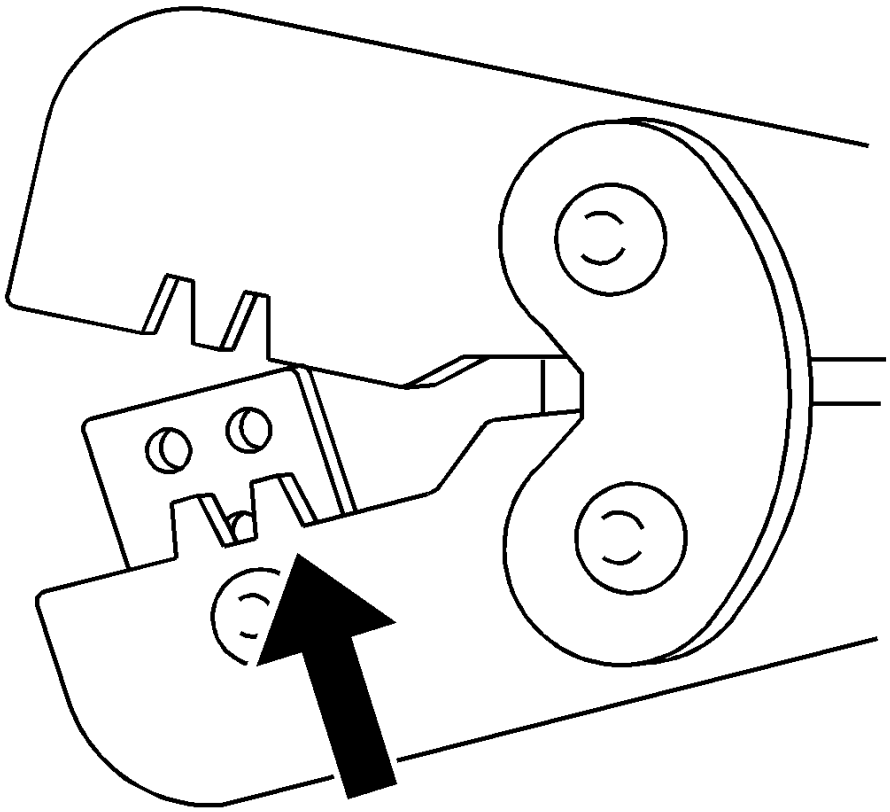

Fig. 214: Identifying Crimping Tool Spring Loaded Locator
Courtesy of GENERAL MOTORS COMPANY

3. Depress the spring loaded locator of the crimping tool until the terminal holder is completely visible.

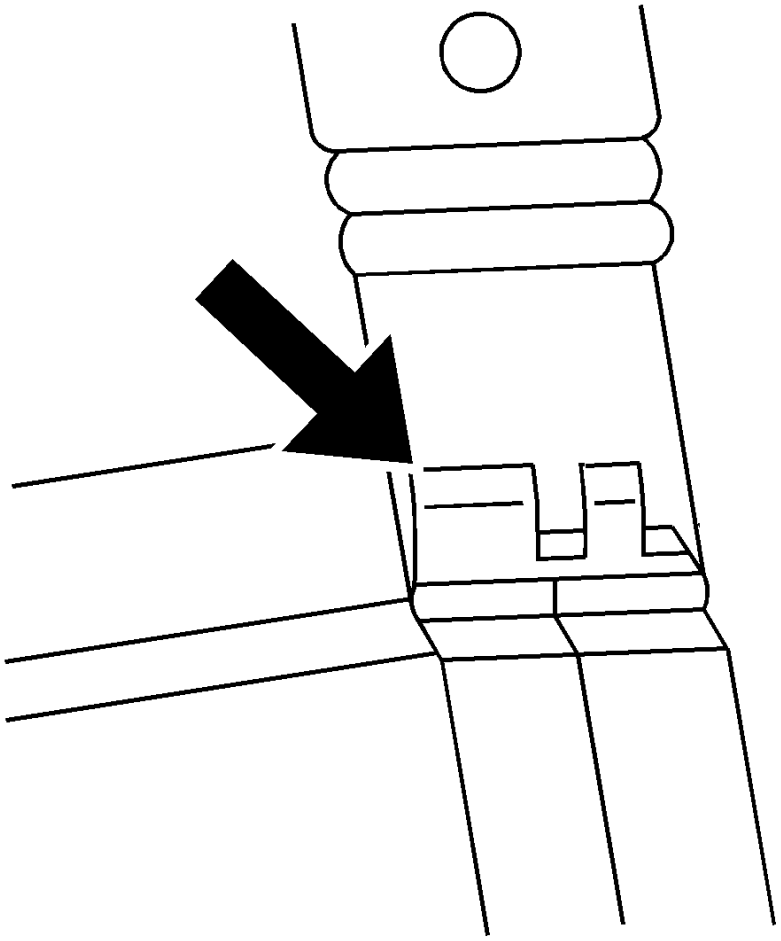

Fig. 215: Identifying Terminal Holder
Courtesy of GENERAL MOTORS COMPANY

4. Insert terminal into the appropriate terminal holder until it hits bottom and stops. The correct terminal holder is determined by the wire size. Also ensure that the terminals wings are pointing towards the former on the tool and the release locator.
5. Insert the stripped cable into the terminal. Insulation should be visible on both sides of the terminal insulation wings.
6. Compress the handles until the ratchet automatically releases.
7. Place the terminal into the appropriate cavity and assemble the connector.

TERMINAL REMOVAL

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **EL-35616** Terminal Test Probe Kit

For equivalent regional tools, refer to Special Tools .

NOTE: **All repairs near the engine manifold, turbo engine and all exhaust pipes should follow the High Temperature Wiring Repair procedures.**

1. Find the appropriate connector end view within the connector end view section. The connector end view has the following information:
   - Diagnostic probe tool
   - Terminal release tool
   - Terminal/terminated lead part numbers

   NOTE: **Not using the proper test kit probe may cause damage to the terminal(s) that are probed.**

2. Determine if a terminal is damaged.
   1. Locate the diagnostic probe tool from the connector end view. The connector end view describes the color and part number to help the technician find and use the correct tool.
   2. Connect the probe tool to the Digital Multimeter.
   3. Insert the probe tool into the cavity and follow the procedures from the **Troubleshooting with a Digital Multimeter**.
3. Disconnect the connector body to perform the repair.
4. Use the following procedure to remove the terminal from the connector body.

   NOTE: **Several procedures for specific connector bodies are called out in the Wiring Repairs section.**

   1. The terminal position assurance (TPA) and connector position assurance (CPA) should be removed before releasing the terminal for the connector body.
   2. Look at the connector end view to locate the cavity of the damaged terminal and find the proper terminal release tool from the terminal release tool kit.

      NOTE: **Using the incorrect terminal release tool can damage the connector body.**

      NOTE: **Some terminals have a lever that must be disengaged before the terminal can be released.**

   3. Insert the terminal release tool into the cavity.

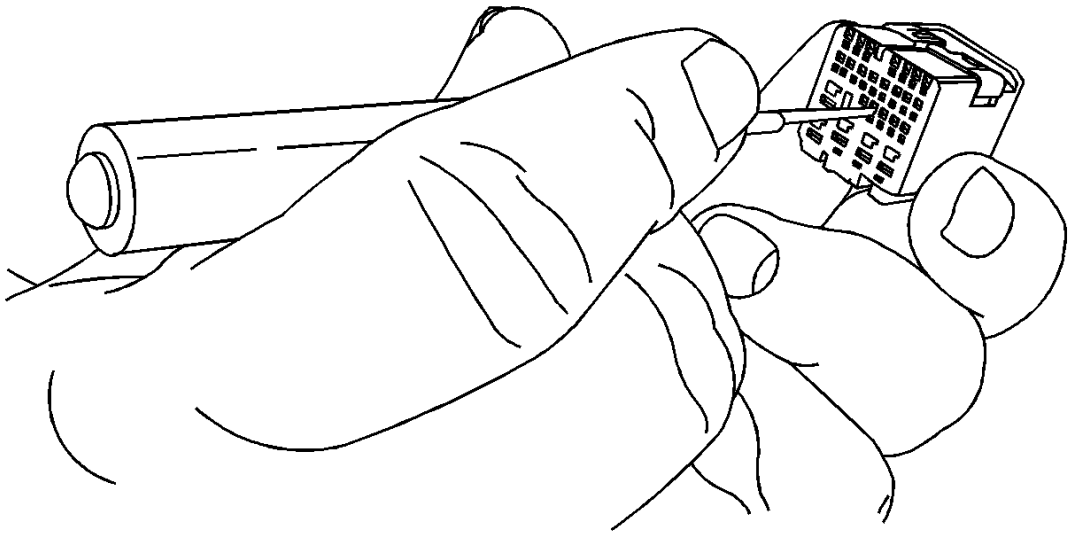

Fig. 216: Gently Pulling Wire Out Of Back Of Connector
Courtesy of GENERAL MOTORS COMPANY

5. Gently pull the wire out of the back of the connector.
6. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)Repairing Connector Terminals (Terminal Repair)** procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

IGNITION KEY CANNOT BE INSERTED, ROTATED, OR REMOVED FROM THE IGNITION LOCK CYLINDER

Step	Action	Yes	No
1	1. Ensure the transmission shift lever is in the PARK position and the steering column is NOT in the locked position. 2. Verify the ignition key cannot be removed from the ignition lock cylinder.	Go to **Step 4**	Go to **Step 2**

Step	Action	Yes	No
	Can the ignition key be removed from the ignition lock cylinder?		
2	Verify the ignition key cannot be turned to the OFF position. Can the ignition key be turned to the OFF position?	Go to **Step 3**	Go to **Step 7**
3	Verify the ignition key cannot be removed from the ignition lock cylinder. Can the ignition key be removed from the ignition lock cylinder?	Go to **Step 7**	Go to **Step 12**
4	Verify the ignition key cannot be fully inserted and rotated without sticking in any position. Can the ignition key be fully inserted into the ignition lock cylinder and be rotated without sticking in any position?	Go to **Step 7**	Go to **Step 5**
5	Inspect for an incorrect, worn, or damaged ignition key. Is the ignition key incorrect, worn, or damaged?	Go to **Step 10**	Go to **Step 6**
6	Inspect the ignition key. Clean the entire middle groove area of the ignition key. Can the cleaned key be fully inserted into the ignition lock cylinder and be rotated without sticking in any position?	Go to **Step 13**	Go to **Step 12**
7	Verify the adjustment of the shift control cable. Refer to **Range Selector Lever Cable Adjustment** . Can the ignition key be turned to the OFF position and be removed?	Go to **Step 13**	Go to **Step 8**
8	Attempt to override the ignition lock solenoid on the ignition and start switch housing. Can the ignition key be turned to the OFF position and be removed?	Go to **Step 9**	Go to **Step 12**
9	Inspect the electrical system for improper operation. Refer to **Ignition Can/Cannot Be Turned Off with Transmission in Any Gear**, and to **Testing for Intermittent Conditions and Poor Connections**. Can the ignition key be turned to the OFF position and be removed?	Go to **Step 13**	Go to **Step 11**
10	Replace the ignition key. Refer to **Replacing Keys (North America except Canada)** **Replacing Keys (Canada)** . Did you complete the repair?	Go to **Step 13**	-
11	Replace the floor shifter. Refer to **Transmission Control Replacement** . Did you complete the repair?	Go to **Step 13**	-
12	Replace the ignition lock cylinder. Refer to **Ignition Lock Cylinder Replacement** . Did you complete the repair?	Go to **Step 13**	-

Step	Action	Yes	No
13	Operate the system in order to verify the repair. Did you correct the condition?	System OK	-

REPAIR INSTRUCTIONS

GMLAN AND MEDIA ORIENTED SYSTEMS TRANSPORT (MOST) WIRING REPAIRS

Special Tools

- **EL-38125-10** Splice Sleeve Crimping Tool
- DuraSeal splice sleeves
- A wire stripping tool

For equivalent regional tools, refer to Special Tools .

The DuraSeal splice sleeves have the following 2 critical features:

- A special heat shrink sleeve environmentally seals the splice. The heat shrink sleeve contains a sealing adhesive inside.
- A cross hatched (knurled) core crimp provides necessary contact integrity for the sensitive, low energy circuits.

The GM Local Area Network (GMLAN) System requires special wiring repair procedures due to the sensitive nature of the circuitry. Follow the specific procedures and instructions when working on GMLAN connectors and terminals.

GMLAN Repairs

NOTE: **When making a repair to any GMLAN network, the original wire length after the repair must be the same length as before the repair. If the network is a twisted pair, the twist must be maintained after the repair is completed.**

GMLAN has 2 types of networks, low speed and high speed. Low speed GMLAN has a single wire and works at slow speeds. High speed GMLAN has 2 wires in a twisted pair and works at higher speeds. For more information on GMLAN, refer to **Data Link Communications Description and Operation** .

GMLAN Connector Terminal Repair

NOTE: **A terminated lead can be used to replace damaged connector terminals for both high speed and low speed GMLAN systems. When making a connector terminal repair on a GMLAN high speed system with twisted pair wires, do not untwist the wires more than necessary to make the repair.**

If the individual terminals are damaged on any GMLAN connection, use the appropriate connector repair procedure in order to repair the terminal. Refer to **Connector Repairs** for the appropriate connector repair procedure.

GMLAN Wire Repair

NOTE: **Refer to Wiring Repairs in the service information connector end views or the vehicle schematics in order to determine the correct wire size for the circuit you are repairing. You must obtain this information in order to ensure circuit integrity.**

If any wire except the pigtail is damaged, repair the wire by splicing in a new section of wire of the same gauge size (0.5 mm^2 , 0.8 mm^2 , 1.0 mm^2 etc.). Use the DuraSeal splice sleeves and **EL-38125-10** tool. For wiring repair, refer to **Splicing Copper Wire Using Splice Sleeves** .

Media Oriented Systems Transport (MOST) Wiring Repair

NOTE: **If harness repair/analysis is performed, MOST bus Twist Pair unshielded wire should be 0.35 mm^2 (22 AWG) wire with at least one twist per each 1 45/64 inch (45 mm) and must not be untwisted for more than 3 15/16 of an inch (10 cm).**

The following conditions need to be met to ensure a valid continuity:

- Untwisted length for all MOST 50 circuits at each wire harness connector should be no longer 50 mm max (25 mm preferred).
- When wire repairs are made, a minimum 25 twists/meter for all MOST 50 circuits.
- MOST 50 has specific receive and transmit I/O.

The transmit of one module is connected to receive of the next module in ring topology.

RELAY REPLACEMENT (ATTACHED TO WIRE HARNESS)

Removal Procedure

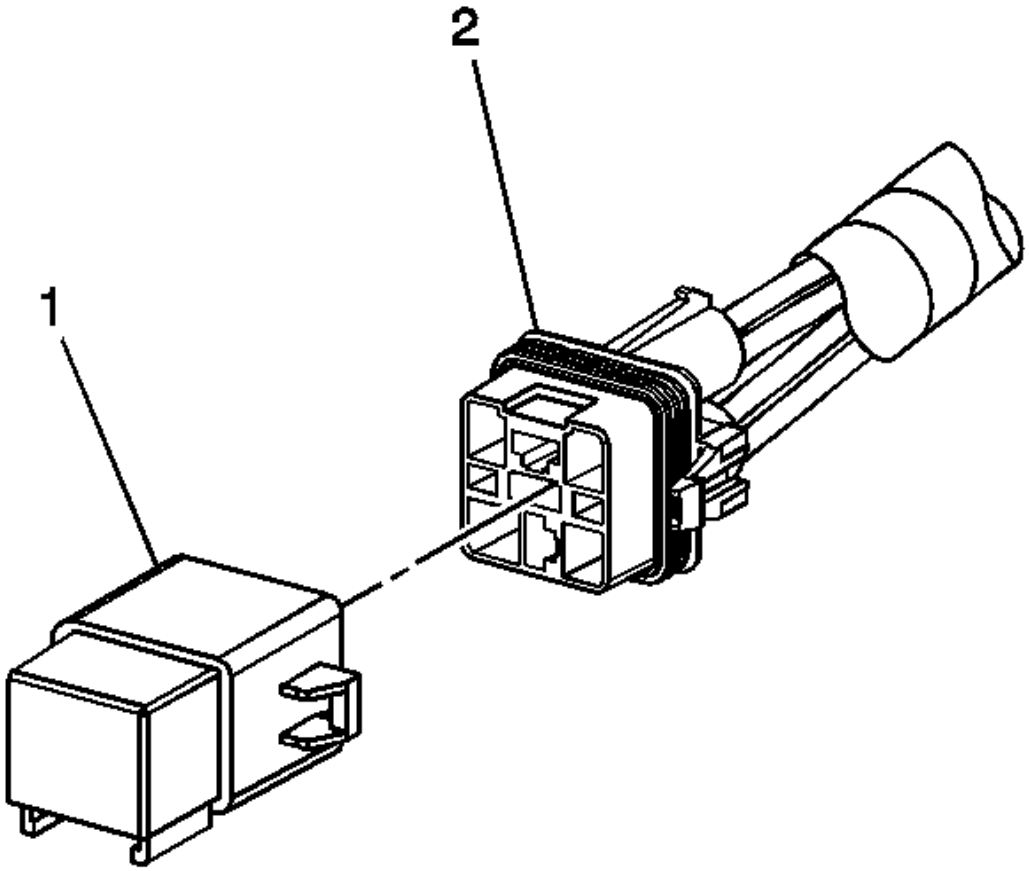

Fig. 1: Identifying Relay & Wire Harness Connector
Courtesy of GENERAL MOTORS COMPANY

1. Locate the relay. Refer to the **Master Electrical Component List** to locate the relay in the vehicle.
2. Remove any fasteners which hold the relay in place.
3. Remove any connector position assurance (CPA) devices or secondary locks.

NOTE: **Use care when removing a relay in a wiring harness when the relay is secured by fasteners or tape.**

4. Separate the relay (1) from the wire harness connector (2).

Installation Procedure

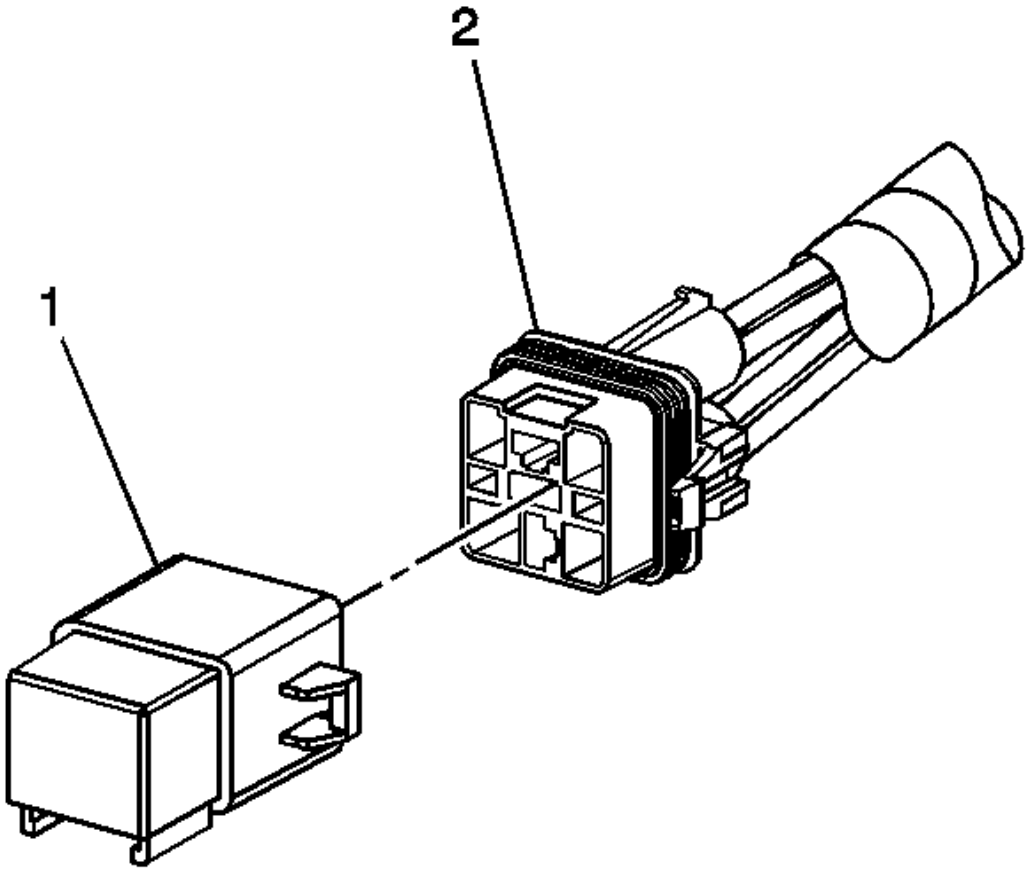

Fig. 2: Identifying Relay & Wire Harness Connector
Courtesy of GENERAL MOTORS COMPANY

1. Connect the relay (1) to the wire harness connector (2).
2. Install any connector position assurance (CPA) devices or secondary locks.
3. Install the relay using any fasteners or tape that originally held the relay in place.

RELAY REPLACEMENT (WITHIN AN ELECTRICAL CENTER)

Special Tools

EL-43244 Relay Puller Pliers

Removal Procedure

1. Remove the electrical center cover.

NOTE:

- **Always note the orientation of the relay.**
- **If equipped with a notch style relay; observe the location of the notch on the old relay to verify the new relay is installed with the notch in**

the same location.

- **Ensure that the electrical center is secure, as not to put added stress on the wires or terminals.**

2. Locate the relay. Refer to **Electrical Center Identification Views** to locate the electrical center where the relay exists.

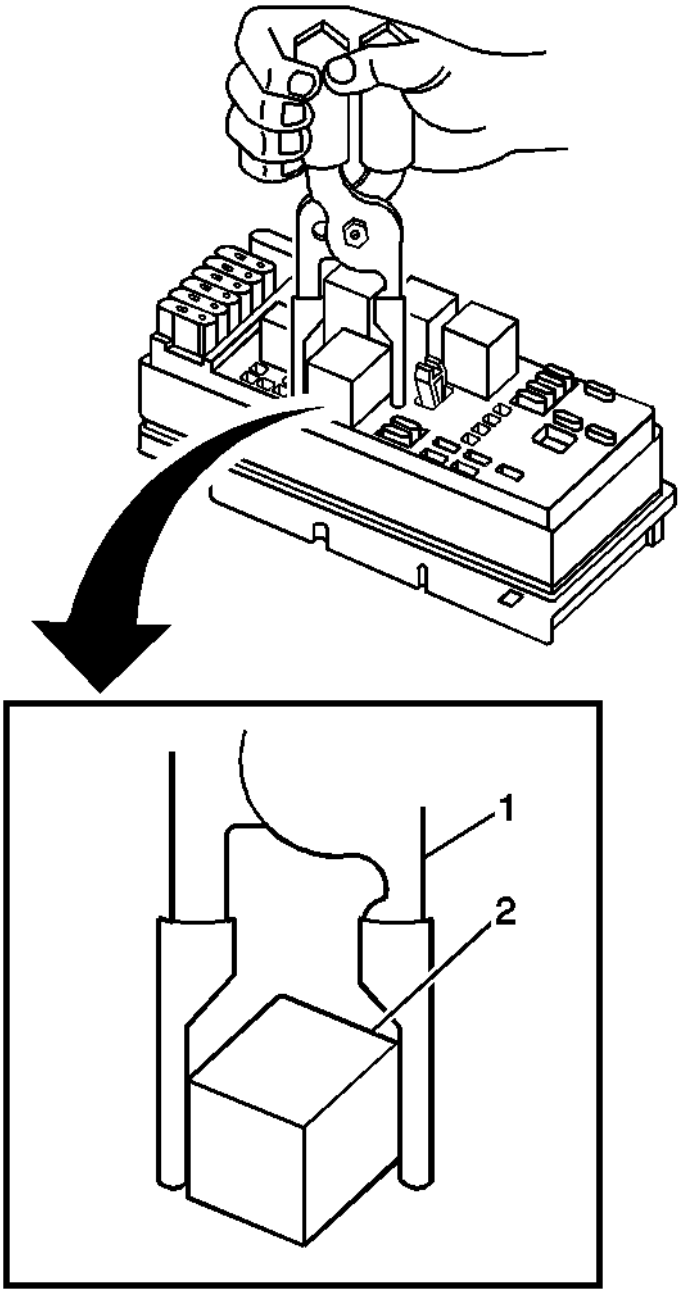

Fig. 3: Removing/Installing Relay
Courtesy of GENERAL MOTORS COMPANY

3. Using the EL-43244 (1) position the tool on opposing corners of the relay (2).

CAUTION: Use EL-43244 to pull the relay straight out from the electrical center terminals. The use of pliers or a flat bladed tool could damage the electrical center.

4. Remove the relay (2) from the electrical center.

Installation Procedure

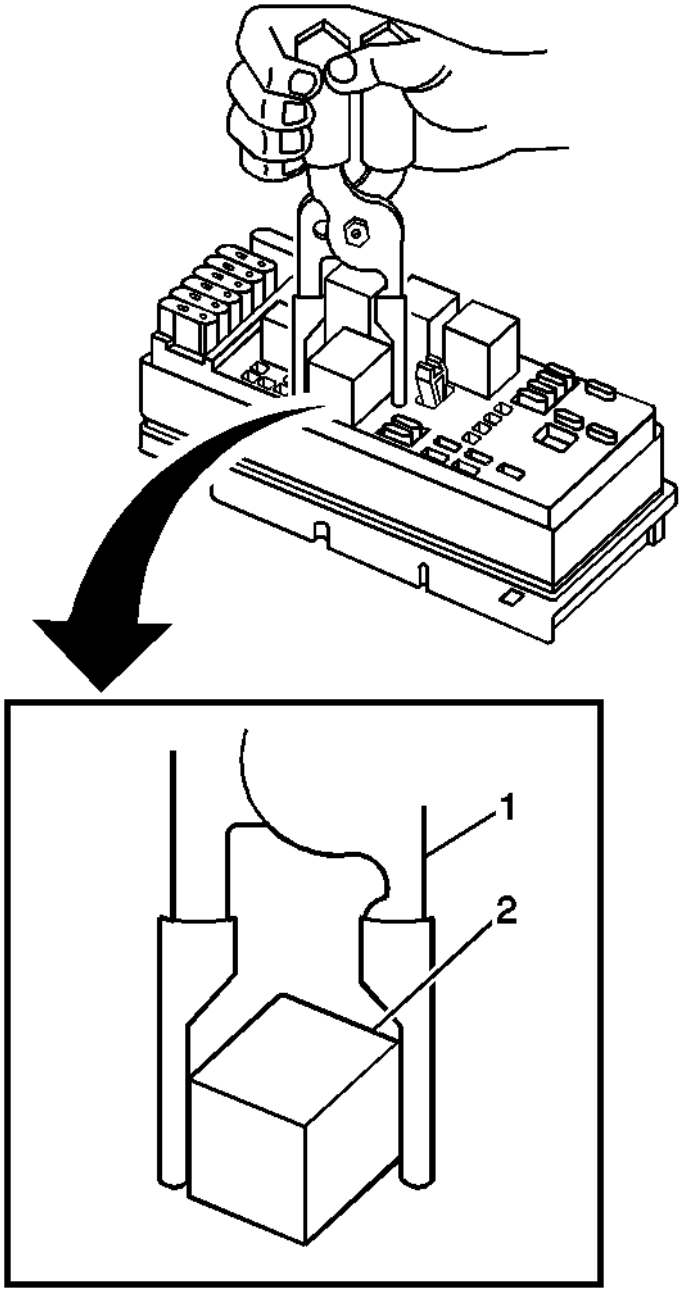

Fig. 4: Removing/Installing Relay
Courtesy of GENERAL MOTORS COMPANY

1. Install the relay (2) in the same position as removed.
2. Install the electrical center cover.

GROUND REPAIR

Electrical Grounds

Proper electrical system function relies on secure, positive, corrosion-free ground connections. Loose, stripped, or corroded connections increase the possibility of improper system function and loss of module communication. These conditions may also lead to unnecessary repairs and component replacements.

In general, electrical ground connections are accomplished using one, or a combination of, three attachment methods:

- Welded M6 stud and nut
- Welded M6 nut and bolt
- Welded M8 nut and bolt

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

Determine which attachment method is used, and carry out the appropriate repair.

M6 Weld Stud Replacement

1. Select a location adjacent the damaged or missing M6 ground stud having 20 mm (0.79 in) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the M6 rivet stud flange.
2. Using GM approved residue-free solvent or equivalent, remove any grease from the repair site and allow to dry.

   NOTE: Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.

3. Drill a 10 mm (0.40 in) diameter hole through the panel.
4. Carefully remove paint and primer from the area surrounding the rivet stud flange until bare metal is visible.

   CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

5. Select a replacement conductive M6 rivet stud. Refer to GM parts catalog for the correct part number and application.
6. Using a rivet stud installer, install the replacement conductive M6 rivet stud.
7. Ensure the new rivet stud is securely fastened, with no detectable movement.

   NOTE: The rivet stud and surrounding panel area must be properly refinished prior to the installation of the ground terminal and nut to maintain positive electrical grounding.

8. Completely wrap the threads of the rivet stud with painters tape or equivalent.
9. Refinish the repair area using an anti-corrosion primer.
10. Allow the refinished repair area to cure sufficiently before removing the protective material applied to the

rivet stud threads.

11. Remove the painters tape or equivalent from the rivet stud threads.
12. Using GM approved residue-free solvent or equivalent, thoroughly clean the rivet stud threads to remove any adhesive and allow to dry.
13. Carefully remove any corrosion from the electrical ground wire terminal. Refer to **Testing for Intermittent Conditions and Poor Connections** .
14. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new conductive M6 rivet stud threads.
15. Install the ground terminal to the new rivet stud.
16. Select a new, conductive M6 nut. Refer to GM parts catalog for the correct part number and application.

CAUTION: Refer to Fastener Caution .

17. Install the M6 nut and tighten to 8 (71 lb in).
18. Check for proper system operation.

M6 Weld Nut

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

1. If the M6 weld nut at the electrical ground location is damaged or stripped, a new, conductive self-threading M7 bolt may be used to secure the ground terminal. Refer to GM parts catalog for the correct part number and application.
2. Using GM approved residue-free solvent or equivalent, remove any grease from the surface surrounding the weld nut and allow to dry.
3. Remove any loose metal particles from the damaged or stripped weld nut with a stiff brush.
4. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new, conductive, self-threading M7 bolt threads.
5. Carefully remove any corrosion from the electrical ground terminal. Refer to **Testing for Intermittent Conditions and Poor Connections** .
6. Install the electrical ground terminal to the new, conductive M7 bolt.

CAUTION: Refer to Fastener Caution .

7. Install the M7 bolt and tighten to 9 (80 lb in).
8. Check for proper system operation.

M6 Weld Nut (Alternative Repair)

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

1. If the electrical ground location is accessible from both sides of the panel, a conductive M6 bolt and a conductive M6 nut may be used to secure the electrical ground terminal. Refer to GM parts catalog for

the correct part number and application.

2. Select a location adjacent the damaged M6 weld nut having 20 mm (0.79) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the new electrical ground site.
3. Using GM approved residue-free solvent or equivalent, remove any grease from the surface surrounding the ground location and allow to dry.

NOTE: Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.

4. Drill a 10 mm (0.40 in) diameter hole through the panel.
5. Carefully remove paint and primer from the area surrounding the new ground site until bare metal is visible.
6. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new, conductive M6 bolt threads.
7. Carefully remove any corrosion from the electrical ground terminal. Refer to **Testing for Intermittent Conditions and Poor Connections** .
8. Install the electrical ground terminal and new, conductive M6 bolt to the ground location.

CAUTION: Refer to Fastener Caution .

9. Install the conductive M6 nut and tighten to 8 (71 lb in).

NOTE: The repair area must be properly refinished to maintain positive electrical grounding.

10. Refinish the repair area using an anti-corrosion primer.
11. Check for proper system operation.

M8 Weld Nut

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

1. If the M8 weld nut electrical ground location is accessible from both sides of the panel, a conductive M8 bolt and a conductive M8 nut may be used to secure the ground terminal. Refer to GM parts catalog for the correct part numbers and application.
2. Select a location adjacent to M8 weld nut having 20 mm (0.79 in) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the new electrical ground site.
3. Using GM approved residue-free solvent or equivalent, remove any grease from the surface surrounding the ground location and allow to dry.

NOTE: Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.

4. Drill a 10 mm (0.40 in) diameter hole through the panel.
5. Carefully remove paint and primer from the area surrounding the new ground site until bare metal is

visible.

6. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new, conductive M8 bolt threads.
7. Carefully remove any corrosion from the electrical ground terminal. Refer to **Testing for Intermittent Conditions and Poor Connections** .
8. Install the electrical ground terminal and new, conductive M8 bolt to the ground location.

CAUTION: Refer to Fastener Caution .

9. Install the conductive M8 nut and tighten to 22 (16 lb ft).

NOTE: The repair area must be properly refinished to maintain positive electrical grounding.

10. Refinish the repair area using an anti-corrosion primer.
11. Check for proper system operation.

M8 Weld Nut (Alternative Repair)

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

1. If the M8 weld nut electrical ground location is not accessible from both sides of the panel, a conductive M6 rivet stud and a conductive M6 nut may be used to secure the ground terminal. Refer to GM parts catalog for the correct part numbers and application.
2. Select a location adjacent the damaged M8 weld nut having 20 mm (0.79 in) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the new, conductive M6 rivet stud flange.
3. Using GM approved residue-free solvent or equivalent, remove any grease from the repair site and allow to dry.

NOTE: Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.

4. Drill a 10 mm (0.40 in) diameter hole through the panel.
5. Carefully remove paint and primer from the area surrounding the rivet stud flange until bare metal is visible.
6. Using a rivet stud installer, install the replacement conductive M6 rivet stud.
7. Ensure the new rivet stud is securely fastened, with no detectable movement.

NOTE: The rivet stud and surrounding panel area must be properly refinished prior to the installation of the ground terminal and nut to maintain positive electrical grounding.

8. Completely wrap the threads of the rivet stud with painters tape or equivalent.
9. Refinish the repair area using an anti-corrosion primer.
10. Allow the refinished repair area to cure sufficiently before removing the protective material applied to the

rivet stud threads.

11. Remove the painters tape or equivalent from the rivet stud threads.
12. Using GM approved residue-free solvent or equivalent, thoroughly clean the rivet stud threads to remove any adhesive and allow to dry.
13. Carefully remove any corrosion from the electrical ground wire terminal. Refer to **Testing for Intermittent Conditions and Poor Connections** .
14. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new conductive M6 rivet stud threads.
15. Install the ground terminal to the new, conductive M6 rivet stud.

CAUTION: Refer to Fastener Caution .

16. Install the conductive M6 nut and tighten to 8 (71 lb in).
17. Check for proper system operation.

Securing Loose Electrical Ground Connections

If the electrical ground connection is loose and the ground attachments are not damaged, properly securing the loose electrical ground may be all that is necessary. Carry out the following procedure to secure loose electrical ground connections.

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

1. Using GM approved residue-free solvent or equivalent, thoroughly clean the ground stud threads and allow to dry.
2. Carefully remove any corrosion from the electrical ground wire terminal. Refer to **Testing for Intermittent Conditions and Poor Connections** .
3. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the ground stud threads.
4. Install the ground wire terminal to the ground stud.

CAUTION: Refer to Fastener Caution .

5. Install the ground stud nut.
   - M6 ground stud nut: Tighten to 9 (80 lb in)
   - M8 ground stud nut: Tighten to 22 (16 lb ft)
   - M10 ground stud nut: Tighten to 45 (33 lb ft)
6. Check for proper system operation.

FRONT COMPARTMENT FUSE BLOCK FUSE REPLACEMENT (MIDI-FUSE)

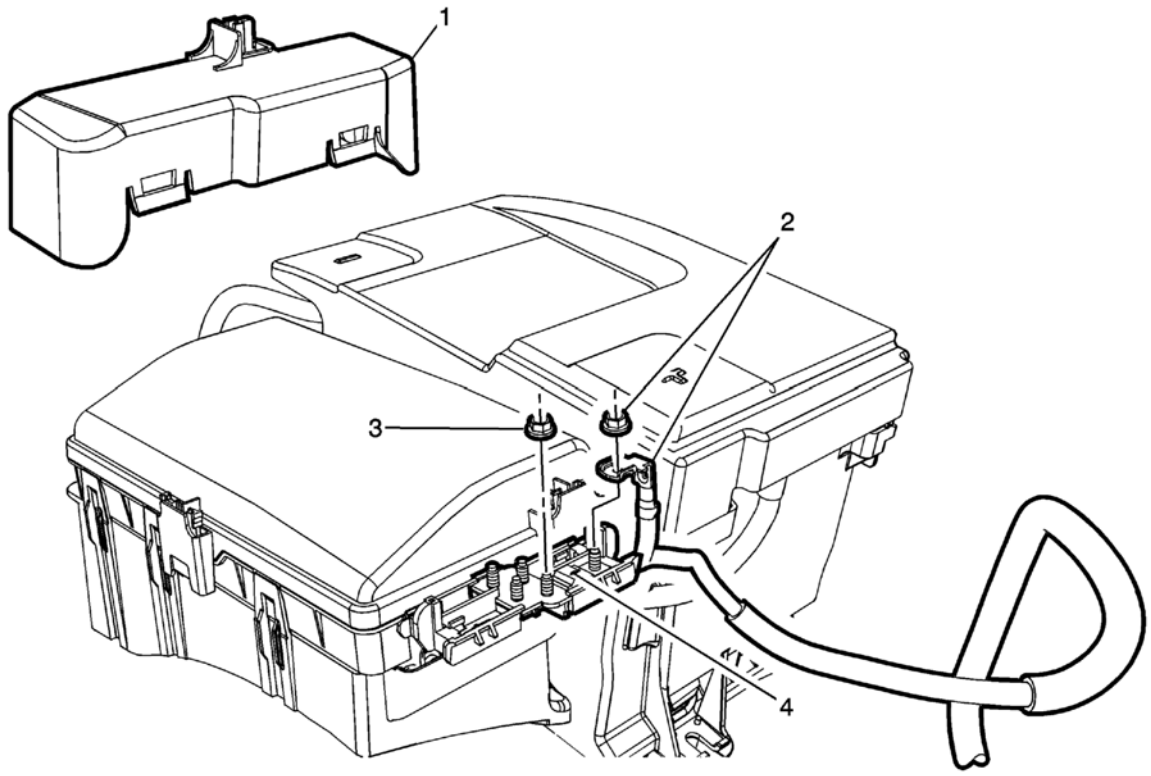

Fig. 5: Front Compartment Fuse Block Fuse (MIDI-Fuse)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Disconnect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection** .	
1	Fuse Block Fuse Cover
2	Battery Positive Cable and Nut **CAUTION:** **Refer to** **Fastener Caution** . **Procedure** Disconnect the battery positive cable(s) from the fuse. **Tighten** 4.7 (42 lb in)
3	Fuse Block Fuse Holder Nut - MIDI-Fuse **Tighten** 4.7 (42 lb in)
4	Fuse Block Fuse - MIDI-Fuse

INSTRUMENT PANEL ELECTRICAL CENTER OR JUNCTION BLOCK REPLACEMENT - RIGHT

SIDE (IMPALA LIMITED)

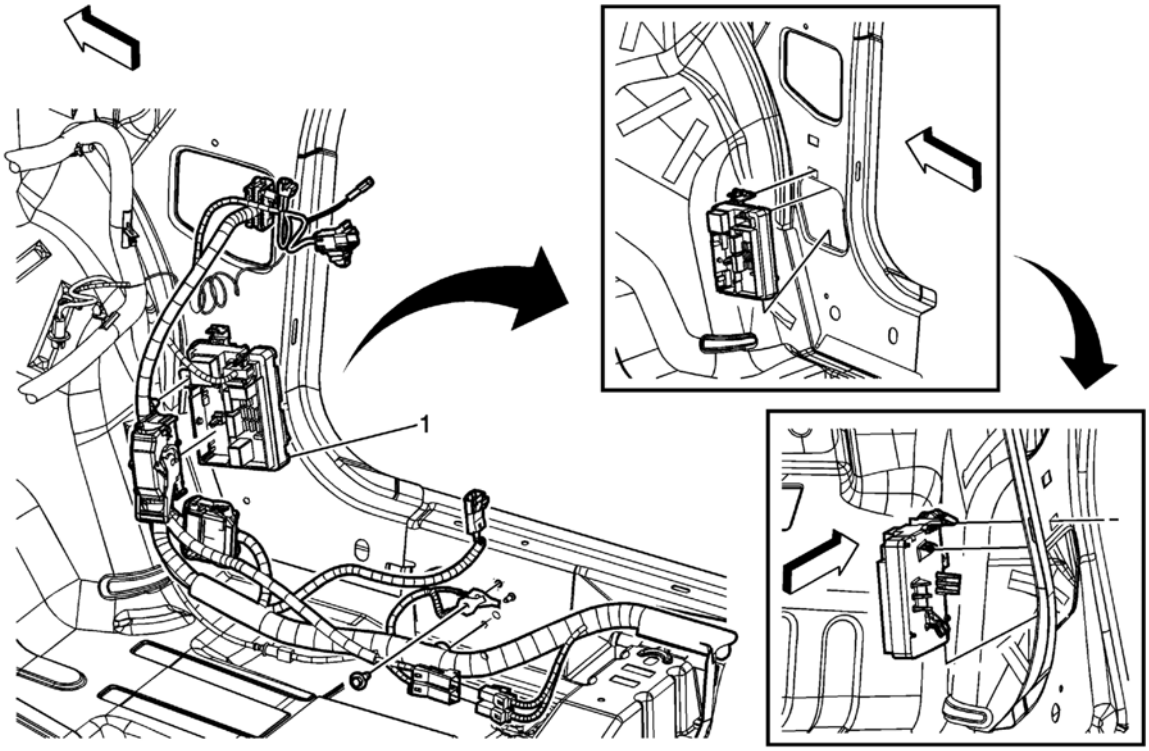

Fig. 6: Exploded View Of Junction Block - Right Side (Impala Limited)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Fastener Tightening Specifications: Refer to **Fastener Specifications** . **Preliminary Procedure** Remove right side carpet retainer. Refer to **Front Side Door Opening Floor Carpet Retainer Replacement (Impala Limited)** .	
1	Body and I/P Wiring Harness Junction Block 1. Pull back carpet to reveal junction block. 2. Press release tab to pull block out.

ACCESSORY WIRING JUNCTION BLOCK REPLACEMENT

Removal Procedure

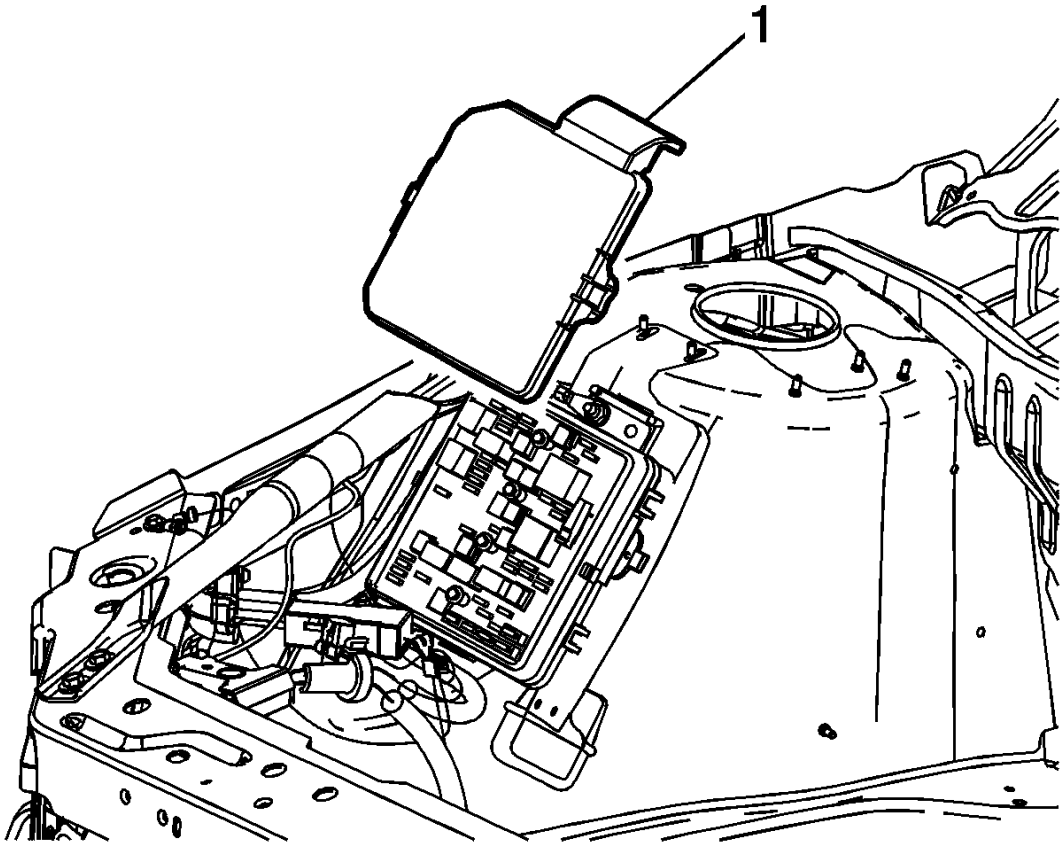

Fig. 7: Identifying Electrical Center Cover
Courtesy of GENERAL MOTORS COMPANY

1. Remove the electrical center cover (1).
2. Disconnect the positive battery cable from junction box. Refer to **Battery Positive and Negative Cable Replacement** .

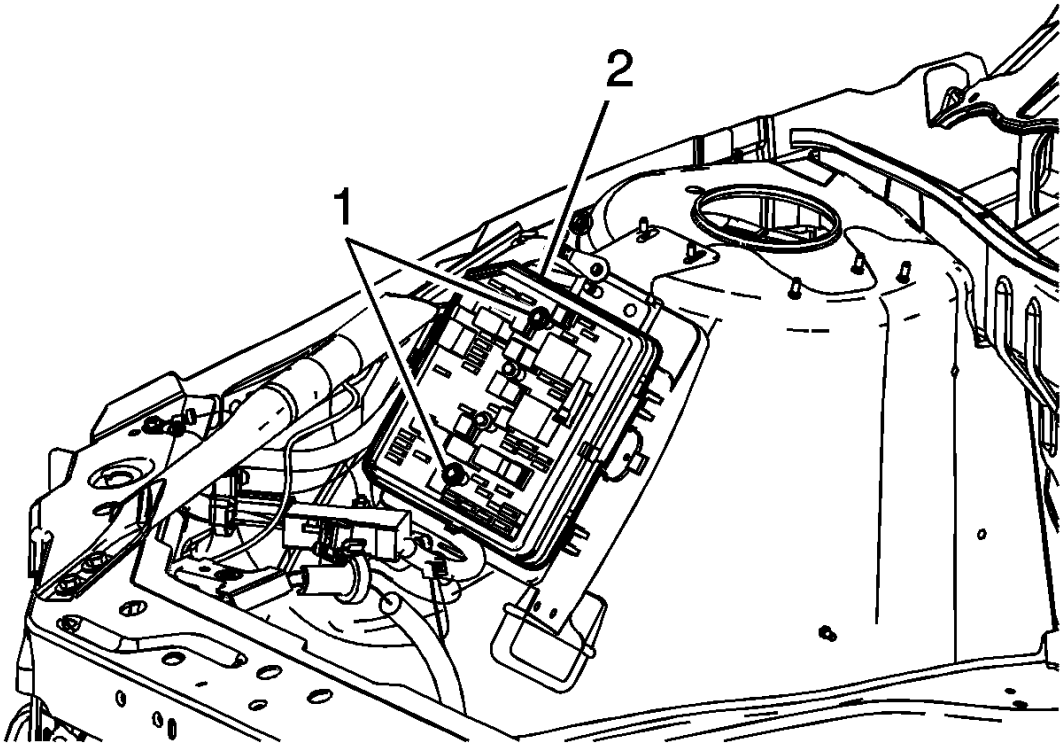

Fig. 8: Identifying Fasteners & Electrical Center Board
Courtesy of GENERAL MOTORS COMPANY

3. Remove the fasteners (1) securing the electrical center board (2).
4. Unlock the tabs on the electrical center board.
5. Lift up on the electrical center board.

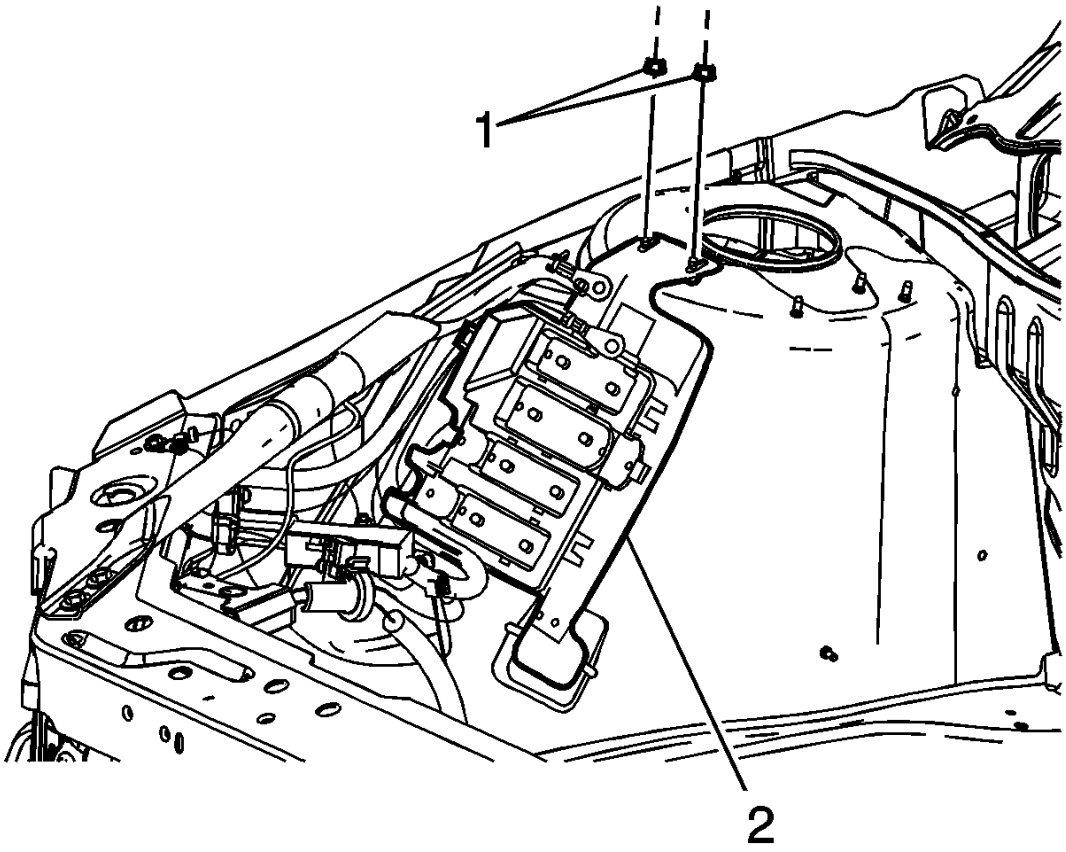

Fig. 9: Identifying Fasteners & Electrical Center Bracket
Courtesy of GENERAL MOTORS COMPANY

6. Remove the fasteners (1) securing the electrical center bracket (2) to vehicle.

Installation Procedure

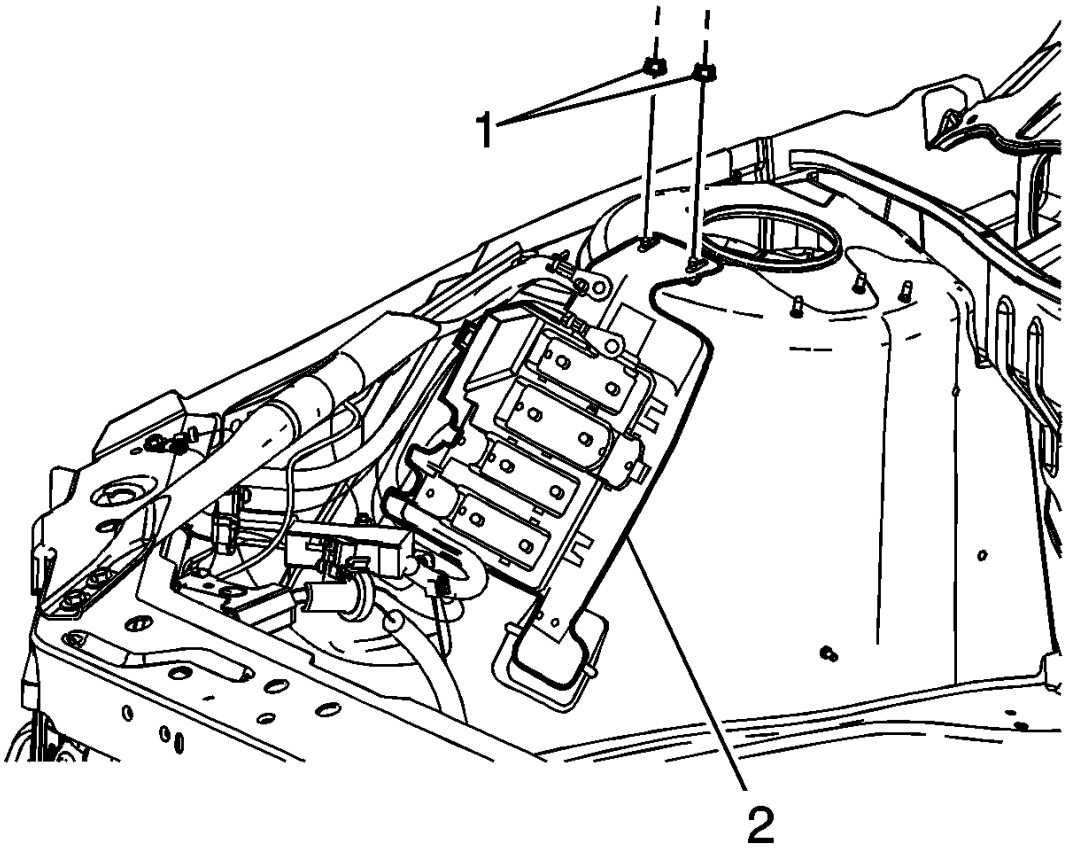

Fig. 10: Identifying Fasteners & Electrical Center Bracket
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install fasteners (1) securing the electrical center (2) to vehicle.

   Tighten

   Tighten the fasteners to 10 N.m (86 lb in).

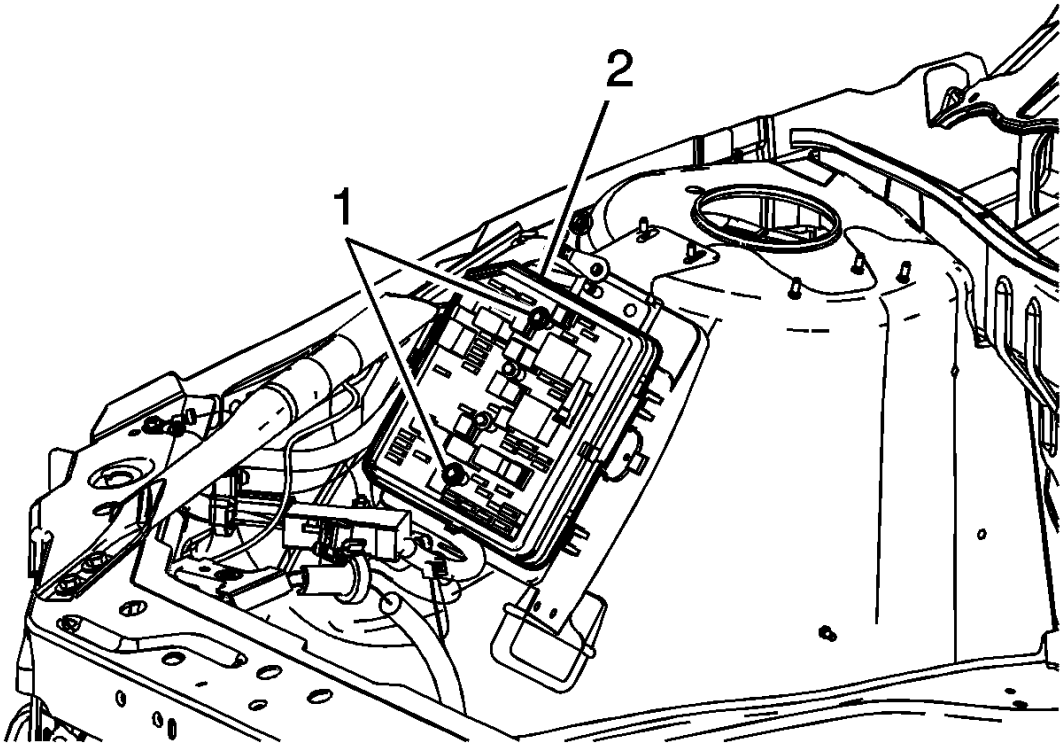

Fig. 11: Identifying Fasteners & Electrical Center Board
Courtesy of GENERAL MOTORS COMPANY

2. Install the fasteners (1) securing the electrical center board (2).

   Tighten

   Tighten the fasteners to 7 N.m (62 lb in).

3. Connect the positive battery cable. Refer to **Battery Positive and Negative Cable Replacement** .

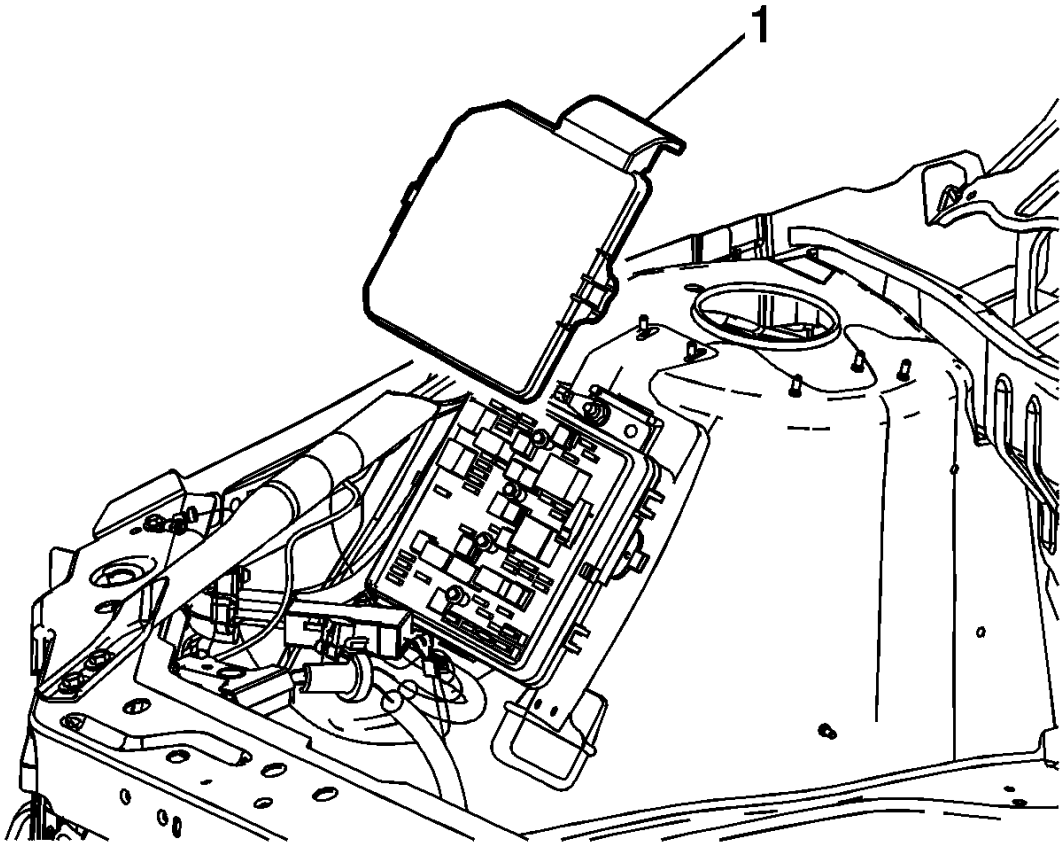

Fig. 12: Identifying Electrical Center Cover
Courtesy of GENERAL MOTORS COMPANY

4. Install the electrical center cover (1).

IGNITION LOCK CYLINDER REPLACEMENT

Removal Procedure

1. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .

WARNING: Refer to SIR Warning .

2. Disable the SIR system. Refer to **SIR Disabling and Enabling** .
3. Remove the tilt lever. Refer to **Steering Column Tilt Wheel Release Lever Replacement** .
4. Remove the steering wheel. Refer to **Steering Wheel Replacement** .
5. Remove the steering column trim covers. Refer to **Steering Column Trim Cover Replacement** .
6. Rotate the ignition lock cylinder to the crank position.

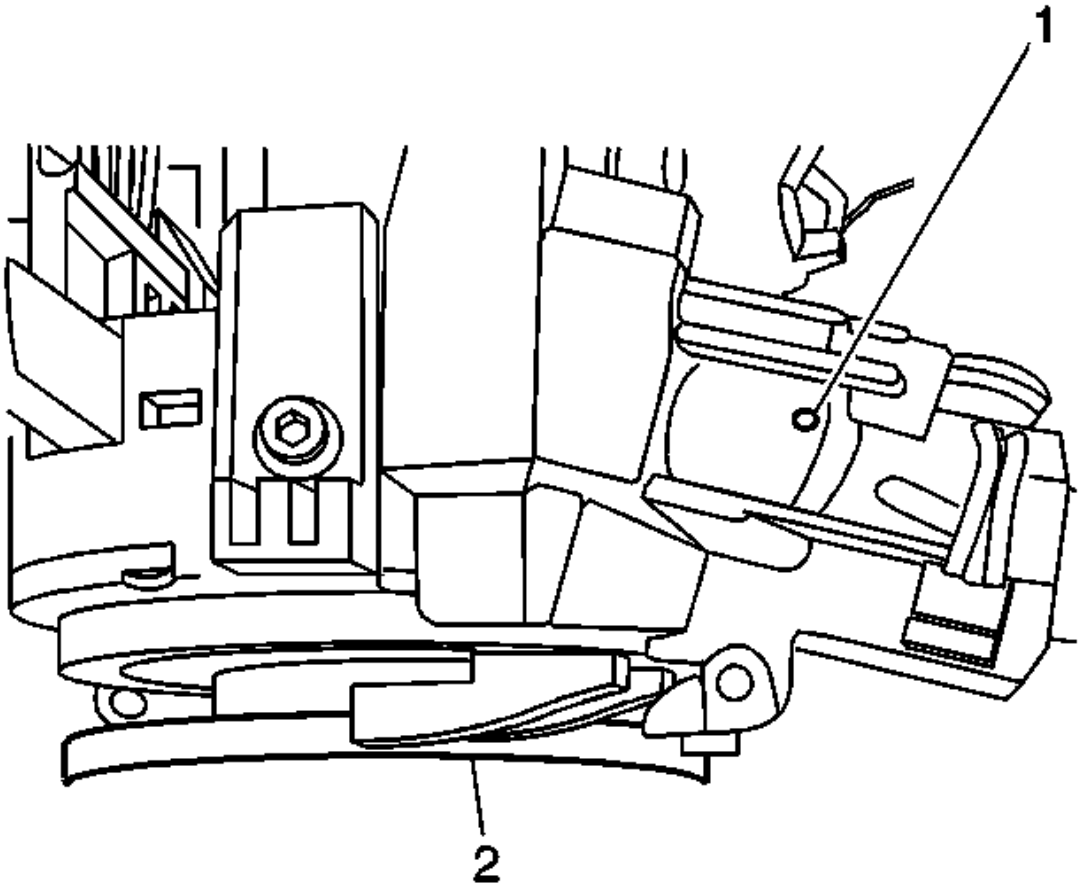

Fig. 13: Locating Ignition Lock Cylinder Release Access Hole
Courtesy of GENERAL MOTORS COMPANY

7. Use a suitable tool in order to push down and hold the lock cylinder retaining pin through the access hole (1) in the ignition lock cylinder case .
8. Release the ignition lock cylinder to the run position.

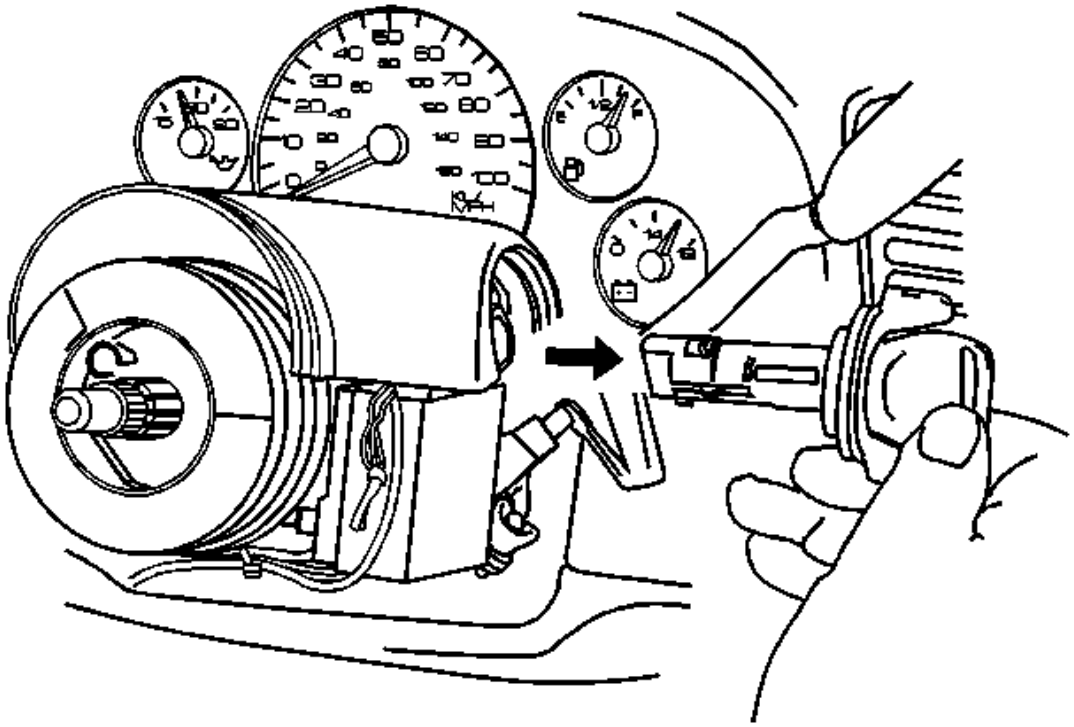

Fig. 14: View of Ignition Lock Cylinder, Ignition Lock Cylinder Case Assembly, and Steering Column

Courtesy of GENERAL MOTORS COMPANY

9. Remove the ignition lock cylinder from the steering column.

Installation Procedure

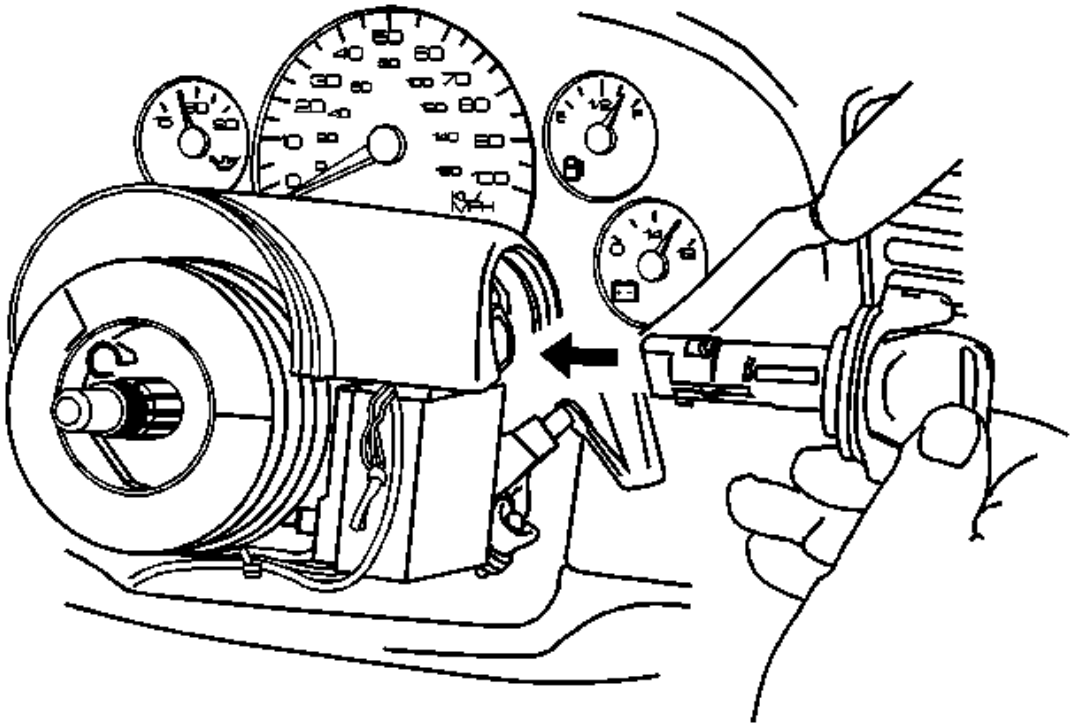

Fig. 15: View of Ignition Cylinder Lock, Ignition Lock Cylinder Case Assembly and Upper Steering Column

Courtesy of GENERAL MOTORS COMPANY

1. Align the lock cylinder retaining pin with the access hole in the ignition lock cylinder case.
2. Push the ignition lock cylinder into the ignition lock cylinder case. Ensure the lock cylinder retaining pin engages the access hole.
3. Install the steering column trim covers. Refer to **Steering Column Trim Cover Replacement** .
4. Install the steering wheel. Refer to **Steering Wheel Replacement** .
5. Install the tilt lever. Refer to **Steering Column Tilt Wheel Release Lever Replacement** .
6. Enable the SIR system. Refer to **SIR Disabling and Enabling** .
7. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .

IGNITION AND START SWITCH REPLACEMENT

Removal Procedure

WARNING: Refer to SIR Warning .

1. Disable the SIR system **SIR Disabling and Enabling** .
2. Remove the upper and lower trim covers. Refer to **Steering Column Trim Cover Replacement** .
3. Remove the ignition lock cylinder. Refer to **Ignition Lock Cylinder Replacement**.

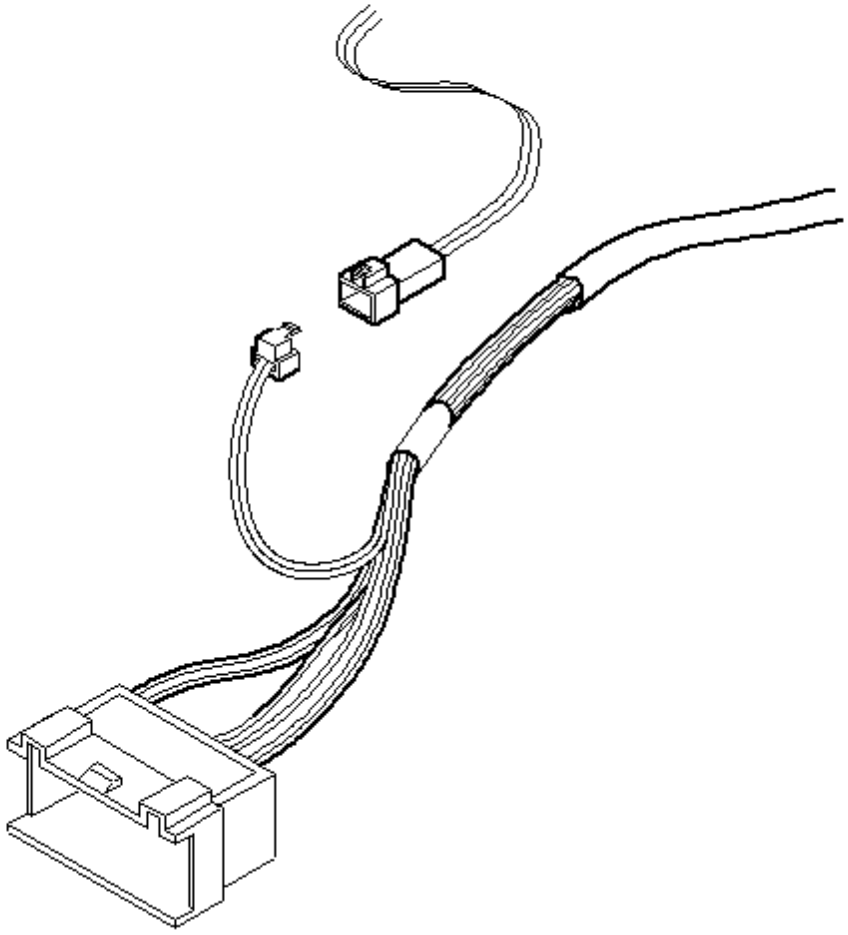

Fig. 16: Theft Deterrent Control Module Connector
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the theft deterrent control module connector.
5. Disconnect the fused jumper assembly connector.

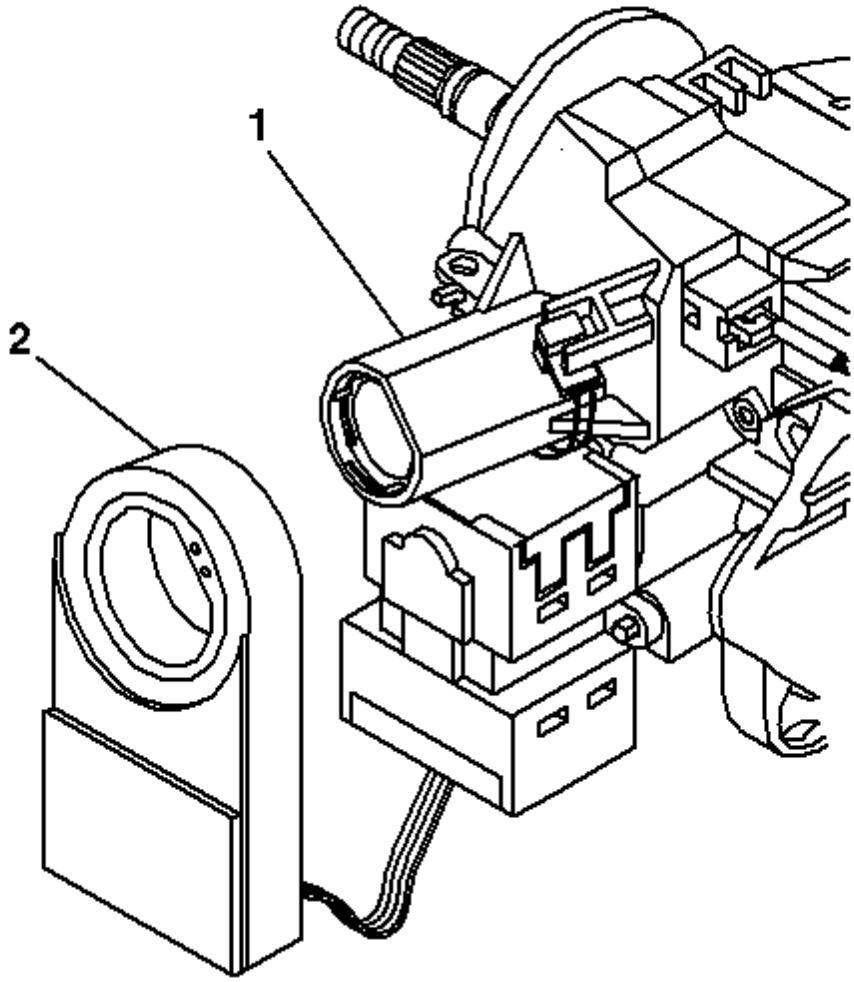

Fig. 17: Locating Theft Deterrent Module & Ignition Lock Cylinder Case Assembly
Courtesy of GENERAL MOTORS COMPANY

6. Slide the theft deterrent control module (2) from the ignition lock cylinder case (1).

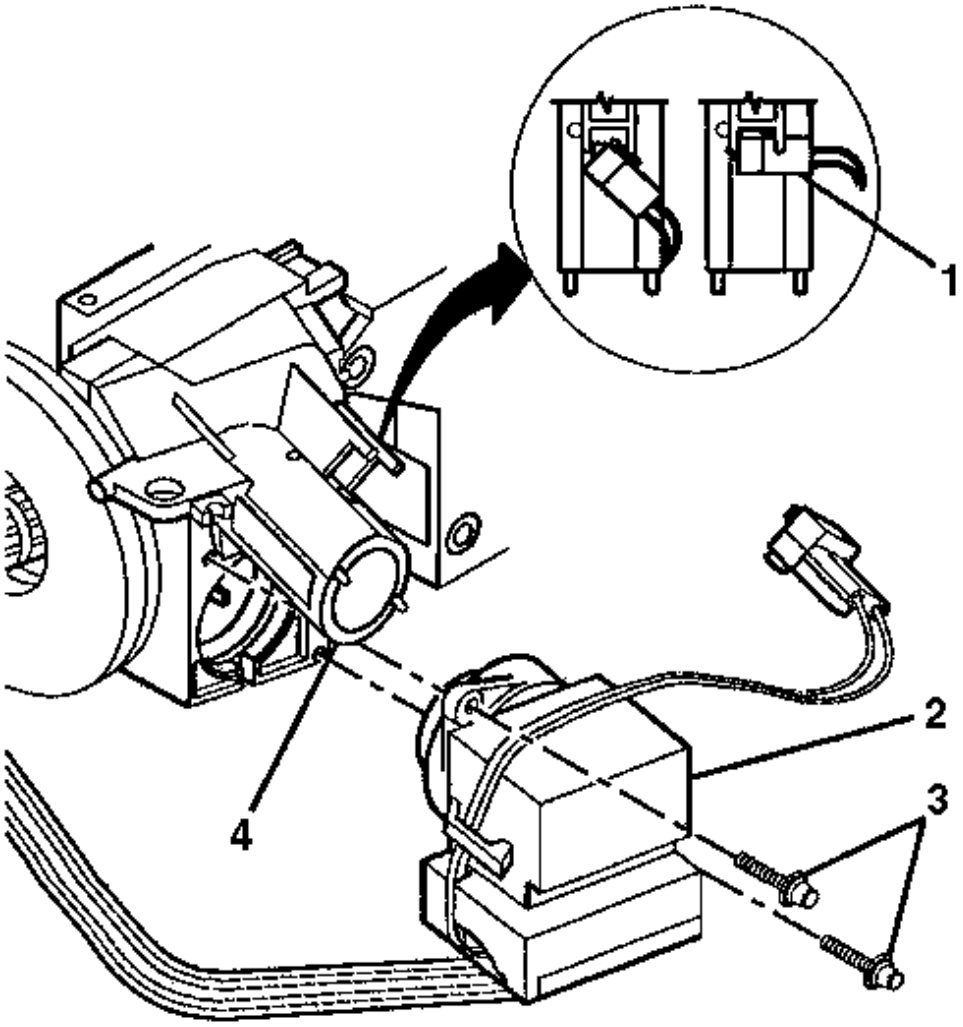

Fig. 18: Key Alarm Connector To/From Ignition Lock Cylinder Case
Courtesy of GENERAL MOTORS COMPANY

7. Remove the key alarm connector (1) from the ignition lock cylinder case (4).
8. Remove the 2 tapping screws (3) from the ignition switch assembly (2).

Installation Procedure

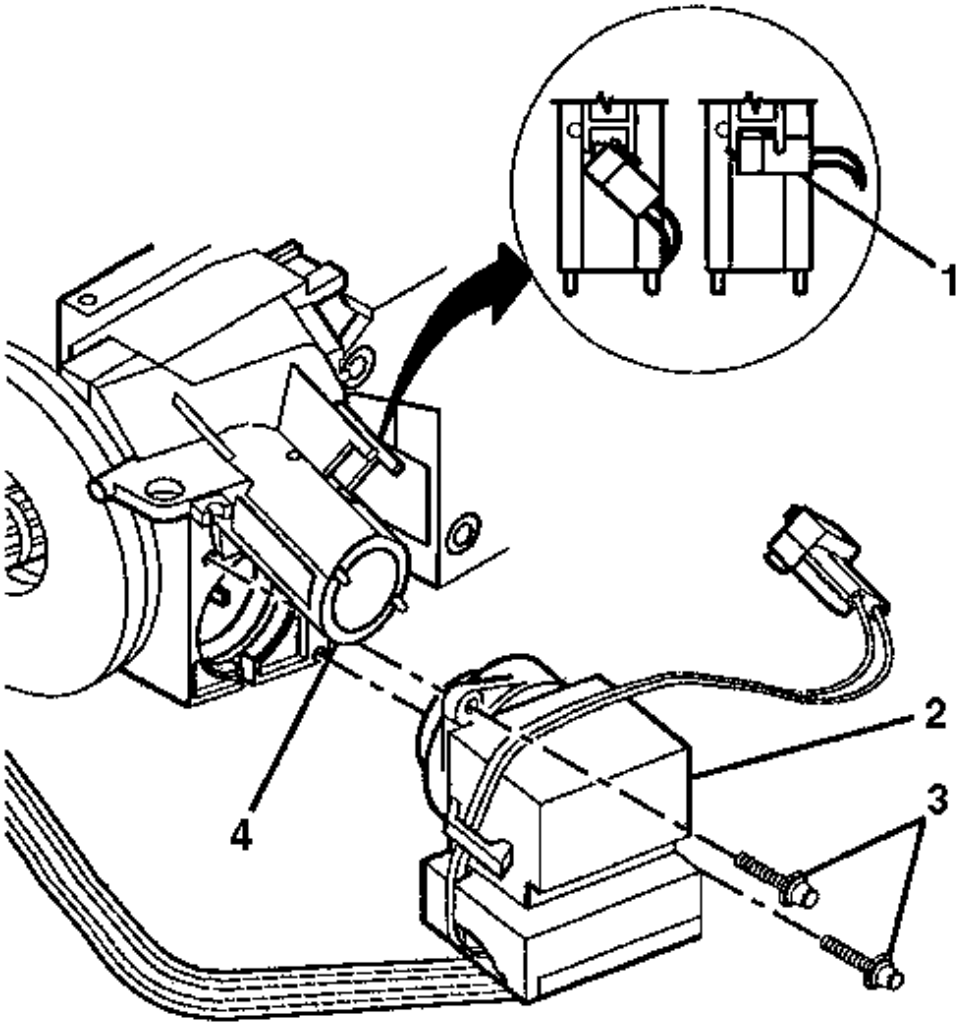

Fig. 19: Key Alarm Connector To/From Ignition Lock Cylinder Case
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install the ignition switch assembly (2) and secure by using 2 tapping screws (3).

   Tighten

   Tighten the screws to 7 N.m (62 lb in).

2. Install the ignition switch assembly connector (1) onto the ignition lock cylinder case (4).

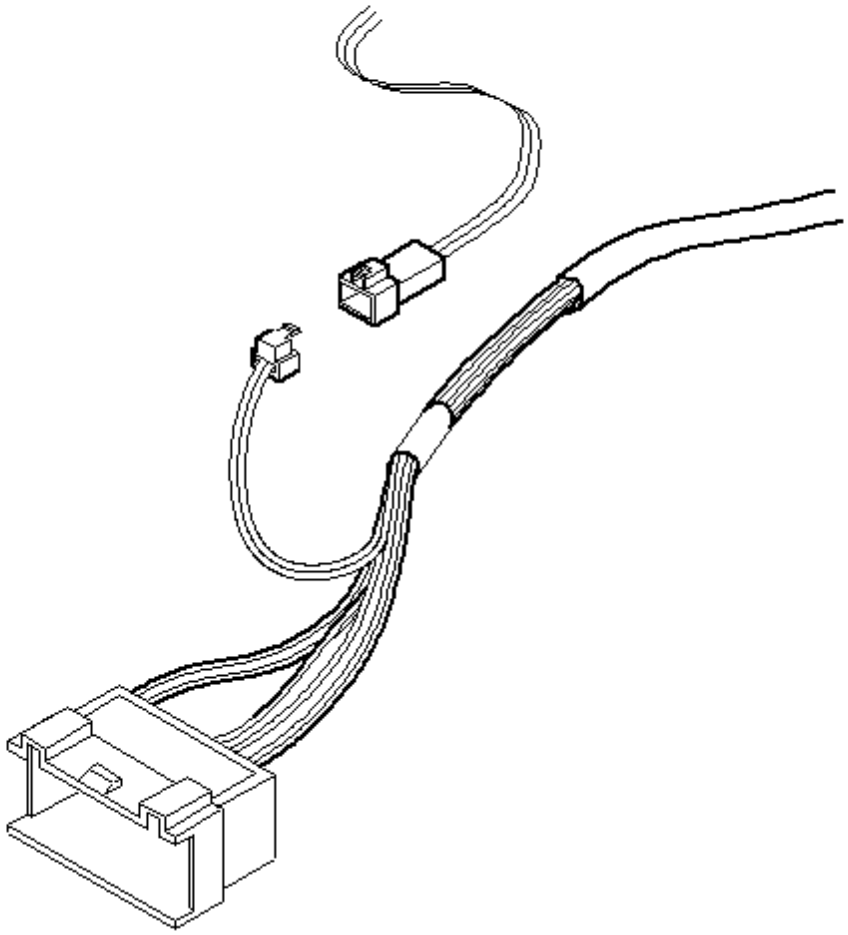

Fig. 20: Theft Deterrent Control Module Connector
Courtesy of GENERAL MOTORS COMPANY

3. Connect the theft deterrent control module connector.
4. Connect the fused jumper assembly connector.

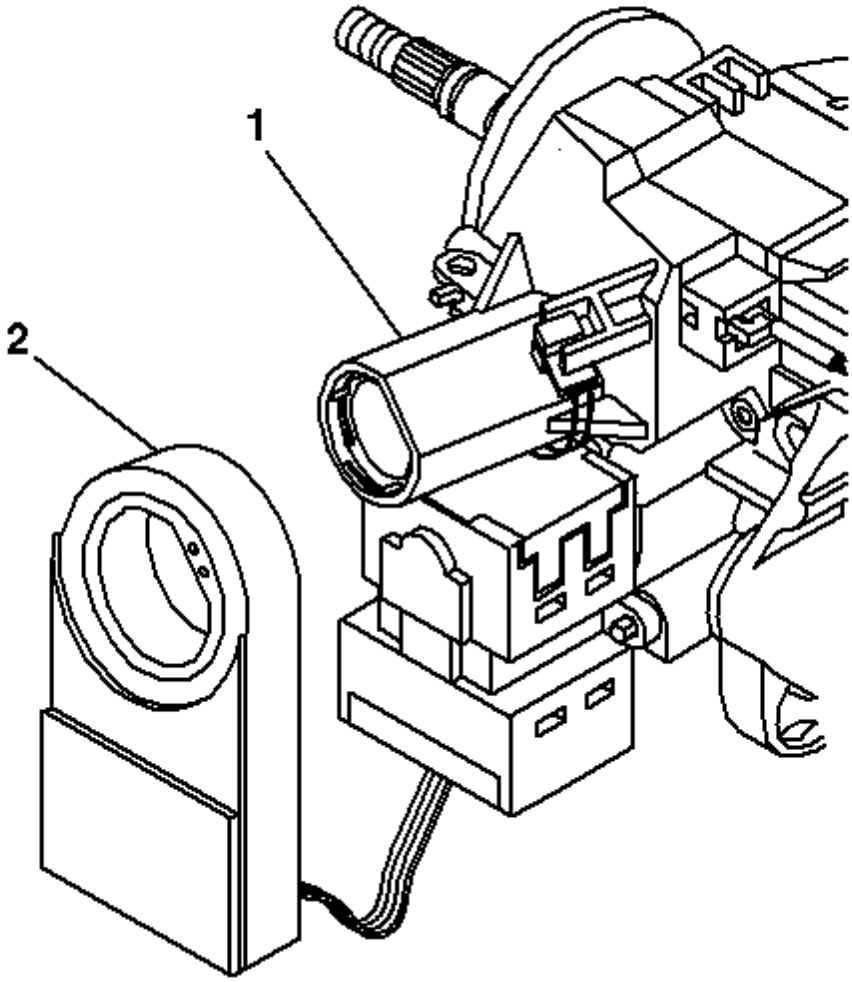

Fig. 21: Locating Theft Deterrent Module & Ignition Lock Cylinder Case Assembly
Courtesy of GENERAL MOTORS COMPANY

5. Install the theft deterrent control module (2) onto the ignition lock cylinder case (1).
6. Install the ignition lock cylinder. Refer to **Ignition Lock Cylinder Replacement**.
7. Install the upper and lower trim covers. Refer to **Steering Column Trim Cover Replacement** .
8. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

IGNITION LOCK CYLINDER CASE REPLACEMENT

Removal Procedure

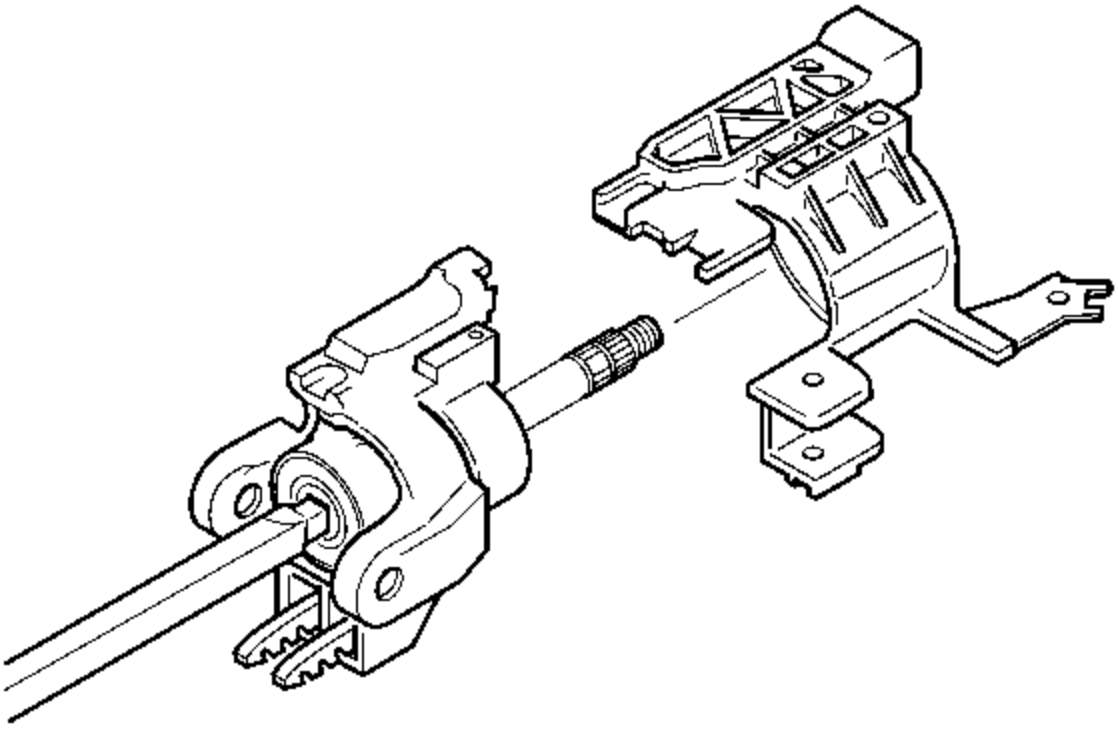

Fig. 22: View Of Turn Signal Switch Housing & Steering Column Shaft Assembly
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to SIR Warning .

1. Disable the SIR system. Refer to **SIR Disabling and Enabling** .
2. Remove the ignition lock cylinder. Refer to **Ignition Lock Cylinder Replacement**.
3. Remove the ignition switch. Refer to **Ignition and Start Switch Replacement**.
4. Remove the steering column tilt head components. Refer to **Turn Signal Cancel Cam and Steering Shaft Upper Bearing Spring Replacement** .
5. Remove the turn signal switch housing. Refer to **Turn Signal Switch Housing Replacement** .
6. Remove the turn signal and multifunction switch assembly only. Refer to **Turn Signal Multifunction Switch Replacement** .

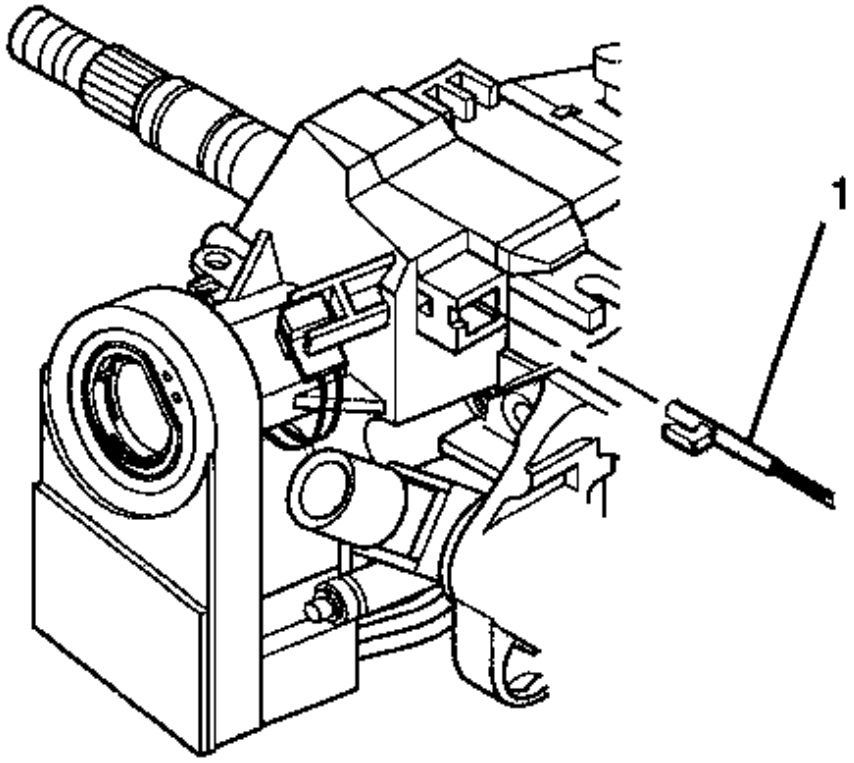

Fig. 23: Identifying Park Lock Cable At Ignition Lock Cylinder
Courtesy of GENERAL MOTORS COMPANY

7. Remove the park lock cable assembly (1) from the ignition lock cylinder case in the following way:
    1. Use a small blade to push against the locking tab on the end of the park lock cable assembly (1).
    2. Disconnect the park lock cable assembly (1) from the ignition lock cylinder case.

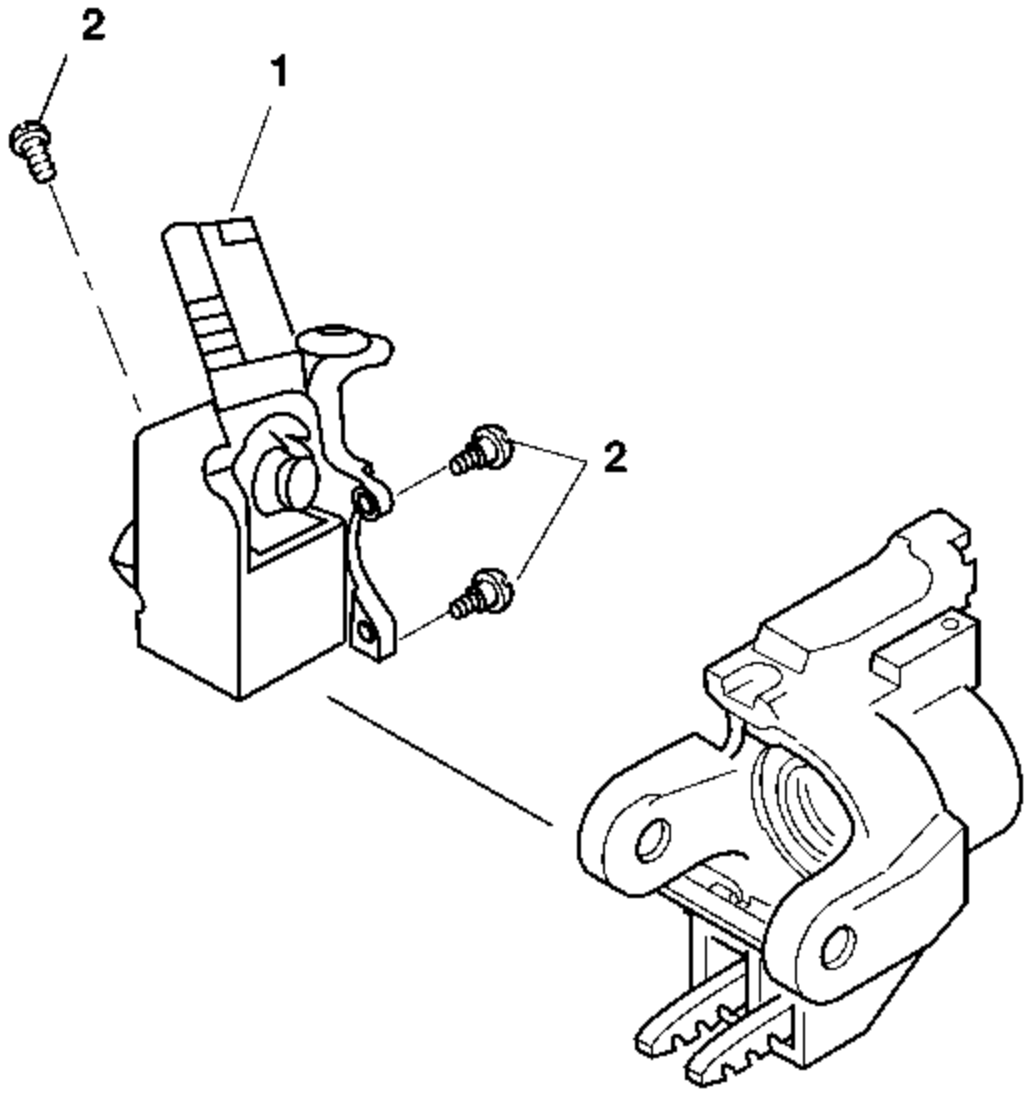

Fig. 24: View Of Ignition Lock Cylinder Case Assembly & Screws
Courtesy of GENERAL MOTORS COMPANY

8. Remove the 3 TORXÂ® screws (2) from the ignition lock cylinder case (1).
9. Remove the ignition lock cylinder case (1) from the steering column tilt head assembly.

Installation Procedure

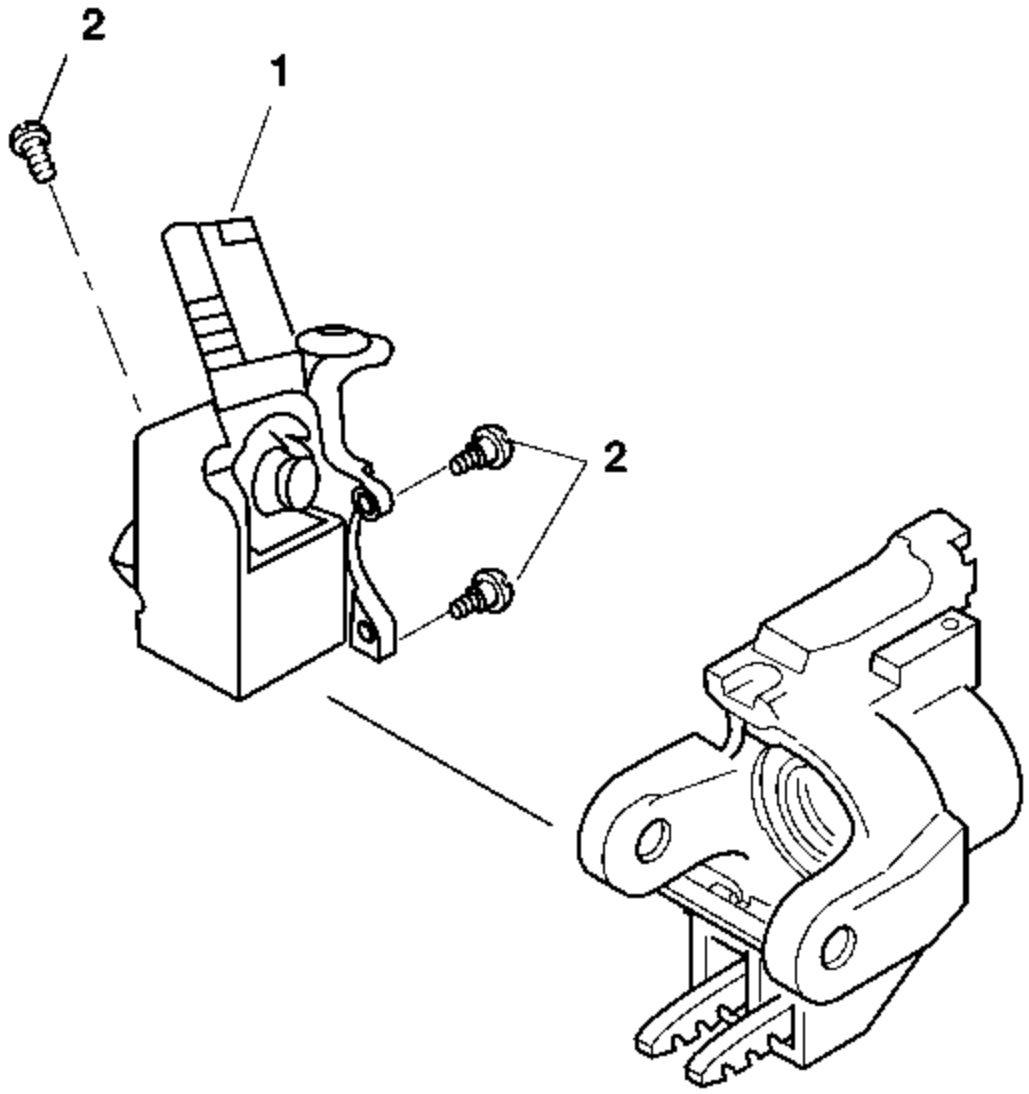

Fig. 25: View Of Ignition Lock Cylinder Case Assembly & Screws
Courtesy of GENERAL MOTORS COMPANY

1. Align the ignition lock cylinder case (1) with the steering column tilt head assembly.

CAUTION: Refer to Fastener Caution .

2. Screw the 3 TORXÂ® screws (2) into the ignition lock cylinder case (1).

Tighten

Tighten the 3 TORXÂ® screws to 7 N.m (62 lb in).

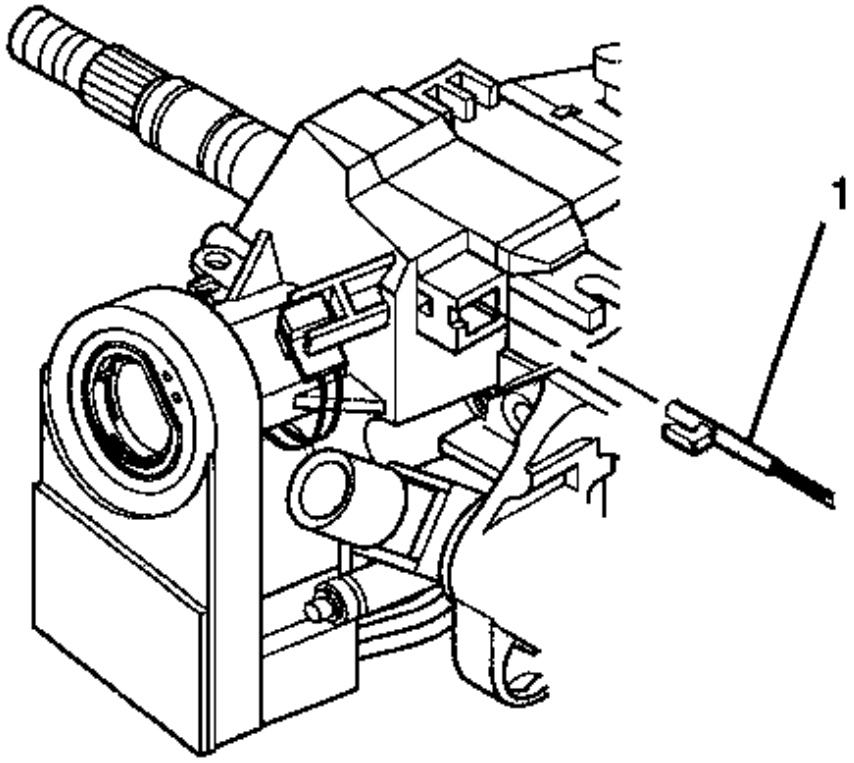

Fig. 26: Identifying Park Lock Cable At Ignition Lock Cylinder
Courtesy of GENERAL MOTORS COMPANY

3. Press the locking tab on the end of the park lock cable assembly (1) into the slot in the ignition lock cylinder case.

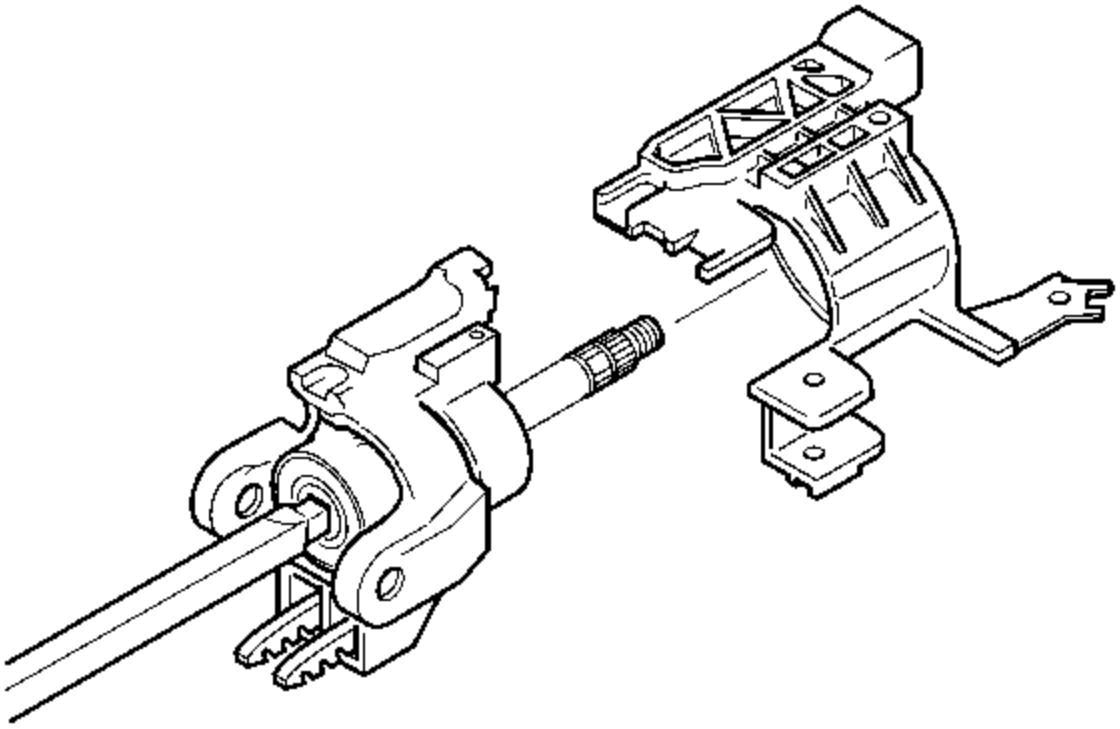

Fig. 27: View Of Turn Signal Switch Housing & Steering Column Shaft Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Press the turn signal switch housing firmly against the steering column tilt head in order for the screws from the turn signal and multifunction switch assembly to align.**

4. Install the turn signal switch housing. Refer to **Turn Signal Switch Housing Replacement** .
5. Install the turn signal and multifunction switch assembly only. Refer to **Turn Signal Multifunction Switch Replacement** .
6. Install the steering column tilt head components. Refer to **Turn Signal Cancel Cam and Steering Shaft Upper Bearing Spring Replacement** .
7. Install the ignition switch only. Refer to **Ignition and Start Switch Replacement**.
8. Install the ignition lock cylinder. Refer to **Ignition Lock Cylinder Replacement**.
9. Enable the SIR system. Refer to **SIR Disabling and Enabling** .

General Icons

Symbol	Description

Symbol	Description
	Master Component List Icon This icon is used on the schematic to link to the Master Electrical Component List.

Symbol	Description
	Description and Operation Icon This icon is used on the schematic to link to the Description and Operation of that particular system.

Symbol	Description
	Computer Programming Icon This icon is used on the schematic to link to Control Module References, which identifies which components need programming upon replacement.

Symbol	Description
	Next Schematic Page Icon This icon is used on the schematic to navigate to the next schematic in the subsystem.

Symbol	Description
	Previous Schematic Page Icon This icon is used on the schematic to navigate to the previous schematic in the subsystem.

Symbol	Description
	Supplemental Inflatable Restraint (SIR) or Supplemental Restraint System (SRS) Icon This icon is used to alert the technician that the system contains SIR/SRS components that require certain precautions before servicing.

Symbol	Description
	Information Icon This icon is used to alert the technician that there is additional information that will aid in servicing a system.

Symbol	Description
	Danger Icon This icon is intended to alert the technician that a component within the system contains labeling with the same icon. This icon is used when a source component has potential for 60 volts DC or greater or has potential for 42 volts AC or greater.

Symbol	Description
	High Voltage Icon This icon is intended to alert the technician that a component within the system contains labeling with the same icon. This icon is used when a component/circuit has potential for 60 volts DC or greater or has potential for 42 volts AC or greater.

Symbol	Description
	Caution Icon This icon is used to advise the technician to use caution when servicing this component. This icon may be used when a component/circuit has a voltage range potential between 30-60 volts DC or 15-42 volts AC.

Symbol	Description
	Functional Serial Data Communication This icon is used to show the technician that the serial data circuit detail is shown incomplete. It also provides an active link to the Data Communication Schematics were the circuit is shown complete.

Switch Position Icons

Vehicle Zoning Strategy

All grounds, in-line connectors, and splices have identifying numbers that correspond to where they are located in the vehicle. The following table explains the numbering system.

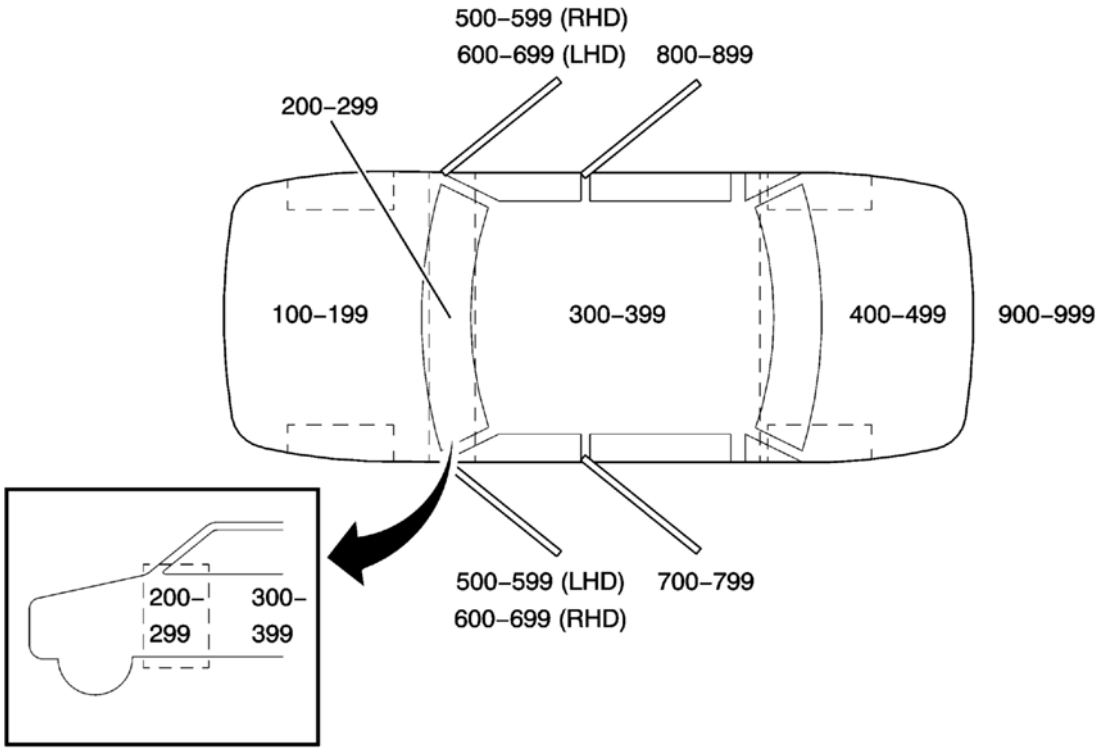

Fig. 23: Passenger Car Zoning View
Courtesy of GENERAL MOTORS COMPANY

Callout Numbers	Zone Description
100-199	Engine compartment (all forward of the instrument panel)
200-299	Within the instrument panel area (between the bulkhead and the front plane of the instrument panel)
300-399	Passenger compartment (from instrument panel to the back of the rear seats)
400-499	Luggage compartment (from the back of the rear seats to the rear of the vehicle)
500-599	Inline harness connectors to or within the driver door
600-699	Inline harness connectors to or within the front passenger door
700-799	Inline harness connectors to or within the left rear door
800-899	Inline harness connectors to or within the right rear door
900-999	Inline harness connectors to or within the luggage compartment lid or hatch

Master Electrical Schematic Icons

Icon	Icon Definition

Icon	Icon Definition
	WARNING: **When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Refer to SIR Disabling and Enabling . Failure to observe the correct procedure could cause deployment of the SIR components, personal injury, or unnecessary SIR system repairs.**
	NOTE: **Twisted-pair wires provide an effective shield that helps protect sensitive electronic components from electrical interference.** **In order to prevent electrical interference from degrading the performance of the connected components, you must maintain the proper specification**

Icon	Icon Definition
	when making any repairs to the twisted-pair wires shown : • **The wires must be twisted a minimum of 9 turns per 31 cm (12 in) as measured anywhere along the length of the wires.** • **The outside diameter of the twisted wires must not exceed 6.0 mm (0.25 in).**

Icon	Icon Definition
	**NOTE:** **The following component has pin numbers that are known to have been changed during production by the wiring harness supplier.** • **JX206 The following lists what cavities are bussed to battery positive voltage and ignition 1 voltage: Pins A, B, C, D, E, and F are all attached to the ignition 1 voltage bus while pins G, H, J, K, and L are all attached to the battery positive**

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC P0010, P0013, P0020, P0023, P2088, P2089, P2090, P2091, P2092, P2093, P2094, OR P2095: CAMSHAFT POSITION ACTUATOR SOLENOID VALVE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Camshaft Position Actuator Solenoid Valve High Control	P0010, P0013, P0020, P0023, P2088, P2090, P2092, P2094	P0010, P0013, P0020, P0023	P0010, P0013, P0020, P0023	P0010, P0013, P0020, P0023, P2089, P2091, P2093, P2095	P0011, P0014, P0021, P0024
Camshaft Position Actuator Solenoid Valve Low Reference	-	P0010, P0013, P0020, P0023	P0010, P0013, P0020, P0023	-	-

Circuit/System Description

The camshaft position actuator system enables the Engine Control Module (ECM) to change the timing of the camshafts while the engine is operating. The Camshaft Position Actuator Solenoid Valve signal from the ECM is pulse width modulated (PWM). The ECM controls the Camshaft Position Actuator Solenoid Valve duty cycle by controlling the amount of solenoid valve On time. The Camshaft Position Actuator Solenoid Valve controls the advance or the retard of each camshaft. The Camshaft Position Actuator Solenoid Valve controls the oil flow that applies the pressure to advance or retard the camshafts.

The ECM controls the Camshaft Position Actuator Solenoid Valve by supplying a 12 V pulse width modulated (PWM) signal. The ECM supplies a ground to the low reference circuit.

Conditions for Running the DTC

- The ignition voltage is greater than 11 V.
- The ignition switch is in the Crank or Run position.
- The ECM commanded the Camshaft Position Actuator Solenoid Valve On.
- DTCs P0010, P0013, P0020, P0023 and P2088 - P2095 run continuously when the above conditions are

met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for greater than 5 s.

Action Taken When the DTC Sets

DTCs P0010, P0013, P0020, P0023 and P2088 - P2095 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0010, P0013, P0020, P0023 and P2088 - P2095 are Type B DTCs.

Diagnostic Aids

If the condition is intermittent, move the related harnesses and connectors, with the engine operating, while monitoring the scan tool circuit status parameters for the component. The circuit status parameters change from OK or Not Run to Malfunction if there is a condition with the circuit or a connection.

Circuit/System Verification

NOTE: **If a crankshaft or camshaft position sensor DTC is set, the Camshaft Position Actuator output control will not function.**

1. Ignition On.
2. Verify DTC P0335, P0336, P0340, P0341, P0345, P0346, P0365, P0366, P0390, or P0391 is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.

   - **If none of the DTCs are set**
3. Verify the scan tool parameters listed below do not display Malfunction:
   - Intake/Exhaust Camshaft Position Actuator Solenoid Valve Control Circuit Low Voltage Test Status Bank 1 or 2
   - Intake/Exhaust Camshaft Position Actuator Solenoid Valve Control Circuit Open Test Status Bank 1 or 2
   - Intake/Exhaust Camshaft Position Actuator Solenoid Valve Control Circuit High Voltage Test Status Bank 1 or 2
   - **If Malfunction is displayed**

     Refer to Circuit/System Testing.

   - **If Malfunction is not displayed**
4. Engine idling at normal operating temperature.
5. Verify the scan tool parameters listed below do not display Malfunction when commanding the appropriate scan tool Camshaft Position Actuator from 0-25Â° and back to 0Â° with a scan tool:
   - Intake/Exhaust Camshaft Position Actuator Solenoid Valve Control Circuit Low Voltage Test Status Bank 1 or 2
   - Intake/Exhaust Camshaft Position Actuator Solenoid Valve Control Circuit Open Test Status Bank 1 or 2
   - Intake/Exhaust Camshaft Position Actuator Solenoid Valve Control Circuit High Voltage Test Status Bank 1 or 2
   - **If Malfunction is displayed**

     Refer to Circuit/System Testing.

   - **If Malfunction is not displayed**
6. Raise the engine speed to 2,000 RPM for 10 s.
7. Verify that DTC P0010, P0013, P0020, P0023 or P2088 - P2095 is not set.
   - **If any of the DTCs are set**

     Refer to Circuit/System Testing.

- **If none of the DTCs set**

8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
9. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
10. All OK

Circuit/System Testing

1. Ignition Off and all vehicle systems Off, disconnect the appropriate harness connector at the Q6 camshaft position actuator solenoid valve. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.
    - **If 5 Ω or greater**
    1. Ignition Off, disconnect the harness connector at the K20 engine control module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit
        - If less than 2 Ω, replace the K20 engine control module
    - **If less than 5 Ω**
3. Ignition On.

    NOTE: **A test lamp must be used for this test. The control circuit is pulled-up to a low current voltage, 1.5-3.5 V on the control circuit is normal.**

4. Verify that a test lamp does not illuminate between the control circuit terminal 1 and ground.
    - **If the test lamp illuminates**
    1. Ignition Off, disconnect the harness connector at the K20 engine control module, ignition On.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit
        - If less than 1 V, replace the K20 engine control module
    - **If the test lamp does not illuminate**
5. Remove the test lamp.
6. Connect the DMM black lead to the control circuit terminal 1. Connect the DMM red lead to B+. Command the Camshaft Position Actuator Solenoid On and Off with a scan tool. Verify the voltage changes.
    - **If the voltage does not change**
    1. Ignition Off, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for less than 2 Ω in the control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance or short to ground in the circuit.

- If less than 2 Ω, replace the K20 Engine Control Module.
- **If the voltage changes**

7. Test or replace the Q6 Camshaft Position Actuator Solenoid Valve.

Component Testing

1. Ignition Off, disconnect the harness connector at the appropriate Q6 Camshaft Position Actuator Solenoid Valve.
2. Test for 5-12 Ω between the control terminal 1 and the low reference terminal 2.
   - **If not between 5-12 Ω**

     Replace the Q6 Camshaft Position Actuator Solenoid Valve.

   - **If between 5-12 Ω**
3. Test for infinite resistance between each terminal and the Q6 Camshaft Position Actuator Solenoid Valve housing.
   - **If not infinite resistance**

     Replace the Q6 Camshaft Position Actuator Solenoid Valve.

   - **If infinite resistance**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 1 (Right Side) Intake**
- **Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 1 (Right Side) Exhaust**
- **Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Intake**
- **Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Exhaust**
- **Control Module References** for K20 Engine Control Module replacement, programming and setup.

DTC P0011, P0014, P0021, OR P0024: CAMSHAFT POSITION SYSTEM

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The camshaft position actuator system enables the engine control module (ECM) to change the timing of the camshafts while the engine is operating. The camshaft position actuator solenoid signal from the ECM is pulse width modulated (PWM). The ECM controls the camshaft position actuator solenoid duty cycle by controlling the amount of solenoid On time. The camshaft position actuator solenoid controls the advance or the retard of each camshaft. The camshaft position actuator solenoid controls the oil flow that applies the pressure to advance or retard the camshafts.

Conditions for Running the DTC

- DTC P0010, P0013, P0020, P0023, P0016, P0017, P0018, P0019, P0335, P0336, P0340, P0341, P0345, P0346, P0365, P0366, P0390, P0391 or P2088 - P2095 is not set.
- The ignition voltage is between 11-32 V.
- The engine is running.
- The desired camshaft position is not changing greater than 4.5Â° for at least 1 s.
- Both of the desired and actual camshaft position actuator values cannot be greater than 20Â° or less than 5Â°.
- DTCs P0011, P0014, P0021, and P0024 run continuously when the above conditions are met.

Conditions for Setting the DTC

P0011 and P0021

The ECM detects the difference between the desired and actual camshaft position angle is greater than 5Â° for greater 2.5 s.

P0014 and P0024

The ECM detects the difference between the desired and actual camshaft position angle is greater than 5Â° for greater 10 s.

Action Taken When the DTC Sets

DTCs P0011, P0014, P0021, and P0024 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0011, P0014, P0021, and P0024 are Type B DTCs.

Diagnostic Aids

Inspect the engine for any recent engine mechanical repairs. An incorrectly installed camshaft, camshaft position actuator solenoid, mechanical camshaft actuator, or timing chain can cause this DTC to set.

Circuit/System Verification

NOTE:

- **The engine oil level and the oil pressure are critical to the correct operation of the camshaft position actuator system. Verify that the engine has the correct oil level and the correct oil pressure before continuing with this diagnostic.**
- **The engine oil condition has a major impact on the camshaft actuator system. Debris in the oil can interfere with the camshaft position actuator solenoid and the mechanical camshaft actuator operation. Inspect for dirty or degraded crankcase oil. The engine may require an oil change. Inquire with the customer when the last oil change was performed. You may also monitor the scan tool Engine Oil Life parameter. Advise the customer an oil change may be required.**
- **If a crankshaft or camshaft position sensor DTC is set, the Camshaft Position Actuator output control will not function.**

1. Ignition On.
2. Verify that the engine has the correct oil level and the correct oil pressure. Refer to **Oil Pressure Diagnosis and Testing** .
   - **If the oil level and the oil pressure are not correct**

     Repair as necessary

   - **If the oil level and the oil pressure are correct**

   NOTE: **If a crankshaft or camshaft position sensor DTC is set, the scan tool Camshaft Position Actuator output control will not function.**

3. Verify DTC P0016, P0017, P0018, P0019, P0335, P0336, P0338, P0340, P0341, P0345, P0346, P0365, P0366, P0390, P0391 or P2088 - P2095 is not set.
   - **If any of the DTCs are set**

     If any of the DTCs are set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.

   - **If none of the DTCs are set**
4. Engine idling.
5. Verify the scan tool parameters are less than 2Â° in each of the commanded states when commanding the Camshaft Position Actuator from 0-20Â° and back to 0Â° with the scan tool.
   - Intake Camshaft Position Variance Bank 1
   - Exhaust Camshaft Position Variance Bank 1
   - Intake Camshaft Position Variance Bank 2

- Exhaust Camshaft Position Variance Bank 2
- **If 2Â° or greater**

  Refer to Circuit/System Testing.

- **If less than 2Â°**

6. Verify that DTC P0011, P0014, P0021 or P0024 is not set.
   - **If any of the DTCs are set**

     Refer to Circuit/System Testing.

   - **If none of the DTCs set**
7. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
8. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
9. All OK.

Circuit/System Testing

1. Ignition Off, disconnect the harness connector at the appropriate Q6 Camshaft Position Actuator Solenoid Valve. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.
   - **If 5 Ω or greater**
   1. Ignition Off, disconnect the harness connector at the K20 Engine Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
   - If 2 Ω or greater, repair the open/high resistance in the circuit.
   - If less than 2 Ω, replace the K20 Engine Control Module.
   - **If less than 5 Ω**
3. Ignition On.
4. Verify that a test lamp does not illuminate between the control circuit terminal 1 and ground.
   - **If the test lamp illuminates**
   1. Ignition Off, disconnect the harness connector at the K20 Engine Control Module, ignition On.
   2. Test for less than 1 V between the control circuit and ground.
   - If 1 V or greater, repair the short to voltage on the circuit.
   - If less than 1 V, replace the K20 Engine Control Module.
   - **If the test lamp does not illuminate**
5. Verify the test lamp illuminates when commanding the appropriate Camshaft Position Actuator Solenoid Valve On with a scan tool.

- **If the test lamp does not illuminate**

1. Ignition Off, disconnect the harness connector at the K20 Engine Control Module.
2. Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance or short to ground in the circuit.
- If less than 2 Ω, replace the K20 Engine Control Module.
- **If the test lamp illuminates**

6. Ignition Off, remove the Q6 Camshaft Position Actuator Solenoid Valve.
7. Verify the conditions listed below do not exist with the Q6 Camshaft Position Actuator Solenoid Valve:
    1. Torn, restricted, mis-positioned, or missing screens.
    2. Engine oil leak between the oil sealing lands of the solenoid. Inspect the lands of the solenoid for nicks.
    3. Oil seepage at the solenoid connector.

- **If a condition is found**

  Replace the Q6 Camshaft Position Actuator Solenoid Valve.

- **If a condition is not found**

NOTE: **After swapping the solenoids, install jumper wires to the appropriate terminals of the harness connectors and the solenoids.**

8. Ignition Off, swap the Q6 Camshaft Position Actuator Solenoid Valve with the Q6 Camshaft Position Actuator Solenoid Valve that is operating correctly.
9. Engine idling.
10. Verify the scan tool Camshaft Position Variance parameter is less than 2Â° in each of the commanded states when commanding the Camshaft Position Actuator from 0-20Â° and back to 0Â° with a scan tool.

- **If 2Â° or greater**

  Replace the mechanical camshaft position actuator.

- **If less than 2Â°**

11. Test or replace the Q6 Camshaft Position Actuator Solenoid Valve.

Component Testing

1. Ignition Off, disconnect the harness connector at the appropriate Q6 Camshaft Position Actuator Solenoid Valve.
2. Test for 5-12 Ω between the control terminal 1 and the low reference terminal 2.

- **If not between 5-12 Ω**

  Replace the Q6 Camshaft Position Actuator Solenoid Valve.

- **If between 5-12 Ω**

3. Test for infinite resistance between each terminal and the Q6 camshaft position actuator solenoid valve housing.

- **If not infinite resistance**

  Replace the Q6 Camshaft Position Actuator Solenoid Valve.

- **If infinite resistance**

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Camshaft Position Actuator Replacement - Bank 1**
- **Camshaft Position Actuator Replacement - Bank 2**
- **Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 1 (Right Side) Intake**
- **Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 1 (Right Side) Exhaust**
- **Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Intake**
- **Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 2 (Left Side) Exhaust**
- **Control Module References** for K20 ECM replacement, programming, and setup

DTC P0016, P0017, P0018, OR P0019: CAMSHAFT POSITION NOT PLAUSIBLE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0016

Crankshaft Position - Intake Camshaft Position Not Plausible Bank 1

DTC P0017

Crankshaft Position - Exhaust Camshaft Position Not Plausible Bank 1

DTC P0018

Crankshaft Position - Intake Camshaft Position Not Plausible Bank 2

DTC P0019

Crankshaft Position - Exhaust Camshaft Position Not Plausible Bank 2

Circuit/System Description

The engine control module (ECM) uses the crankshaft position sensor and the camshaft position sensor pulses to monitor the correlation between the crankshaft and the camshaft position.

Conditions for Running the DTC

- DTC P0335, P0336, P0340, P0341, P0345, P0346, P0365, P0366, P0390, P0391, P0641, or P0642 is not set.
- The crankshaft and camshaft position signals are synchronized.
- The engine is cranking or running.
- The camshaft position actuator is in the parked position.

The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

DTC P0016, P0017, P0018, or P0019

- The ECM detects that one camshaft is mis-aligned with the crankshaft. The ECM detects one of the following conditions:
  - Bank 1 intake camshaft is greater than 9Â° advanced or 12Â° retarded in relationship to the crankshaft.
  - Bank 1 exhaust camshaft is greater than 10Â° advanced or 13Â° retarded in relationship to the crankshaft.
  - Bank 2 intake camshaft is greater than 11Â° advanced or 13Â° retarded in relationship to the crankshaft.
  - Bank 2 exhaust camshaft is greater than 9Â° advanced or 13Â° retarded in relationship to the crankshaft.
- The ECM detects that all 4 camshafts are mis-aligned with the crankshaft. The ECM detects the following conditions:
  - Bank 1 intake camshaft is greater than 9Â° advanced or 12Â° retarded in relationship to the crankshaft.
  - Bank 1 exhaust camshaft is greater than 10Â° advanced or 13Â° retarded in relationship to the crankshaft.
  - Bank 2 intake camshaft is greater than 6Â° advanced or 9Â° retarded in relationship to the crankshaft.
  - Bank 2 exhaust camshaft is greater than 7Â° advanced or 9Â° retarded in relationship to the crankshaft.

Action Taken When the DTC Sets

DTCs P0016, P0017, P0018, and P0019 are type B DTCs.

Conditions for Clearing the DTC

DTCs P0016, P0017, P0018, and P0019 are type B DTCs.

Diagnostic Aids

- Inspect the engine for any recent engine mechanical repairs. An incorrectly installed secondary timing chain can cause this DTC to set.

- This diagnostic algorithm is designed to detect an alignment condition between a primary intermediate sprocket and the secondary timing chain or the alignment between a primary intermediate sprocket and the crankshaft. Either condition would cause the camshaft timing for both cams on one bank to be off an equal number of degrees.
- DTCs P0016, P0017, P0018, and P0019 set at the same time indicate a possible condition with the primary timing chain and the alignment between both intermediate sprockets and the crankshaft. Also, the crankshaft reluctor wheel may have moved and is no longer referenced to top dead center (TDC).
- Observing the desired and actual camshaft angle parameters with a scan tool before a DTC sets may help to isolate whether a condition is specific to one camshaft, one bank, or caused by a condition with the primary crankshaft timing.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC P0010, P0013, P0020, P0023, P0335, P0336, P0340, P0341, P0345, P0346, P0365, P0366, P0390, P0391, P2088, P2089, P2090, P2091, P2092, P2093, P2094, 20095 or P25CA-P25CE is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Verify the conditions below do not exist:
    - A Q6 Camshaft Position Actuator Solenoid Valve that is stuck in the full advance or retard position
    - The correct installation of the Q6 Camshaft Position Actuator Solenoid Valves
    - The correct installation of the B23 Camshaft Position Sensors
    - The correct installation of the B26 Crankshaft Position Sensor
    - A timing chain tensioner condition
    - An incorrectly installed timing chain
    - Excessive play in the timing chain
    - A timing chain that jumped teeth
    - A crankshaft reluctor wheel that has moved in relationship to top dead center (TDC) on the crankshaft

- **If a condition is found**

  Repair as necessary.

- **If no condition is found**

4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.
   - **If the DTC sets**

     A mechanical condition listed above still exists.

   - **If the DTC does not set**
6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

HO2S Heater Low Control	0 A	0 A	0 A
HO2S Heater Voltage Supply	0 A	0 A	0.2-2 A

Circuit/System Description

Heated oxygen sensors (HO2S) are used for fuel control and post catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content in the exhaust stream. The HO2S must reach operating temperature to provide an accurate voltage signal. A heating element inside the HO2S minimizes the time required for the sensors to reach operating temperature. Voltage is provided to the heater by an ignition voltage circuit through a fuse. With the engine running, ground is provided to the heater by the HO2S heater low control circuit through a low side driver within the engine control module (ECM). The ECM uses pulse width modulation (PWM) to control the HO2S heater operation to maintain a specific HO2S operating temperature range.

Conditions for Running the DTC

P0030-P0032, P0036-P0038, P0050-P0052, or P0056-P0058

- The Ignition voltage is between 11-32 V.
- The engine speed is greater than 400 RPM.
- The DTCs run continuously when the above conditions are met.

P0053, P0054, P0059, or P0060

- DTCs P0112, P0113, P0117, P0118, or P2610 are not set.
- The engine run time is greater than 20 s.
- The Ignition voltage is less than 18 V.
- The ignition is OFF for greater than 8 h.
- The engine coolant temperature (ECT) is between -30 to +45Â°C (-22 to +113Â°F) at engine start-up.
- The ECT and the intake air temperature (IAT) are within 8Â°C (14Â°F) at engine start-up.
- The DTCs run once per drive cycle when the above conditions are met.

P0135, P0141, P0155, or P0161

- DTCs P0116, P0117, P0118, P0125, or P0128 are not set.
- The Ignition voltage is between 10-32 V.
- The HO2S is at operating temperature.
- The HO2S is commanded ON.
- The DTCs run once per drive cycle when the above conditions are met for 120 s.

Conditions for Setting the DTC

P0030, P0036, P0050, or P0056

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match

for greater than 5 s.

P0031, P0037, P0051, or P0057

The engine control module detects a short to ground in the heater output low side driver circuit of the heated oxygen sensor when the heater is commanded OFF for greater than 13 s.

P0032, P0038, P0052, or P0058

The engine control module detects a short to voltage in the heater output low side driver circuit of the heated oxygen sensor when the heater is commanded ON for greater than 13 s.

P0053, P0054, P0059, or P0060

The ECM detects the HO2S heater is not within a specified resistance range at engine start-up.

P0135 or P0155

The ECM detects that the HO2S 1 heater current is greater than 3.1 amps, or less than 0.3 amps for greater than 8 s.

P0141 or P0161

The ECM detects that the HO2S 2 heater current is greater than 2.9 amps, or less than 0.3 amps for greater than 8 s.

Action Taken When the DTC Sets

DTCs P0030-P0032, P0036-P0038, P0050-P0054, P0056-P0060, P0135, P0141, P0155, and P0161 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0030-P0032, P0036-P0038, P0050-P0054, P0056-P0060, P0135, P0141, P0155, and P0161 are Type B DTCs.

Circuit/System Verification

1. Ignition ON.
2. Verify the parameters listed below do not display Malfunction when commanding the HO2S Heater Bank 1 or 2 Sensor 1 or 2 ON and OFF with a scan tool .
   - HO2S Heater Control Circuit Low Voltage Test Status Bank 1 or 2 Sensor 1 or 2
   - HO2S Heater Control Circuit Open Test Status Bank 1 or 2 Sensor 1 or 2
   - HO2S Heater Control Circuit High Voltage Test Status Bank 1 or 2 Sensor 1 or 2
   - **If Malfunction is displayed**

     Refer to Circuit/System Testing.

   - **If Malfunction is not displayed**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate B52 Heated Oxygen Sensor. Ignition ON.
2. Verify that a test lamp illuminates between the ignition voltage circuit terminal D and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF, remove the test lamp.
   2. Test for less than 2 Ω in the ignition circuit end to end.
   - If 2 Ω or greater, repair the open/high resistance in the circuit.
   - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF.
   2. Test for infinite resistance between the ignition circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, test all components connected to the fuse and replace as necessary.
- **If the test lamp illuminates**

3. Verify that a test lamp does not illuminate between the ignition voltage circuit terminal D and the control circuit terminal C.
   - **If the test lamp illuminates**
   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
   2. Test for infinite resistance between the control circuit and ground.
   - If less than infinite resistance, repair the short to ground on the circuit.
   - If infinite resistance, replace the K20 Engine Control Module.
   - **If the test lamp does not illuminate**
4. Remove the test lamp.
5. Verify the scan tool HO2S Heater Control Circuit High Voltage Test Status Bank 1 or 2 Sensor 1 or 2 parameter is OK when commanding the HO2S Heater ON with a scan tool.
   - **If the parameter is not OK**
   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module. Ignition ON.
   2. Test for less than 1 V between the control circuit and ground.
   - **If the parameter is OK**

NOTE:

- **Less than 10 Ω of additional resistance on the ignition voltage circuit or control circuit may set a DTC. If there is a resistance on a circuit, the driver will remain ON and the scan tool HO2S High Voltage Test Status parameter will display OK.**
- **Performing this test may set additional DTCs.**

6. Install a 10 A fused jumper wire between the control circuit terminal C and the ignition voltage circuit terminal D.

NOTE: **This test may only be performed once per key cycle. If test is repeated, ignition OFF, allow the engine control module to shut down completely, then ignition ON.**

7. Verify the scan tool HO2S Heater Control Circuit High Voltage Test Status Bank 1 or 2 Sensor 1 or 2 parameter is Malfunction when commanding the HO2S Heater ON with a scan tool.
   - **If the parameter is not Malfunction**
   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
   2. Test for less than 2 Ω in the control circuit end to end.
   - If 2 Ω or greater, repair the open/high resistance in the circuit.
   - If less than 2 Ω, replace the K20 Engine Control Module.
   - **If the parameter is Malfunction**
8. Test or replace the B52 Heated Oxygen Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Heated Oxygen Sensor Replacement - Bank 1 Sensor 1**
- **Heated Oxygen Sensor Replacement - Bank 1 Sensor 2**
- **Heated Oxygen Sensor Replacement - Bank 2 Sensor 1**
- **Heated Oxygen Sensor Replacement - Bank 2 Sensor 2**
- Perform the scan tool Heated Oxygen Sensor Resistance Learn Reset after replacing an HO2S.
- **Control Module References** for ECM replacement, programming and setup

DTC P0068 OR P1101: AIR FLOW

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0068

Throttle Body Air Flow Performance

DTC P1101

Intake Air Flow System Performance

Circuit/System Description

The engine control module (ECM) compares actual air flow based on throttle position (TP) to a calculated air flow based on manifold absolute pressure (MAP) sensor, and mass air flow (MAF).

Conditions for Running the DTC

DTC P0068

- The engine speed is greater than 800 RPM.
- The ignition voltage is greater than 6.5 V.
- The throttle actuator control system is not in reduced power mode.
- The DTC runs continuously when the above conditions are met.

DTC P1101

- DTCs P0102, P0103, P0107, P0108, P0111, P0112, P0113, P0114. P0116, P0117, P0118, P0128, P0335, or P0336 are not set
- The engine speed is between 600-6,800 RPM
- The engine coolant temperature (ECT) is between -7 and +125Â°C (+19 and +257Â°F).

- The intake air temperature (IAT) sensor 1 is between -20 and +125Â°C (-4 to +257Â°F).
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the actual air flow rate is greater than the calculated air flow.

Action Taken When the DTC Sets

- DTC P0068 is a type A DTC.
- DTC P1101 is a type B DTC.

Conditions for Clearing the DTC

- DTC P0068 is a type A DTC.
- DTC P1101 is a type B DTC.

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC P0641, P0651, P0697, or P06A3 is not set.
    - **If any of the DTCs are set**

Refer to **DTC P0641, P0651, P0697, or P06A3 (ECM)** for further diagnosis.

- **If none of the DTCs are set**

3. Verify the scan tool Throttle Body Idle Air Flow Compensation parameter is less than 90 %.
   - **90 % or greater**

     Refer to **Throttle Body Inspection and Cleaning** .

   - **If less than 90 %**
4. Verify the scan tool Throttle Position Sensors 1 and 2 Agree/Disagree parameter displays Agree while performing the Throttle Sweep Test with a scan tool.
   - **If Disagree**

     Refer to **DTC P0121-P0123, P0222, P0223, P16A0-P16A2, or P2135** for further diagnosis.

   - **If Agree**
5. Determine the current vehicle testing altitude.
6. Verify the scan tool MAP Sensor pressure parameter is within the range specified in the **Altitude Versus Barometric Pressure (With LFX)** table.
   - **If the MAP Sensor parameter is not in range**

     Refer to **DTC P0106** for further diagnosis.

   - **If the MAP Sensor parameter is in range**
7. Verify the scan tool MAF Sensor g/s parameter changes smoothly and gradually as the engine speed is increased and decreased while performing the actions listed below.
   1. Engine idling
   2. Perform the scan tool snapshot function.
   3. Increase the engine speed slowly to 3,000 RPM and then back to idle.
   4. Exit from the scan tool snapshot and review the data.
   5. Observe the MAF Sensor parameter frame by frame with a scan tool.
   - **The MAF Sensor parameter does not change smoothly and gradually**

     Refer to **DTC P0101** for further diagnosis.

   - **The MAF Sensor parameter changes smoothly and gradually**
8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
9. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing for further diagnosis.

   - **If the DTC does not set.**
10. All OK.

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.**

1. Verify the integrity of the entire air induction system by verifying that none of the following conditions exist:
    - Any damaged, improperly installed, collapsed, or restricted components
    - Loose clamps, cracks, or other damage
    - An air flow restriction
    - Restricted air filter
    - Splits, kinks, leaks, or improper connections at the vacuum hoses
    - Vacuum leaks at the intake manifold, MAP sensor, and throttle body
    - Water intrusion
    - Any snow or ice buildup, in cold climates
    - Contamination of the MAF sensor element
    - Improper operation of the crankcase ventilation system-Refer to **Crankcase Ventilation System Inspection/Diagnosis** for further diagnosis.
    - Missing, restricted, or leaking exhaust components-Refer to **Symptoms - Engine Exhaust** for further diagnosis.
    - **If a condition is found**

      Repair or replace component as appropriate.

    - **If no condition is found**
2. Test the engine for a mechanical condition. Refer to **Symptoms - Engine Mechanical** for diagnosis.
    - **If a condition is found**

      Repair or replace component as appropriate.

    - **If no condition is found**
3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for engine control module replacement, programming, and setup.

DTC P0089, P00C6, P228C, OR P228D: FUEL PRESSURE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0089

Fuel Pressure Regulator Performance

DTC P00C6

Fuel Rail Pressure Low During Engine Cranking

DTC P228C

Fuel Pressure Regulator Solenoid Control Performance - Low Pressure

DTC P228D

Fuel Pressure Regulator Control Performance - High Pressure

Circuit/System Description

The high fuel pressure necessary for direct injection is supplied by the high pressure fuel pump. The high pressure fuel pump is mounted on the rear of the engine and is driven by a three-lobe cam on the Bank 2 exhaust camshaft. This high pressure fuel pump also regulates the fuel pressure using an actuator in the form of an internal solenoid-controlled valve. In order to keep the engine running efficiently under all operating conditions, the engine control module (ECM) requests pressure ranging from 2 to 15 MPa (290 to 2,176 psi), depending on engine speed and load. Output drivers in the ECM provide the high pressure fuel pump actuator control circuit with a 12 V pulse-width modulated (PWM) signal, which regulates fuel pressure by closing and opening the control valve at specific times during pump strokes. This effectively regulates the portion of each pump stroke that is delivered to the fuel rail. When the control solenoid is NOT powered, the pump operates at maximum flow rate. In the event of pump control failure, the high pressure system is protected by a relief valve in the high pressure fuel pump that prevents the pressure from exceeding 17.5 MPa (2,538 psi).

The fuel rail pressure sensor provides the feedback necessary to the ECM to control the high pressure fuel pump and the fuel injectors. This sensor is diagnosed separately from the fuel pressure control system.

The ECM monitors the fuel rail pressure sensor and the high pressure fuel pump actuator to determine if the commanded and actual pressures are within a predetermined range during engine cranking and at all times while the engine is running. The ECM also monitors the high pressure fuel pump actuator to make sure it is operating within expected limits.

Conditions for Running the DTC

P0089, P228C, or P228D

- DTC P0016, P0017, P0018, P0019, P0090, P0091, P0092, P00C8, P00C9, P00CA, P0111, P0112, P0113, P0116, P0117, P0118, P0128, P0192, P0193, P0335, P0336, P0340, P0341, P0345, P0346, P0365, P0366, P0390, P0391, or P0628, is not set.
- The ignition voltage is greater than 8 V.
- The low side fuel pressure is greater than 275 kPa (40 psi).
- The engine is running.

- The DTCs run continuously when the above conditions are met for 10 s.

P00C6

- DTC P0090, P0091, P0092, P00C8, P00C9, P00CA, P0116, P0117, P0118, P0128, P0192, P0193, P0335, P0336, P0340, P0341, P0345, P0346, P0365, P0366, P0390, P0391, or P0628, is not set.
- The ignition voltage is more than 8 V.
- The engine coolant temperature is less than 65Â°C (149Â°F).
- The low side fuel pressure is greater than 300 kPa (44 psi).
- The diagnostic runs once for each engine start.

Conditions for Setting the DTC

P0089

The high pressure fuel pump has exceeded it's control limits. This condition exists when the high pressure fuel pump actuator command is 0Â° or greater than 240Â°. The condition exists for greater than 10 s.

P00C6

The engine control module detects that the fuel rail pressure is not rising greater than 3 MPa (435 psi) or has fallen below 2 MPa (290 psi) during engine cranking, depending on initial pressure when cranking begins.

P228C

The actual fuel rail pressure is 3 MPa (435 psi) less than the desired fuel rail pressure. The condition exists for greater than 10 s.

P228D

The actual fuel rail pressure is 3 MPa (435 psi) greater than the desired fuel rail pressure. The condition exists for greater than 10 s.

Action Taken When the DTC Sets

- DTCs P0089 and P00C6 are Type B DTCs.
- DTCs P228C and P228D are Type A DTCs.
- A message center or an indicator displays Reduced Engine Power for P228C and P228D.

Conditions for Clearing the DTC

- DTCs P0089 and P00C6 are Type B DTCs.
- DTCs P228C and P228D are Type A DTCs.

Diagnostic Aids

- A leak in the high pressure fuel system may set a DTC.
- A faulty valve, plunger, or solenoid in the high pressure fuel pump may set a DTC. High pressure fuel pump damage will most likely be undetectable upon visual inspection.

- A restricted fuel feed pipe between the high pressure fuel pump and the fuel rail pressure sensor may set a DTC.
- Any problem with the Bank 2 exhaust cam may set fuel pressure DTCs due to the location and design of the high pressure fuel pump. If DTC P0019 or P0391 are current or in history, a cam control issue may be the root cause.
- A leaking or restricted fuel injector may set DTC P0089.
- For DTC P00C6, park the vehicle outdoors overnight and perform a start in the morning.
- A short to voltage in the crankshaft position signal circuit may set a DTC.
- As little as 2 Ω on either circuit of the high pressure fuel pump actuator will cause these DTCs to set. Test the circuits of the high pressure fuel pump actuator for a high resistance if you suspect a condition.

Circuit/System Verification

1. Ignition ON
2. Verify DTC P0016, P0017, P0018, P0019, P0090, P0091, P0092, P00C8, P00C9, P00CA, P0111, P0112, P0113, P0116, P0117, P0118, P0128, P0192, P0193, P0335, P0336, P0340, P0341, P0345, P0346, P0365, P0366, P0390, P0391, or P0628 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of the DTCs are set**

3. Engine at idle.
4. Verify the Fuel Rail Pressure Sensor parameter is between 1.9-5.0 MPa (276-725 psi).
   - **If not between 1.9-5.0 MPa (276-725 psi)**

     Refer to Circuit/System Testing.

   - **If between 1.9-5.0 MPa (276-725 psi)**
5. Verify the scan tool Fuel Rail Pressure Sensor parameter increases and decreases when commanding the Fuel Rail Pressure Control with a scan tool.
   - **If the Fuel Rail Pressure Sensor does not increase and decrease with each command**

     Refer to Circuit/System Testing.

   - **If the Fuel Rail Pressure Sensor increases and decreases with each command**

WARNING: Road test a vehicle under safe conditions and while obeying all traffic laws. Do not attempt any maneuvers that could jeopardize vehicle control. Failure to adhere to these precautions could lead to serious personal injury and vehicle damage.

6. Road test the vehicle and perform a wide open acceleration from a stop until the transmission shifts into second gear. On manual transmission applications, shift to second gear or stop the test near 7,000 RPM. Repeat the test at least three times.
7. Verify DTCs P0089, P00C6, P228C, and P228D do not set.
   - **If any of the DTCs set**

     Refer to Circuit/System Testing.

   - **If none of the DTCs set**
8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
9. Verify DTCs P0089, P00C6, P228C, and P228D do not set.
   - **If any of the DTCs set**

     Refer to Circuit/System Testing.

   - **If none of the DTCs set**
10. All OK.

Circuit/System Testing

NOTE: Circuit/System Verification must be performed first or misdiagnosis may result.

1. Clear all DTCs.

WARNING: **Road test a vehicle under safe conditions and while obeying all traffic laws. Do not attempt any maneuvers that could jeopardize vehicle control. Failure to adhere to these precautions could lead to serious personal injury and vehicle damage.**

2. Road test the vehicle and perform a wide open acceleration from a stop until the transmission shifts into second gear. On manual transmission applications, shift to second gear or stop the test near 7,000 RPM. Repeat the test at least three times.
3. Verify the scan tool Fuel Rail Pressure Sensor parameter is between 14-17 MPa (2031-2,466 psi) while under load near 7,000 RPM.
    - **If not within the specified range**
    1. Remove the G18 High Pressure Fuel Pump.
    2. Inspect the lobes on the camshaft for unusual wear.
        - If the camshaft lobes are worn, replace the camshaft.
        - If the camshaft lobes appear normal, test or replace the G18 High Pressure Fuel Pump.
    - **If within the specified range**
4. Verify none of the conditions listed below exist:
    1. Contaminates in the fuel system, Refer to **Alcohol/Contaminants-in-Fuel Diagnosis**
    2. A Leak in the high pressure fuel system.
    3. A restricted fuel feed pipe between the G18 High Pressure Fuel Pump and the B47B Fuel Rail Pressure Sensor.
    4. A leaking or restricted Q17 Fuel Injector, Refer to **Fuel Injector Solenoid Coil Test** , and **Fuel Injector Balance Test** .
    5. High resistance in the G18 High Pressure Fuel Pump actuator circuits.
    - **If a condition exist**

      Repair as necessary.

    - **If none of the conditions exist**
5. All OK.

Component Testing

1. Ignition OFF, disconnect the harness connector at the G18 High Pressure Fuel Pump.

NOTE: **The DMM and test leads must be calibrated to 0 Ω in order to prevent misdiagnosis.**

2. Test for 9-11 Ω at 25Â°C (77Â°F) of resistance between G18 High Pressure Fuel Pump actuator low control circuit terminal 1 and high control circuit terminal 2.
    - **If not within the specified range**

      Replace the G18 High Pressure Fuel Pump.

    - **If within the specified range**

3. Test for infinite resistance between each G18 High Pressure Fuel Pump actuator terminal and the G18 High Pressure Fuel Pump housing/case.
    - **If less than infinite resistance**

      Replace the G18 High Pressure Fuel Pump.

    - **If infinite resistance**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Camshaft Replacement - Left Side**
- **Fuel Pump Replacement** for G18 High Pressure Fuel Pump replacement.

  NOTE: **Some vehicles do not support the Fuel Rail Pressure Relief Valve Reset procedure. Applications not supporting this procedure will return an error message stating "Parameter ID not supported. Check for proper vehicle selection."**

- Perform the Fuel Rail Pressure Relief Valve Reset procedure.

DTC P0090-P0092, P00C8, P00C9, OR P00CA: FUEL PRESSURE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

High Pressure Fuel Pump Actuator Low Control	P0091, P0092, P00C9	P0090, P00C8	P0092, P00CA	-

Circuit/System Description

High pressure fuel is regulated by the high pressure fuel pump actuator, which is a part of the high pressure fuel pump. The high pressure fuel pump actuator is a solenoid valve. The engine control module (ECM) provides battery voltage on the actuator high control circuit and ground on the actuator low control circuit. Both circuits are controlled through output drivers within the ECM. When deactivated, both drivers are disabled. When activated, the high control circuit driver energizes the high pressure fuel pump actuator and the low control circuit driver pulse-width modulates (PWM) the low control circuit to ground. The ECM monitors the voltage on the circuits to detect a failure.

The high fuel pressure necessary for direct injection is supplied by the high pressure fuel pump. The high pressure fuel pump is mounted on the rear of the engine and is driven by a three-lobe cam on the Bank 2 exhaust camshaft. This high pressure fuel pump also regulates the fuel pressure using an actuator in the form of an internal solenoid-controlled valve. In order to keep the engine running efficiently under all operating conditions, the ECM requests pressure ranging from 2-15 MPa (290-2,176 PSI), depending on engine speed and load. Output drivers in the ECM provide the pump control circuit with a 12 V pulse-width modulated (PWM) signal, which regulates fuel pressure by closing and opening the control valve at specific times during pump strokes. This effectively regulates the portion of each pump stroke that is delivered to the fuel rail.

It is important to note that the high pressure fuel pump is a trailing-edge control system, meaning that if the control solenoid is NOT powered, the pump operates at maximum flow rate. In the event of pump control failure, the high pressure system is protected by a relief valve in the pump that prevents the pressure from exceeding 17.5 MPa (2,538 PSI).

NOTE: **The fuel rail pressure sensor is diagnosed separately from the fuel pressure control system and should not be replaced for any codes referenced in this document.**

The fuel rail pressure sensor operates on a 5 V reference circuit and it provides the feedback necessary to the ECM to control the high pressure fuel pump and the fuel injectors.

Conditions for Running the DTC

- The ignition voltage is between 11-18 V.

- The DTCs run continuously within the enabling conditions.

Conditions for Setting the DTC

P0090

- The engine control module detects an open circuit in the high pressure fuel pump actuator low control circuit.
- The DTC sets when the above condition is present for 4 s.

P0091

- The engine control module detects a short to ground in the high pressure fuel pump actuator low control circuit.
- The DTC sets when the above condition is present for 4 s.

P0092

- The engine control module detects a short to voltage in the high pressure fuel pump actuator low control circuit.
- The DTC sets when the above condition is present for 4 s.

P00C8

- The engine control module detects an open circuit in the high pressure fuel pump actuator high control circuit.
- The DTC sets when the above condition is present for 4 s.

P00C9

- The engine control module detects a short to ground in the high pressure fuel pump actuator high control circuit.
- The DTC sets when the above condition is present for 4 s.

P00CA

- The engine control module detects a short to voltage in the high pressure fuel pump actuator high control circuit.
- The DTC sets when the above condition is present for 4 s.

Action Taken When the DTC Sets

- DTCs P0090, P0091, P0092, P00C8, P00C9, and P00CA are Type A DTCs.
- A message center or an indicator displays Reduced Engine Power.

Conditions for Clearing the DTC

DTCs P0090, P0091, P0092, P00C8, P00C9, and P00CA are Type A DTCs.

   - **If none of the DTCs are set**
3. Verify the parameters listed below do not display Malfunction when commanding the Fuel Pressure Regulator ON and OFF with a scan tool.
   - Fuel Pressure Regulator Control Circuit High Voltage Test Status
   - Fuel Pressure Regulator Control Circuit Open Test Status
   - Fuel Pressure Regulator Control Circuit Low Voltage Test Status
   - Fuel Pressure Regulator High Control Circuit High Voltage Test Status
   - Fuel Pressure Regulator High Control Circuit Open Test Status
   - Fuel Pressure Regulator High Control Circuit Low Voltage Test Status
   - **If Malfunction is displayed**

     Refer to Circuit/System Testing.

- **If Malfunction is not displayed**

4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
6. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the G18 High Pressure Fuel Pump, ignition ON. It may take up to 2 min for all vehicle systems to power down.
2. Verify that a test lamp does not illuminate between the high control circuit terminal 1 and ground.
    - **If the test lamp illuminates**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
    2. Test for less than 1 V between the high control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
    - **If the test lamp does not illuminate**
3. Verify that a test lamp does not illuminate between the low control circuit terminal 2 and ground.
    - **If the test lamp illuminates**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
    2. Test for less than 1 V between the low control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
    - **If the test lamp does not illuminate**
4. Verify that a test lamp does not illuminate between the high control circuit terminal 1 and B+.
    - **If the test lamp illuminates**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the high control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K20 Engine Control Module.
    - **If the test lamp does not illuminate**
5. Verify that a test lamp does not illuminate between the low control circuit terminal 2 and B+.
    - **If the test lamp illuminates**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the low control circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the K20 Engine Control Module.

- **If the test lamp does not illuminate**

6. Remove the test lamp, connect a 3 A fused jumper wire between the high control circuit terminal 2 and ground.
7. Verify the Fuel Pressure Regulator High Control Circuit Low Voltage Test Status transitions from OK to Malfunction.
    - **If Malfunction is not displayed**
    1. Ignition OFF, remove the fused jumper, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for less than 2 Ω in the high control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If Malfunction is displayed**
8. Connect a 3 A fused jumper wire between the low control circuit terminal 1 and B+.
9. Verify the Fuel Pressure Regulator Control Circuit High Voltage Test Status transitions from OK to Malfunction.
    - **If Malfunction is not displayed**
    1. Ignition OFF, remove the fused jumper, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for less than 2 Ω in the low control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If Malfunction is displayed**
10. Test or replace the G18 High Pressure Fuel Pump.

Component Testing

Static Test

1. Ignition OFF, disconnect the harness connector at the G18 High Pressure Fuel Pump.

NOTE: **The DMM and test leads must be calibrated to 0 Ω in order to prevent misdiagnosis.**

2. Test for 9-11 Ω between low control circuit terminal 1 and high control circuit terminal 2.
    - **If not within the specified range**

      Replace the G18 High Pressure Fuel Pump.

- **If within the specified range**

3. Test for infinite resistance between each terminal and the High Pressure Fuel Pump housing/case.
    - **If less than infinite resistance**

      Replace the G18 High Pressure Fuel Pump.

    - **If infinite resistance**

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Fuel Pump Replacement** for G18 High Pressure Fuel Pump replacement.
- **Control Module References** for K20 Engine Control Module replacement, programming, and setup.

> **NOTE:** **Some vehicles do not support the Fuel Rail Pressure Relief Valve Reset procedure. Applications not supporting this procedure will return an error message stating "Parameter ID not supported. Check for proper vehicle selection."**

- Perform the Fuel Rail Pressure Relief Valve Reset procedure.

DTC P0096 OR P0111: INTAKE AIR TEMPERATURE (IAT) SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Signal	-40Â°C (-40Â°F) 10 Hz	-40Â°C (-40Â°F) 10 Hz	-40Â°C (-40Â°F)* 10 Hz
Ground	-	-40Â°C (-40Â°F) 10 Hz	-

Circuit	Short to Ground	Open or High Resistance	Short to Voltage
*Internal ECM or sensor damage may occur if the circuit is shorted to B+.			

ECT Sensor

Circuit	Short to Ground	Open or High Resistance	Short to Voltage
Operating Conditions: Engine Running **Parameter Normal Range:** Varies with coolant temperature			
Signal	150Â°C (302Â°F)	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)*
Low Reference	-	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)*
*Internal ECM or sensor damage may occur if the circuit is shorted to B+.			

Circuit/System Description

The sensors listed below are integrated within the multifunction intake air sensor:

- IAT sensor 1
- IAT sensor 2
- Humidity sensor
- MAF sensor
- BARO pressure sensor

The intake air temperature (IAT) sensor 1 is a variable resistor that changes the voltage on the engine control module (ECM) supplied 5 V signal circuit. The signal varies with inlet air temperature in the sensor bore and is displayed by the scan tool as Â°C (Â°F). The IAT sensor 2 and the humidity sensor share the same circuit. The IAT sensor 2 signal is displayed by the scan tool as Hertz (Hz) and Â°C (Â°F).

The sensors listed below share an ECM supplied 5 V reference circuit:

- IAT sensor 2
- Humidity sensor
- Barometric pressure (BARO) sensor

The sensors listed below share an ECM supplied low reference circuit:

- IAT sensor 1
- IAT sensor 2
- Humidity sensor
- Barometric pressure (BARO) sensor

IAT Sensor 1 - Temperature, Resistance, Voltage Table

IAT Sensor 1	IAT Sensor 1 Resistance	IAT Sensor 1 Signal Voltage
Cold	High	High

IAT Sensor 1	IAT Sensor 1 Resistance	IAT Sensor 1 Signal Voltage
Warm	Low	Low

IAT Sensor 2 - Temperature, Frequency Table

IAT Sensor 2	IAT Sensor 2 Frequency	IAT Sensor 2 Temperature
Cold	45 Hz	-40Â°C (-40Â°F)
Warm	302 Hz	104Â°C (219Â°F)

Conditions for Running the DTCs

P0096 and P0111

- DTCs P0097, P0098, P0112, P0113, P0116, P0117, P0118, P0119, or P1682 are not set.
- The vehicle has been OFF at least 8 hours.
- Ignition voltage is at least 11 V.
- These DTCs run once per ignition cycle when the enabling conditions are met.

Conditions for Setting the DTCs

P0096

- The ECM determines the absolute difference between IAT sensor 1 start-up temperature and the IAT sensor 2 start-up temperature is greater than 10Â°C (18Â°F).

  AND

- The absolute difference between ECT start-up temperature and the IAT sensor 2 start-up temperature is greater than the absolute difference between ECT start-up temperature and the IAT sensor 1 start-up temperature.
- This DTC runs once per ignition cycle when the enabling conditions are met.

P0111

- The ECM determines the absolute difference between IAT sensor 1 start-up temperature and the IAT sensor 2 start-up temperature is greater than 10Â°C (18Â°F).

  AND

- The absolute difference between ECT start-up temperature and the IAT sensor 1 start-up temperature is greater than the absolute difference between ECT start-up temperature and the IATsensor 2 start-up temperature.
- This DTC runs once per ignition cycle when the enabling conditions are met.

Action Taken When the DTC Sets

- DTC P0096 is a Type B DTC - North America and Korea.
- DTC P0096 is a Type C DTC - Except North America and Korea.
- DTC P0111 is a Type B DTC.

- The ECM commands the cooling fans ON.

Conditions for Clearing the DTCs

- DTC P0096 is a Type B DTC - North America and Korea.
- DTC P0096 is a Type C DTC - Except North America and Korea.
- DTC P0111 is a Type B DTC.

Diagnostic Aids

- With the ignition ON, when the engine is OFF and cold; properly functioning IAT sensors 1 and 2 will gradually increase the scan tool IAT Sensor 1 and 2 parameters. This is due to the heat that is generated by the multifunction intake air sensor internal heating elements.
- The humidity sensor and the IAT sensor 2 signals are sent to the ECM on the same circuit. If the IAT Sensor 2 parameter displays the values: 10 Hz; -40Â°C (-40Â°F), and there are also Humidity Sensor DTCs, check for a circuit problem.

Circuit/System Verification

NOTE: **To minimize the effects of residual engine heat and sensor internal heating elements, perform Steps 1 and 2 of this verification procedure only if the ignition has been OFF for 8 hours or more.**

1. Ignition ON.
2. Verify the following scan tool parameters are within 10Â°C (18Â°F) of each other.
    - Start-Up IAT Sensor 1
    - IAT Sensor 2
    - Start-Up ECT
    - **If not within 10Â°C (18Â°F)**

      Refer to Circuit/System Testing.

    - **If within 10Â°C (18Â°F)**
3. Engine idling, verify the following scan tool parameters are between: -38 and +149Â°C (-36 and +300Â°F).
    - IAT Sensor 1
    - IAT Sensor 2
    - ECT Sensor
    - **If not between: -38 and +149Â°C (-36 and +300Â°F)**

      Refer to Circuit/System Testing.

    - **If between: -38 and +149Â°C (-36 and +300Â°F)**
4. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.
5. Verify the DTCs do not set.
    - **If any DTC sets**

      Refer to Circuit/System Testing.

    - **If no DTC sets**
6. All OK

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.**

1. Verify none of the following conditions exist:
    - A restricted or collapsed air intake duct
    - An intake manifold leak
    - A MAP sensor seal that is leaking, missing, or damaged

- A restricted or collapsed air intake duct
- A misaligned or damaged air intake duct
- Any water intrusion in the induction system
- An Intake Manifold Resonator with a leaking seal, or a cracked or broken housing
- **If a condition exists**

  Repair or replace component as appropriate.

- **If no condition exists**

2. Ignition OFF and all systems OFF, it may take up to for 2 minutes for all vehicle systems to power down. Disconnect the harness connector at the B75C Multifunction Intake Air sensor.
3. Test for less than 2 Ω between the low reference circuit terminal 3 and ground.
   - **If 2 Ω or greater**
   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open or high resistance in the circuit.
      - If less than 2 Ω replace the K20 Engine Control Module.
   - **If less than 2 Ω**
4. Ignition OFF, all vehicle systems OFF, test for less than 2 Ω between the ground circuit terminal 7 and ground.
   - **If 2 Ω or greater**
   1. Ignition OFF. Disconnect the sensor chassis ground.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open or high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 2 Ω**
5. Ignition ON, verify that a test lamp illuminates between the ignition circuit terminal 5 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF, remove the test lamp and remove the fuse for the ignition voltage circuit.
   2. Test for less than 2 Ω in the ignition voltage circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF, remove the test lamp and remove the fuse for the ignition voltage circuit.
   2. Test for infinite resistance between the ignition voltage circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, test all components connected to the ignition circuit, replace as necessary.
   - **If a test lamp illuminates**
6. Ignition ON, test for 4.8-5.2 V between the intake air temperature signal 1 circuit terminal 1 and ground.

- **If less than 4.8 V**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the signal circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K20 Engine Control Module.

- **If greater than 5.2 V**

NOTE: **If the signal circuit is shorted to a voltage the engine control module or the sensor may be damaged.**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Ignition ON, test for less than 1 V between the signal circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K20 Engine Control Module.

- **If between 4.8-5.2 V**

7. Ignition ON, verify the scan tool IAT Sensor 1 parameter is colder than -39Â°C (-38Â°F).
    - **If warmer than -39Â°C (-38Â°F).**

    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the signal circuit terminal 1 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.

    - **If colder than -39Â°C (-38Â°F).**

8. Ignition OFF, install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 3.
9. Verify the scan tool IAT Sensor 3 parameter is warmer than 150Â°C (302Â°F).
    - **If colder than 150Â°C (302Â°F).**

    1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Ignition OFF.
    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω, replace the K20 Engine Control Module.

- **If warmer than 150Â°C (302Â°F).**

10. Ignition ON, test for 4.8-5.2 V between the intake air temperature signal 2 circuit terminal 8 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If greater than 5.2 V**

      NOTE: If the signal circuit is shorted to a voltage the engine control module or the sensor may be damaged.

    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Ignition ON, test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
    - **If between 4.8-5.2 V**
11. Determine if **EL-38522-A** Variable Signal Generator or equivalent is available.
    - **EL-38522-A, Variable Signal Generator; or equivalent is not available**
    1. Test or replace the B75C Multifunction Intake Air sensor.
    2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.
    3. Verify the DTC does not set.
        - **If the DTC sets**

          Replace the K20 Engine Control Module.

        - **If the DTC does not set**
    4. All OK.
    - **EL-38522-A, Variable Signal Generator; or equivalent is available**
12. Ignition OFF, connect the leads of the **EL-38522-A** Variable Signal Generator as follows:
    - Red lead to the signal circuit terminal 8 at the harness connector
    - Black leads to ground
    - Battery voltage supply lead to B+
13. Set the **EL-38522-A** Variable Signal Generator to the following specifications.
    - Signal switch to 5 V
    - Duty Cycle switch to 50 % (Normal)

- Frequency switch to 30 Hz

14. Ignition ON, verify the scan tool IAT Sensor 2 parameter is between 28-32 Hz.
    - **If not between 28-32 Hz**

      Replace the K20 Engine Control Module.

    - **If between 28-32 Hz**
15. Test or replace the B75C Multifunction Intake Air sensor.

Component Testing

Multifunction Intake Air Sensor

1. Ignition OFF, disconnect the harness connector at the B75C Multifunction Intake Air sensor.

   NOTE: A thermometer can be used to test the sensor off the vehicle.

2. Test the IAT sensor 1 by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the **Temperature Versus Resistance - Intake Air Temperature Sensor (Hitachi Sensor)** table for Hitachi Sensors. The resistance values should be in range of the table values.
    - **If not within the table values.**

      Replace the B75C Multifunction Intake Air sensor.

    - **If within the table values.**
3. All OK

Multifunction Intake Air Sensor

1. Test the IAT Sensor 2 by varying the sensor temperature while monitoring the air temperature with a thermometer. Compare the readings with the scan tool IAT Sensor 2 parameter. The values should be within 5%.
    - **If not within 5%**

      Replace the B75C Multifunction Intake Air sensor.

    - **If within 5%**
2. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Mass Airflow Sensor with Intake Air Temperature Sensor Replacement** for multifunction intake air sensor replacement
- **Control Module References** for engine control module replacement, programming, and setup

DTC P0097, P0098, OR P0099: INTAKE AIR TEMPERATURE (IAT) SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The sensors listed below are integrated within the mass air flow/multifunction intake air sensor:

- IAT sensor 1
- IAT sensor 2
- Humidity sensor
- MAF sensor
- BARO pressure sensor

The IAT sensor 2 and the humidity sensor share the same circuit. The IAT sensor 2 signal is displayed by the scan tool as Hertz (Hz) and Â°C (Â°F).

The sensors listed below share an ECM supplied 5 V reference circuit:

- IAT sensor 2
- Humidity sensor
- Barometric pressure (BARO) sensor

The sensors listed below share an ECM supplied low reference circuit:

- IAT sensor 1
- IAT sensor 2
- Humidity sensor
- Barometric pressure (BARO) sensor

IAT Sensor 1 - Temperature, Resistance, Voltage Table

IAT Sensor 1	IAT Sensor 1 Resistance	IAT Sensor 1 Signal Voltage
Cold	High	High
Warm	Low	Low

IAT Sensor 2 - Temperature, Frequency Table

IAT Sensor 2	IAT Sensor 2 Frequency	IAT Sensor 2 Temperature
Cold	45 Hz	-40Â°C (-40Â°F)
Warm	302 Hz	104Â°C (219Â°F)

Conditions for Running the DTCs

P0097, P0098, and P0099

- The ignition is ON, or the engine is running.

- The Ignition voltage is at least 11 V.
- The DTCs run continuously within the enabling conditions.

Conditions for Setting the DTCs

P0097

NOTE: The scan tool display range is between -40 and +150Â°C (-40 and +302Â°F).

The ECM detects that the IAT sensor 2 signal is less than 13 Hz, colder than -60Â°C (-76Â°F), for greater than 5 s.

P0098

The ECM detects that the IAT sensor 2 signal is greater than 390 Hz, warmer than 150Â°C (302Â°F), for greater than 5 s.

P0099

The ECM detects that the IAT sensor 2 signal is intermittent or has abruptly changed for longer than 5 s.

Action Taken When the DTC Sets

- DTCs P0097, P0098, and P0099 are Type B DTCs - North America and Korea.
- DTCs P0097, P0098, and P0099 are Type C DTCs - Except North America and Korea.
- The ECM commands the cooling fans ON.

Conditions for Clearing the MIL/DTC

- DTCs P0097, P0098, and P0099 are Type B DTCs - North America and Korea.
- DTCs P0097, P0098, and P0099 are Type C DTCs - Except North America and Korea.

Diagnostic Aids

- With the ignition ON, the engine OFF and the engine is cold, a properly functioning IAT sensor 2 will gradually increase the scan tool IAT Sensor 2 parameter. This is due to the heat that is generated by the MAF sensor heating elements.
- The humidity sensor and the IAT sensor 2 signals are sent to the ECM on the same circuit. If the IAT Sensor 2 parameter displays the values: 10 Hz; -40Â°C (-40Â°F), and there are also Humidity Sensor DTCs, check for a circuit problem.

Special Tools

EL-38522-A Variable Signal Generator

For equivalent regional tools, refer to **Special Tools (Diagnostic Tools)** **Special Tools (Repair Tools)** .

Circuit/System Verification

NOTE: **To minimize the effects of residual engine heat and sensor internal heating elements, perform Steps 1 and 2 of this verification procedure only if the ignition has been OFF for 8 hours or more.**

1. Ignition ON.
2. Verify the following scan tool parameters are within 10Â°C (18Â°F) of each other.
   - Start-Up IAT Sensor 1
   - IAT Sensor 2
   - Start-Up ECT
   - **If not within 10Â°C (18Â°F)**

     Refer to Circuit/System Testing.

   - **If within 10Â°C (18Â°F)**
3. Engine idling, verify the following scan tool parameters are between: between -38 and +149Â°C (-36 and +300Â°F).
   - IAT Sensor 1
   - IAT Sensor 2
   - **If not between: -38 and +149Â°C (-36 and +300Â°F)**

     Refer to Circuit System Testing.

- **If between: -38 and +149Â°C (-36 and +300Â°F)**

4. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.
5. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
6. All OK

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.**

1. Ignition OFF and all systems OFF, it may take up to for 2 min. for all vehicle systems to power down. Disconnect the harness connector at the B75C Multifunction Intake Air sensor.
2. Test for less than 2 Ω between the low reference circuit terminal 3 and ground.
   - **If 2 Ω or greater**
   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open or high resistance in the circuit.
      - If less than 2 Ω replace the K20 Engine Control Module.
   - **If less than 2 Ω**
3. Ignition OFF, all vehicle systems OFF, test for less than 2 Ω between the ground circuit terminal 7 and ground.
   - **If 2 Ω or greater**
   1. Ignition OFF. Disconnect the sensor chassis ground.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open or high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 2 Ω**
4. Ignition ON, verify that a test lamp illuminates between the ignition circuit terminal 5 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF, remove the test lamp and remove the fuse for the ignition voltage circuit.
   2. Test for less than 2 Ω in the ignition voltage circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF, remove the test lamp and remove the fuse for the ignition voltage circuit.
   2. Test for infinite resistance between the ignition voltage circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, test all components connected to the ignition circuit, replace as necessary.

- **If a test lamp illuminates**

5. Ignition ON, test for 4.8-5.2 V between the intake air temperature sensor 2 signal circuit terminal 8 and ground.
   - **If less than 4.8 V**
   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K20 Engine Control Module.
   - **If greater than 5.2 V**

     NOTE: If the signal circuit is shorted to a voltage the engine control module or the sensor may be damaged.

   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
   2. Ignition ON, test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K20 Engine Control Module.
   - **If between 4.8-5.2 V**
6. Determine if **EL-38522-A** Variable Signal Generator or equivalent is available.
   - **EL-38522-A, Variable Signal Generator; or equivalent is not available**
   1. Test or replace the B75C Multifunction Intake Air sensor.
   2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.
   3. Verify the DTC does not set.
      - **If the DTC sets**

        Replace the K20 Engine Control Module.

      - **If the DTC does not set**
   4. All OK.
   - **EL-38522-A, Variable Signal Generator; or equivalent is available**
7. Ignition OFF, connect the leads of the **EL-38522-A** Variable Signal Generator as follows:
   - Red lead to the signal circuit terminal 8 at the harness connector
   - Black leads to ground
   - Battery voltage supply lead to B+

8. Set the **EL-38522-A** Variable Signal Generator to the following specifications.
    - Signal switch to 5 V
    - Duty Cycle switch to 50 % (Normal)
    - Frequency switch to 30 Hz
9. Ignition ON, observe the scan tool IAT Sensor 2 parameter. The scan tool parameter should be between 28-32 Hz.
    - **If not between 28-32 Hz**

      Replace the K20 Engine Control Module.

    - **If between 28-32 Hz**
10. Test or replace the B75C Multifunction Intake Air sensor.

Component Testing

Multifunction Intake Air Sensor

1. Test the IAT Sensor 2 by varying the sensor temperature while monitoring the air temperature with a thermometer. Compare the readings with the scan tool IAT Sensor 2 parameter. The values should be within 5%.
    - **If not within 5%**

      Replace the B75C Multifunction Intake Air sensor.

    - **If within 5%**
2. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Mass Airflow Sensor with Intake Air Temperature Sensor Replacement** for multifunction intake air sensor replacement
- **Control Module References** for engine control module replacement, programming, and setup

DTC P00F4-P00F6: INTAKE AIR HUMIDITY SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

*Internal ECM or sensor damage may occur if the circuit is shorted to B+.				

Typical Scan Tool Data

Intake Air Humidity

Circuit	Short to Ground	Open or High Resistance	Short to Voltage
Operating Conditions: Engine Running **Parameter Normal Range:** Varies with ambient humidity and temperature; and engine bay conditions			
Ignition	0 %	0 %	-
Signal	100 %	0 %	0 %*
Ground	-	0 %	-
*Internal ECM or sensor damage may occur if the circuit is shorted to B+.			

Circuit/System Description

The humidity sensor measures the ambient humidity of the air in the sensor bore. The signal varies with intake air humidity and is displayed by the scan tool as duty cycle %. The ECM applies 5 V to the circuit. The signal circuit is shared by the humidity sensor and the intake air temperature (IAT) sensor 2. Ignition voltage and ground circuits are also supplied to the multifunction intake air sensor's internal circuits for these sensors:

- IAT sensor 2
- Humidity sensor
- MAF sensor

The multifunction intake air sensor houses the following:

- IAT sensor 1
- IAT sensor 2
- Humidity sensor
- MAF sensor
- BARO pressure sensor

Conditions for Running the DTCs

P00F4, P00F5, and P00F6

- DTC P1682 is not set.
- The ignition is ON.
- The ignition voltage is at least 11 V.
- These DTCs run continuously within the enabling conditions.

Conditions for Setting the DTCs

P00F4

The ECM detects that the humidity sensor signal is less than or equal to 5 % for greater than 5 s.

P00F5

The ECM detects that the humidity sensor signal is greater than or equal to 95 % for greater than 5 s.

P00F6

The ECM detects that the humidity sensor signal is intermittent or has abruptly changed over a period of time greater than 5 s.

Action Taken When the DTC Sets

- DTCs P00F4, P00F5, and P00F6 are Type B DTCs - North America and Korea.
- DTCs P00F4, P00F5, and P00F6 are Type C DTCs - Except North America and Korea.

Conditions for Clearing the MIL/DTC

- DTCs P00F4, P00F5, and P00F6 are Type B DTCs - North America and Korea.
- DTCs P00F4, P00F5, and P00F6 are Type C DTCs - Except North America and Korea.

Diagnostic Aids

- The Intake Air Humidity Signal parameter displays the measured humidity within the air intake system and may differ from atmospheric humidity measured outside the air intake system.
- The humidity sensor and the IAT sensor 2 signals are sent to the ECM on the same circuit. If the Intake Air Humidity parameter displays the value: 0 % or 100 %, and there are also IAT Sensor 2 DTCs, check for a circuit problem.

Circuit/System Verification

NOTE: **To minimize the effects of residual engine heat and sensor internal heating elements, perform Steps 1 and 2 of this verification procedure only if the ignition has been OFF for 8 hours or more.**

1. Ignition ON.
2. Verify the following scan tool parameters are within 10Â°C (18Â°F) of each other.
    - Start-Up IAT Sensor 1
    - IAT Sensor 2
    - Start-Up ECT
    - **If not within 10Â°C (18Â°F)**

      Refer to Circuit/System Testing.

- **If within 10Â°C (18Â°F)**

3. Engine idling, verify the scan tool Intake Air Humidity parameter is between 5 and 90 %.
    - **If not between 5 and 90 %**

      Refer to Circuit/System Testing.

    - **If between 5 and 90 %**
4. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.
5. Verify the DTCs do not set.
    - **If any DTC sets**

      Refer to Circuit/System Testing.

    - **If no DTCs set**
6. All OK

Circuit/System Testing

1. Ignition OFF and all systems OFF, it may take up to for 2 minutes for all vehicle systems to power down. Disconnect the harness connector at the B75C Multifunction Intake Air sensor.
2. Test for less than 2 Ω between the low reference circuit terminal 3 and ground.
    - **If 2 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open or high resistance in the circuit.
        - If less than 2 Ω replace the K20 Engine Control Module.
    - **If less than 2 Ω**
3. Ignition OFF, all vehicle systems OFF, test for less than 2 Ω between the ground circuit terminal 7 and ground.
    - **If 2 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open or high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 2 Ω**
4. Ignition ON, verify that a test lamp illuminates between the ignition circuit terminal 5 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition OFF, remove the test lamp and remove the fuse for the ignition voltage circuit.
    2. Test for less than 2 Ω in the ignition voltage circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF, remove the test lamp and remove the fuse for the ignition voltage circuit.
2. Test for infinite resistance between the ignition voltage circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, test all components connected to the ignition circuit, replace as necessary.

- **If a test lamp illuminates**

5. Ignition ON, test for 4.8-5.2 V between the humidity signal circuit terminal 8 and ground.
    - **If less than 4.8 V**

    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.

    - **If greater than 5.2 V**

    NOTE: If the signal circuit is shorted to a voltage the engine control module or the sensor may be damaged.

    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Ignition ON, test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.

    - **If between 4.8-5.2 V**

6. Determine if **EL-38522-A** Variable Signal Generator or equivalent is available.
    - **EL-38522-A, Variable Signal Generator; or equivalent is not available**

    1. Test or replace the B75C Multifunction Intake Air sensor.
    2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.
    3. Verify the DTC does not set.
        - **If the DTC sets**

          Replace the K20 Engine Control Module.

        - **If the DTC does not set**

    4. All OK.

    - **EL-38522-A, Variable Signal Generator; or equivalent is available**

7. Ignition OFF, connect the leads of the **EL-38522-A** Variable Signal Generator as follows:
    - Red lead to the signal circuit terminal 8 at the harness connector

- Black leads to ground
- Battery voltage supply lead to B+

8. Set the **EL-38522-A** Variable Signal Generator to the following specifications.
    - Signal switch to 5 V
    - Frequency switch to 250 Hz
    - Duty Cycle switch to 50 % (Normal)
9. Ignition ON, observe the scan tool Intake Air Humidity parameter. The scan tool parameter should be between 45-55 %.
    - **If not between 45-55 %.**

      Replace the K20 Engine Control Module.

    - **If between 45-55 %.**
10. Test or replace the B75C Multifunction Intake Air sensor.

Component Testing

Multifunction Intake Air Sensor

1. Test the Intake Air Humidity Sensor by varying the air humidity in the intake duct near the sensor, while observing the scan tool Intake Air Humidity Sensor parameter. The parameter should change and be within 5-95%.
    - **If not within 5-95%, or the parameter does not change.**

      Replace the K20 Engine Control Module.

    - **If within 5-95% and the parameter does change**
2. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Mass Airflow Sensor with Intake Air Temperature Sensor Replacement** for multifunction intake air sensor replacement
- **Control Module References** for engine control module replacement, programming, and setup

DTC P0101: MASS AIR FLOW (MAF) SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0101

Typical Scan Tool Data

MAF Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine running at various operating conditions **Parameter Normal Range:** 2,000-10,000 Hz			
Ignition Voltage	0 Hz	0 Hz	-
Signal	0 Hz	0 Hz	0 Hz*
Ground	-	0 Hz	-
*Internal ECM or sensor damage may occur if the circuit is shorted to B+.			

Circuit Description

The intake flow rationality diagnostic provides the within-range rationality check for the mass air flow (MAF), manifold absolute pressure (MAP), and the throttle position sensors. This is an explicit model-based diagnostic containing 4 separate models for the intake system.

The estimates of MAF and MAP obtained from this system of models and calculations are then compared to the actual measured values from the MAF, MAP, and the throttle position sensors and to each other to determine the appropriate DTC to fail.

Conditions for Running the DTCs

- DTCs P0102, P0103, P0107, P0108, P0111, P0112, P0113, P0114. P0116, P0117, P0118, P0128, P0335, or P0336 are not set
- The engine speed is greater than 500 RPM.
- The engine coolant temperature (ECT) is between -7 and +125Â°C (+19 and +257Â°F).
- The intake air temperature (IAT Sensor 1) is between -20 and +125Â°C (-4 and +257Â°F).
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

The engine control module (ECM) detects that the actual measured air flow from the MAF, MAP, and throttle position sensors is not within range of the calculated air flow that is derived from the system of models for greater than 2 s.

Action Taken When the DTC Sets

DTC P0101 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0101 is a Type B DTC.

Diagnostic Aids

- Any type of contamination on the MAF sensor heating elements will degrade the proper operation of the sensor. Certain types of contaminants act as a heat insulator, which will impair the response of the sensor to air flow changes. Water or snow can create the opposite effect, and cause the signal to increase rapidly.
- Certain aftermarket air filters may cause this DTC to set.
- Certain aftermarket air induction systems may cause this DTC to set.
- Modifications to the air induction system may cause this DTC to set.

Special Tools

EL-38522-A Variable Signal Generator

For equivalent regional tools, refer to **Special Tools (Diagnostic Tools)** **Special Tools (Repair Tools)** .

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC P0641, P0651, P0697, or P06A3 is not set.
   - **If any of the DTCs are set**

     Refer to **DTC P0641, P0651, P0697, or P06A3 (ECM)** for further diagnosis.

   - **If none of the DTCs are set**
3. Verify the scan tool Throttle Body Idle Air Flow Compensation parameter is less than 90 %.
   - **90 % or greater**

     Refer to **Throttle Body Inspection and Cleaning** .

   - **If less than 90 %**
4. Verify the scan tool Throttle Position Sensors 1 and 2 Agree/Disagree parameter displays Agree while performing the Throttle Sweep Test with a scan tool.
   - **If Disagree**

     Refer to **DTC P0121-P0123, P0222, P0223, P16A0-P16A2, or P2135** for further diagnosis.

   - **If Agree**
5. Determine the current vehicle testing altitude.
6. Verify the scan tool MAP Sensor pressure parameter is within the range specified in the **Altitude Versus Barometric Pressure (With LFX)** table.
   - **If the MAP Sensor parameter is not in range**

     Refer to **DTC P0106** for further diagnosis.

   - **If the MAP Sensor parameter is in range**
7. Verify the scan tool MAF Sensor g/s parameter changes smoothly and gradually as the engine speed is increased and decreased while performing the actions listed below.
   1. Engine idling
   2. Perform the scan tool snapshot function.
   3. Increase the engine speed slowly to 3,000 RPM and then back to idle.
   4. Exit from the scan tool snapshot and review the data.
   5. Observe the MAF Sensor parameter frame by frame with a scan tool.
   - **The MAF Sensor parameter does not change smoothly and gradually**

     Refer to Circuit/System Testing for further diagnosis.

   - **The MAF Sensor parameter changes smoothly and gradually**

8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
9. Verify a DTC does not set.
    - **If the DTC sets**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.

    - **If the DTC does not set**
10. All OK

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.**

1. Verify the integrity of the entire air induction system by verifying that none of the following conditions exist:
    - Any damaged components
    - Improperly installed components
    - Collapsed, restricted, or damaged components
    - Loose clamps, cracks, or other damage
    - An air flow restriction
    - Restricted air filter
    - Splits, kinks, leaks, or improper connections at the vacuum hoses
    - Vacuum leaks at the intake manifold, MAP sensor, and throttle body
    - Water intrusion
    - Any snow or ice buildup, in cold climates
    - Contamination of the Multifunction Intake Air sensor element
    - **If a condition is found**

      Repair or replace component as appropriate.

    - **If no condition is found**
2. Ignition OFF, disconnect the harness connector at the B75C Multifunction Intake Air sensor.
3. Test for less than 2 Ω between the ground circuit terminal 7 and ground.
    - **If 2 Ω or greater**
    1. Ignition OFF. Disconnect the sensor chassis ground.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 2 Ω**
4. Ignition ON, verify that a test lamp illuminates between the ignition circuit terminal 5 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition OFF, remove the test lamp and remove the fuse for the ignition voltage circuit.
2. Test for less than 2 Ω in the ignition voltage circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF, remove the test lamp and remove the fuse for the ignition voltage circuit.
2. Test for infinite resistance between the ignition voltage circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, test all components connected to the ignition circuit, replace as necessary.

- **If a test lamp illuminates**

5. Ignition ON, test for 4.8-5.2 V between the signal circuit terminal 6 and ground.
    - **If less than 4.8 V**

    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.

    - **If greater than 5.2 V**

    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Ignition ON, test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.

    - **If between 4.8-5.2 V**

6. Determine if **EL-38522-A** Variable Signal Generator or equivalent is available.
    - **EL-38522-A, Variable Signal Generator; or equivalent is not available**

    1. Test or replace the B75C Multifunction Intake Air sensor.
    2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.
    3. Verify the DTC does not set.
        - **If the DTC sets**

          Replace the K20 Engine Control Module.

        - **If the DTC does not set**

    4. All OK.

    - **EL-38522-A, Variable Signal Generator; or equivalent is available**

7. Ignition OFF, connect the leads of the **EL-38522-A** Variable Signal Generator as follows:

- Red lead to the signal circuit terminal 6 at the harness connector
- Black leads to ground
- Battery voltage supply lead to B+

8. Set the **EL-38522-A** Variable Signal Generator to the following specifications.
   - Signal switch to 5 V
   - Frequency switch to 5 kHz
   - Duty Cycle switch to 50 % (Normal)
9. Engine idling, observe the scan tool MAF Sensor parameter. The scan tool MAF Sensor parameter should be between 4,950-5,050 Hz.
   - **If not between 4,950-5,050 Hz.**

     If not between 4,950-5,050 Hz, replace the K20 Engine Control Module.

   - **If between 4,950-5,050 Hz.**
10. Test or replace the B75C Multifunction Intake Air sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Mass Airflow Sensor with Intake Air Temperature Sensor Replacement** for multifunction intake air sensor replacement.
- **Control Module References** for ECM replacement, programming, and setup.

DTC P0102 OR P0103: MASS AIR FLOW (MAF) SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The mass air flow (MAF) sensor is integrated with the multifunction intake air sensor. The MAF sensor is an air flow meter that measures the amount of air in the sensor bore. The engine control module (ECM) uses the MAF sensor signal to provide the correct fuel delivery for all engine speeds and loads. A small quantity of air entering the engine indicates a deceleration or idle condition. A large quantity of air entering the engine indicates an acceleration or high load condition.

The ECM applies 5 V to the MAF sensor on the MAF sensor signal circuit. The sensor uses the voltage to produce a variable frequency signal based on the inlet air flow through the sensor bore. The signal varies with engine load and is displayed by the scan tool as Hertz (Hz) and grams per second (g/s). Ignition voltage and ground circuits are also supplied to the multifunction intake air sensor internal circuits for these sensors:

- Intake Air Temperature (IAT) sensor 2
- Humidity sensor
- MAF sensor

The multifunction intake air sensor houses the following:

- IAT sensor 1
- IAT sensor 2
- Humidity sensor
- MAF sensor
- BARO pressure sensor

Conditions for Running the DTC

- The engine is running for greater than 1 s.
- The ignition signal is greater than 10 V.
- The above conditions are met for greater than 1 s.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P0102

The ECM detects that the MAF Sensor Signal is less than 800 Hz (about 0.90 g/s) for greater than 10 s.

P0103

The ECM detects that the MAF Sensor Signal parameter is greater than 14,500 Hz (about 630 g/s) for greater than 10 s.

Action Taken When the DTC Sets

DTCs P0102 and P0103 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0102 and P0103 are Type B DTCs.

Special Tools

EL-38522-A Variable Signal Generator

For equivalent regional tools, refer to **Special Tools (Diagnostic Tools)** **Special Tools (Repair Tools)** .

Circuit/System Verification

1. Engine idling, observe the scan tool MAF Sensor parameter. The reading should be between 2.5-8.8 g/s.
    - **If not between 2.5-8.8 g/s**

      Refer to Circuit/System Testing.

    - **If between 2.5-8.8 g/s**
2. Verify the scan tool MAF Sensor g/s parameter changes smoothly and gradually as the engine speed is increased and decreased while performing the actions listed below.
    1. Engine idling
    2. Perform the scan tool snapshot function.
    3. Increase the engine speed slowly to 3,000 RPM and then back to idle.
    4. Exit from the scan tool snapshot and review the data.
    5. Observe the MAF Sensor parameter frame by frame with a scan tool.
    - **The MAF Sensor parameter does not change smoothly and gradually**

      Refer to Circuit/System Testing.

    - **The MAF Sensor parameter changes smoothly and gradually**
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify a DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set.**
5. All OK

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.**

1. Ignition OFF, disconnect the harness connector at the B75C Multifunction Intake Air sensor.

2. Test for less than 2 Ω between the ground circuit terminal 7 and ground.
    - **If 2 Ω or greater**
    1. Ignition OFF. Disconnect the sensor chassis ground.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the chassis ground connection.
    - **If less than 2 Ω**
3. Ignition ON, verify that a test lamp illuminates between the ignition circuit terminal 5 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition OFF, remove the test lamp and remove the fuse for the ignition voltage circuit.
    2. Test for less than 2 Ω in the ignition voltage circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition OFF, remove the test lamp and remove the fuse for the ignition voltage circuit.
    2. Test for infinite resistance between the ignition voltage circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, test all components connected to the ignition circuit, replace as necessary.
    - **If a test lamp illuminates**
4. Ignition ON, test for 4.8-5.2 V between the signal circuit terminal 6 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If greater than 5.2 V**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Ignition ON, test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
    - **If between 4.8-5.2 V**
5. Determine if **EL-38522-A** Variable Signal Generator or equivalent is available.
    - **EL-38522-A, Variable Signal Generator; or equivalent is not available**
    1. Test or replace the B75C Multifunction Intake Air sensor.

2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.
3. Verify the DTC does not set.
    - **If the DTC sets**

      Replace the K20 Engine Control Module.

    - **If the DTC does not set**
4. All OK.

- **EL-38522-A, Variable Signal Generator; or equivalent is available**

6. Ignition OFF, connect the leads of the **EL-38522-A** Variable Signal Generator as follows:
    - Red lead to the signal circuit terminal 6 at the harness connector
    - Black leads to ground
    - Battery voltage supply lead to B+
7. Set the **EL-38522-A** Variable Signal Generator to the following specifications.
    - Signal switch to 5 V
    - Frequency switch to 5 kHz
    - Duty Cycle switch to 50 % (Normal)
8. Engine idling, verify the scan tool MAF Sensor parameter is between 4,950-5,050 Hz.
    - **If not between 4,950-5,050 Hz.**

      If not between 4,950-5,050 Hz, replace the K20 Engine Control Module.

    - **If between 4,950-5,050 Hz.**
9. Test or replace the B75C Multifunction Intake Air sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Mass Airflow Sensor with Intake Air Temperature Sensor Replacement** for multifunction intake air sensor replacement.
- **Control Module References** for engine control module replacement, programming, and setup

DTC P0106: MANIFOLD ABSOLUTE PRESSURE (MAP) SENSO

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

Low Reference	-	255 kPa (36.9 PSI)	-
* Internal ECM or sensor damage may occur if the circuit is shorted to B+.			

Circuit Description

The manifold absolute pressure (MAP) sensor measures the pressure inside the intake manifold. Pressure in the intake manifold is affected by engine speed, throttle opening, air temperature, barometric pressure (BARO) and if equipped, turbocharger output. A diaphragm within the MAP sensor is displaced by the pressure changes that occur from the varying load and operating conditions of the engine. The sensor translates this action into electrical resistance.

The MAP sensor wiring includes 3 circuits. The engine control module (ECM) supplies a regulated 5 volts to the sensor on a 5 V reference circuit. The ECM supplies a ground on a low reference circuit. The MAP sensor provides a signal voltage to the ECM, relative to the pressure changes, on the MAP sensor signal circuit. The

ECM converts the signal voltage input to a pressure value.

Under normal operation the greatest pressure that can exist in the intake manifold is at ignition ON, engine OFF, which is equal to the BARO. If equipped, a turbocharger can increase the pressure above BARO, when the vehicle is operated at wide-open throttle (WOT). The lowest manifold pressure occurs when the vehicle is idling or decelerating. The ECM monitors the MAP sensor signal for pressure outside of the normal range.

Conditions for Running the DTC

- DTC P0102, P0103, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0128, P0335 or P0336 is not set.
- The engine speed is between 400-7,000 RPM.
- The intake air temperature (IAT) Sensor parameter is between -20Â° to +125Â°C (-4Â° to +257Â°F).
- The engine coolant temperature (ECT) Sensor parameter is between 69-127Â°C (156-260Â°F).
- This DTC runs continuously when the above conditions are met.

Conditions for Setting the DTCs

The ECM determines if the MAP Sensor is not within the normal operating range. It accomplishes this by running 3 different models within the software to determine the values, for greater than 0.5 S.

Action Taken When the DTC Sets

DTC P0106 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0106 is a Type B DTC.

Special Tools

GE-23738-A Vacuum Pump

For equivalent regional tools, refer to **Special Tools (Diagnostic Tools)** **Special Tools (Repair Tools)** .

Circuit/System Verification

1. Ignition ON, verify that DTC P0641, P0651, P0697, or P06A3 is not set.
   - **If any of the DTCs are set**

     Refer to **DTC P0641, P0651, P0697, or P06A3 (ECM)** for further diagnosis.

   - **If none of the DTCs are set**
2. If you were sent here from DTC P0068, P0101, P0121, or P1101; refer to Circuit/System Testing.
3. Ignition ON, verify the scan tool Throttle Body Idle Airflow Compensation parameter is less than 90%.
   - **If 90 % or greater**

     Refer to **Throttle Body Inspection and Cleaning** .

   - **If less than 90 %**
4. Verify the scan tool Throttle Position Sensors 1 and 2 Agree/Disagree parameter displays Agree while performing the Throttle Sweep Test with a scan tool.
   - **If Disagree**

     Refer to **DTC P0121-P0123, P0222, P0223, P16A0-P16A2, or P2135** for further diagnosis.

   - **If Agree**
5. Determine the current vehicle testing altitude.
6. Verify the scan tool MAP Sensor parameter is within the range specified in the **Altitude Versus Barometric Pressure (With LFX)** table.
   - **If the MAP Sensor parameter is not in range**

     Refer to Circuit/System Testing.

   - **If the MAP Sensor parameter is within range**
7. Engine idling, verify the scan tool MAP Sensor pressure parameter is between 26-52 kPa (3.8-7.5 PSI) and changes with accelerator pedal input.
   - **If not between 26-52 kPa (3.8-7.5 PSI) or does not change**

     Refer to Circuit/System Testing.

   - **If between 26-52 kPa (3.8-7.5 PSI) and changes**
8. Verify the scan tool MAF Sensor g/s parameter changes smoothly and gradually as the engine speed is

increased and decreased while performing the actions listed below.

1. Engine idling
2. Perform the scan tool snapshot function.
3. Increase the engine speed slowly to 3000 RPM and then back to idle.
4. Exit from the scan tool snapshot and review the data.
5. Observe the MAF Sensor parameter frame by frame with a scan tool.

- **The MAF Sensor parameter does not change smoothly and gradually**

  Refer to **DTC P0101** for further diagnosis.

- **The MAF Sensor parameter changes smoothly and gradually**

9. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
10. Verify a DTC does not set.

- **If the DTC sets**

  Refer to Circuit/System Testing.

- **If the DTC does not set**

11. All OK.

Circuit/System Testing

1. Verify the integrity of the entire air induction system and verify that none of the following conditions exist:
   - Any damaged components
   - Improper operation of turbocharger wastegate actuator or bypass valve, if equipped
   - Loose or improper installation of the turbocharger and the charge air cooler, including the flexible ductwork, if equipped
   - An air flow restriction
   - Any vacuum leak
   - Improperly routed vacuum hoses
   - In cold climates, inspect for any snow or ice buildup at the BARO port on the ECM, if equipped
   - A restriction in the MAP Sensor port or the BARO port
   - Proper operation of the Positive Crankcase Ventilation (PCV) system
   - Missing, restricted or leaking exhaust components. Refer to **Symptoms - Engine Exhaust** .
   - Engine mechanical condition; for example: low compression or incorrect timing chain installation. Refer to **Symptoms - Engine Mechanical** .
   - **If a condition is found**

     Repair or replace the component as appropriate.

   - **If no condition is found**
2. Ignition OFF, and all vehicle systems OFF. It may take up to 2 min for all vehicle systems to power down.

Disconnect the harness connector at the B74 Manifold Absolute Pressure Sensor.

3. Test for less than 2 Ω between the low reference circuit terminal 2 and ground.
    - **If 2 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If less than 2 Ω**
4. Ignition ON, test for 4.8-5.2 V between the 5 V reference circuit terminal 1 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.

    NOTE: **If the signal circuit is shorted to a voltage the ECM or the MAP Sensor may be damaged.**

    -
    - **If greater than 5.2 V**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Ignition ON, test for less than 1 V between the 5 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
    - **If between 4.8-5.2 V**
5. Ignition ON, verify the scan tool MAP Sensor parameter is less than 0.5 V.
    - **If 0.5 V or greater**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Ignition ON, test for less than 1 V between the signal circuit terminal 3 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
    - **If less than 0.5 V**
6. Ignition OFF, install a 3 A fused jumper wire between the signal circuit terminal 3 and the 5 V reference circuit terminal 1.
7. Ignition ON, verify the scan tool MAP Sensor voltage parameter is greater than 4.5 V.
    - **If 4.5 V or less**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Remove the jumper wire, test for infinite resistance between the signal circuit terminal 3 and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open or high resistance in the circuit.
    - If less than 2 Ω, replace the K20 Engine Control Module.

- **If greater than 4.5 V**

8. Test or replace the B74 Manifold Absolute Pressure Sensor.

Component Testing

NOTE: **You must perform the Circuit/System Testing in order to verify the integrity of the MAP Sensor circuits before proceeding with the Component Testing.**

Skewed Sensor Test

1. Ignition OFF, remove the B74 Manifold Absolute Pressure Sensor from the engine. Connect the harness to the sensor, if disconnected.
2. Ignition ON, apply 17 kPa (5.0 in Hg) of vacuum to the B74 Manifold Absolute Pressure Sensor, with the **GE-23738-A** . Verify the scan tool MAP pressure parameter decreases between 13-21 kPa (1.8-3.0 PSI).
    - **If the parameter does not decrease between 13-21 kPa (1.8-3.0 PSI).**

      Replace the B74 Manifold Absolute Pressure Sensor.

    - **If the parameter does decrease between 13-21 kPa (1.8-3.0 PSI).**
3. Apply 34 kPa (10.0 in Hg) of vacuum to the B74 Manifold Absolute Pressure Sensor, with the **GE-23738-A** . Verify the scan tool MAP pressure parameter decreases between 30-38 kPa (4.4-5.5 PSI).
    - **If the parameter does not decrease between 30-38 kPa (4.4-5.5 PSI).**

      Replace the B74 Manifold Absolute Pressure Sensor.

    - **If the parameter does decrease between 30-38 kPa (4.4-5.5 PSI).**
4. All OK.

Erratic Signal Test

1. Ignition OFF, remove the B74 Manifold Absolute Pressure Sensor and disconnect the harness.
2. Install a 3 A fused jumper wire between the 5 V reference circuit terminal 1 of the sensor and the sensor harness.
3. Install a jumper wire between the low reference circuit terminal 2 of the sensor and ground.
4. Install a jumper wire to the signal circuit terminal 3 of the sensor.
5. Connect a DMM between the jumper wire and ground.
6. Ignition ON, observe the DC voltage on the DMM. Slowly apply between 0-15 kPa (0-4.4 in Hg) of

vacuum to the sensor with the **GE-23738-A** .

7. Verify the voltage changes, without any spikes or dropouts, between 0.2-4.9 V.
    - **If not between 0.2-4.9 V or has spikes or dropouts**

      Replace the B74 Manifold Absolute Pressure Sensor.

    - **If between 0.2-4.9 V and there are no spikes or dropouts**
8. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair

DTC P0107

Manifold Absolute Pressure (MAP) Sensor Circuit Low Voltage

DTC P0108

Manifold Absolute Pressure (MAP) Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
5 V Reference	P0107, P0697	P0106, P0697	P0107	P0106, P0697	P0106, P0107
Signal	P0107	P0106, P0107	P0107	P0108*	P0106, P0107, P1101
Low Reference	-	P0106, P0108	P0106, P0108	-	P0106, P0108
* Internal ECM or sensor damage may occur if the circuit is shorted to B+.					

Typical Scan Tool Data

MAP Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine running, transmission in Park or Neutral **Parameter Normal Range:** 20-48 kPa (2.9-7 PSI), varies with altitude			
5 V Reference	0 kPa (0 PSI)	0 kPa (0 PSI)	127 kPa (18.4 PSI)
Signal	0 kPa (0 PSI)	0 kPa (0 PSI)	127 kPa (18.4 PSI)*
Low Reference	-	127 kPa (18.4 PSI)	-
* Internal ECM or sensor damage may occur if the circuit is shorted to B+.			

MAP Sensor, if equipped with Turbocharger

Circuits	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine running at various operating conditions **Parameter Normal Range:** 12-225 kPa (1.7 to 32.6 PSI) (Varies with altitude)			
5 V Reference	0 kPa (0 PSI)	0 kPa (0 PSI)	255 kPa (36.9 PSI)
Signal	0 kPa (0 PSI)	0 kPa (0 PSI)	255 kPa (36.9 PSI)*
Low Reference	-	255 kPa (36.9 PSI)	-
* Internal ECM or sensor damage may occur if the circuit is shorted to B+.			

Circuit Description

The manifold absolute pressure (MAP) sensor measures the pressure inside the intake manifold. Pressure in the intake manifold is affected by engine speed, throttle opening, air temperature, barometric pressure (BARO) and if equipped turbocharger output. A diaphragm within the MAP sensor is displaced by the pressure changes that occur from the varying load and operating conditions of the engine. The sensor translates this action into electrical resistance.

The MAP sensor wiring includes 3 circuits. The engine control module (ECM) supplies a regulated 5 volts to the sensor on a 5 V reference circuit. The ECM supplies a ground on a low reference circuit. The MAP sensor provides a signal voltage to the ECM, relative to the pressure changes, on the MAP sensor signal circuit. The ECM converts the signal voltage input to a pressure value.

Under normal operation the greatest pressure that can exist in the intake manifold is at ignition ON, engine OFF, which is equal to the BARO. If equipped, a turbocharger can increase the pressure above BARO, when the vehicle is operated at wide-open throttle (WOT). The lowest manifold pressure occurs when the vehicle is idling or decelerating. The ECM monitors the MAP sensor signal for pressure outside of the normal range.

Conditions for Running the DTC

P0107

This DTC runs continuously.

P0108

This DTC runs continuously.

Conditions for Setting the DTC

P0107

The ECM detects that the MAP Sensor voltage is less than 0.15 V for more than 13 ms.

P0108

The ECM detects that the MAP Sensor voltage is more than 4.50 V for more than 13 ms.

Action Taken When the DTC Sets

DTCs P0107 and P0108 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0107 and P0108 are Type B DTCs.

Special Tools

GE-23738-A Vacuum Pump

For equivalent regional tools, refer to **Special Tools (Diagnostic Tools)** **Special Tools (Repair Tools)** .

Circuit/System Verification

1. Ignition ON, verify that DTC P0641, P0651, P0697, or P06A3 is not set.
   - **If any of the DTCs are set**

     Refer to **DTC P0641, P0651, P0697, or P06A3 (ECM)** for further diagnosis.

- **If none of the DTCs are set**

2. Determine the current vehicle testing altitude.
3. Verify the scan tool MAP Sensor parameter is within the range specified in the **Altitude Versus Barometric Pressure (With LFX)** table.
    - **If the MAP Sensor parameter is not in range**

      Refer to Circuit/System Testing for further diagnosis.

4. Verify the engine is equipped with a turbocharger.
    - **If not equipped with a turbocharger**

      Refer to Step 6.

    - **If equipped with a turbocharger**
5. Engine idling, verify the scan tool MAP Sensor voltage parameter is between 0.3-4.8 V and changes with accelerator pedal input.
    - **If not between 0.3-4.8 V or does not change**

      Refer to Circuit/System Testing.

    - **If between 0.3-4.8 V and changes**

      Refer to Step 7.

6. Engine idling, verify the scan tool MAP Sensor voltage parameter is between 0.2-4.5 V and changes with accelerator pedal input.
    - **If not between 0.2-4.5 V or does not change**

      Refer to Circuit/System Testing.

    - **If between 0.2-4.5 V and changes**
7. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed in the Freeze Frame/Failure Records data.
8. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
9. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the B74 Manifold Absolute Pressure Sensor.
2. Ignition OFF and all vehicle systems OFF. It may take up to 2 min for all vehicle systems to power down. Test for less than 2 Ω between the low reference circuit terminal 2 and ground.

- **If 2 Ω or greater**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for less than 2 Ω in the low reference circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K20 Engine Control Module.

- **If less than 2 Ω**

3. Ignition ON, test for 4.8-5.2 V between the 5 V reference circuit terminal 1 and ground.
    - **If less than 4.8 V**

    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.

    NOTE: **If the signal circuit is shorted to a voltage the ECM or the MAP Sensor may be damaged.**

    -
    - **If greater than 5.2 V**

    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Ignition ON, test for less than 1 V between the 5 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.

    - **If between 4.8-5.2 V**

4. Ignition ON, verify the scan tool MAP Sensor parameter is less than 0.5 V.
    - **If 0.5 V or greater**

    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Ignition ON, test for less than 1 V between the signal circuit terminal 3 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.

    - **If less than 0.5 V**

5. Ignition OFF, install a 3 A fused jumper wire between the signal circuit terminal 3 and the 5 V reference circuit terminal 1.
6. Ignition ON, verify the scan tool MAP Sensor voltage parameter is greater than 4.5 V.
    - **If 4.5 V or less**

    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Remove the jumper wire, test for infinite resistance between the signal circuit terminal 3 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open or high resistance in the circuit.
    - If less than 2 Ω, replace the K20 Engine Control Module.

- **If greater than 4.5 V**

7. Test or replace the B74 Manifold Absolute Pressure Sensor.

Component Testing

NOTE: **You must perform the Circuit/System Testing in order to verify the integrity of the MAP Sensor circuits before proceeding with the Component Testing.**

Skewed Sensor Test

1. Ignition OFF, remove the B74 Manifold Absolute Pressure Sensor from the engine. Connect the harness to the sensor, if disconnected.
2. Ignition ON, apply 17 kPa (5.0 in Hg) of vacuum to the B74 Manifold Absolute Pressure Sensor, with the **GE-23738-A** . Verify the scan tool MAP Sensor pressure parameter decreases between 13-21 kPa (1.8-3.0 PSI).
    - **If the parameter does not decrease between 13-21 kPa (1.8-3.0 PSI).**

      Replace the B74 Manifold Absolute Pressure Sensor.

    - **If the parameter does decrease between 13-21 kPa (1.8-3.0 PSI).**
3. Apply 34 kPa (10.0 in Hg) of vacuum to the B74 Manifold Absolute Pressure Sensor, with the **GE-23738-A** . Verify the scan tool MAP pressure parameter decreases between 30-38 kPa (4.4-5.5 PSI).
    - **If the parameter does not decrease between 30-38 kPa (4.4-5.5 PSI).**

      Replace the B74 Manifold Absolute Pressure Sensor.

    - **If the parameter does decrease between 30-38 kPa (4.4-5.5 PSI).**
4. All OK.

Erratic Signal Test

1. Ignition OFF, remove the B74 Manifold Absolute Pressure Sensor and disconnect the harness.
2. Install a 3 A fused jumper wire between the 5 V reference circuit terminal 1 of the sensor and the sensor harness.
3. Install a jumper wire between the low reference circuit terminal 2 of the sensor and ground.
4. Install a jumper wire to the signal circuit terminal 3 of the sensor.
5. Connect a DMM between the jumper wire and ground.
6. Ignition ON, observe the DC voltage on the DMM. Slowly apply between 0-15 kPa (0-4.4 in Hg) of vacuum to the sensor with the **GE-23738-A** .
7. Verify the voltage changes, without any spikes or dropouts, between 0.2-4.9 V.

- **If not between 0.2-4.9 V or has spikes or dropouts**

  Replace the B74 Manifold Absolute Pressure Sensor.

- **If between 0.2-4.9 V and there are no spikes or dropouts**

8. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Manifold Absolute Pressure Sensor Replacement**
- **Control Module References** for ECM replacement, programming, and setup

DTC P0112, P0113, OR P0114: INTAKE AIR TEMPERATURE (IAT) SENSOR 1

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Typical Scan Tool Data

IAT Sensor 1

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine running **Parameter Normal Range:** Varies with ambient temperature			
Signal	150Â°C (302Â°F)	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)*
Low Reference	-	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)*
*Internal ECM or sensor damage may occur if the circuit is shorted to B+			

Circuit/System Description

The intake air temperature (IAT) sensor 1 is a variable resistor that measures the temperature of the air in the sensor bore. The engine control module (ECM) supplies 5 V to the IAT sensor 1 signal circuit and a ground for the IAT sensor 1 low reference circuit. The signal varies with inlet air temperature and is displayed by the scan tool as Â°C (Â°F).

The multifunction intake air sensor houses the following:

- IAT sensor 1
- IAT sensor 2
- Humidity sensor
- Mass Air Flow (MAF) sensor
- BARO pressure sensor

IAT Sensor 1 - Temperature, Resistance, Voltage Table

IAT Sensor 1	IAT Sensor 1 Resistance	IAT Sensor 1 Signal Voltage
Cold	High	High
Warm	Low	Low

Conditions for Running the DTCs

P0112 and P0113

- The engine run time is greater than 1 s.
- The DTCs run continuously when the above conditions are met.

P0114

- The ignition is ON or the engine is running.
- This DTC runs continuously within the enabling conditions.

Conditions for Setting the DTCs

P0112

The ECM detects that the IAT sensor 1 signal is warmer than 149Â°C (300Â°F) for greater than 5 s.

P0113

The ECM detects that the IAT sensor 1 signal is colder than -60Â°C (-76Â°F) for greater than 5 s.

NOTE: The scan tool display range is between -40 and +150Â°C (-40 and +302Â°F).

P0114

The ECM detects that the IAT sensor 1 signal is intermittent or has abruptly changed for greater than 5 s.

Action Taken When the DTCs Set

- DTCs P0112, P0113, and P0114 are Type B DTCs.
- The ECM commands the cooling fans ON.

Conditions for Clearing the DTCs

DTCs P0112, P0113, and P0114 are Type B DTCs.

Diagnostic Aids

With the ignition ON, the engine OFF, if the engine is cold, a properly functioning IAT sensor 1 will gradually increase the scan tool IAT Sensor 1 parameter. This is due to the heat that is generated by the MAF sensor heating elements.

Circuit/System Verification

NOTE: **To minimize the effects of residual engine heat and sensor internal heating elements, perform Steps 1 and 2 of this verification procedure only if the ignition has been OFF for 8 hours or more.**

1. Ignition ON.
2. Verify the following scan tool parameters are within 10Â°C (18Â°F) of each other.
    - Start-Up IAT Sensor 1
    - IAT Sensor 2
    - Start-Up ECT
    - **If not within 10Â°C (18Â°F)**

      Refer to Circuit/System Testing.

    - **If within 10Â°C (18Â°F)**
3. Engine idling, verify the following scan tool parameters are between: -38 and +149Â°C (-36 and +300Â°F).
    - IAT Sensor 1
    - IAT Sensor 2
    - ECT Sensor
    - **If not between: -38 and +149Â°C (-36 and +300Â°F)**

      Refer to Circuit/System Testing.

    - **If between: -38 and +149Â°C (-36 and +300Â°F)**
4. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.
5. Verify the DTC does not set.
    - **If the DTC sets.**

      Refer to Circuit/System Testing.

    - **If the DTC does not set.**
6. All OK

Circuit/System Testing

1. Ignition OFF and all systems OFF, it may take up to for 2 minutes for all vehicle systems to power down. Disconnect the harness connector at the B75C Multifunction Intake Air sensor.
2. Test for less than 2 Ω between the low reference circuit terminal 3 and ground.
    - **If 2 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K20 engine control module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open or high resistance in the circuit.

- If less than 2 Ω replace the K20 engine control module.

- **If less than 2 Ω**

3. Ignition ON, test for 4.8-5.2 V between the intake air temperature sensor 1 signal circuit terminal 1 and ground.
   - **If less than 4.8 V**
   1. Ignition OFF, disconnect the harness connector at the K20 engine control module.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K20 engine control module.
   - **If greater than 5.2 V**

     NOTE: If the signal circuit is shorted to a voltage the engine control module or the sensor may be damaged.

   1. Ignition OFF, disconnect the harness connector at the K20 engine control module.
   2. Ignition ON, test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K20 engine control module.
   - **If between 4.8-5.2 V**
4. Ignition ON, verify the scan tool IAT Sensor 1 parameter is colder than -39Â°C (-38Â°F).
   - **If warmer than -39Â°C (-38Â°F).**
   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
   2. Test for infinite resistance between the signal circuit terminal 1 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K20 Engine Control Module.
   - **If colder than -39Â°C (-38Â°F).**
5. Ignition OFF, install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 3.
6. Verify the scan tool IAT Sensor 1 parameter is warmer than 150Â°C (302Â°F).
   - **If colder than 150Â°C (302Â°F).**
   1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V

3. Ignition OFF.
4. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K20 Engine Control Module.

- **If warmer than 150Â°C (302Â°F).**

7. Test or replace the B75C Multifunction Intake Air sensor.

Component Testing

Multifunction Intake Air Sensor

1. Ignition OFF, disconnect the harness connector at the B75C Multifunction Intake Air sensor.

NOTE: **A thermometer can be used to test the sensor off the vehicle.**

2. Test the IAT sensor 1 by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the **Temperature Versus Resistance - Intake Air Temperature Sensor (Hitachi Sensor)** table for Hitachi Sensors. The resistance values should be in range of the table values.
    - **If not within the table values.**

      Replace the B75C Multifunction Intake Air sensor.

    - **If within the table values.**
3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Mass Airflow Sensor with Intake Air Temperature Sensor Replacement** for multifunction intake air sensor replacement.
- **Control Module References** for engine control module replacement, programming, and setup.

DTC P0116: ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

DTC Descriptor

DTC P0116

Engine Coolant Temperature (ECT) Sensor Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P0117, P0119	P0118, P0119	P0118, P0119	P0116, P0128
Low Reference	-	P0118	-	P0128

Typical Scan Tool Data

ECT Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running **Parameter Normal Range:** -39 to 149Â°C (-38 to 300Â°F)			
ECT Sensor	150Â°C (302Â°F)	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)
Low Reference	-	-40Â°C (-40Â°F)	-

Circuit/System Description

The engine coolant temperature (ECT) sensor is a variable resistor that measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 V to the ECT sensor signal circuit and a ground for the low reference circuit.

The ECM uses this high side coolant rationality diagnostic to determine if the input from the ECT sensor is skewed warmer than normal. The internal clock of the ECM will record the amount of time the ignition is OFF. If the calibrated ignition OFF time is met at start-up, the ECM will compare the temperature difference between the ECT and the intake air temperature (IAT) to determine if the temperatures are within an acceptable operating range of each other.

Conditions for Running the DTC

- DTC P0111, P0112, P0113, P0114, P0117, P0118, P0119, P0128, P0502, P0503, P0601, or P2610 is not set.
- The vehicle has had a minimum ignition OFF time of 8 h.
- The ignition is ON.
- The start-up IAT is warmer than -7Â°C (+19Â°F).
- The Fuel Level Sensor is greater than 2.5%.
- This DTC runs once per ignition cycle when the above conditions are met.

Conditions for Setting the DTC

- The ECM detects a temperature difference at power-up that indicates that the ECT sensor is 30Â° C (54Â° F) warmer than the IAT sensor.

  OR

- The ECM detects a temperature difference at power-up that indicates that the ECT sensor is 15Â° C (27Â° F) warmer than the IAT sensor, and NO engine block heater was not detected.

  OR

- The ECM detects a temperature difference at power-up that indicates that the ECT sensor is 15Â° C (27Â° F) warmer than the IAT sensor, the engine cranked for greater than 10 s without starting and NO engine block heater was not detected.

Action Taken When the DTC Sets

- DTC P0116 is a Type B DTC.
- The cooling fans will be commanded ON.
- The A/C compressor will be commanded OFF.

Conditions for Clearing the MIL/DTC

DTC P0116 is a Type B DTC.

Diagnostic Aids

- Engine coolant that is leaking through the sensor will create a high resistance short to ground. This condition results in less voltage on the ECT sensor signal circuit, which is interpreted by the ECM as a warmer ECT.
- An IAT sensor that is skewed colder at various ambient temperatures due to greater resistance than is normal will increase the range between these two sensors. Measure and record the resistance of the IAT sensor at various ambient temperatures, then compare those measurements to the **Temperature Versus Resistance - Intake Air Temperature Sensor (Hitachi Sensor)** table.
- A slight to moderate resistance in the IAT sensor signal circuit or low reference circuit will increase the range between these two sensors. This condition results in a greater voltage on the IAT sensor signal circuit, which is interpreted by the ECM as a colder IAT.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool ECT Sensor parameter is between -40 and 150Â°C (-40 and 302Â°F) and changes with engine run time.
   - **If not within the specified range or does not change**

     Refer to Circuit/System Testing.

   - **If within the specified range and changes**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF. Disconnect the harness connector at the B34 Engine Coolant Temperature Sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 Ω between the low reference terminal A or 2 and ground.
   - **If 5 Ω or greater**
   1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K20 Engine Control Module.
   - **If less than 5 Ω**
3. Ignition ON.
4. Verify the scan tool ECT Sensor parameter is colder than -39Â°C (-38Â°F).
   - **If warmer than -39Â° C (-38Â° F)**
   1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
   2. Test for infinite resistance between the signal circuit terminal B or 1 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K20 Engine Control Module.
   - **If colder than -39Â° C (-38Â° F)**

5. Install a 3 A fused jumper wire between the signal circuit terminal B or 1 and the low reference circuit terminal A or 2.
6. Verify the scan tool ECT sensor parameter is warmer than 149Â°C (300Â°F).
    - **If 149Â° C (300Â° F) or colder**
    1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Ignition OFF
    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If warmer than 149Â° C (300Â° F)**
7. Test or replace the B34 Engine Coolant Temperature Sensor.

Component Testing

1. Ignition OFF, disconnect the harness connector at the B34 Engine Coolant Temperature Sensor.
2. Test the ECT sensor by varying the sensor temperature while monitoring the sensor resistance.
3. Verify the readings are within the range specified in the **Temperature Versus Resistance - Engine Coolant Temperature Sensor** table.
    - **If not within the specified range**

      Replace the B34 Engine Coolant Temperature Sensor.

    - **If within the specified range**
4. Test for infinite resistance between each terminal and the sensor housing.
    - **If less than infinite resistance**

      Replace the B34 Engine Coolant Temperature Sensor.

    - **If infinite resistance**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Engine Coolant Temperature Sensor Replacement**
- **Control Module References** for engine control module replacement, setup, and programming

DTC P0117, P0118, OR P0119: ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Typical Scan Tool Data

ECT Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine running at various operating conditions **Parameter Normal Range:** Varies with coolant temperature			
Signal	150Â°C (302Â°F)	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)
Low Reference	-	-40Â°C (-40Â°F)	-

Circuit/System Description

The engine coolant temperature (ECT) sensor is a variable resistor that measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 V to the ECT sensor signal circuit and a ground for the low reference circuit. This diagnostic checks for an open, short to ground or an intermittent circuit condition between the ECM and ECT sensor.

Conditions for Running the DTC

P0117

- The ignition is ON.

  OR

- The engine is running for greater than 10 s.
- This DTC runs continuously within the enabling conditions.

P0118

- The ignition is ON.

  OR

- The engine is running for greater than 10 s.

  OR

- The engine run time is less than 10 s when the IAT is warmer than -7Â°C (19Â°F).
- This DTC runs continuously within the enabling conditions.

P0119

- No active DTCs set.
- The ignition is ON.
- This DTC runs continuously within the enabling conditions.

Conditions for Setting the DTC

P0117

The ECM detects that the ECT is warmer than 149Â°C (300Â°F) for greater than 5 s.

P0118

The ECM detects that the ECT is colder than -39Â°C (-38Â°F) for greater than 5 s.

P0119

The ECM detects that the ECT is intermittent or has abruptly changed for greater than 3 seconds.

Action Taken When the DTC Sets

- DTC P0117, P0118 and P0119 are Type B DTCs.
- The cooling fans will be commanded ON.
- The Engine Coolant Temperature Gauge is inoperative.
- The AC compressor will be commanded OFF.

Conditions for Clearing the DTC

DTC P0117, P0118 and P0119 are Type B DTCs.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool ECT Sensor parameter is between -40 and 150Â°C (-40 and 302Â°F) and changes with engine run time.
    - **If not between the specified range or does not change**

      Refer to Circuit/System Testing.

    - **If within the specified rante and changes**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF. Disconnect the B34 Engine Coolant Temperature sensor harness connector at the sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 Ω between the low reference circuit terminal A or 2 and ground.
    - **If 5 Ω or greater**
    1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If less than 5 Ω**
3. Ignition ON.
4. Verify the scan tool ECT Sensor parameter is colder than -39Â° C (-38Â° F).
    - **If warmer than -39Â° C (-38Â° F)**
    1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the signal circuit terminal B or 1 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K20 Engine Control Module.
    - **If colder than -39Â° C (-38Â° F)**
5. Install a 3 A fused jumper wire between the signal circuit terminal B or 1 and the low reference circuit terminal A or 2.
6. Verify the scan tool ECT sensor parameter is warmer than 149Â° C (300Â° F).
    - **If 149Â° C (300Â° F) or colder**
    1. Ignition OFF, remove the jumper wire, disconnect the X3 harness connector at the K20 Engine Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Ignition OFF.
    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If warmer than 149Â° C (300Â° F)**
7. Test or replace the B34 Engine Coolant Temperature Sensor.

Component Testing

1. Ignition OFF, disconnect the harness connector at the B34 Engine Coolant Temperature Sensor.
2. Test the ECT sensor by varying the sensor temperature while monitoring the sensor resistance.
3. Verify the readings are within the range specified in **Temperature Versus Resistance - Engine Coolant Temperature Sensor** table.

- **If not within the specified range**

  Replace the B34 Engine Coolant Temperature Sensor.

- **If within the specified range**

4. Test for infinite resistance between each terminal and the sensor housing.
   - **If less than infinite resistance**

     Replace the B34 Engine Coolant Temperature Sensor.

   - **If infinite resistance**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Engine Coolant Temperature Sensor Replacement**
- **Control Module References** for ECM replacement, programming, and setup.

DTC P0121-P0123, P0222, P0223, P16A0-P16A2, OR P2135: THROTTLE POSITION SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

* This DTC set indicates an internal throttle body condition. ** A short to voltage causes P16A1 to set. If DTC P16A0, P16A1, and P16A2 set at the same time, an intermittent circuit condition exists.				

Typical Scan Tool Data

Throttle Position Sensor 1

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: The engine is operating with the throttle closed. All accessories OFF. **Parameter Normal Range:** Throttle Position Sensor 1 3.75-4.75 V			
5 V Reference	5.0 V	5.0 V	5.0 V
Signal	5.0 V	0.0 V	0.0 V
Low Reference	-	0.0 V	-

Throttle Position Sensor 2

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: The engine is operating with the throttle closed. All accessories OFF. **Parameter Normal Range:** Throttle Position Sensor 2 0.45-0.90 V			
5 V Reference	0.0 V	0.0 V	0.0 V
Signal	0.0 V	5.0 V	5.0 V
Low Reference	-	5.0 V	-

Circuit/System Description

The throttle body assembly contains a contact-less inductive throttle position sensing element that is managed by a customized integrated circuit. The throttle position sensor is mounted within the throttle body assembly and is not serviceable. The engine control module (ECM) supplies the throttle body with a 5 V reference circuit, a low reference circuit, an H-bridge motor directional control circuit, and an asynchronous signal/serial data circuit. The asynchronous signal means communication is only going from the throttle body to the ECM. The throttle body cannot receive data from the ECM over the signal/serial data circuit. The throttle position sensor provides a signal voltage that changes relative to throttle blade angle. The customized integrated circuit translates the voltage based position information into serial data using the Society of Automotive Engineers (SAE) J2716 Single Edge Nibble Transmission (SENT) protocol. The throttle position sensor information is transmitted between the throttle body and the ECM on the signal/serial data circuit. The ECM decodes the serial data signal into separate voltages which are displayed on a scan tool as the voltage inputs from TP sensors 1 and 2.

Conditions for Running the DTC

P0121

- DTCs P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0335, or P0336 is not set.
- The engine speed is between 500-6,800 RPM.
- The engine coolant temperature (ECT) is -7 to +126Â°C (19-259Â°F).
- The intake air temperature (IAT) is -20 to +125Â°C (-4 to +257Â°F).
- The DTC runs continuously when the above conditions are met.

P0122, P0123, P0222, P0223

- DTC P06A3 is not set.
- The ignition is ON or the engine is running.
- The run/crank or powertrain relay voltage is greater than 6.41 V and reduced power is not active.
- The DTCs run continuously when the above condition are met.

P16A0, P16A1, or P16A2

- DTC P06A3 is not set.
- The ignition is ON or the engine is operating.
- The run/crank voltage is greater than 6.41 V.
- The DTCs run continuously once the above conditions are met for greater than 1 s.

P2135

- DTCs P0122, P0123, P0222, P0223, or P06A3 are not set.
- The ignition is ON or the engine is running.
- The run/crank or powertrain relay voltage is greater than 6.41 V and reduced power is not active.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P0121

The ECM detects that the throttle position sensor 1 voltage is stuck within normal operating range for greater than 1 s.

P0122

The ECM detects the throttle position sensor 1 signal voltage is less than 0.32 V for greater than 1 s.

P0123

The ECM detects the throttle position sensor 1 signal voltage is greater than 4.75 V for greater than 1 s.

P0222

The ECM detects the throttle position sensor 2 signal voltage is less than 0.25 V for greater than 1 s.

P0223

The ECM detects the throttle position sensor 2 signal voltage is greater than 4.59 V for greater than 1 s.

P16A0

The ECM detects a low voltage circuit condition on the throttle position sensor signal circuit for greater than 1 s.

P16A1

The ECM detects a high voltage circuit condition on the throttle position sensor signal circuit for greater than 1 s.

P16A2

The ECM detects an incorrect message was received over the throttle position sensor signal circuit for greater than 1 s.

P2135

The ECM detects that throttle position sensors 1 and 2 disagree greater than 7-10 percent for greater than 1 s.

Action Taken When the DTC Sets

- DTCs P0121 is a Type B DTC.
- DTCs P0122, P0123, P0222, P0223, P16A0, P16A1, P16A2, and P2135 are Type A DTCs.
- The ECM commands the throttle actuator control (TAC) system to operate in a Reduced Engine Power mode.
- A message center or an indicator displays Reduced Engine Power.
- Under certain conditions, the ECM commands the engine OFF.

Conditions for Clearing the DTC

- DTCs P0121 is a Type B DTC.
- DTCs P0122, P0123, P0222, P0223, P16A0, P16A1, P16A2, and P2135 are Type A DTCs.

Diagnostic Aids

- A high resistance condition on the throttle position and throttle actuator control circuits could cause a DTC to set.
- If the accelerator pedal is pressed to the wide open throttle position, the throttle blade angle or Throttle Position angle is limited to less than 40 percent.

Circuit/System Verification

NOTE: **If you were sent here from DTC P0068, P0101, P0106, or P1101 refer to Circuit/System Testing.**

1. Ignition ON.
2. Verify that DTC P0601-P0606, P06A3, and P16F3 is not set.
   - **If a DTC is set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.

   - **If a DTC is not set**
3. Verify the scan tool Throttle Body Idle Airflow Compensation parameter is less than 90 %.
   - **If 90 % or greater**

Refer to **Throttle Body Inspection and Cleaning** .

- **If less than 90 %**

4. Verify that DTC P0122, P0123, P0222, P0223, P16A0, P16A1, P16A2, or P2135 are not set.
   - **If DTC P0122, P0123, P0222, P0223, or P2135 are the only DTCs set**

     Replace the Q38 Throttle Body.

   - **If DTC P16A0, P16A1, or P16A2 is set with any of the DTCs**

     Refer to Circuit/System Testing.

   - **If none of the DTCs are set**
5. Verify the TP Sensors 1 and 2 Agree/Disagree parameter displays Agree while performing the Throttle Sweep Test with a scan tool.
   - **If Agree is not displayed**

     Replace the Q38 Throttle Body.

   - **If Agree is displayed**
6. Verify DTC P0122, P0123, P0222, P0223, P16A0, P16A1, P16A2, and P2135 is not set.
   - **If a DTC is set**

     Refer to Circuit/System Testing.

   - **If a DTC is not set**
7. Determine the current vehicle testing altitude.
8. Verify the scan tool MAP Sensor pressure parameter is within range specified in the **Altitude Versus Barometric Pressure (With LFX)** table.
   - **If the MAP Sensor pressure is not in range**

     Refer to **DTC P0106**.

   - **If the MAP Sensor pressure is within range**
9. Engine idling.
10. Verify the scan tool MAP Sensor pressure parameter is between 26-52 kPa (3.8-7.5 psi) and changes with accelerator pedal input.
    - **If not between 26-52 kPa (3.8-7.5 psi) or does not change**

      Refer to **DTC P0106**.

    - **If between 26-52 kPa (3.8-7.5 psi) and changes**
11. Verify the scan tool MAF Sensor g/s parameter changes smoothly and gradually as the engine speed is increased and decreased while performing the actions listed below.
    1. Engine idling
    2. Perform the scan tool snapshot function.

3. Increase the engine speed slowly to 3,000 RPM and then back to idle.
4. Exit from the scan tool snapshot and review the data.
5. Observe the MAF Sensor parameter frame by frame with a scan tool.

- **If the MAF Sensor parameter does not change smoothly and gradually**

  Refer to **DTC P0101**.

- **If the MAF Sensor parameter changes smoothly and gradually**

12. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
13. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
14. All OK.

Circuit/System Testing

NOTE: Disconnecting the throttle body harness connector causes additional DTCs to set.

1. Ignition OFF, and all vehicle systems OFF, disconnect the harness connector at Q38 Throttle Body. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 Ω between the low reference circuit terminal 4 and ground.
   - **If 5 Ω or greater**
   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K20 Engine Control Module.
   - **If less than 5 Ω**
3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 5 and ground.
   - **If less than 4.8 V**
   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
   2. Test for infinite resistance between the 5 V reference circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the 5 V reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K20 Engine Control Module.
   - **If greater than 5.2 V**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
2. Test for less than 1 V between the 5 V reference circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K20 Engine Control Module.

- **If between 4.8-5.2 V**

5. Ignition ON.
6. Test for 4.8-5.2 V between the signal circuit terminal 3 and ground.

- **If less than 4.8 V**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the signal circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K20 Engine Control Module.

- **If greater than 5.2 V**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
2. Test for less than 1 V between the signal circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K20 Engine Control Module.

- **If between 4.8-5.2 V**

7. Replace the Q38 Throttle Body.

Repair Instructions

- **Throttle Body Assembly Replacement**
- **Control Module References** for engine control module replacement, programming, and setup

Repair Verification

1. Install any components that have been removed or replaced during diagnosis.
2. Perform any adjustments, programming or setup procedures that are required when a component is removed or replaced.
3. Clear the DTCs with a scan tool.
4. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
5. Ignition ON.
6. Verify the TP Sensors 1 and 2 Agree/Disagree parameter displays Agree while performing the Throttle Sweep Test with a scan tool.

- **If Agree is not displayed**

  Replace the Q38 Throttle Body.

- **If Agree is displayed**

7. If the repair was related to a DTC, duplicate the Conditions for Running the DTC and use the Freeze Frame/Failure Records, if applicable, in order to verify the DTC does not set.
   - **If DTC sets**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.

   - **If DTC does not set**
8. All OK.

DTC P0128: ENGINE COOLANT TEMPERATURE (ECT) BELOW THERMOSTAT REGULATING TEMPERATURE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0128

Engine Coolant Temperature (ECT) Below Thermostat Regulating Temperature

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P0117, P0119	P0118	P0118	P0116, P0119, P0128
Low Reference	-	P0118, P0119	-	P0119, P0128

Typical Scan Tool Data

ECT Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running at various operating conditions **Parameter Normal Range:** Varies with coolant temperature within a range of -39 to 149Â°C (-38 to 300Â°F)			
Signal	150Â°C (302Â°F)	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)
Low Reference	-	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)

Circuit/System Description

The engine control module (ECM) monitors the temperature of the engine coolant for engine control and enabling criteria for some diagnostics. The ECM estimates the amount of energy generated to calculate a target engine coolant temperature (ECT). If the ECT fails to reach the thermostat regulating temperature, before a predetermined amount of energy is generated engine, the DTC sets.

Conditions for Running the DTC

- DTC P0068, P0071, P0072, P0073, P0074, P0101, P0102, P0103, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0222, P0223, P0502, P0503, P1101, P1516, P2101, or P2135 is not set.
- The start-up ECT is between -40Â° and 66Â°C (-40Â° and 151Â°F).
- The engine OFF time is greater than 30 min.
- The engine run time is between 2 and 24 min.
- The vehicle has traveled greater than 2.4 km (1.5 mi).
- The ethanol in the fuel is less than 87%.
- This DTC runs once per ignition cycle when the above conditions are met.

Conditions for Setting the DTC

- The ECM determines that the ECT has not met its calibrated target of 71Â°C (160Â°F) when the start-up ambient temperature was between 10 and 52Â°C (50 and 126Â°F), for greater than 1 s.

  OR

- The ECM determines that the ECT has not met its calibrated target of 55Â°C (131Â°F) when the start-up ambient temperature was between -7 and 10Â°C (19 and 50Â°F), for greater than 1 s.

Action Taken When the DTC Sets

- DTC P0128 is a Type B DTC.
- The engine coolant temperature gauge defaults to cold.
- The A/C is commanded OFF and inoperative.
- The cooling fans are commanded ON.

Conditions for Clearing the MIL/DTC

DTC P0128 is a Type B DTC.

Diagnostic Aids

- DTC P0128 occurring with insufficient vehicle interior heating is an indication of improper thermostat operation.
- Corrosion in the ECT sensor terminals or the ECT harness connector results in a greater voltage on the ECT sensor signal circuit, which is interpreted by the ECM as a colder ECT.
- A slight to moderate resistance in the ECT sensor signal circuit or low reference circuit will affect this diagnostic. This condition results in a greater voltage on the ECT sensor signal circuit, which is interpreted by the ECM as a colder ECT.

Circuit/System Verification

1. Ignition ON, verify that DTC P0116, P0117, P0118, or P0119 is not set.
   - **If a DTC is set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

   - **If a DTC is not set**
2. Verify the cooling system is filled to the correct coolant level. Refer to **Cooling System Draining and Filling** , and **Loss of Coolant** .
   - **If the coolant level is not correct**

     Repair as necessary

   - **If the coolant level is correct**
3. Engine running for 15 min with the A/C OFF, increase the engine speed to 3,000 RPM.
4. Verify the scan tool ECT Sensor parameter is greater than 80Â°C (176Â°F).
   - **If less than 80Â°C (176Â°F)**

     Replace the engine coolant thermostat.

   - **If greater than 80Â°C (176Â°F)**

5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
7. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF. Disconnect the harness connector at the B34 Engine Coolant Temperature sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 Ω between the low reference circuit terminal A or 2 and ground.
    - **If 5 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If less than 5 Ω**
3. Ignition ON.
4. Verify the scan tool ECT Sensor parameter is colder than -39Â° C (-38Â° F).
    - **If warmer than -39Â° C (-38Â° F)**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the signal circuit terminal B or 1 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K20 Engine Control Module.
    - **If colder than -39Â° C (-38Â° F)**
5. Install a 3 A fused jumper wire between the signal circuit terminal B or 1 and the low reference circuit terminal A or 2.
6. Verify the scan tool ECT sensor parameter is warmer than 149Â° C (300Â° F).
    - **If 149Â° C (300Â° F) or colder**
    1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Ignition OFF.
    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω, replace the K20 Engine Control Module.

- **If warmer than 149Â° C (300Â° F)**

7. Test the B34 Engine Coolant Temperature Sensor.

   Refer to Component Testing.

Component Testing

1. Ignition OFF, disconnect the harness connector at the B34 Engine Coolant Temperature Sensor.
2. Test the ECT sensor by varying the sensor temperature while monitoring the sensor resistance.
3. Verify the readings are within the range specified in the **Temperature Versus Resistance - Engine Coolant Temperature Sensor** table.
   - **If not within the specified range**

     Replace the B34 Engine Coolant Temperature Sensor.

   - **If within the specified range**
4. Test for infinite resistance between each terminal and the sensor housing.
   - **If less than infinite resistance**

     Replace the B34 Engine Coolant Temperature Sensor.

   - **If infinite resistance**
5. Refer to **Thermostat Diagnosis** .

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Engine Coolant Temperature Sensor Replacement**
- **Engine Coolant Thermostat Housing Replacement**
- **Control Module References** for engine control module replacement, programming and setup.

Typical Scan Tool Data

HO2S Sensor 1 Voltage, HO2S Sensor 2 Voltage

Circuit	Short to Ground	Open	Short to Voltage
Parameter Normal Range: 200-800 mV			
HO2S High Signal	0.00 V	Approximately 1.9 V	Approximately 1.9 V
HO2S Low Signal	0.00 V	Approximately 1.9 V	Approximately 1.9 V

Circuit/System Description

The heated oxygen sensors (HO2S) are used for fuel control and catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content of the exhaust stream. When the engine is started, the control module operates in an Open Loop mode, ignoring the HO2S signal voltage while calculating the air-to-fuel ratio. While the engine runs, the HO2S heats up and begins to generate a voltage within a range of 0-1,000 mV. Once sufficient HO2S voltage fluctuation is observed by the control module, Closed Loop is entered. The control module uses the HO2S voltage to determine the air-to-fuel ratio. An HO2S voltage that increases toward 1,000 mV indicates a rich fuel mixture. An HO2S voltage that decreases toward 0 mV indicates a lean fuel mixture.

The heating elements inside each HO2S heat the sensor to bring the sensor up to operating conditions faster. This allows the system to enter Closed Loop earlier and the control module to calculate the air-to-fuel ratio sooner.

Conditions for Running the DTC

P0131, P0137, P0151, or P0157

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The engine is operating in Closed Loop.
- The Ignition voltage is between 10-32 V.
- The fuel level is greater than 10 percent.

- The throttle position (TP) is between 3-70 percent.
- The DTCs run continuously when the above conditions are met for 2 s.

P0132, P0138, P0152, or P0158

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The engine is operating in Closed Loop.
- The Ignition voltage is between 10-32 V.
- The fuel level is greater than 10 percent.
- The throttle position (TP) is between 0-70 percent.
- The DTCs run continuously when the above conditions are met for 3 s.

P0134, P0140, P0154, or P0160

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The ignition voltage is between 10-32 V.
- The engine run time is greater than 150 s.
- The fuel system is in Closed Loop.
- The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

P0131, P0137, P0151, or P0157

- The ECM detects that the HO2S voltage is less than 50 mV.
- The DTCs set within 50 s when the above condition is met.

P0132, P0138, P0152, or P0158

- The ECM detects that the HO2S voltage is greater than 1,050 mV.
- The DTCs set within 50 s when the above condition is met.

P0134 or P0154

- The ECM detects that the HO2S 1 voltage is between 350-550 mV.
- The HO2S heater warm-up cycle is complete.
- The DTCs set within 15 s when the above conditions are met.

P0140 or P0160

- The ECM detects that the HO2S 2 voltage is not varying.

- The HO2S heater warm-up cycle is complete.
- The DTCs set within 15 s when the above conditions are met.

Action Taken When the DTC Sets

DTCs P0131, P0132, P0134, P0137, P0138, P0140, P0151, P0152, P0154, P0157. P0158, and P0160 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0131, P0132, P0134, P0137, P0138, P0140, P0151, P0152, P0154, P0157, P0158, and P0160 are Type B DTCs.

Circuit/System Verification

1. Ignition ON.
2. Verify no HO2S heater DTCs are set
   - **If a DTC is set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If a DTC is not set**
3. Engine running.
4. Verify the scan tool HO2S Bank 1 or 2 Sensor 1 or 2 parameters are between 50-1,050 mV.
   - **If not between 50-1,050 mV**

Refer to Circuit/System Testing.

- **If between 50-1,050 mV**

5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
7. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the appropriate B52 Heated Oxygen Sensor harness connector. It may take up to 2 minutes for all vehicle systems to power down. Ignition ON.
2. Test for 1.7-3.0 V between the high signal circuit terminal B and ground.
   - **If less than 1.7 V**
   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
   2. Test for infinite resistance between the high signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the high signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K20 Engine Control Module.
   - **If greater than 3.0 V**
   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module. Ignition ON.
   2. Test for less than 1 V between the high signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K20 Engine Control Module.
   - **If between 1.7-3.0 V**
3. Verify the scan tool heated oxygen sensor Bank 1 or 2 Sensor 1 or 2 parameter is between 1.7-2.1 V
   - **If less than 1.7 V**
   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
   2. Test for infinite resistance between the low signal circuit terminal A and ground.
   - If less than infinite resistance, repair the short to ground on the circuit.
   - If infinite resistance, replace the K20 Engine Control Module.
   - **If between 1.7-2.1 V**
4. Connect a 3 A fused jumper wire between the high signal circuit terminal B and the low signal circuit terminal A.

NOTE: **The low signal circuit is tied to a pull-up circuit within the engine control module. A voltage of 0.0-1.10 V on the low signal circuit is normal.**

5. Verify the scan tool HO2S Bank 1 or 2 Sensor 1 or 2 parameter displays 0.0 V.
   - **If greater than 0.0 V**
   1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module. Ignition ON.
   2. Test for less than 2 Ω in the low signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω
   3. Test for less than 1 V between the low signal circuit terminal A and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K20 Engine Control Module.
   - **If 0.0 V**
6. Verify none of the following conditions exist:
   - Water intrusion in the B52 HO2S harness connector
   - Low or high fuel system pressure-Refer to **Fuel System Diagnosis** .
   - Fuel that is contaminated-Refer to **Alcohol/Contaminants-in-Fuel Diagnosis** .
   - Fuel saturation of the evaporative emission (EVAP) canister
   - Exhaust leaks
   - Engine vacuum leaks
   - **If any of the conditions exist**

     Repair as necessary.

   - **If none of the conditions exist.**
7. Test or replace the B52 Heated Oxygen Sensor

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Heated Oxygen Sensor Replacement - Bank 1 Sensor 1**
- **Heated Oxygen Sensor Replacement - Bank 1 Sensor 2**
- **Heated Oxygen Sensor Replacement - Bank 2 Sensor 1**
- **Heated Oxygen Sensor Replacement - Bank 2 Sensor 2**
- Perform the scan tool Heated Oxygen Sensor Resistance Learn Reset after replacing an HO2S.
- **Control Module References** for ECM replacement, programming and setup

HO2S Low Signal	0.00 V	1.7-2.1 V	1.7-2.1 V

Circuit/System Description

The heated oxygen sensors (HO2S) are used for fuel control and catalyst monitoring. Each HO2S compares the

oxygen content of the surrounding air with the oxygen content of the exhaust stream. When the engine is started, the control module operates in an Open Loop mode, ignoring the HO2S signal voltage while calculating the air-to-fuel ratio. While the engine runs, the HO2S heats up and begins to generate a voltage within a range of 0-1,000 mV. Once sufficient HO2S voltage fluctuation is observed by the control module, Closed Loop is entered. The control module uses the HO2S voltage to determine the air-to-fuel ratio. An HO2S voltage that increases toward 1,000 mV indicates a rich fuel mixture. An HO2S voltage that decreases toward 0 mV indicates a lean fuel mixture.

The heating elements inside each HO2S heat the sensor to bring the sensor up to operating conditions faster. This allows the system to enter Closed Loop earlier and the control module to calculate the air-to-fuel ratio sooner.

Conditions for Running the DTC

P0133 or P0153

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The engine coolant temperature (ECT) is greater than 54Â°C (129Â°F).
- The intake air temperature (IAT) is warmer than -40Â°C (-40Â°F)
- The Ignition voltage is between 10-32 V.
- The fuel level is greater than 10%.
- The engine run time is greater than 60 s.
- The engine speed is between 1,000-3,000 RPM.
- The barometric (BARO) pressure is greater than 70 kPa.
- The mass airflow (MAF) is between 15-43 g/s.
- The fuel system is in Closed Loop.
- The throttle position (TP) is greater than 5%.
- The DTCs run once per drive cycle when the above conditions are met.

P013A P013C, P013E, or P014A

- Before the ECM can report DTC P013A, or P013C failed, DTCs P013E, P014A, P2270, and P2272 must run and pass.
- Before the ECM can report DTC P013E, or P014A failed, DTCs P2270 and P2272 must run and pass.
- DTCs P0030, P0036, P0053, P0054, P0101, P0102, P0103, P0106, P0107, P0108, P0120, P0121, P0122, P0123, P0131, P0132, P0133, P0134, P0135, P0137, P0138, P013A, P013B, P013E, P013F, P0140, P0141, P0171, P0172, P0201, P0202, P0203, P0204, P0220, P0222, P0223, P0300, P0442, P0443, P0446, P0449, P0455, P0496, P1133, P1174, P1516, P2101, P2119, P2135, P2176, P2270, P2271, P2A00 are not set.
- The Ignition voltage is between 10-32 V.
- The learned heater resistance is valid.
- The fuel level is greater than 10%.

- The engine run time is equal to or greater than 5 min.
- The accelerator pedal (APP) is steady.
- The torque converter clutch (TCC) is applied.
- The DTCs run once per ignition cycle, during decel fuel cut-off (DFCO), when the above conditions are met.

P013B P013D, P013F, or P014B

- Before the ECM can report DTC P013B, or P013D failed, DTCs P013A, P013C, P013E, P013F, P014A, P014B, P2270, P2271, P2272, and P2273 must run and pass.
- Before the ECM can report DTC P013F, or P014B failed, DTCs P013A, P013C, P013E, P014A, P2270, P2271, P2272, and P2273 must run and pass.
- DTCs P0030, P0036, P0053, P0054, P0101, P0102, P0103, P0106, P0107, P0108, P0120, P0121, P0122, P0123, P0131, P0132, P0133, P0134, P0135, P0137, P0138, P013A, P013B, P013E, P013F, P0140, P0141, P0171, P0172, P0201, P0202, P0203, P0204, P0220, P0222, P0223, P0300, P0442, P0443, P0446, P0449, P0455, P0496, P1133, P1174, P1516, P2101, P2119, P2135, P2176, P2270, P2271, P2A00 are not set.
- The Ignition voltage is between 10-32 V.
- The learned heater resistance is valid.
- The fuel level is greater than 10%.
- The engine run time is equal to or greater than 5 min.
- The DTCs run once per ignition cycle when the above conditions are met.

P015A, P015B, P015C or P015D

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The engine coolant temperature (ECT) is warmer than 54Â°C (129Â°F).
- The intake air temperature (IAT) is warmer than -40Â°C (-40Â°F)
- The Ignition voltage is between 10-32 V.
- The fuel level is greater than 10%.
- The engine run time is greater than 60 s.
- The engine speed is between 1,025-2,325 RPM.
- The vehicle speed is between 70 km/h (44 mph).
- The mass airflow (MAF) is between 3-12 g/s.
- The fuel system is in Closed Loop.
- The DTCs run once per drive cycle when the above conditions are met.

P2270 or P2272

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P013A, P013B, P013E, P013F, P0171, P0172, P0201, P0202, P0203,

P0204, P0220, P0222, P0223, P0300, P0411, P0412, P0418, P1174, P1516, P2101, P2119, P2135, P2176, P2270, P2271 are not set.

- The system voltage is between 10-32 V.
- The fuel level is greater than 10%.
- The engine speed is between 1,100-2,300 RPM.
- The engine airflow is between 3-11 g/s.
- The vehicle speed is between 64 km/h (39.8 mph) and 120 km/h (74 mph).
- The fuel state is in Closed Loop.
- The evaporative emission (EVAP) diagnostics are not in control of purge.
- The heated oxygen sensor heaters are ON for more than 180 s.
- The predicted catalytic converter temperature is between 600-900Â°C (1,112-1,652Â°F).
- This DTC runs once per trip when all of the above conditions have been met for 3 s.

P2271 or P2273

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P013A, P013B, P013E, P013F, P0171, P0172, P0201, P0202, P0203, P0204, P0220, P0222, P0223, P0300, P0411, P0412, P0418, P1174, P1516, P2101, P2119, P2135, P2176, P2270 are not set.
- The system voltage is between 10-32 V.
- The fuel level is greater than 10%.
- The engine speed is 1,150-2,300 RPM.
- The engine airflow is between 3-11 g/s.
- The vehicle speed is between 70-120 km/h (44-74 mph).
- The fuel state is in Closed Loop.
- The EVAP is not in control of purge.
- Power take-off is not active.
- The heated oxygen sensor heaters have been on more than 180 s.
- The predicted catalyst temperature is between 500-980Â°C (1,112-1,652Â°F).
- DTCs P013A, P013E, and P2270 have run and passed.

THEN

- DFCO is active.
- The accelerator pedal position is stable.
- This DTC runs once per trip when the above conditions are met for 3 s.

Conditions for Setting the DTC

P0133, P0153, P015A, P015B, P015C or P015D

- The ECM detects that the HO2S 1 rich-to-lean or lean-to-rich average response time is greater than a calibrated value.

- The DTCs set within 60 s when the above condition is met.

P013A or P013C

The ECM detects that the accumulated mass air flow monitored during rich-to-lean transitions between 450-150 mV is greater than 75 grams.

P013B or P013D

The ECM detects that the accumulated mass air flow monitored during lean-to-rich transitions between 350-650 mV is greater than 75 grams.

P013E or P014A

The ECM detects that the HO2S voltage has not decreased below 450 mV within a calibrated value of accumulated air flow.

P013F or P014B

The ECM detects that the HO2S voltage has not increased above 350 mV within a calibrated value of accumulated air flow.

P2270 or P2272

The ECM does not detect a HO2S voltage greater than 800 mV before accumulated mass air flow exceeds a calibrated value.

P2271 or P2273

The ECM does not detect an HO2S voltage less than 100 mV before accumulated mass air flow exceeds a calibrated value.

Action Taken When the DTC Sets

- DTCs P0133, P013E, P013F, P014A, P014B, P0153, P2270, P2271, P2272, and P2273 are Type B DTCs.
- DTCs P013A, P013B, P013C, P013D, P015A, P015B, P015C, and P015D are Type A DTCs.

Conditions for Clearing the DTC

- DTCs P0133, P013E, P013F, P014A, P014B, P0153, P2270, P2271, P2272, and P2273 are Type B DTCs.
- DTCs P013A, P013B, P013C, P013D, P015A, P015B, P015C, and P015D are Type A DTCs.

Circuit/System Verification

1. Ignition ON.
2. Verify no HO2S heater DTCs are set.
   - **If a DTC is set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If a DTC is not set**
3. Verify none of the conditions listed below exist:
   - Lean or rich fuel injectors-Refer to **Fuel Injector Solenoid Coil Test** .
   - Water intrusion in the HO2S harness connector
   - Low or high fuel system pressure-Refer to **Fuel System Diagnosis** .
   - Fuel that is contaminated-Refer to **Alcohol/Contaminants-in-Fuel Diagnosis** .
   - Fuel saturation of the evaporative emission (EVAP) canister
   - Exhaust leaks-Refer to **Exhaust Leakage** .
   - Engine vacuum leaks
   - Engine oil consumption-Refer to **Oil Consumption Diagnosis** .
   - Engine coolant consumption-Refer to **Loss of Coolant** .
     - **If any of the conditions exist**

       Repair as necessary.

   - **If none of the conditions exist**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.
   - **If the DTC sets**

     Test or replace the appropriate B52 Heated Oxygen Sensor.

- **If the DTC does not set**

6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair .

- **Heated Oxygen Sensor Replacement - Bank 1 Sensor 1**
- **Heated Oxygen Sensor Replacement - Bank 1 Sensor 2**
- **Heated Oxygen Sensor Replacement - Bank 2 Sensor 1**
- **Heated Oxygen Sensor Replacement - Bank 2 Sensor 2**
- Perform the scan tool Heated Oxygen Sensor Resistance Learn Reset after replacing an HO2S.
- **Control Module References** for ECM replacement, programming and setup

DTC P0171, P0172, P0174, OR P0175: FUEL TRIM SYSTEM LEAN/RICH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC P0172

Fuel Trim System Rich Bank 1

DTC P0174

Fuel Trim System Lean Bank 2

DTC P0175

Fuel Trim System Rich Bank 2

Circuit/System Description

The engine control module (ECM) controls a closed loop air/fuel metering system in order to provide the best possible combination of driveability, fuel economy, and emission control. The ECM monitors the heated oxygen sensor (HO2S) signal voltage, and adjusts the fuel delivery based on the signal voltage while in Closed Loop. A change made to the fuel delivery changes the long and short term fuel trim values. The short term fuel trim values change rapidly in response to the HO2S signal voltages. These changes fine tune the engine fueling. The long term fuel trim values change in response to trends in the short term fuel trim. The long term fuel trim makes coarse adjustments to fueling in order to re-center and restore control to short term fuel trim. The ideal fuel trim values are around 0%. A positive fuel trim value indicates that the ECM is adding fuel in order to

compensate for a lean condition. A negative fuel trim value indicates that the ECM is reducing the amount of fuel in order to compensate for a rich condition.

Conditions for Running the DTC

- DTCs P0030, P0050, P0053, P0059, P0101, P0102, P0103, P0106, P0107, P0108, P0131-P0135, P0151-P0155, P015A, P015B, P015C, P015D, P0178, P0179, P0201-P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P0300-P0306, P0411, P0442, P0455, P0458, P0496, P0506, P0507, P1133, P1153, P1248, P1249, P124A, P124B, P124C, P124D, P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, P216F, P2227, P2228, P2229, P2230, or P2269 are not set.
- The engine is in Closed Loop status.
- The catalyst monitor diagnostic intrusive test, post HO2S diagnostic intrusive test, device control, and evaporative emissions leak test are not active.
- The engine coolant temperature is between -20 and +150Â°C (-4 and +302Â°F).
- The intake air temperature is between -20 and +150Â°C (-4 and +302Â°F).
- The manifold absolute pressure is between 5-255 kPa (0.7-37 PSI).
- The engine speed is between 400-6,600 RPM.
- The mass air flow is between 0.5-510 g/s.
- The barometric pressure is greater than 70 kPa (10.2 PSI).
- The fuel level is greater than 10% and no fuel level sensor fault is present.
- This diagnostic runs continuously when the above conditions have been met.

Conditions for Setting the DTC

- The average long term fuel trim weighted average value is greater or less than a calibrated value.
- The above condition is present for approximately 3 min after the Conditions for Running the DTC have been met.

Action Taken When the DTC Sets

DTCs P0171, P0172, P0174, and P0175 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0171, P0172, P0174, and P0175 are Type B DTCs.

Diagnostic Aids

- Allow the engine to reach operating temperature. With the engine running, observe the HO2S parameter with a scan tool. The HO2S value should vary from approximately 40 mV to approximately 900 mV, and respond to fueling changes.
- With the engine running at operating temperature, the normal Short Term Fuel Trim and Long Term Fuel Trim parameters should be between +10 and -10% with 0% the optimum, .
- Any un-metered air into the engine causes this DTC to set. Thoroughly inspect all areas of the engine for vacuum leaks. An un-metered air leak in the induction system or a small vacuum leak may cause the ECM to learn an incorrect Throttle Body Idle Airflow Compensation value over time. The incorrectly

learned value may cause various symptoms to occur such as rough or unstable idle speeds, and/or engine stall. If this condition is detected and repaired it will be necessary perform the scan tool Idle Learn procedure to ensure any symptoms are corrected

- A MAF sensor condition can cause this DTC without setting a MAF DTC. If there is a MAF sensor condition, the MAF sensor parameters will appear to be within range.
- Verify the air filter is the correct one for this application, the engine oil fill cap is in place and is tight, and the engine oil dip stick is fully seated.
- Certain aftermarket air filters may cause a DTC to set.
- Certain aftermarket air induction systems or modifications to the air induction system may cause a DTC to set.
- Certain aftermarket exhaust system components may cause a DTC to set.

Circuit/System Testing

1. Ignition ON.
2. Verify no other DTCs are set.
   - **If any other DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If no other DTCs are set**
3. Verify the MAP sensor pressure parameter is within the range specified for your altitude. Refer to **Altitude Versus Barometric Pressure (With LFX)** .
   - **If not within the specified range**

     Refer to **DTC P0106**.

   - **If within the specified range**

NOTE: **Fuel vapor introduced into the intake manifold during evaporative**

emission system purge can temporarily cause fuel trim parameter readings to be outside the normal range.

4. Engine running at the operating temperature, EVAP Purge Solenoid Valve Command 0%.
5. Verify the appropriate Long Term Fuel Trim Bank 1 or 2 parameter is between -26% and +38%.
    - **If greater than +38%**
    1. Ignition OFF.
    2. Verify the conditions listed below do not exist:
        - Mass air flow sensor signal skewed. If the Short Term Fuel Trim or Long Term Fuel Trim parameters for both banks changes greater than 20% when the MAF sensor is disconnected, refer to **DTC P0101**.
        - Fuel contamination. Refer to **Alcohol/Contaminants-in-Fuel Diagnosis** .
        - Missing, restricted, or leaking exhaust components. Refer to **Symptoms - Engine Exhaust** .
        - Malfunctioning fuel injectors. Refer to **Fuel Injector Solenoid Coil Test** .
        - Split, kinked, or improperly connected vacuum hoses.
        - Insufficient fuel in the tank.
        - Low fuel pressure. Refer to **Fuel System Diagnosis** .
        - Vacuum leaks at the intake manifold, the throttle body, and the injector O-rings.
        - Leaks in the air induction system and the air intake ducts.
        - Missing air filter element.
        - Cracked evaporative emissions canister.
        - Evaporative pipes obstructed or leaking.
        - Leaks in the crankcase ventilation system. Refer to **Crankcase Ventilation System Inspection/Diagnosis** .
            - If a condition is found, repair as necessary.
            - If no condition is found, test the engine for a mechanical condition. Refer to **Symptoms - Engine Mechanical** .
    - **If less than -26%**
    1. Ignition OFF.
    2. Verify the conditions listed below do not exist:
        - Mass air flow (MAF) sensor signal skewed. If the Short Term Fuel Trim or Long Term Fuel Trim parameters for both banks changes greater than 20% when the MAF sensor is disconnected, refer to **DTC P0101**.
        - Fuel contamination. Refer to **Alcohol/Contaminants-in-Fuel Diagnosis** .
        - Missing, restricted, or leaking exhaust components. Refer to **Symptoms - Engine Exhaust** .
        - Malfunctioning fuel injectors. Refer to **Fuel Injector Solenoid Coil Test** .
        - Collapsed or restricted air intake duct.
        - Excessive fuel pressure. Refer to **Fuel System Diagnosis** .
        - Dirty or restricted air filter.
        - Objects blocking the throttle body.

- Improper operation of the evaporative emissions control system.
- Excessive fuel in the crankcase. Change the engine oil as necessary.
  - If a condition is found, repair as necessary.
  - If no condition is found, test the engine for a mechanical condition. Refer to **Symptoms - Engine Mechanical** .
- **If between -26% and +38%**

6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Perform the scan tool Fuel Trim Reset after completing the repair.

DTC P0178: FUEL COMPOSITION SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0178

Fuel Composition Sensor Circuit Low Frequency

Circuit/System Description

Alcohol content information is supplied to the engine control module (ECM) from the fuel composition sensor. The fuel composition sensor has a battery positive circuit, a signal circuit, and a ground circuit. The fuel composition sensor uses a microprocessor inside the sensor to measure the ethanol percentage and changes the output signal accordingly. The signal circuit carries the ethanol percentage via the frequency signal. The ECM provides an internal pull up to 5 V on the signal circuit, and the fuel composition sensor pulls the 5 V to ground in pulses. The normal range of operating frequency is between 50-150 Hz. The microprocessor inside the sensor is capable of a certain amount of self-diagnosis. An output frequency between 180 Hz and 190 Hz indicates that the fuel is contaminated.

Conditions for Running the DTC

- The ignition voltage is greater than 11 V.
- The DTC runs continuously when the above condition is met.

Conditions for Setting the DTC

The engine control module detects that the fuel composition sensor output frequency is less than 45 Hz for greater than 6 s.

Action Taken When the DTC Sets

DTC P0178 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0178 is a Type B DTC.

Diagnostic Aids

- The Fuel Composition Sensor scan tool parameter reacts immediately to any change in the fuel composition sensor circuits, but may not react long enough to set a DTC.
- An intermittent condition may not be detected because the sensor does not immediately power down and the connection may be restored before voltage drops below the operating threshold.
- If this DTC will not reset and the parameters are steady, thoroughly inspect all fuel composition sensor circuits for an intermittent open.

Special Tools

- **CH 44175-A** Alcohol Tester Kit
- **EL 38522-A** Variable Signal Generator

For equivalent regional tools, Refer to **Special Tools (Diagnostic Tools)** **Special Tools (Repair Tools)**

Circuit/System Verification

1. Engine running,

2. Verify the scan tool Fuel Composition Sensor parameter is between 50-150 Hz.
    - **If not between 50-150 Hz**

      Refer to Circuit/System Testing.

    - **If between 50-150 Hz**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B198 Fuel Composition Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the ground circuit terminal 2 and ground.
    - **If 5 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 5 Ω**
3. Ignition ON.
4. Verify that a test lamp illuminates between the B+ circuit terminal 1 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is OK**
    1. Ignition OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground in the circuit.
        - If infinite resistance, replace the B198 Fuel Composition Sensor.
    - **If the test lamp illuminates**
5. Ignition ON.
6. Test for 4.8-5.2 V between the signal circuit terminal 3 and ground.

- **If less than 4.8 V**

1. Ignition OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the signal circuit and ground.
    - If less than infinite resistance, repair the short to ground in the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K20 Engine Control Module.

- **If greater than 5.2 V**

1. Ignition OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
2. Ignition ON.
3. Test for less than 1 V between the signal circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K20 Engine Control Module.

- **If between 4.8-5.2 V**

7. Ignition OFF, connect the red lead of the **EL 38522-A** Variable Signal Generator to the signal circuit terminal 3 at the B198 Fuel Composition Sensor harness connector.
8. Connect the battery voltage supply to B+, and the black lead to ground.
9. Set the **EL 38522-A** Variable Signal Generator Signal to 5 V, the Frequency to 60 Hz, and the Duty Cycle to Normal.
10. Ignition ON.
11. Clear the DTCs with a scan tool.
12. Verify the scan tool Fuel Composition Sensor parameter is at 60 Hz.
    - **If not the specified value**

      Replace the K20 Engine Control Module.

    - **If the specified value**
13. Test or replace the B198 Fuel Composition Sensor.

Component Testing

1. Test the fuel composition using the **CH 44175-A** Alcohol Tester Kit and the CH 44175-A Instruction Manual. Record the frequency.
2. Compare the special tool test frequency and the scan tool Fuel Composition Sensor frequency parameter.
3. Verify the difference between the tool and the sensor is 12 Hz or less.
    - **If greater than the specified value**

      Replace the B198 Fuel Composition Sensor.

    - **If less than the specified value**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Flexible Fuel Sensor Replacement**
- **Control Module References** for K20 Engine Control Module replacement, programming, and setup.

DTC P0179: FUEL COMPOSITION SENSOR CIRCUIT HIGH FREQUENCY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0179

Fuel Composition Sensor Circuit High Frequency

Circuit/System Description

Alcohol content information is supplied to the engine control module (ECM) from the fuel composition sensor. The fuel composition sensor has a battery positive circuit, a signal circuit, and a ground circuit. The fuel composition sensor uses a microprocessor inside the sensor to measure the ethanol percentage and changes the output signal accordingly. The signal circuit carries the ethanol percentage via the frequency signal. The ECM provides an internal pull up to 5 V on the signal circuit, and the fuel composition sensor pulls the 5 V to ground in pulses. The normal range of operating frequency is between 50-150 Hz. The microprocessor inside the sensor is capable of a certain amount of self-diagnosis. An output frequency between 180 Hz and 190 Hz indicates that the fuel is contaminated.

Conditions for Running the DTC

- The ignition voltage is greater than 11 V.
- The DTC runs continuously when the above condition is met.

Conditions for Setting the DTC

The engine control module detects that the fuel composition sensor output frequency is between 155-185 Hz for greater than 6 s.

Action Taken When the DTC Sets

DTC P0179 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0179 is a Type B DTC.

Diagnostic Aids

A momentary slug of water in the fuel system may set this DTC.

- **EL 38522-A** Variable Signal Generator

For equivalent regional tools, Refer to **Special Tools (Diagnostic Tools)** **Special Tools (Repair Tools)**

Circuit/System Verification

1. Engine running,
2. Verify the scan tool Fuel Composition Sensor parameter is between 50-150 Hz.
    - **If not between 50-150 Hz**

      Refer to Circuit/System Testing.

    - **If between 50-150 Hz**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

- **If the DTC does not set**

5. All OK.

Circuit/System Testing

1. Verify that there are no contaminants, water, or too high of a concentration of ethanol in the fuel. Refer to **Alcohol/Contaminants-in-Fuel Diagnosis** and the **CH 44175-A** Instruction Manual.
2. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B198 Fuel Composition Sensor. It may take up to 2 minutes for all vehicle systems to power down.
3. Test for less than 5 Ω between the ground circuit terminal 2 and ground.
    - **If 5 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 5 Ω**
4. Ignition ON.
5. Verify that a test lamp illuminates between the B+ circuit terminal 1 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is OK**
    1. Ignition OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground in the circuit.
        - If infinite resistance, replace the B198 Fuel Composition Sensor.
    - **If the test lamp illuminates**
6. Ignition ON.
7. Test for 4.8-5.2 V between the signal circuit terminal 3 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground in the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If greater than 5.2 V**

1. Ignition OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
2. Ignition ON.
3. Test for less than 1 V between the signal circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K20 Engine Control Module.

- **If between 4.8-5.2 V**

8. Ignition OFF, connect the red lead of the **EL 38522-A** Variable Signal Generator to the signal circuit terminal 3 at the B198 Fuel Composition Sensor harness connector.
9. Connect the battery voltage supply to B+, and the black lead to ground.
10. Set the **EL 38522-A** Variable Signal Generator Signal to 5 V, the Frequency to 60 Hz, and the Duty Cycle to Normal.
11. Ignition ON.
12. Clear the DTCs with a scan tool.
13. Verify the scan tool Fuel Composition Sensor parameter is at 60 Hz.
    - **If not the specified value**

      Replace the K20 Engine Control Module.

    - **If the specified value**
14. Test or replace the B198 Fuel Composition Sensor.

Component Testing

1. Test the fuel composition using the **CH 44175-A** Alcohol Tester Kit and the CH 44175-A Instruction Manual. Record the frequency.
2. Compare the special tool test frequency and the scan tool Fuel Composition Sensor frequency parameter.
3. Verify the difference between the tool and the sensor is 12 Hz or less.
    - **If greater than the specified value**

      Replace the B198 Fuel Composition Sensor.

    - **If less than the specified value**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Flexible Fuel Sensor Replacement**
- **Fuel System Cleaning**
- **Control Module References** for K20 Engine Control Module replacement, programming, and setup.

DTC P018B-P018D: FUEL PRESSURE SENSOR (CHASSIS CONTROL MODULE)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P018B

Fuel Pressure Sensor Performance

DTC P018C

Fuel Pressure Sensor Circuit Low Voltage

DTC P018D

Fuel Pressure Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference	P018C, P0641, P06A6	P018C	P018D	P06A6
Signal	P018C	P018C	P018D	P018B
Low Reference	-	P018D	-	P06A6

Circuit/System Description

The fuel pressure sensor is located on the fuel line. The fuel pressure sensor monitors the fuel pressure in the fuel line. The chassis control module monitors the voltage signal from the fuel pressure sensor.

Conditions for Running the DTC

- The engine is running.
- DTC P018C, P018D, P0231, P0232, P023F, P064A, P1255 or P06A6 are not active.
- DTC P0641 has not failed this ignition cycle.
- Fuel pump control is enabled and the fuel pump control state is normal.
- The engine has been running for at least 5 seconds.

Conditions for Setting the DTC

The chassis control module does not detect a change in the fuel pressure of at least 30 kPa (4.4 psi) when the fuel pump is operating. The fuel pressure sensor performance diagnostic provides a means to detect fuel pressure sensor output that is stuck within the normal operating range of the sensor.

Action Taken When the DTC Sets

DTC P018B, P018C and P018D are Type A DTCs.

Conditions for Clearing the DTC

DTC P018B, P018C and P018D are Type A DTCs.

Diagnostic Aids

Using the failure records data may help locate an intermittent condition. If you cannot duplicate the DTC, the information in the failure records can help determine how many miles since the DTC set. The fail counter and pass counter can help determine how many ignition cycles that the diagnostic test reported a pass and/or a fail.

Circuit/System Verification

1. Engine running.
2. Verify the scan tool Fuel Pressure Sensor Voltage parameter is between 0.2-4.8 V.
    - **If not between 0.2-4.8 V**

      Refer to Circuit/System Testing.

    - **If between 0.2-4.8 V**
3. All OK.

Circuit/System Testing

NOTE: **Verify that the fuel tank is not empty. Only perform this diagnostic if there is at least 2 gallons of fuel in the fuel tank. Clear the DTC, and start and run the engine. Verify that the DTC resets before proceeding with the circuit system testing. If the DTC does not reset, refer to diagnostic aids.**

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B47 Fuel Pressure Sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If less than 10 Ω**
3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 3 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If greater than 5.2 V**
    1. Ignition OFF, disconnect the harness connector at the K38 Chassis Control Module, ignition ON.
    2. Test for less than 1 V between the 5 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K38 Chassis Control Module.
    - **If between 4.8-5.2 V**
5. Verify the scan tool Fuel Pressure Sensor Voltage parameter is less than 1 V.
    - **If 1 V or greater**
    1. Ignition OFF, disconnect the harness connector at the K38 Chassis Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit terminal 1 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K38 Chassis Control Module.
    - **If less than 1 V**
6. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the 5 V reference circuit terminal 3, wait 15 seconds.
7. Verify the scan tool Fuel Pressure Sensor Voltage parameter is greater than 4.8 V.

- **If 4.8 V or less**

1. Ignition OFF, disconnect the harness connector at the K38 Chassis Control Module.
2. Test for infinite resistance between the signal circuit terminal 1 and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K38 Chassis Control Module.

- **If greater than 4.8 V**

8. Test or replace the B47 Fuel Pressure Sensor.

DTC P0191: FUEL RAIL PRESSURE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0191

Fuel Rail Pressure Sensor Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference Voltage	P0192, P0193, P0340, P0345, P0365, P0390, P0506, P0641, P2227	P0192	P0193, P0641, P2227, P2229	P0191
Fuel Rail Pressure Sensor Signal	P0192	P0192, P0193	P0193	P0191
Low Reference	-	P0193	P0193	P0191

Circuit/System Description

The fuel rail pressure sensor detects fuel pressure within the fuel rail. The engine control module (ECM) provides a 5 V reference voltage on the 5 V reference circuit and ground on the low reference circuit. The ECM receives a varying signal voltage on the signal circuit. The ECM monitors the voltage on the fuel rail pressure

sensor circuits. When the fuel pressure is high, the signal voltage is high. When the fuel pressure is low, the signal voltage is low.

Conditions for Running the DTC

Condition 1

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0122, P0123, P0201-P0206, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0300, P0301-P0306, P0351-P0356, P0506, P0507, P0722, P0723, P1248, P1249, P124A, P124B, P2122, P2123, P2127, P2128, P2135, P2147, P2148, P2150, P2151, P2153, P2154, P2156, or P2157 are not set.
- The engine is running.
- The accelerator pedal position is 0 percent for 4 s.
- The ignition voltage is greater than 11 V.
- The low side fuel pressure is greater than 275 kPa (40 psi).
- The vehicle speed is less than 1 km/h (0.62 mph).
- The diagnostic runs continuously when the above conditions are met.

Condition 2 and 3

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0122, P0123, P0201-P0206, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0300, P0301-P0306, P0351-P0356, P0506, P0507, P0722, P0723, P1248, P1249, P124A, P124B, P2122, P2123, P2127, P2128, P2135, P2147, P2148, P2150, P2151, P2153, P2154, P2156, or P2157 are not set.
- The ignition voltage is greater than 11 V.
- The low side fuel pressure is greater than 275 kPa (40 psi).
- The desired fuel rail pressure is between 4-6 MPa (580-870 psi).
- The engine speed is between 1,000-3,000 RPM.
- The vehicle speed is greater than 30 km/h (18.64 mph).
- The diagnostic runs continuously when the above conditions are met.

Condition 4

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0122, P0123, P0201-P0206, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0300, P0301-P0306, P0351-P0356, P0506, P0507, P0722, P0723, P1248, P1249, P124A, P124B, P2122, P2123, P2127, P2128, P2135, P2147, P2148, P2150, P2151, P2153, P2154, P2156, or P2157 are not set.
- The engine speed is greater than 2,000 RPM.
- The vehicle speed is greater than 30 km/h (18.64 mph).
- DTC P0191 runs once an ignition cycle at engine start up when the above conditions have been met.

Conditions for Setting the DTC

Condition 1

The low side fuel pressure is at least 0.8 MPa (116 psi) less than the high side fuel pressure or the high side fuel

pressure is at least 0.3 MPa (44 psi) greater than the low side fuel pressure with the high pressure fuel pump actuator commanded OFF.

The condition exists for greater than 3 s.

Condition 2

The measured fuel rail pressure is at least 2 MPa (290 psi) less than the calibrated relief pressure for greater than 3 s.

Condition 3

The difference between the desired fuel rail pressure and the actual fuel rail pressure is greater than 2 MPa (290 psi) for 3 s.

Condition 4

The difference between the measured maximum high pressure and the measured minimum high pressure is less than or equal to 0.1 MPa (14.5 psi) for greater than 10 s.

Action Taken When the DTC Sets

- DTC P0191 is a Type A DTC.
- A message center or an indicator may display Reduced Engine Power.

Conditions for Clearing the DTC

DTC P0191 is a Type A DTC.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC P0628, P069E, or U0109 is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If none of the DTCs are set**
3. Engine at idle.
4. Verify the scan tool Fuel Rail Pressure Sensor parameter is between 1.9-5.0 MPa (276-725 psi).
   - **If not within the specified range**

     Refer to Circuit/System Testing.

   - **If within the specified range**
5. Verify the scan tool Fuel Rail Pressure Sensor and Desired Fuel Rail Pressure parameters closely match.
   - **If the parameters do not match**

     Refer to Circuit/System Testing.

   - **If the parameters match**
6. Move related harnesses/connectors of the B47B Fuel Rail Fuel Pressure Sensor.
7. Verify the engine does not stumble, stall, or change engine speed.
   - **If the engine stumbles, stalls, or changes engine speed**

     Test or repair the suspected harness or connection.

   - **If the engine does not stumbles, stalls, or changes engine speed**
8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
9. Verify DTC P0191 is not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
10. All OK.

Circuit/System Testing

1. Ignition OFF, all vehicle systems OFF, disconnect the B47B Fuel Rail Pressure Sensor connector. It may

take up to 2 min for all vehicle systems to power down.

2. Test for less than 5 Ω between the low reference circuit terminal C and ground.
    - **If 5 Ω or greater**
    1. Ignition OFF, disconnect the X2 harness connector at the K20 Engine Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If less than 5 Ω**
3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal A and ground.
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the X2 harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground in the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If greater than 5.2 V**
    1. Ignition OFF, disconnect the X2 harness connector at the K20 Engine Control Module, ignition ON.
    2. Test for less than 1 V between the 5 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
    - **If within 4.8-5.2 V**
5. Verify the scan tool Fuel Rail Pressure Sensor voltage parameter is less than 0.02 V.
    - **If 0.02 V or greater**
    1. Ignition OFF, disconnect the X2 harness connector at the K20 Engine Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
    - **If less than 0.02 V**
6. Connect a 3 A fused jumper wire between the signal circuit terminal B and the 5 V reference circuit terminal A.
7. Verify the scan tool Fuel Rail Pressure Sensor Voltage parameter is greater than 4.96 V.
    - **If 4.96 V or less**
    1. Ignition OFF, remove fused jumper, disconnect the X2 harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the signal circuit terminal 12 and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K20 Engine Control Module.

- **If greater than 4.96 V**

8. Test or replace the B47B Fuel Rail Pressure Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Low Reference	-	P0193	P0193	P0191

Circuit/System Description

The fuel rail pressure sensor detects fuel pressure within the fuel rail. The engine control module (ECM) provides a 5 V reference voltage on the 5 V reference circuit and ground on the reference ground circuit. The ECM receives a varying signal voltage on the signal circuit. The ECM monitors the voltage on the fuel rail pressure sensor circuits. When the fuel pressure is high, the signal voltage is high. When the fuel pressure is low, the signal voltage is low.

Conditions for Running the DTC

- The engine is running.
- The ignition voltage is between 11-18 V.
- The DTCs run continuously within the enabling conditions.

Conditions for Setting the DTC

P0192

The engine control module detects that the fuel rail pressure sensor signal voltage is low.

P0193

The engine control module detects that the fuel rail pressure sensor signal voltage is high.

Action Taken When the DTC Sets

- DTCs P0192 and P0193 are Type A DTCs.
- A message center or an indicator may display Reduced Engine Power.

Conditions for Clearing the DTC

DTCs P0192 and P0193 are Type A DTCs.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC P0641, P0651, P0697, or P06A3 is not set.
   - **If any of the DTCs are set**

     Refer to **DTC P0641, P0651, P0697, or P06A3 (ECM)** .

   - **If none of the DTCs are set**
3. Engine running.
4. Verify the scan tool Fuel Rail Pressure Sensor parameter is between 0.25-4.75 V.
   - **If not between 0.25-4.75 V**

     Refer to Circuit/System Testing.

   - **If between 0.25-4.75 V**
5. Verify the scan tool Fuel Rail Pressure Sensor increases or decreases when commanding an increase and decrease in Fuel Rail Pressure with a scan tool.
   - **If the parameter does not change**

     Refer to Circuit/System Testing.

   - **If the parameter changes**
6. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
7. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
8. All OK.

Circuit/System Testing

1. Ignition OFF, all vehicle systems OFF, disconnect the B47B Fuel Rail Pressure Sensor connector. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the low reference circuit terminal C and ground.
   - **If 5 Ω or greater**

1. Ignition OFF, disconnect the X2 harness connector at the K20 Engine Control Module.
2. Test for less than 2 Ω in the low reference circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K20 Engine Control Module.

- **If less than 5 Ω**

3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal A and ground.

- **If less than 4.8 V**

1. Ignition OFF, disconnect the X2 harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the 5 V reference circuit and ground.
    - If less than infinite resistance, repair the short to ground in the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the 5 V reference circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K20 Engine Control Module.

- **If greater than 5.2 V**

1. Ignition OFF, disconnect the X2 harness connector at the K20 Engine Control Module, ignition ON.
2. Test for less than 1 V between the 5 V reference circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K20 Engine Control Module.

- **If within 4.8-5.2 V**

5. Verify the scan tool Fuel Rail Pressure Sensor voltage parameter is less than 0.02 V.

- **If 0.02 V or greater**

1. Ignition OFF, disconnect the X2 harness connector at the K20 Engine Control Module, ignition ON.
2. Test for less than 1 V between the signal circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K20 Engine Control Module.

- **If less than 0.02 V**

6. Connect a 3 A fused jumper wire between the signal circuit terminal B and the 5 V reference circuit terminal A.
7. Verify the scan tool Fuel Rail Pressure Sensor Voltage parameter is greater than 4.96 V.

- **If 4.96 V or less**

1. Ignition OFF, disconnect the X2 harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the signal circuit terminal 12 and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω, replace the K20 Engine Control Module.

- **If greater than 4.96 V**

8. Test or replace the B47B Fuel Rail Pressure Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Fuel Pressure Sensor Replacement - Fuel Injection Fuel Rail**
- **Control Module References** for K20 Engine Control Module replacement, programming, and setup.

Circuit/System Description

The engine control module (ECM) supplies voltage to each fuel injector on the high control circuits. The ECM energizes each fuel injector by grounding the low control circuit of the fuel injector. The ECM monitors the status of the fuel injector circuits. When a fuel injector circuit condition is detected by the ECM, the affected fuel injector(s) is disabled.

Conditions for Running the DTC

- The engine is running.
- The ignition voltage is between 11-18 V.
- The DTCs run continuously once the above conditions are met.

Conditions for Setting the DTC

P0201, P0202, P0203, P0204, P0205, or P0206

The engine control module detects the fuel injector high voltage supply circuit or the fuel injector high voltage control circuit is open for greater than 2 s.

P0261, P0264, P0267, P0270, P0273, or P0276

The engine control module detects the fuel injector high voltage control circuit is shorted to ground for greater than 2 s.

P0262, P0265, P0268, P0271, P0274, or P0277

The engine control module detects the fuel injector high voltage control circuit is shorted to voltage for greater than 2 s.

Action Taken When the DTC Sets

DTCs P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, and P0277 are Type A DTCs.

Conditions for Clearing the DTC

DTCs P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, and P0277 are Type A DTCs.

Diagnostic Aids

- Performing the fuel injector coil test may help isolate an intermittent condition. Refer to **Fuel Injector Solenoid Coil Test** .
- If the condition is intermittent, move the related harnesses and connectors, with the engine operating, while monitoring the scan tool Cylinder 1-6 Injector Control Circuit Status parameters. An Injector Control Circuit Status parameter will change from OK or Not Run to Malfunction if there is a condition with the circuit or a connection.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC P0685 or P1682 is not set.
    - **If the DTC is set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If the DTCs are not set**

3. Engine idling.
4. Verify the scan tool Cylinder 1-6 Injector Control Circuit Status parameters display OK.
    - **If any parameters do not display OK**

      Refer to Circuit/System Testing.

    - **If all parameters display OK**
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, or P0277 does not set.
    - **If any DTC sets**

      Refer to Circuit/System Testing.

    - **If no DTC sets**
7. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the appropriate multi-way harness connector X160 or X161, at the rear of the intake manifold, ignition ON. It may take up to 2 min for all vehicle systems to power down.
2. Verify the scan tool Cylinder 1-6 Injector Control Circuit Status parameters display Open.
    - **If Open is not displayed**
    1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.

       NOTE: **Test on the Engine Control Module side of the multi-way harness connector.**

    2. Test for infinite resistance between the appropriate Q17 Fuel Injector low control circuit and ground.
        - If less than infinite, repair the short to ground on the circuit.
        - If infinite resistance
    3. Ignition ON.
    4. Test for less than 1 V between the Q17 Fuel Injector low control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, test or replace the K20 Engine Control Module.
    - **If Open is displayed**
3. Ignition ON, connect a test lamp between the appropriate Q17 Fuel Injector high control circuit and low control circuits.
4. Verify the appropriate Cylinder 1-6 Injector Control Circuit Status transitions from Open to OK.
    - **If OK is not displayed**

1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
2. Test for less than 2 Ω on the Q17 Fuel Injector high control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω
3. Test for less than 2 Ω on the Q17 Fuel Injector low control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, test or replace the K20 Engine Control Module.

- **If OK is displayed**

NOTE: **Testing for the following steps is performed on the fuel injector side of the multi-way harness connector. It may be necessary to remove the intake manifold to isolate the condition.**

5. Test for 2-3 Ω between the appropriate Q17 Fuel Injector high control circuit and low control circuit.
    - **If less than 2 Ω**
    1. Disconnect the harness connector at the Q17 Fuel Injector.
    2. Test for infinite resistance between the Q17 Fuel Injector high control circuit and low control circuit.
        - If less than infinite, repair the short between the circuits.
        - If infinite resistance, test or replace the Q17 Fuel Injector.
    - **If greater than 3 Ω**
    1. Disconnect the harness connector at the Q17 Fuel Injector.
    2. Test for less the 2 Ω in the Q17 Fuel Injector high control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω
    3. Test for less the 2 Ω in the Q17 Fuel Injector low control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, test or replace the Q17 Fuel Injector.
    - **If between 2-3 Ω**
6. Test for infinite resistance between the appropriate Q17 Fuel Injector low control circuit and ground.
    - **If less than infinite resistance**
    1. Disconnect the harness connector at the Q17 Fuel Injector.
    2. Test for infinite resistance between the Q17 Fuel Injector high control circuit and ground.
        - If less than infinite, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for infinite resistance between the Q17 Fuel Injector low control circuit and ground.
        - If less than infinite, repair the short to ground on the circuit.
        - If infinite resistance, test or replace the Q17 Fuel Injector.
    - **If infinite resistance**
7. Ignition ON.

8. Test for less than 1 V between the appropriate Q17 Fuel Injector low control circuit and ground.
    - **If 1 V or greater**

      Repair the short to voltage on the circuit.

    - **If less than 1 V**
9. All OK.

DTC P0231, P0232, OR P023F: FUEL PUMP CONTROL CIRCUIT (CHASSIS CONTROL MODULE)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0231

Fuel Pump Control Circuit Low Voltage

DTC P0232

Fuel Pump Control Circuit High Voltage

DTC P023F

Fuel Pump Control Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	P0231	P023F	P0232	P023F, P2635
Low Reference	-	P023F	-	P023F, P2635

Circuit/System Description

The engine control module (ECM) supplies voltage to the chassis control module when the ECM detects that the ignition is on. The voltage from the ECM to the chassis control module remains active for 2 s, unless the engine is in crank or run. While this voltage is being received, the chassis control module supplies a varying voltage to the fuel tank pump module in order to maintain the desired fuel line pressure.

Conditions for Running the DTC

P0231

- The ignition voltage is greater than 11 V.
- The engine is cranking or running.
- The fuel pump enable circuit is commanded ON.
- The fuel pump power module output current is less than 75 A.
- The DTC runs continuously when the conditions above are met.

P0232

- The ignition voltage is greater than 7 V.
- The fuel pump enable circuit is commanded ON.
- The DTC runs continuously when the conditions above are met.

P023F

- The ignition voltage is greater than 7 V.
- The commanded duty cycle is between 30-60 %.
- The DTC runs continuously when the conditions above are met.

Conditions for Setting the DTC

P0231

The fuel pump driver control module detects that the fuel pump current is greater than 14.48 A for 1 s.

P0232

The fuel pump driver control module detects that the fuel pump output circuit voltage is greater than 4.0 V for 1 s when the voltage should be 0 V.

P023F

The fuel pump driver control module detects that the fuel pump current is less than 1 A and the fuel pump duty cycle is approximately 30-60 % for 1 s.

Action Taken When the DTC Sets

DTCs P0231, P0232, and P023F are Type A DTCs.

Conditions for Clearing the DTC

DTCs P0231, P0232, and P023F are Type A DTCs.

Diagnostic Aids

Using the failure records data may help locate an intermittent condition. If you cannot duplicate the DTC, the information in the failure records can help determine how many miles since the DTC set. The fail counter and pass counter can help determine how many ignition cycles that the diagnostic test reported a pass and/or a fail.

On vehicles equipped with a high pressure mechanical pump on direct fuel injection engines, the vehicle may continue to run even though the pump in the fuel tank is not operating.

Circuit/System Verification

1. Ignition ON.
2. Verify the fuel pump turns ON and OFF when commanding the Fuel Pump Enable On and Off with a scan tool.
    - **If the fuel pump does not turn ON and OFF**

      Refer to Circuit/System Testing.

    - **If the fuel pump turns ON and OFF**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

4. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the A7 Fuel Pump and Level Sensor Assembly. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.
    - **If 5 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If less than 5 Ω**
3. Connect a test lamp between the control circuit terminal 1 and the low reference circuit terminal 2.
4. Ignition ON.
5. Verify the test lamp turns ON and OFF when commanding the Fuel Pump Enable On and Off with a scan tool.
    - **If the test lamp is always OFF**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If the test lamp is always ON**
    1. Ignition OFF, disconnect the harness connector at the K38 Chassis Control Module, ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K38 Chassis Control Module.
    - **If the test lamp turns ON and OFF**
6. Test or replace the A7 Fuel Pump and Level Sensor Assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for K38 Chassis Control Module replacement, programming, and setup

DTC P025A: FUEL PUMP CONTROL MODULE (CHASSIS CONTROL MODULE)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P025A

Fuel Pump Control Module Enable Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	P025A	P025A	-	P025A

Circuit/System Description

The engine control module (ECM) supplies voltage to the chassis control module when the ECM detects that the ignition is on. The voltage from the ECM to the chassis control module remains active for 2 seconds, unless the engine is in crank or run. While this voltage is being received, the chassis control module supplies a varying voltage to the fuel tank pump module in order to maintain the desired fuel line pressure.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The serial data message from the ECM to the chassis control module does not agree with the state of the control enable voltage signal supplied from the ECM to the chassis control module for more than 2 seconds.

Action Taken When the DTC Sets

DTC P025A is a Type A DTC.

Conditions for Clearing the DTC

DTC P025A is a Type A DTC.

Diagnostic Aids

Beginning in the 2014 model year the K27 Fuel Pump Control Module (FPCM) will now be called the chassis control module (CCM). The component code for the chassis control module will be K38. The chassis control

module name will be used in Service Information, the Global Diagnostic System and the Service Programming System.

Circuit/System Testing

NOTE: **Verify that the fuel tank is not empty. Only perform this diagnostic if there is at least 2 gallons of fuel in the fuel tank. Clear the DTC, and start and run the engine. Verify that the DTC resets before proceeding with the circuit system testing. If the DTC does not reset, refer to diagnostic aids.**

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the K38 Chassis Control Module, ignition ON.
2. Connect a test lamp between the control circuit terminal 20 and ground.
3. Verify the test lamp turns On and Off when commanding the fuel pump ON and OFF using the scan tool ECM fuel pump enable control function.
    - **If the test lamp is always Off**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance

3. Test for less than 2 Ω in the control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K20 Engine Control Module.

- **If the test lamp is always On**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
2. Test for less than 1 V between the control circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K20 Engine Control Module.

- **If the test lamp turns On and Off**

4. Test or replace the K38 Chassis Control Module.

Repair Instructions

DTC P0300-P0306: CYLINDER MISFIRE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0300

Engine Misfire Detected

DTC P0301

Cylinder 1 Misfire Detected

DTC P0302

Cylinder 2 Misfire Detected

DTC P0303

Cylinder 3 Misfire Detected

DTC P0304

Cylinder 4 Misfire Detected

DTC P0305

Cylinder 5 Misfire Detected

DTC P0306

Cylinder 6 Misfire Detected

Circuit/System Description

The engine control module (ECM) uses information from the crankshaft position sensor and the camshaft position sensor to determine when a engine cylinder misfire is occurring. By monitoring variations in the crankshaft rotation speed for each cylinder, the ECM can detect individual cylinder misfire events.

Extreme cylinder misfire events can cause catalytic converter damage. The malfunction indicator lamp (MIL) will flash when the conditions for catalytic converter damage are present. DTCs P0301 through P0306 correspond to cylinders 1 through 6. When the ECM detects that one or more specific cylinders are misfiring, the DTC for the respective misfiring cylinder will set and up to 2 of the corresponding fuel injectors are disabled for a minimum of 30 s. The ECM will then re-enable the fuel injector and, after approximately 200 engine revolutions, will determine if the misfire is still present. If the misfire is still present, the ECM will disable the fuel injector again repeating the process. If the misfire is not present, the fuel injector will remain enabled by the ECM. In Spark Ignition Direct Injection (SIDI) system applications, if a fuel injector fault DTC is set during a misfire event, the ECM will not re-enable the injector.

Conditions for Running the DTC

- DTC P0010, P0011, P0013, P0014, P0016, P0017, P0018, P0019, P0020, P0021, P0023, P0024, P0068, P00C8, P00C9, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0117, P0118, P0119, P0122, P0123, P0191, P0192, P0193, P0222, P0223, P0335, P0336, P0340, P0341, P0345, P0346, P0365, P0366, P0390, P0391, P0601, P0604, P0606, P0651, P16A0, P16A1, P16A2, P16F3, P2101, P2135, P2227, P2228, P2229, or P2230 is not set.
- DTC P0806, P0807, or P0808 is not set when equipped with manual transmission.
- The engine speed is less than 1,000 RPM and DTC P0315 is set.
- The engine speed is greater than 1,500 RPM.
- The crankshaft position and camshaft position sensors are synchronized.
- The engine coolant temperature (ECT) is between -7 and 130Â°C (19-266Â°F).
- If the ECT is colder than -7Â°C (19Â°F) at start-up, this diagnostic will not run until the ECT is between 21-130Â° (70-266Â°F).
- The battery voltage is between 9-32 V.
- The vehicle is not in an acceleration or deceleration condition.
- The ECM is not detecting a rough road signal.
- The fuel level is at least 11%.
- The ECM is not in fuel cut-off or deceleration fuel cut-off mode.

The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

P0300

The ECM detects a crankshaft rotation speed variation indicating a misfire rate sufficient to cause emissions levels to exceed a predetermined value or a misfire rate high enough to cause catalyst damage.

P0301, P0302, P0303, P0304, P0305, or P0306

The ECM detects a crankshaft rotation speed variation indicating a single cylinder misfire rate sufficient to cause emissions levels to exceed mandated standards.

Action Taken When the DTC Sets

- DTCs P0300-P0306 are Type B DTCs.
- When a catalyst damaging level of misfire is present, the ECM may disable the fuel injectors for up to 2 misfiring cylinders and will flash the malfunction indicator lamp (MIL).

Conditions for Clearing the DTC

DTCs P0300-P0306 are Type B DTCs.

Diagnostic Aids

- A misfire DTC could be caused by an excessive vibration from sources other than the engine. Inspect for the conditions listed below:
  - A tire or wheel that is out of round or out of balance
  - Variable thickness brake rotors
  - An unbalanced drive shaft
  - Certain rough road conditions
  - Transmission operation
  - A damaged or defective accessory drive component or belt
- Observe misfire counters after Active Fuel Management is commanded Off for a sticking lifter.
- High resistance in the circuits of the injectors may set a misfire DTC without setting an injector DTC. Test the injector circuits of the affected cylinder(s) for a high resistance if you suspect a condition.
- If the condition is intermittent, observing the scan tool IC Circuit Test and Fuel Injector Circuit Test Status parameters may help isolate the condition. The circuit test status parameters will change from OK or Not Run to Fault/Malfunction if a condition exists.
- A condition in the heated O2 sensor (HO2S) heater control circuits may set a DTC P0300.

Special Tools

EL26792 HEI Spark Tester

For equivalent regional tools, refer to Special Tools (Diagnostic Tools) Special Tools (Repair Tools) .

Circuit/System Verification

NOTE: **Before starting the engine, review the freeze frame failure records data to determine if the misfire sets during a cold start or at operating temperature. If there is a cold start condition and the engine is started, the engine will need to be cooled down before the next attempt to start the engine within the fail conditions.**

1. Engine Running at normal operating temperature.
2. Verify there is no abnormal engine noise.
   - **If abnormal engine noise is present**

     Refer to Symptoms - Engine Mechanical .

   - **If abnormal engine noise is not present**
3. Perform the scan tool Crankshaft Position System Variation Learn procedure.
4. Verify no DTCs are set.
   - **If any DTCs other than P0300-P0306 are set**

     Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

   - **If DTC P0300-P0306 is set**

     Refer to Circuit/System Testing.

   - **If no DTCs are set**
5. Verify the scan tool Cylinder 1-6 Current Misfire Counter parameters do not increment.
   - **If increments**

     Refer to Circuit/System Testing.

   - **If does not increment**
6. Engine Running, perform the Cylinder Power Balance Test with a scan tool.
7. Verify the engine speed changes when each injector is disabled and then enabled.
   - **If engine speed does not change**

     Refer to Circuit/System Testing.

   - **If engine speed does change**
8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within

the conditions that you observed from the Freeze Frame/Failure Records data.

9. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
10. All OK.

Circuit/System Testing

1. Verify none of the conditions listed below exist:
    - Damage, carbon tracking, or fluid intrusion of the spark plug boots and/or spark plugs
    - Vacuum hose splits, kinks, and incorrect connections
    - Engine vacuum leaks
    - Crankcase ventilation system for vacuum leaks
    - Fuel pressure that is too low or too high. Refer to **Fuel System Diagnosis** .
    - Contaminated fuel. Refer to **Alcohol/Contaminants-in-Fuel Diagnosis** .
    - Exhaust system restrictions
        - **If a condition exists**

          Repair or replace as necessary.

        - **If no conditions exist**

NOTE: **An erratic or weak spark is considered a no spark condition.**

2. Ignition OFF, remove the appropriate T8 Ignition Coil and connect the **EL 26792** to the spark plug boot, engine Cranking.
3. Verify the spark output.
    - **If no output or the output is weak**

      Refer to **Electronic Ignition System Diagnosis** .

    - **If the output is good**
4. Ignition OFF.
5. Verify the conditions listed below. Refer to **Ignition System Specifications** .
    - The correct spark plug type
    - The correct spark plug gap
    - The correct spark plug torque
    - **If a condition exists**

      Repair or replace as necessary.

    - **If no conditions exist**

6. Exchange the suspect spark plug with another cylinder that is operating correctly.
7. Engine Running.
8. Verify the scan tool Cylinder 1-6 Current Misfire Counter does not increment for the cylinder where the suspect spark plug was installed.
    - **If increments**

      Replace the spark plug.

    - **If does not increment**
9. Verify the conditions listed below do not exist:
    - A lean or rich Q17 Fuel Injector-Refer to **Fuel Injector Balance Test** .
    - An engine mechanical condition-Refer to **Symptoms - Engine Mechanical** .

Repair Instructions

- **Ignition Coil Replacement - Bank 1**
- **Ignition Coil Replacement - Bank 2**
- **Spark Plug Replacement**

Repair Verification

1. Install any components or connectors that have been removed or replaced during diagnosis.
2. Perform any adjustment, programming or setup procedures that are required when a component or module is removed or replaced.
3. Clear the DTCs.
4. Turn OFF the ignition for 60 s.
5. If the repair was related to a DTC, duplicate the Conditions for Running the DTC and use the Freeze Frame/Failure Records, if applicable, in order to verify the DTC does not reset. If the DTC resets or another DTC is present, refer to the **Diagnostic Trouble Code (DTC) List - Vehicle** and perform the appropriate diagnostic procedure.
6. Engine Running, verify the scan tool Cylinder 1-6 Current Misfire Counter parameters do not increment.
    - If the misfire counter parameters increment, a misfire condition still exists.
7. To verify that the performance of the catalytic converter has not been affected by the condition that set this DTC, perform the Repair Verification for DTC P0420 or P0430. Refer to **DTC P0420 or P0430** .

DTC P0315: CRANKSHAFT POSITION SYSTEM VARIATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0315

Crankshaft Position System Variation Not Learned

Circuit/System Description

The crankshaft position variation learn feature is used to calculate reference period errors caused by slight tolerance variations in the crankshaft, and the crankshaft position sensor. The calculated error allows the engine control module (ECM) to accurately compensate for reference period variations. This enhances the ability of the ECM to detect misfire events over a wider range of engine speed and load conditions.

The crankshaft position system variation compensating values are stored in ECM memory after a learn procedure has been performed and the ignition switch is turned to the OFF position for at least 30 s. If the actual variation is not within the crankshaft position system variation compensating values stored in the ECM, DTC P0300 may set.

If the crankshaft position system variation values are not stored in the ECM memory or a proper ECM power down does not occur after completing the Crankshaft Position Learn Procedure, DTC P0315 sets.

Conditions for Running the DTC

Engine is Running.

The DTC runs continuously when the above condition is met.

Conditions for Setting the DTC

The ECM detects that the crankshaft position system variation values are not stored in memory.

Action Taken When the DTC Sets

DTC P0315 is a Type A DTC.

Conditions for Clearing the MIL/DTC

DTC P0315 is a Type A DTC.

Diagnostic Aids

This test procedure requires that the vehicle battery has passed a load test and is completely charged. Refer to **Battery Inspection/Test** .

Knock Sensor 1 Low Signal	P0327	P0325	P0328	P0324*, P0326**
Knock Sensor 2 Low Signal	P0332	P0330	P0333	P0324*, P0331**
* Signal Performance High ** Signal Performance Low				

Circuit/System Description

The knock sensors enable the engine control module (ECM) to control the ignition timing for the best possible performance while protecting the engine from potentially damaging levels of detonation. The knock sensors produce an alternating current (AC) voltage signal that varies depending on the vibration level during engine operation. The ECM adjusts the spark timing based on the amplitude and the frequency of the two knock sensor signals. The ECM receives each knock sensor signal through a dedicated circuit. The ECM learns a minimum knock sensor noise level for all of the engine speed ranges and monitors the normal knock sensor signal. The ECM monitors the internal knock sensor processor test circuits which perform the open circuit diagnostic.

Conditions for Running the DTCs

P0324

- Engine is running for 2 s or greater.
- Engine speed is 8,500 RPM or less.
- Engine air flow is between 200-2,000 mg per cylinder.
- The engine coolant temperature (ECT) is -40Â°C (-40Â°F) or warmer.
- The intake air temperature (IAT) sensor 1 is -40Â°C (-40Â°F) or warmer.

  AND

- Engine speed is 400 RPM or greater.

  OR

- Engine speed is 8,500 RPM or greater.

  OR

- Engine speed is 8,500 RPM or greater.

P0326 and P0331

- Engine is running for 2 s or greater.
- Engine speed is 8,500 RPM or less.
- Engine air flow is between 200-2,000 mg per cylinder.
- The engine coolant temperature (ECT) is -40Â°C (-40Â°F) or warmer.
- The intake air temperature (IAT) sensor 1 is -40Â°C (-40Â°F) or warmer.

AND

- Engine speed is 400 RPM or greater for 167 or more cumulative revolutions.

OR

- Engine speed is 8,500 RPM or greater for 100 or more cumulative revolutions.

OR

- Engine speed is 8,500 RPM or greater for 5 or more cumulative revolutions.

P06B6 and P06B7

- Engine is running for 2 s or greater.
- Engine speed is between 400-4,000 RPM for 200 or more cumulative revolutions.
- Engine air flow is between 10-2,000 mg per cylinder.

The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTCs

P0324

The ECM detects that either knock sensor signal performance is out of the normal calibrated range due to excessive engine knock on a per cylinder basis.

P0326

The ECM detects that the knock sensor 1 signal performance is out of the normal calibrated range due to a low signal level.

P0331

The ECM detects that the knock sensor 2 signal performance is out of the normal calibrated range due to a low signal level.

P06B6 and P06B7

The ECM has detected a fault in the knock sensor processor open circuit diagnostic internal test circuit.

Action Taken When the DTCs Set

- DTCs P0324, P0326, P0331, P06B6, and P06B7 are Type B DTCs.
- The ignition timing is retarded to reduce the potential of engine damaging spark knock.

Conditions for Clearing the DTCs

DTCs P0324, P0326, P0331, P06B6, and P06B7 are Type B DTCs.

The ECM monitors the internal knock sensor processor test circuits which perform the open circuit diagnostic.

Conditions for Running the DTCs

P0325 and P0330

- Engine is running for 2 s or greater.
- Engine speed is between 400-5,500 RPM for 100 or more cumulative revolutions.
- Engine air flow is between 10-2000 mg per cylinder.
- The engine coolant temperature (ECT) is -40Â°C (-40Â°F) or warmer.
- The intake air temperature (IAT) sensor 1 is -40Â°C (-40Â°F) or warmer.

P0327, P0328, P0332, and P0333

Engine speed is less than 8,500 RPM.

The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTCs

P0325

The ECM detects knock sensor 1 signal circuit is open.

P0327

The ECM detects knock sensor 1 signal circuit is shorted to ground.

P0328

The ECM detects knock sensor 1 signal circuit is shorted to voltage.

P0330

The ECM detects knock sensor 2 signal circuit is open.

P0332

The ECM detects knock sensor 2 signal circuit is shorted to ground.

P0333

The ECM detects knock sensor 2 signal circuit is shorted to voltage.

Action Taken When the DTCs Set

- DTCs P0325, P0327, P0328, P0330, P0332, and P0333 are Type B DTCs.
- The ignition timing is retarded to reduce the potential of engine damaging spark knock.

Conditions for Clearing the DTCs

DTCs P0325, P0327, P0328, P0330, P0332, and P0333 are Type B DTCs.

Diagnostic Aids

The following conditions listed below may cause a knock sensor DTC to set:

- Sensor damage.
- Knock sensor and engine mounting surface burrs, casting flash, and foreign material.
- Close proximity of hoses, brackets, and engine wiring.
- Loose brackets.
- Loose or broken accessory drive belts, brackets, components.
- An engine mechanical condition. Refer to **Symptoms - Engine Mechanical** .

   - **If the DTC is not set**
3. Verify the appropriate B68 Knock Sensor mounting bolt is properly tightened. Refer to **Fastener Specifications** .
   - **If not tightened to the correct specification**

     Repair a necessary.

   - **If tightened to the correct specification**
4. Verify the scan tool parameters listed below display No while moving the related harnesses and connectors of the B68 Knock Sensor.
   - Cylinder 1 Knock Detected
   - Cylinder 2 Knock Detected
   - Cylinder 3 Knock Detected
   - Cylinder 4 Knock Detected
   - Cylinder 5 Knock Detected
   - Cylinder 6 Knock Detected
   - **If No is not displayed**

     Repair the wiring harness or connectors.

   - **If No is displayed**
5. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
7. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the B68 Knock Sensor, ignition ON.
2. Test for 1-2 V between the low signal circuit terminal B and ground.
    - **If less than 1 V**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the low signal circuit terminal B and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance.
    3. Test for less than 2 Ω in the low signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If greater than 2 V**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
    2. Test for less than 1 V between the low signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
    - **If between 1-2 V**
3. Test for 2-4 V between the high signal circuit terminal A and ground.
    - **If less than 2 V**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the high signal circuit terminal A and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance.
    3. Test for less than 2 Ω in the high signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If greater than 4 V**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
    2. Test for less than 1 V between the high signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
    - **If between 2-4 V**
4. Test or replace the B68 Knock Sensor.

Low Reference	-	P0335	-	P0336

Circuit/System Description

The crankshaft position sensor circuits consist of an engine control module (ECM) supplied 5 V reference circuit, low reference circuit, and an output signal circuit. The crankshaft position sensor is an internally magnetic biased digital output integrated circuit sensing device. The sensor detects magnetic flux changes of the teeth and slots of a 58-tooth reluctor wheel on the crankshaft. Each tooth on the reluctor wheel is spaced at 60-tooth spacing, with 2 missing teeth for the reference gap. The crankshaft position sensor produces an ON/OFF DC voltage of varying frequency, with 58 output pulses per crankshaft revolution. The frequency of the crankshaft position sensor output depends on the velocity of the crankshaft. The crankshaft position sensor sends a digital signal, which represents an image of the crankshaft reluctor wheel, to the ECM as each tooth on the wheel rotates past the crankshaft position sensor. The ECM uses each crankshaft position signal pulse to determine crankshaft speed and decodes the crankshaft reluctor wheel reference gap to identify crankshaft position. This information is then used to determine the optimum ignition and injection points of the engine. The ECM also uses crankshaft position sensor output information to determine the camshaft relative position to the crankshaft, to control camshaft phasing, and to detect cylinder misfire.

Conditions for Running the DTC

P0335 Condition 1

- The starter is engaged and the engine control module detects camshaft position sensor pulses.

Or

- DTCs P0101, P0102 and P0103 are not set.

  And

- The airflow into the engine is greater than 3 g/s.

Condition 2

- DTC P0651 is not set.
- The engine is running and the starter is not engaged.

Condition 3

- DTCs P0365, P0366, P0641, and P0651 are not set.
- The engine is running or the starter is engaged.

P0336 Condition 1

- DTCs P0335 or P0651 are not set.
- The airflow into the engine is greater than 3 g/s.
- Engine speed is greater than 450 RPM.

Condition 2

- DTC P0651 is not set.
- The engine is running and the starter is not engaged.

Condition 3

- The starter is engaged and the engine control module detects camshaft position sensor pulses.

  Or

- DTCs P0101, P0102, and P0103 are not set.
- The airflow into the engine is greater than 3 g/s.

Condition 4

- DTCs P0365, P0366, P0641, and P0651, are not set.
- The engine is running or the starter is engaged.

The DTCs run continuously once the above conditions are met.

Conditions for Setting the DTC

P0335 Condition 1

The ECM does not detect a crankshaft position sensor pulse for greater than 4 s.

Condition 2

The ECM does not detect a crankshaft position sensor pulse for greater than 1.0 s.

Condition 3

The ECM does not detect a crankshaft position sensor pulse for 2 out of 10 engine revolutions.

P0336 Condition 1

The ECM detects that 10 or more crankshaft resynchronization have occurred within 10.0 s.

Condition 2

The ECM does not detect the synchronization gap on the reluctor wheel for greater than 0.4 s.

Condition 3

The ECM does not detect the synchronization gap on the reluctor wheel for 1.5 s after the starter was engaged.

Condition 4

The ECM detects less than 51 or greater than 65 crankshaft position sensor pulses during 1 engine revolution for 8 out of 10 engine revolutions.

Action Taken When the DTC Sets

- DTCs P0335 and P0336 are Type B DTCs.
- An engine driveability issue occurs after the first failure.
- The camshaft position sensor is used to determine engine position.
- The camshaft actuators are commanded to the parked position.

Conditions for Clearing the DTC

DTCs P0335 and P0336 are Type B DTCs.

1. Ignition ON.
2. Verify DTC P0651 is not set.
   - **If the DTC is set**

     Refer to **DTC P0641, P0651, P0697, or P06A3 (ECM)** .

   - **If the DTC is not set**
3. Engine running.
4. Verify the scan tool Crankshaft Position Active Counter parameter increments.
   - **If the counter does not increment**

     Refer to Circuit/System Testing.

   - **If the counter increments**
5. Verify the scan tool Crankshaft Position Resync Counter parameter displays 0 counts and the engine does not stumble or stall while moving the related harness/connectors of the B26 Crankshaft Position Sensor.
   - **If greater than 0 counts and the engine stumbles or stalls**

     Refer to Circuit/System Testing.

   - **If 0 counts and the engine does not stumble or stall**
6. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
7. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
8. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B26 Crankshaft Position Sensor. It may take up to 2 minutes for all vehicle systems to power down.

2. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.
    - **If 5 Ω or greater**
    1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If 2 Ω or less, replace the K20 Engine Control Module.
    - **If less than 5 Ω**
3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 3 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If greater than 5.2 V**
    1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module, ignition ON.
    2. Test for less than 1 V between the 5 V reference and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
    - **If between 4.8-5.2 V**
5. Test for 4.8-5.2 V between the signal circuit terminal 2 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance.
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If greater than 5.2 V**
    1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.

- **If between 4.8-5.2 V**

6. Ignition OFF, connect a 3 A fused jumper wire to the signal circuit terminal 2, ignition ON.

NOTE: **Additional DTCs may set when performing this test.**

7. Verify the scan tool Crankshaft Position Sensor Active Counter parameter increments while rapidly tapping the fused jumper wire end to ground.
   - **If the counter does not increment**

     Replace the K20 Engine Control Module.

   - **If the counter increments**
8. Verify DTC P0336 is not set.
   - **If the DTC is set**

     Inspect for the conditions listed below:

   - Excessive play or looseness of the B26 Crankshaft Position Sensor or the reluctor wheel
   - Improper installation of the B26 Crankshaft Position Sensor
   - Foreign material passing between the B26 Crankshaft Position Sensor and the reluctor wheel
   - Damaged reluctor wheel
   - Excessive air gap between the B26 Crankshaft Position Sensor and the reluctor wheel
   - Engine oil for debris
   - Timing chain, tensioner, and sprockets for wear or damage
     - If any of the conditions above are found, repair as necessary.
     - If all components test normal, test or replace the B26 Crankshaft Position Sensor.
   - **If the DTC is not set**
9. Test or replace the B26 Crankshaft Position Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Crankshaft Position Sensor Replacement**

Circuit/System Description

The 4 camshaft position sensors each have 3 circuits consisting of an engine control module (ECM) supplied 5 V reference circuit, low reference circuit, and an output signal circuit. The camshaft position sensor is an internally magnetic biased digital output integrated circuit sensing device. The sensor detects magnetic flux changes of the teeth and slots of a 4-tooth reluctor wheel attached to the camshaft. As each reluctor wheel tooth rotates past the camshaft position sensor, the resulting change in the magnetic field is used by the sensor electronics to produce a digital output pulse. The sensor returns a digital ON/OFF DC voltage pulse of varying frequency with 4 varying width output pulses per camshaft revolution that represent an image of the camshaft reluctor wheel. The frequency of the camshaft position sensor output depends on the velocity of the camshaft. The ECM decodes the narrow and wide tooth pattern to identify camshaft position. This information is then used to determine the optimum ignition and injection points of the engine. The ECM uses the cylinder 1 exhaust camshaft position sensor to determine injector and ignition system synchronization. The intake and exhaust camshaft position sensors are also used to determine camshaft to crankshaft relationship. The ECM also uses camshaft position sensor output information to determine the camshaft relative position to the crankshaft to control camshaft phasing and limp-home operation.

Conditions for Running the DTC

P0340, P0345, P0365, or P0390 Condition 1

- DTCs P0101, P0102, and P0103 are not set.
- The airflow into the engine is greater than 3 g/s.

  OR

- The starter is engaged and the engine control module detects camshaft position sensor pulses.

Condition 2

- DTC P0651 is not set.
- The engine is running and the starter is not engaged.

Condition 3

- DTC P0335, P0336, P0641, or P0651 are not set.
- The crankshaft is synchronized.
- The starter is engaged.

Condition 4

- DTC P0335, P0336, P0641, or P0651 are not set.
- The crankshaft is synchronized.

P0341, P0346, P0366, or P0391 Condition 1

- DTC P0335, P0336, P0641, or P0651 are not set.
- The crankshaft is synchronized.
- The starter is engaged.

Condition 2

- DTC P0335, P0336, P0641, or P0651 are not set.
- The crankshaft is synchronized.

The DTCs run continuously once the above conditions are met.

Conditions for Setting the DTC

P0340, P0345, P0365, or P0390 Condition 1

- The ECM does not detect a camshaft position sensor pulse for greater than 5.5 s.

  OR

- The ECM does not detect a camshaft position sensor pulse for greater than 4.0 s since the time the starter has been engaged.

Condition 2

The ECM detects less than 4 camshaft position sensor pulses for greater than 3.0 s.

Condition 3

The ECM does not detect a camshaft position sensor pulse during the first 2 engine revolutions.

Condition 4

The ECM does not detect a camshaft position sensor pulse during 200 engine revolutions.

P0341, P0346, P0366, or P0391 Condition 1

- The ECM detects less than 4 camshaft position sensor pulses during 2 engine revolutions.

  OR

- The ECM detects greater than 10 camshaft position sensor pulses during 2 engine revolutions.

Condition 2

The ECM detects less than 398 or greater than 402 camshaft position sensor pulses during 200 engine revolutions.

Action Taken When the DTC Sets

- DTCs P0340, P0341, P0345, P0346, P0365, P0366, P0391, and P0390 are Type B DTCs.
- The camshaft position actuator is commanded to the Home or Parked position.
- The ignition system defaults to a failed camshaft position sensor limp home mode.

Conditions for Clearing the DTC

DTCs P0340, P0341, P0345, P0346, P0365, P0366, P0391, and P0390 are Type B DTCs.

Diagnostic Aids

- With a DTC set, the engine may crank for an extended period of time at start-up
- The exhaust camshaft position sensor is used for injector and ignition system synchronization. A stalling condition will occur if the camshaft position sensor signal is intermittent and a DTC will not set. Inspect all camshaft position sensor circuits for poor connections.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC P0641 or P0651 is not set.
   - **If any of the DTCs are set**

     Refer to **DTC P0641, P0651, P0697, or P06A3 (ECM)**.

   - **If none of the DTCs are set**
3. Engine running.
4. Verify the scan tool parameters listed below increment:
   - Exhaust Camshaft Position Active Counter Bank 1
   - Exhaust Camshaft Position Active Counter Bank 2
   - Intake Camshaft Position Active Counter Bank 1
   - Intake Camshaft Position Active Counter Bank 2
   - **If any counter does not increment**

     Refer to Circuit/System Testing.

   - **If all counters increment**
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
7. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate B23 Camshaft Position Sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.
   - **If 5 Ω or greater**
   1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If 2 Ω or less, replace the K20 Engine Control Module.
   - **If less than 5 Ω**
3. Ignition ON.

4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 3 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance.
    3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω , replace the K20 Engine Control Module.
    - **If greater than 5.2 V**
    1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module, ignition ON.
    2. Test for less than 1 V between the 5 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
    - **If between 4.8-5.2 V**
5. Test for 4.8-5.2 V between the signal circuit terminal 2 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance.
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If greater than 5.2 V**
    1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
    - **If between 4.8-5.2 V**
6. Verify DTC P0341, P0346, P0366, or P0391 is not set.
    - **If any of the DTCs are set**

      Verify the conditions listed below do not exist:

    - Excessive play or looseness of the B23 Camshaft Position Sensor or the reluctor wheel
    - Improper installation of the B23 Camshaft Position Sensor
    - Foreign material passing between the B23 Camshaft Position Sensor and the reluctor wheel

- Damaged reluctor wheel
- Excessive air gap between the B23 Camshaft Position Sensor and the reluctor wheel
- Engine oil for debris
- Timing chain, tensioner, and sprockets for wear or damage
  - If a conditions exist, repair as necessary.
  - If none of the condition exist test or replace the B23 Camshaft Position Sensor.
- **If none of the DTCs are set**

7. Test or replace the B23 Camshaft Position Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Camshaft Position Sensor Replacement - Bank 1 (Right Side) Exhaust**
- **Camshaft Position Sensor Replacement - Bank 2 (Left Side) Exhaust**
- **Camshaft Position Sensor Replacement - Bank 1 (Right Side) Intake**
- **Camshaft Position Sensor Replacement - Bank 2 (Left Side) Intake**

Circuit/System Description

The ignition system on this engine uses an individual coil for each cylinder. The engine control module (ECM) controls the spark event for each cylinder through the 6 individual ignition control circuits. When the ECM commands the ignition control circuit ON, electrical current will flow through the primary winding of the ignition coil, creating a magnetic field. When a spark event is requested, the ECM will command the ignition control circuit OFF, interrupting current flow through the primary winding. The magnetic field created by the primary winding will collapse across the secondary coil windings, producing a high voltage across the spark plug electrodes. The ECM uses information from the crankshaft position sensor, and the camshaft position sensor for sequencing and timing of the spark events. The ECM monitors each ignition control circuit for improper voltage levels.

Conditions for Running the DTC

- The engine is cranking or running.
- Ignition voltage greater than 5 V.

The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match.

Action Taken When the DTC Sets

DTCs P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 and P2316 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 and P2316 are Type B DTCs.

Circuit/System Verification

1. Engine Running.
2. Verify the scan tool parameters listed below do not display Malfunction:
   - Ignition Coil 1-6 Control Circuit High Voltage Test Status
   - Ignition Coil 1-6 Control Circuit Low Voltage Test Status
   - Ignition Coil 1-6 Control Circuit Open Test Status
   - **If Malfunction is displayed**

     Refer to Circuit/System Testing.

   - **If Malfunction is not displayed**
3. Operate the vehicle within the Conditions for Running the DTCs. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

4. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate T8 Ignition Coil. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 Ω between the ground circuit terminal A and ground.
    - **If 5 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 5 Ω**
3. Verify the scan tool Ignition Coil Control Circuit Low Voltage Test Status does not display Malfunction.
    - **If Malfunction is displayed**
    1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the control circuit.
        - If infinite resistance, replace the K20 Engine Control Module.
    - **If Malfunction is not displayed**
4. Verify the scan tool Ignition Coil Control Circuit High Voltage Test Status does not display Malfunction.
    - **If Malfunction is displayed**
    1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage in the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
    - **If Malfunction is not displayed**
5. Ignition OFF, install a 3 A fused jumper wire between the control circuit terminal C and ground, engine Running.
6. Verify the scan tool Ignition Coil Control Circuit Low Voltage Test Status displays Malfunction.
    - **If Malfunction is not displayed**
    1. Ignition OFF, remove the fused jumper, and disconnect the X3 harness connector at the K20 Engine Control Module.
    2. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω, replace the K20 Engine Control Module.
- **If Malfunction is displayed**

7. Test or replace the T8 Ignition Coil.

Component Test

NOTE: **You must perform the Circuit/System Testing before proceeding with Component Testing.**

1. Ignition OFF, connect the **EL 26792** HEI spark tester to the appropriate T8 Ignition Coil.
2. Engine Running.
3. Verify the spark output of the T8 Ignition Coil.
   - **If no output or the output is weak**

     Replace the T8 Ignition Coil.

   - **If the output is normal**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Ignition Coil Replacement - Bank 1**
- **Ignition Coil Replacement - Bank 2**
- **Control Module References** for engine control module replacement, programming, and setup

DTC P0420 OR P0430: CATALYST SYSTEM LOW EFFICIENCY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0420

Catalyst System Low Efficiency Bank 1

DTC P0430

Catalyst System Low Efficiency Bank 2

Circuit/System Description

A 3-way catalytic converter (TWC) controls emissions of hydrocarbons, CO and NOx. The catalyst within the converter promotes a chemical reaction, which oxidizes the hydrocarbons and the CO that are present in the

exhaust gas. This process converts the hydrocarbons and the CO into water vapor and CO2, and reduces the NOx, converting the NOx into nitrogen. The TWC also stores oxygen. The ECM monitors this process by using a heated oxygen sensor (HO2S) that is in the exhaust stream after the TWC. The HO2S 2 produces an output signal that the ECM uses to calculate the oxygen storage capacity of the catalyst. This indicates the ability of the catalyst to convert the exhaust emissions efficiently. The ECM monitors the efficiency of the catalyst by allowing the catalyst to heat, then wait for a stabilization period while the engine is idling. The ECM then adds and removes fuel while monitoring the HO2S 2. When the catalyst is functioning properly, the HO2S 2 response to the extra fuel is slow compared to the response of the HO2S 1, which is located before the TWC. When the HO2S 2 response is near that of the HO2S 1, the oxygen storage capability and efficiency of the catalyst may be degraded below an acceptable threshold.

Conditions for Running the DTC

- DTC P0016, P0017, P0018, P0019, P0053, P0054, P0059, P0060, P0068, P0090, P0091, P0092, P00C8, P00C9, P00CA, P0101, P0102, P0103, P0112, P0113, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0128, P0131, P0132, P0133, P0135, P0137, P0138, P013A, P013B, P013C, P013D, P013E, P013F, P0140, P0141, P014A, P014B, P0151, P0152, P0153, P0155, P0157, P0158, P0160, P0161, P0171, P0172, P0174, P0175, P0191, P0192, P0193, P0222, P0223, P0300, P0301. P0302, P0303, P0304, P0305, P0306, P0335, P0336, P0341, P0345, P0346, P0365, P0366, P0390, P0391, P0443, P0506, P0507, P0606, P1153, P16F3, P2101, P2122, P2123, P2127, P2128, P2135, P2138, P2227, P2228, P2229, P2230, P2270, P2271, P2272, or P2273 is not set.
- Before the ECM performs the idle test, the vehicle must be driven under the following conditions:
  - The engine speed is greater than 965 RPM
  - The engine run time is greater than a calibrated value
  - Both conditions exist for greater than 15 s
- The throttle is in the rest position.
- The Intake Air Temperature (IAT) is between -20 to +250Â°C (-4 to +482Â°F).
- The ignition voltage is greater than 11 V.
- The Engine Coolant Temperature (ECT) is between 40-127Â°C (104-261Â°F).
- The Barometric Pressure (BARO) is greater than 70 kPa.
- The engine has been idling less than 50 s.
- The vehicle speed is less than 2 km/h (1 mph).
- The short term fuel trim is learned.
- The air flow into the engine is between 3-13 g/s.
- The Evaporative Emission (EVAP) purge concentration is learned.
- The catalytic converter calculated temperature is between 450-850Â°C (842-1,562Â°F).
- The engine is operating in Closed Loop.
- The transmission is not in P/N (automatic transmission only).

This diagnostic attempts one test during each valid idle period once the above conditions have been met. This diagnostic attempts up to 8 tests during each drive cycle.

Conditions for Setting the DTC

The ECM determines that the efficiency of the catalyst has degraded below a calibrated threshold.

Action Taken When the DTC Sets

DTC P0420 and P0430 are Type A DTCs.

Conditions for Clearing the DTC

DTC P0420 and P0430 are Type A DTCs.

Diagnostic Aids

Inspect for the following conditions, which may cause a catalytic converter to degrade:

- An engine misfire
- High engine oil or high coolant consumption
- Retarded spark timing
- A weak or poor spark
- A lean fuel mixture
- A rich fuel mixture
- A damaged oxygen sensor or wiring harness

Control Module References for scan tool information

Circuit/System Verification

1. Verify that no other DTCs are set.
    - If a DTC is set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.
2. Operate the vehicle within the Conditions for Running the DTC while observing the scan tool TWC Mon. Off Idle Test Conditions Met parameter. The parameter will change to Yes when the Off Idle Conditions have been met.
    - If not the specified value, operate the vehicle within the Off Idle Conditions.
3. When the parameter has changed to Yes and the conditions are safe, stop and idle the vehicle in gear.
4. Apply the service brake.
5. Monitor the scan tool TWC Monitor Test State parameter. When the parameter indicates Active, the TWC Monitor Test is running.
6. Continue to monitor the parameter. When the parameter indicates Inactive, the TWC Monitor Test has completed.
7. When the test has completed, the TWC Monitor Test Count parameter will increment by one and the TWC Monitor Test Result parameter will indicate Passed, Failed or No Decision.
    - If No Decision is indicated, repeat steps 2-6 until the Test Result parameter indicates Passed or

Failed.

Circuit/System Testing

1. Verify the following conditions do not exist with the appropriate catalytic converter:
    - Dents
    - Severe discoloration caused by excessive temperatures
    - Road damage
    - Internal rattles caused by damaged catalyst substrate
    - Restrictions
        - If a condition is found, replace the catalytic converter.
2. Verify the following conditions do not exist with the exhaust system:
    - Leaks
    - Physical damage
    - Loose or missing hardware
        - If a condition is found, repair the exhaust system.
3. Verify the following conditions do not exist with the appropriate B52B heated oxygen sensor 2:
    - The HO2S is not at the correct torque
    - Damage
        - If a condition is found, replace the B52B heated oxygen sensor 2 as necessary.
4. If all physical conditions test normal, test or replace the catalytic converter.

Repair Instructions

NOTE: **A new converter with less than 100 miles on it may set DTC P0420 or P0430 due to out-gassing of the internal matting. Operating the vehicle at highway speeds for approximately 1 hour may correct the condition.**

- **Exhaust Leakage**
- **Restricted Exhaust**
- **Heated Oxygen Sensor Replacement - Bank 1 Sensor 2**
- **Heated Oxygen Sensor Replacement - Bank 2 Sensor 2**
- Perform the HO2S Heater Learn procedure with a scan tool after replacing the Heated Oxygen Sensor.
- **Catalytic Converter Replacement - Left Side (Front)**
- **Catalytic Converter Replacement - Right Side (Rear)**

Repair Verification

1. Install any components that have been removed or replaced during diagnosis.
2. Perform any adjustments, programming or setup procedures that are required when a component is removed or replaced.
3. Clear the DTCs with a scan tool.
4. Turn OFF the ignition for 60 s

5. Operate the vehicle within the Conditions for Running the DTC while observing the scan tool TWC Mon. Off Idle Test Conditions Met parameter. The parameter will change to Yes when the Off Idle Conditions have been met.
    - If not the specified value, operate the vehicle within the Off Idle Conditions.
6. When the parameter has changed to Yes and the conditions are safe, stop and idle the vehicle in gear.
7. Apply the service brake.
8. Monitor the scan tool TWC Test State parameter. When the parameter indicates Active, the TWC Monitor Test is running.
9. Continue to monitor the parameter. When the parameter indicates Inactive, the TWC Monitor Test has completed.
10. When the test has completed, the TWC Monitor Test Count parameter will increment by one and the TWC Monitor Test Result parameter will indicate Passed, Failed or No Decision.
    - If No Decision is indicated, repeat steps 5-9 until the Test Result parameter indicates Passed or Failed.
11. If the repair was related to a DTC, duplicate the Conditions for Running the DTC and use the Freeze Frame/Failure Records, if applicable, in order to verify the DTC does not reset. If the DTC resets or another DTC is present, refer to the **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.

DTC P0442: EVAPORATIVE EMISSION (EVAP) SYSTEM SMALL LEAK DETECTED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0442

Evaporative Emission (EVAP) System Small Leak Detected

Circuit/System Description

The engine off natural vacuum test is the small leak detection diagnostic for the evaporative emission (EVAP) system. This diagnostic tests the EVAP system for a small leak when the key is turned OFF and the correct conditions are met. Heat from the exhaust system is transferred into the fuel tank while the vehicle is operating. When the vehicle is turned OFF and the EVAP system is sealed a change in the fuel tank vapor temperature occurs which results in a corresponding pressure change in the fuel tank vapor space. This change is monitored by the engine control module (ECM) using the fuel tank pressure sensor input. With a leak in the system, the amount of pressure change will be less than that of a sealed system.

Conditions for Running the DTC

- DTCs P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0125, P012B, P012C, P012D, P0128, P0443, P0446, P0449, P0452, P0453, P0455, P0496, P0502, P0503, P0722, P0723, P2227, P2228, P2229, P2610 are not set.

- The barometric pressure (BARO) is greater than 70 kPa.
- The engine coolant sensor (ECT) is greater than 70Â°C (158Â°F)
- No key cycle during engine off natural vacuum or test will abort.
- The fuel level is between 10-90%.
- The start-up engine coolant temperature (ECT) and the start-up intake air temperature (IAT) are within 8Â°C (14Â°F).
- The engine run time before shut-off was greater than 10 min.
- The drive distance before engine shut-off was more than 8 km (5 mi).
- The ambient air temperature at the end of the drive cycle is between 0-34Â°C (32-93Â°F).
- DTC P0442 runs once per drive cycle during the hot soak period after the ignition is turned OFF and may require up to 40 min to complete. The controller will not make more than 2 test attempts per day. The time since the last completed engine off natural vacuum test must be at least 17 h if passed or 10 h if failed.

Conditions for Setting the DTC

- The ECM detects a leak in the EVAP system that is greater than a calibrated amount.
- The ECM must complete several engine off natural vacuum tests before the diagnostic can turn the MIL on or off.

Action Taken When the DTC Sets

DTC P0442 is a Type A DTC.

Conditions for Clearing the DTC

DTC P0442 is a Type A DTC.

Diagnostic Aids

- The EVAP system can be filled with smoke more quickly and completely by opening the system opposite the end where the smoke is injected. When injecting smoke at the service port tool remove the fuel fill cap, or temporarily leave the EVAP Vent Solenoid Valve open, until smoke is observed then close the system and continue testing. If using a fuel cap adapter at the filler neck, use the **EN 41413-VLV** at the service port to allow the system to fill faster.
- To help locate intermittent leaks using the **GE 41413-A** , move all EVAP components while observing smoke with the **GE 41413-SPT** .
- Individual components can be isolated and tested using adapters in the **GE 41413-300** .
- When servicing the EVAP system, test pressure must not exceed 13 in H20 (0.5 PSI) as pressure in excess of this could cause system components to perform inaccurately.
- A condition may exist where a leak in the EVAP system only exists under a vacuum condition. This type of leak may be detected by using the scan tool EVAP Purge/Seal function to create a vacuum in the EVAP system and then observe the Fuel Tank Pressure Sensor parameter for vacuum decay.

For equivalent regional tools, refer to **Special Tools (Diagnostic Tools)** **Special Tools (Repair Tools)** .

Circuit/System Testing

NOTE:

- **Refer to the GE 41413-A operation manual for detailed instructions in Evaporative Emission System Diagnosis.**
- **Larger volume fuel tanks and/or those with lower fuel levels may require several minutes for the floating indicator to stabilize or produce smoke from a leak.**
- **Ensure that the underbody temperature of the vehicle and the tester are similar.**

1. Disconnect the purge tube at the quick connector on the EVAP canister side of the Q12 Evaporative Emission Canister Purge Solenoid Valve and install the **CH 48096** .
2. Connect the **GE 41413-A** to the **CH 48096** .
3. Command the EVAP Purge/Seal function to System Seal or Not Venting with a scan tool to seal the EVAP system.
4. Use the flow meter on the **GE 41413-A** calibrated to 0.51 mm (0.020 in) to determine if there is a leak.
    - **If a leak is detected**
    1. Use the **GE 41413-A** to apply smoke to the EVAP system at the purge tube service port until the leak is located using the **GE 41413-SPT**
        - If leak is detected, repair or replace the affected component as necessary.
    - **If no leak is detected**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P0443, P0458, OR P0459: EVAPORATIVE EMISSION (EVAP) PURGE SOLENOID VALVE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0443

Evaporative Emission (EVAP) Purge Solenoid Valve Control Circuit

DTC P0458

Evaporative Emission (EVAP) Purge Solenoid Valve Control Circuit Low Voltage

DTC P0459

Evaporative Emission (EVAP) Purge Solenoid Valve Control Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Ignition	P0443, P0458	P0443	P0690
Control	P0443, P0458	P0443, P0458	P0459, P0690

Circuit/System Description

The evaporative emission (EVAP) purge solenoid valve is used to purge fuel vapor from the EVAP canister to

the intake manifold. The EVAP purge solenoid valve is pulse width modulated (PWM). Ignition voltage is supplied directly to the EVAP purge solenoid valve. The engine control module (ECM) controls the solenoid valve by grounding the control circuit with a solid state device called a driver. The driver is equipped with a feedback circuit that is pulled-up to a voltage. The ECM can determine if the control circuit is open, shorted to ground, or shorted to a voltage by monitoring the feedback voltage. A scan tool will display the amount of ON time as a percentage.

Conditions for Running the DTC

- The ignition voltage is greater than 11 V.
- The DTCs run continuously once the above conditions are met.

Conditions for Setting the DTC

P0443

The ECM detects the EVAP purge solenoid valve control circuit is open within 0.25 s.

P0458

The ECM detects the EVAP purge solenoid valve control circuit is shorted to ground within 0.25 s.

P0459

The ECM detects the EVAP purge solenoid valve control circuit is shorted to voltage within 0.25 s.

Action Taken When the DTC Sets

DTC P0443, P0458 and P0459 are Type B DTCs.

Conditions for Clearing the DTC

DTC P0443, P0458 and P0459 are Type B DTCs.

Diagnostic Aids

- The audible clicking intensity will vary depending on mounting locations and interference with the fuel injectors clicking. You may also feel a change in the frequency of clicking.
- Verify the EVAP Purge Solenoid Valve control circuit parameters do not display Malfunction when moving the related harnesses and connectors of the Q12 Evaporative Emission Purge Solenoid Valve.
- Use a hand vacuum pump to verify the purge solenoid actually flows vacuum during the dynamic testing.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, verify DTC P0690 is not set.
   - **If the DTC is set**

     Refer to **DTC P0685-P0687, P0689, P0690, or P1682**

   - **If the DTC is not set**
2. Verify the control circuit status parameters listed below do not display Malfunction while commanding the EVAP Purge Solenoid Valve from 0% to 50% and back to 0% with a scan tool:
   - EVAP Purge Solenoid Valve Control Circuit Open Test Status
   - EVAP Purge Solenoid Valve Control Circuit Low Voltage Test Status
   - EVAP Purge Solenoid Valve Control Circuit High Voltage Test Status
   - **If Malfunction is displayed**

     Refer to Circuit/System Testing

   - **If Malfunction is not displayed**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing

   - **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the Q12 Evaporative Emission Purge Solenoid Valve, ignition ON.
2. Verify that a test lamp illuminates between the ignition voltage circuit terminal A or 1 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition OFF, remove the test lamp.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition OFF, remove the test lamp.
    2. Test for infinite resistance between the ignition circuit and ground
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, test all components connected to the ignition voltage circuit for a short and replace as necessary.
    - **If the test lamp illuminates**
3. Verify that a test lamp does not illuminate between the ignition circuit terminal A or 1 and the control circuit terminal B or 2.
    - **If the test lamp illuminates**
    1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K20 Engine Control Module.
    - **If the test lamp does not illuminate**
4. Remove the test lamp.
5. Verify the scan tool EVAP Purge Solenoid Valve Control Circuit High Voltage Test Status parameter is OK when commanding the EVAP Purge Solenoid Valve to 50% with a scan tool.
    - **If OK is not displayed**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
    - **If OK is displayed**
6. Install a 3 A fused jumper wire between the control circuit terminal B or 2 and the ignition circuit terminal A or 1.
7. Verify the scan tool EVAP Purge Solenoid Valve Control Circuit High Voltage Test Status parameter is Malfunction when commanding the EVAP Purge Solenoid Valve to 50% with a scan tool.
    - **If Malfunction is not displayed**
    1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module.

2. Test for less than 2 Ω in the control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω replace the K20 Engine Control Module.
- **If Malfunction is displayed**

8. Test or replace the Q12 Evaporative Emission Purge Solenoid Valve.

Component Testing

Static Test

1. Ignition OFF, disconnect the harness connector at the Q12 Evaporative Emission Purge Solenoid Valve.
2. Test for 10-30 Ω between the control terminal B or 2 and the ignition circuit terminal A or 1.
    - **If not between 10-30 Ω**

      Replace the Q12 Evaporative Emission Purge Solenoid Valve.

    - **If between 10-30 Ω**
3. All OK.

Dynamic Test

1. Ignition OFF, disconnect the harness connector at the Q12 Evaporative Emission Purge Solenoid Valve.
2. Install a 3 A fused jumper wire between the ignition, terminal A or 1 and 12 V. Install a jumper wire between the control terminal B or 2 and ground.
3. Verify the Evaporative Emission Purge Solenoid Valve turns on & off/clicks and flows vacuum.
    - **If it does not turn on & off/click or flow vacuum.**

      Replace the Q12 Evaporative Emission Purge Solenoid Valve.

    - **If it does turns on & off/clicks and flows vacuum.**
4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Evaporative Emission Canister Purge Solenoid Valve Replacement**
- **Control Module References** for ECM replacement, programming and setup

DTC P0446: EVAPORATIVE EMISSION (EVAP) VENT SYSTEM

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0446

Evaporative Emission (EVAP) Vent System Performance

Typical Scan Tool Data

Fuel Tank Pressure Sensor Signal Voltage	Fuel Tank Pressure
1.5 V	Atmospheric Pressure / BARO
Less than 1.5 V	Positive Pressure
Greater than 1.5 V	Negative Pressure / Vacuum

Circuit/System Description

This DTC tests the evaporative emission (EVAP) system for a restricted or blocked EVAP vent path that would cause excess amounts of vacuum to be developed in the EVAP system. The engine control module (ECM) commands the EVAP purge solenoid valve Open and the EVAP vent solenoid valve Closed. This allows vacuum to be applied to the EVAP system. Once a calibrated vacuum level has been reached, the ECM commands the EVAP purge solenoid valve Closed and the EVAP vent solenoid valve Open. The ECM monitors the fuel tank pressure (FTP) sensor for a decrease in vacuum. If the vacuum does not decrease to near 0 in H2O in a calibrated time, this DTC sets.

The following table illustrates the relationship between the ON and OFF states, and the OPEN or CLOSED states of the EVAP purge and vent solenoid valves.

ECM Command	EVAP Purge Solenoid Valve	EVAP Vent Solenoid Valve
ON	Open	Closed
OFF	Closed	Open

Conditions for Running the DTC

- DTC P0068, P00C8, P00C9, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0121, P0122, P0123, P0128, P0191, P0192, P0193, P0222, P0223, P0443, P0601, P0604, P0606, P16A0, P16A1, P16A2, P16F3, P2101, P2135, P2176, is not set.
- The ignition voltage is between 11-32 V.
- The start up IAT is between 4-30Â°C (39-86Â°F).
- The start up ECT is less than 35Â°C (95Â°F)
- The barometric pressure (BARO) is greater than 70 kPa.
- The fuel level is between 10-90%.
- This test will start and run once per cold start for no greater than 17 min.

Conditions for Setting the DTC

NOTE: **There are two stages to setting this DTC. Stage one, prep test, then stage two test.**

- If the fuel tank pressure sensor reading is less than -3.0 kPa (-12 in) H2O of vacuum for 5 s before 6 L (1.6 gal) of purge volume.

OR

- If the fuel tank pressure sensor reading is greater than 0.62 kPa (2.5 in) H2O of pressure or less than -1.24 kPa (-5 in) H2O of vacuum for 60 s.
- After setting the DTC for the first time, 2 L (0.5 gal) of fuel must be consumed before setting the DTC for the second time.

Action Taken When the DTC Sets

DTC P0446 is a Type B DTC.

Conditions for Clearing the DTC

DTC P0446 is a Type B DTC.

Diagnostic Aids

An intermittent condition could be caused by:

- A damaged EVAP vent housing
- A temporary blockage at the EVAP vent solenoid valve inlet
- A pinched vent hose
- A blockage in the vent system may also cause a poor fuel fill problem.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC P0449 is not set.
   - **If the DTC is set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If the DTC is not set**
3. Ignition OFF, remove the fuel tank filler cap or install GE 41415-60 for capless vehicles. Ignition ON.
4. Verify the scan tool Fuel Tank Pressure Sensor voltage parameter is within 1.3-1.7 V.
   - **If not between the 1.3-1.7 V**

     Refer to P0452, P0453 within **DTC P0451-P0454**.

   - **If between the 1.3-1.7 V**
5. Install the fuel tank filler cap or remove the GE 41415-60. Engine idling at operating temperature for 5 min,
6. Verify the scan tool Fuel Tank Pressure Sensor parameter does not increase to greater than 2.5 V when commanding the EVAP Purge Solenoid Valve to 50%.
   - **If greater than 2.5 V**

     Refer to Circuit System Testing.

   - **If 2.5 V or less**
7. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/failure Records data.
   - **If the DTC sets**

     Refer to Circuit System Testing.

   - **If the DTC does not set**
8. All OK.

Circuit/System Testing

NOTE: Perform the Circuit/System Verification before proceeding with the Circuit/System Testing.

1. Verify a blockage or restriction does not exist in the EVAP system components listed below.
   - Evaporative Emission Vent System Hoses
   - Evaporative Emission Canister
   - Q13 Evaporative Emission Vent Solenoid Valve
   - Evaporative Emission Vent Filter
   - **If a condition exists**

     Repair or replace the component as necessary

   - **If none of the conditions exist**
2. Reconnect all previously disconnected EVAP hardware.

NOTE: Refer to the GE 41413-A operation manual for detailed instructions in Evaporative Emission System Diagnosis.

3. Remove the fuel fill cap and connect the CH 41415-30 to the fuel tank filler neck or install GE 41415-60 on capless fuel fill vehicles. Connect the GE 41413-A to the CH 41415-30 or GE 41415-60.
4. Ignition ON, command the EVAP Purge/Seal function to System Seal or Not Venting with a scan tool to seal the EVAP system.
5. Turn the nitrogen/smoke valve on the GE 41413-A to nitrogen.

NOTE: DO NOT exceed the specified value in this step. Exceeding the specified value may produce incorrect test results.

6. Use the remote switch to activate the GE 41413-A and pressurize the fuel tank to 5.0 in H20.
7. Verify the scan tool Fuel Tank Pressure Sensor parameter is 0 in H20 when commanding the EVAP Vent Solenoid Valve to OFF or Venting.
   - **If not 0 in H20**
   1. Ignition OFF
   2. Verify a blockage or a restriction does not exist in the EVAP vent hose or inlet.
      - **If a condition exists**

        Repair or replace the component as necessary

      - **If none of the conditions exist**

        Replace the Q13 Evaporative Emission Vent Solenoid Valve

   - **If 0 in H20**
8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

- **If the DTC sets**

  Refer to step 1 above.

- **If the DTC does not set**

9. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Evaporative Emission Canister Vent Solenoid Valve Replacement**
- **Evaporative Emission Canister Replacement**
- **Fuel Tank Pressure Sensor Replacement (E-85)** **Fuel Tank Pressure Sensor Replacement (E-10)**

DTC P0449, P0498, OR P0499: EVAPORATIVE EMISSION (EVAP) VENT SOLENOID VALVE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0449

Evaporative Emission (EVAP) Vent Solenoid Valve Control Circuit

DTC P0498

Evaporative Emission (EVAP) Vent Solenoid Valve Control Circuit Low Voltage

DTC P0499

Evaporative Emission (EVAP) Vent Solenoid Valve Control Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
B+	P0449, P0498	P0449	-
Control	P0449, P0498	P0449	P0499

Circuit/System Description

Battery voltage is supplied to the evaporative emission (EVAP) vent solenoid valve through a fuse. The engine control module (ECM) grounds the EVAP vent solenoid valve control circuit through an internal switch called a driver. The ECM monitors the status of the driver. A scan tool will display the commanded state of the EVAP vent solenoid valve as ON (Not Venting) or OFF (Venting).

Conditions for Running the DTC

The DTCs run continuously once the above conditions are met.

Conditions for Setting the DTC

P0449

The ECM detects the EVAP Vent Solenoid Valve control circuit is open within 0.25 s.

P0498

The ECM detects the EVAP Vent Solenoid Valve control circuit is shorted to ground within 0.25 s.

P0499

The ECM detects the EVAP Vent Solenoid Valve control circuit is shorted to voltage within 0.25 s.

Action Taken When the DTC Sets

DTC P0449, P0498 and P0499 are Type B DTCs.

Conditions for Clearing the DTC

DTC P0449, P0498 and P0499 are Type B DTCs.

Diagnostic Aids

- An audible click may be heard when performing verification step 2 below.
- Verify the EVAP Vent Solenoid Valve control circuit parameters do not display Malfunction when moving the related harnesses and connectors of the Q13 Evaporative Emission Vent Solenoid Valve

Circuit/System Verification

1. Ignition ON.
2. Verify the control circuit status parameters listed below do not display Malfunction while commanding the EVAP Vent Solenoid Valve to ON (Not Venting) and OFF (Venting) with a scan tool:
   - EVAP Vent Solenoid Valve Control Circuit Open Test Status
   - EVAP Vent Solenoid Valve Control Circuit Low Voltage Test Status
   - EVAP Vent Solenoid Valve Control Circuit High Voltage Test Status
   - **If Malfunction is displayed**

     Refer to Circuit/System Testing

   - **If Malfunction is not displayed**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing

   - **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the Q13 Evaporative Emission Vent Solenoid Valve, Ignition ON,
2. Verify that a test lamp illuminates between the B+ circuit terminal A or 2 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF, remove the test lamp.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF, remove the test lamp.
2. Test for infinite resistance between the B+ circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, test all components connected to the B+ circuit for a short and replace as necessary.

- **If the test lamp illuminates**

3. Verify that a test lamp does not illuminate between the B+ circuit terminal A or 2 and the control circuit terminal B or 1.

- **If the test lamp illuminates**

1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the control circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the K20 Engine Control Module.

- **If the test lamp does not illuminate**

4. Remove the test lamp.
5. Verify the scan tool EVAP Vent Solenoid Valve Control Circuit High Voltage Test Status parameter is OK when commanding the EVAP Vent Solenoid Valve to ON (Not Venting) with a scan tool.

- **If OK is not displayed**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, Ignition ON.
2. Test for less than 1 V between the control circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K20 Engine Control Module.

- **If OK is displayed**

6. Install a 3 A fused jumper wire between the control circuit terminal B or 1 and the B+ circuit terminal A or 2.
7. Verify the scan tool EVAP Vent Solenoid Valve Control Circuit High Voltage Test Status parameter is Malfunction when commanding the EVAP Vent Solenoid Valve to ON (Not Venting) with a scan tool.

- **If Malfunction is not displayed**

1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module.
2. Test for less than 2 Ω in the control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω replace the K20 Engine Control Module.

- **If Malfunction is displayed**

8. Test or replace the Q13 Evaporative Emission Vent Solenoid Valve.

Component Testing

1. Ignition OFF, disconnect the harness connector at the Q13 Evaporative Emission Vent Solenoid Valve.
2. Test for 10-30 Ω between the control terminal B or 1 and the B+ circuit terminal A or 2.

- **If not between 10-30 Ω**

  Replace the Q13 Evaporative Emission Vent Solenoid Valve.

- **If between 10-30 Ω**

3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Evaporative Emission Canister Vent Solenoid Valve Replacement**
- **Control Module References** for ECM replacement, programming and setup

DTC P0451-P0454: FUEL TANK PRESSURE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Fuel Tank Pressure Sensor Voltage

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Ignition ON, Engine OFF **Parameter Normal Range:** 1.3-1.7 V			
5 V Reference	0 V	0 V	4.2-5 V
Signal	0 V	0 V	5 V
Low Reference	-	4.96 V	-

Circuit/System Description

The fuel tank pressure sensor measures vapor pressure or vacuum in the evaporative emission (EVAP) system. The engine control module (ECM) supplies a 5 V reference and a low reference circuit to the fuel tank pressure sensor. The fuel tank pressure sensor signal voltage varies depending on EVAP system pressure or vacuum. The controller also uses this fuel tank pressure signal to determine atmospheric pressure for use in the engine-off small leak test, DTC P0442. Before using this signal as an atmospheric reference it must first be re-zeroed.

Conditions for Running the DTC

P0451

- DTC P0451 runs only when the engine-off natural vacuum small leak test, P0442, executes.
- The number of times this test runs can range from 0-2 per engine-off period. The length of the test can be up to 10 min.

P0452 and P0453

DTC P0452 and P0453 run continuously when the ignition is ON.

P0454

- DTC P0454 runs only when the engine-off natural vacuum small leak test, P0442, executes.
- This test can run once per engine-off period. The length of the test can be up to 10 min.
- A refueling event is not detected. A refueling event is confirmed if the fuel level has a persistent change of 10% for 30 s during a 10 min refueling rationality test.

Conditions for Setting the DTC

P0451

This DTC will set if the controller is unable to re-zero the fuel tank pressure sensor voltage within a calibrated range during the engine-off small leak test, P0442.

P0452

The fuel tank pressure sensor voltage is less than 0.15 V for more than 10 s.

P0453

The fuel tank pressure sensor voltage is more than 4.9 V for more than 10 s.

P0454

If, during the engine-off natural vacuum small leak test, P0442, the ECM detects an abrupt fuel tank pressure signal change, other than a refueling event, this DTC will set. An abrupt change is defined as a change of greater than 0.45 in H2O in the span of 1 s but less than 1 in H2O in 12.5 ms. This test must fail twice to set this DTC.

Action Taken When the DTC Sets

- DTCs P0451 and P0454 are Type A DTCs.
- DTCs P0452 and P0453 are Type B DTCs.

Conditions for Clearing the MIL/DTC

- DTCs P0451 and P0454 are Type A DTCs.
- DTCs P0452 and P0453 are Type B DTCs.

Diagnostic Aids

P0451 and P0454

- A restriction in the EVAP canister or vent lines could prevent fuel vapor pressure from bleeding off fast enough. If the vent system cannot bleed off pressure fast enough, the re-zero procedure may not complete successfully, which could cause this code to set.
- Ensure that the reference port on the fuel tank pressure sensor is unobstructed.
- A fuel tank pressure sensor that is skewed or does not have a linear transition from low to high may cause this code to set. Scan tool output controls, snapshot, and plot functions can help detect erratic sensor response. To test the sensor signal under vacuum conditions, use the Quick Snapshot and the Purge/Seal functions to capture data while commanding purge to 20%, then plot or review the data to look for erratic sensor operation. A similar test can be done for the pressure side of the sensor operation by applying pressure with the **GE 41413-A** while taking a snapshot or reviewing stored data.

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Special Tools

- **GE 41413-A** Evaporative Emission System Tester (EEST)
- **GE 41415-60** Engine Induction System Leak Test Adapter/Capless Fuel Fill Adapter

For equivalent regional tools, refer to **Special Tools (Diagnostic Tools)** **Special Tools (Repair Tools)**

Circuit/System Verification

1. Remove the fuel cap or install GE 41415-60 for capless fuel fill vehicles.
2. Ignition ON, engine OFF.
3. Verify the scan tool Fuel Tank Pressure Sensor parameter is between 1.3 and 1.7 V.
    - **If not between 1.3-1.7 V**

      Refer to Circuit/System Testing

    - **If between 1.3-1.7 V**
4. All OK.

Circuit/System Testing

1. Ignition OFF, all vehicle systems OFF. Disconnect the harness connector at the B150 Fuel Tank Pressure Sensor. This may take up to 2 min, for all vehicle systems to power down. .
2. Test for less than 5 Ω of resistance between the low reference circuit terminal 2 and ground.

- **If 5 Ω or greater**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for less than 2 Ω in the low reference circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K20 Engine Control Module.

- **If less than 5 Ω**

3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 3 and ground.
    - **If less than 4.8 V**

    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.

    - **If greater than 5.2 V**

    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, Ignition ON.
    2. Test for less than 1 V between the 5 V reference circuit and ground.

    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K20 Engine Control Module.
    - **If between 4.8-5.2 V**

5. Verify the scan tool Fuel Tank Pressure Sensor parameter is less than 0.2 V.
    - **If 0.2 V or greater**

    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, Ignition ON
    2. Test for less than 1 V between the signal circuit terminal 1 and ground.

    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K20 Engine Control Module.
    - **If less than 0.2 V**

6. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the 5 V reference circuit terminal 3.
7. Verify the scan tool Fuel Tank Pressure Sensor parameter is greater than 4.7 V.
    - **If 4.7 V or less**

    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the signal circuit terminal 1 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω, replace the K20 Engine Control Module.
- **If greater than 4.7 V**

8. Test or replace the B150 Fuel Tank Pressure Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Fuel Tank Pressure Sensor Replacement (E-85)** **Fuel Tank Pressure Sensor Replacement (E-10)**

DTC P0455: EVAPORATIVE EMISSION (EVAP) SYSTEM LARGE LEAK DETECTED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0455

Evaporative Emission (EVAP) System Large Leak Detected

Circuit/System Description

The engine control module (ECM) tests the evaporative emission (EVAP) system for a large leak or restrictions to the purge path in the EVAP system. When the enabling criteria has been met, the ECM commands the EVAP vent solenoid valve and purge solenoid valve ON, allowing vacuum into the EVAP system. The ECM monitors the fuel tank pressure sensor voltage to verify that the system is able to reach a calibrated level of vacuum before a calibrated amount of purge volume has passed through the system.

Conditions for Running the DTC

- DTCs P0068, P00C8, P00C9, P00CA, P0090, P0091, P0092, P0106, P0107, P0108, P0111, P0112, P0113, P0114 P0116, P0117, P0118, P0122, P0123, P0125, P0128, P0191, P0192, P0193, P0222, P0223, P06A3, P06DB, P06DE, P0A1D, P160D, P160E P1682, P16A0, P16A1, P16A2, P16F3, P1104, P127A, P127C, P127D, P15F2, P0443, P0449, P0452, P0453, P0502, P0503, P0601, P0604, P0606, P0697, P2100, P2101, P2102, P2103, P2122, P2123, P2127, P2128, P2135, P2138, P215B, P2176, P228C, P228D, U0073, U0074, U0293 or U1817 are not set.
- The ignition voltage is between 11-32 V.
- The barometric pressure (BARO) is greater than 70 kPa.
- The fuel level is between 10-90%.
- The cold startup engine coolant temperature (ECT) and the startup intake air temperature (IAT) are within 8Â°C (14Â°F).
- The startup engine coolant temperature (ECT) is less than 35Â°C (95Â°F).

- The startup intake air temperature (IAT) is between 4-34Â°C (39-93Â°F).
- DTC P0455 runs once per cold start, shortly after purge is enabled followed by vent system performance test P0446.

Conditions for Setting the DTC

- The EVAP system is not able to achieve or maintain a calibrated level of vacuum less than -2.74 kPa (-11 in H20) before a calibrated amount of purge volume has passed through the system.
- After setting the DTC for the first time, 2 L (0.5 gal) of fuel must be consumed before setting the DTC for the second time.

NOTE: **The weak vacuum follow-up test and Driver Information Center message is disabled on capless fuel fill systems.**

-
- With a DTC P0455 detected a weak vacuum follow-up test (fuel cap replacement test) will run and passes if tank vacuum is greater than 2.74 kPa (11 in H20). This test will run for a maximum of 22 min. This test runs until it passes.

Action Taken When the DTC Sets

DTC P0455 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0455 is a Type B DTC.

Diagnostic Aids

- Inspect for a loose, missing, damaged, or incorrect fuel fill cap.
- On capless fuel fill systems inspect for damaged seals on the flapper valves.
- Inspect for a damaged fuel filler neck and seal surface.
- A blockage or restriction in the EVAP Purge Solenoid Valve, purge pipe, EVAP canister, or vapor pipe, can cause this DTC to set.
- The EVAP system can be filled with smoke more quickly and completely by opening the system opposite the end where the smoke is injected. For example, when injecting smoke at the service port remove the fuel fill cap, or temporarily leave the vent open, until smoke is observed, then close the system and continue testing. If using a fuel cap or capless fuel fill adapter at the filler neck, use the **J 41413-VLV** at the service port to allow the system to fill faster.
- To help locate intermittent leaks using the **GE 41413-A** , move all EVAP components while observing smoke with the **GE 41413-SPT** .
- Individual components can be isolated and tested using adapters in the **J 41413-300** .
- When servicing the EVAP system, test pressure must not exceed 13 in H20 (0.5 PSI) as pressure in excess of this could cause system components to perform inaccurately.
- A condition may exist where a leak in the EVAP system only exists under a vacuum condition. This type of leak may be detected by using the scan tool Purge/Seal function to create a vacuum in the EVAP system and then observe the Fuel Tank Pressure Sensor parameter for vacuum decay.

Circuit/System Testing

IMPORTANT:
- Larger volume fuel tanks and/or those with lower fuel levels may require several minutes

for the floating indicator to stabilize or produce smoke from a leak.

- Refer to the **GE 41413-A** operation manual for detailed instructions in Evaporative Emission System Diagnosis.

1. Disconnect the purge tube at the quick connector on the EVAP canister side of the Q12 Evaporative Emission Purge Solenoid Valve and install the **CH 48096** .
2. Connect the **GE 41413-A** to the vehicle EVAP service access port adapter.
3. Command the EVAP Purge/Seal function to System Seal or Not Venting with a scan tool to seal the EVAP system.
4. Verify that there is no leak in the EVAP system using the flow meter on the **GE 41413-A** , calibrated to 0.51 mm (0.020 in).
   - **If a leak is detected**
   1. Apply smoke to the EVAP system at the service access port adapter with the **GE 41413-A** .
   2. Locate the leak using the **GE 41413-SPT** .
      - When the leak is located, repair or replace the affected component as necessary.
   - **If no leak detected**

NOTE: **The steps below test for a restriction in the purge path.**

5. Connect the **GE 41413-A** nitrogen/smoke hose to the **J 41413-311** .
6. Disconnect the hose at the fuel cap end of the **GE 41415-30** and connect to the **J 41413-311** . Capless fuel fill vehicles will need to use **GE 41415-60** connected to **GE 41413-A** .
7. Install the **GE 41415-30** , filler neck end only, to the vehicle.
8. Engine idling, command the Purge/Seal function to System Seal or Not Venting with a scan tool to seal the system.
9. Command the EVAP Purge Solenoid Valve to 30% with a scan tool.
10. Verify the vacuum/pressure gauge on the **GE 41413-A** and the scan tool Fuel Tank Pressure Sensor parameter both show vacuum.
    - **If the vacuum/pressure gauge shows vacuum but the Fuel Tank Pressure Sensor parameter does not show vacuum**

      Replace the B150 Fuel Tank Pressure Sensor.

    - **If both do not show vacuum**

      Repair the restriction in the purge path.

    - **If both show vacuum**
11. Verify that the Fuel Tank Pressure Sensor parameter increases to greater than 3.2 V, and the pressure values are similar between the scan tool Fuel Tank Pressure Sensor and the vacuum/pressure gauge on the **GE 41413-A** .
    - **If not within the specified range**

Replace the B150 Fuel Tank Pressure Sensor.

- **If within the specified range**

12. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for ECM replacement, programming and setup
- **Fuel Tank Pressure Sensor Replacement (E-85)** **Fuel Tank Pressure Sensor Replacement (E-10)**

DTC P0496: EVAPORATIVE EMISSION (EVAP) SYSTEM FLOW DURING NON-PURGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0496

Evaporative Emission (EVAP) System Flow During Non-Purge

Circuit/System Description

This DTC tests for undesired intake manifold vacuum flow to the evaporative emission (EVAP) system. The engine control module (ECM) seals the EVAP system by commanding the EVAP purge solenoid valve OFF and the vent solenoid valve ON. The ECM monitors the fuel tank pressure (FTP) sensor to determine if a vacuum is being drawn on the EVAP system. If vacuum in the EVAP system is greater than a predetermined value within a predetermined time, this DTC sets.

The following table illustrates the relationship between the ON and OFF states, and the Open or Closed states of the EVAP purge and vent solenoid valves.

ECM Command	EVAP Purge Solenoid Valve	EVAP Vent Solenoid Valve
ON	Open	Closed
OFF	Closed	Open

Conditions for Running the DTC

- DTCs P0068, P00C8, P00C9, P00CA, P0090, P0091, P0092, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0122, P0123, P0125, P0128, P0191, P0192, P0193, P0222, P0223, P0601, P0604, P0606, P0697, P06A3, P06DB, P06DE, P0A1D, P1104, P127A, P127C, P127D, P15F2, P160D, P160E, P1682, P16A0, P16A1, P16A2, P16F3, P0443, P0449, P0452, P0453, P0454, P0502, P0503, P0722, P0723, P2100, P2101, P2102, P2103, P2122, P2123, P2127, P2128, P2135, P2138, P215B, P2176, P228C, P228D, U0073, U0074, U0293, U1817, are not set.
- The ignition voltage is between 11-32 V.

- The engine OFF time is greater than 48 min,
- The barometric pressure (BARO) is greater than 70 kPa.
- The fuel level is between 10-90%.
- The startup engine coolant temperature (ECT) is less than 35Â°C (95Â°F).
- The startup intake air temperature (IAT) is between 4-34Â°C (39-93Â°F).
- DTC P0496 runs once per cold start, for up to 17 min, when the above conditions are met.This test will run with the purge valve and the vent valve closed.

Conditions for Setting the DTC

The ECM detects greater than 10 in H2O vacuum for 5 s during a non-purge condition.

Action Taken When the DTC Sets

DTC P0496 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0496 is a Type B DTC.

Diagnostic Aids

An intermittent condition could be caused by:

- An improperly installed or damaged EVAP Purge Solenoid Valve
- A temporary blockage or restriction in the EVAP Purge Solenoid Valve

Circuit/System Verification

1. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
2. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing

   - **If the DTC does not set**
3. All OK

Circuit/System Testing

1. Ignition ON, engine OFF.
2. Command the EVAP Purge/Seal function to System Seal or Not Venting with a scan tool to seal the EVAP system.
3. Start the engine.
4. Observe the Fuel Tank Pressure Sensor with a scan tool. The Fuel Tank Pressure Sensor parameter should be less than 1.7 V after 90 s.
   - **If not within specifications**

     Replace the Q12 Evaporative Emission Purge Solenoid Valve

   - **Within Specifications**
5. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Evaporative Emission Canister Purge Solenoid Valve Replacement

DTC P0506 OR P0507: IDLE SPEED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0506

Idle Speed Low

DTC P0507

Idle Speed High

Circuit/System Description

The throttle actuator control (TAC) motor is a DC motor that is part of the throttle body assembly. The TAC motor drives the throttle valve. The engine control module (ECM) controls the TAC motor based on throttle position sensor input. The idle speed is controlled by the ECM based on various inputs. The ECM commands the TAC motor to open or close the throttle valve in order to maintain the desired idle speed.

Conditions for Running the DTC

- DTCs P0068, P0101, P0102, P0103, P0112, P0113, P0117, P0118, P0121, P0122, P0123, P0171, P0172, P0174, P0175, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268. P0270, P0271, P0273, P0274, P0276, P0277, P0300-P0306, P0351-P0356, P0461-P0464, P0496, P0627, P0628, P0629, P0722, P1516, P2066-P2068, are not set.
- The barometric pressure (BARO) is greater than 70 kPa.
- The engine coolant temperature (ECT) is greater than 60Â°C (140Â°F).
- The engine run time is greater than 60 s.
- The ignition voltage is between 11-32 V.
- The transmission is not changing gears.
- The torque converter clutch (TCC) is not changing states.
- The intake air temperature (IAT) is warmer than -20Â°C (-4Â°F).
- The vehicle speed is less than 3 km/h (2 mph).
- The commanded engine speed is steady within 25 RPM.
- The engine is idling for greater than 5 s.
- The DTCs run when the above conditions are met.

Conditions for Setting the DTC

P0506

The actual engine speed is 94 RPM less than the desired idle speed for 10 s.

P0507

The actual engine speed is 188 RPM greater than the desired idle speed for 10 s.

Action Taken When the DTC Sets

DTCs P0506 and P0507 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0506 and P0507 are Type B DTCs.

Circuit/System Verification

1. Ignition ON.
2. Verify there are no other DTCs set.
    - **If any other DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.

    - **If no other DTCs are set**
3. Verify the scan tool Throttle Body Idle Airflow Compensation parameter is less than 90 %.
    - **If 90 % or greater**

      Refer to **Throttle Body Inspection and Cleaning** .

    - **If less than 90 %**

4. Engine Idling at the normal operating temperature.
5. Verify the actual Engine Speed is not 100 RPM less than the Desired Idle Speed.
    - **If 100 RPM less than the Desired Idle Speed**

      Refer to Circuit/System Testing.

    - **If 100 RPM greater than the Desired Idle Speed**
6. Verify the actual Engine Speed is not 200 RPM greater than the Desired Idle Speed.
    - **If 200 RPM greater than the Desired Idle Speed**

      Refer to Circuit/System Testing.

    - **If 200 RPM less than the Desired Idle Speed**
7. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
8. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
9. All OK

Circuit/System Testing

P0506

1. Verify the conditions listed below do not exist.
    - Restricted exhaust
    - Mechanical conditions that limits engine speed
    - Parasitic load on the engine-For example, a transmission condition, a belt driven accessory condition.
    - **If a condition is found**

      Repair as necessary.

    - **If a condition is not found**
2. All OK.

P0507

1. Verify the conditions listed below do not exist.
    - Vacuum leaks
    - A throttle valve that does not close correctly
    - Verify the correct operation of the crankcase ventilation system. Inspect for the conditions listed below:

- Improper routing of the positive crankcase ventilation (PCV) system
- Vacuum leaks in the PCV system-Refer to **Crankcase Ventilation System Inspection/Diagnosis** .

- **If a condition is found**

  Repair as necessary.

- **If a condition is not found**

2. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Throttle Body Assembly Replacement

DTC P050D: COLD START ROUGH IDLE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P050D

Cold Start Rough Idle

Circuit/System Description

During a cold start, the Engine Control Module (ECM) commands dual-pulse mode during Open Loop operation to improve cold start emissions. In dual-pulse mode, the Fuel Injectors are energized twice during each injection event. As with misfire diagnosis, in dual-pulse mode the ECM monitors the crankshaft position sensor and the camshaft position sensors to calculate crankshaft rotation speed. In normal operation, optimum fuel delivery during dual-pulse mode produces a steady crankshaft rotation speed. If the variations exceed a calibrated value, the code will be set.

Conditions for Running the DTC

- DTCs P0010, P0011, P0013, P0014, P0016, P0017, P0018, P0019, P0020, P0021, P0023, P0024, P0089, P0090-P0092, P00C6, P00C8, P00C9, P00CA, P0101-P0103, P0106-P0108, P0112-P0114, P0116-P0118, P0121-P0123, P0128, P0192, P0193, P0201-P0206, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P0315, P0335, P0336, P0351-P0356, P0627-P0629, P069E, P0716, P0717, P0722, P0723, P0850-P0852, P1248, P1249, P124A, P124B, P124C, P124D, P1258, P135A, P135B, P150C, P163A, P1762, P1763, P1915, P2122, P2123, P2127, P2128, P2135, P2138, P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, P216F, P228C, P228D, U0109 are not set.
- The catalyst temperature is less than 100Â°C (212Â°F).

- The engine coolant temperature is warmer than 10Â°C (14Â°F).
- The barometric pressure is greater than 70 kPa.
- The engine speed is between 450-1800 RPM.
- The engine is running and a cold start has been detected.
- DTC P050D runs once per cold start.

Conditions for Setting the DTC

This DTC will set if the Engine Control Module detects variations in crankshaft rotation speed caused by the lack of adequate fuel delivery during dual-pulse mode.

Action Taken When the DTC Sets

- DTC P050D is a Type B DTC.
- The Engine Control Module disables dual pulse mode and energizes the fuel injector as it would for a warm engine.

Conditions for Clearing the DTC

DTC P050D is a Type B DTC.

Diagnostic Aids

- This DTC may be set with a misfire DTC, however the existence of this DTC is a higher priority and indicates the condition to diagnose is related to fuel and/or injectors, not the ignition/spark system.
- A restricted Fuel Injector may cause this DTC to set.
- High resistance in the circuits of the Fuel Injectors could set this DTC without setting a Fuel Injector DTC. Test the Fuel Injector circuits of the affected cylinders for a high resistance if you suspect a condition.
- A drop in system voltage during cold start may set this DTC.

Circuit/System Testing

NOTE: **Circuit/System Testing requires cold start. Do not start vehicle prior to connecting scan tool and preparing to evaluate the condition during engine crank.**

1. Start the engine and observe the Cylinder 1-6 Current Misfire Counters during the first 500 engine cycles. The Cylinder 1-6 Current Misfire Counters should not be incrementing.
    - **If the misfire counters are incrementing on one or more cylinders**
    1. Ignition OFF.
    2. Verify that the following conditions do not exist:
        - Fuel pressure that is too low or too high-Refer to **Fuel System Diagnosis**.
        - Contaminated fuel-Refer to **Alcohol/Contaminants-in-Fuel Diagnosis**.
        - If a condition exist, repair as necessary.
        - If none of the conditions exist, replace the Q17 Fuel Injectors as indicated by high misfire counts.
    - **If the misfire counters are not incrementing**
2. All OK.

Repair Instructions

- **Fuel Injection Fuel Rail Assembly Replacement - Bank 1**
- **Fuel Injection Fuel Rail Assembly Replacement - Bank 2**

Repair Verification

NOTE: **Repair Verification requires cold start.**

1. Ignition ON, engine OFF, clear the DTCs with a scan tool.
2. Start the engine.
3. Verify the DTC does not reset.

DTC P05CC-P05CF: COLD START INTAKE CAMSHAFT POSITION SYSTEM

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P05CC

Cold Start Intake Camshaft Position System Performance Bank 1

DTC P05CD

Cold Start Intake Camshaft Position System Performance Bank 2

DTC P05CE

Cold Start Exhaust Camshaft Position System Performance Bank 1

DTC P05CF

Cold Start Exhaust Camshaft Position System Performance Bank 2

Circuit/System Description

The camshaft position actuator system enables the Engine Control Module (ECM) to change the timing of the camshafts while the engine is operating. The camshaft position actuator solenoid signal from the ECM is Pulse Width Modulated (PWM). The ECM controls the camshaft position actuator solenoid duty cycle by controlling the amount of solenoid On time. The camshaft position actuator solenoid controls the advance or the retard of each camshaft. The camshaft position actuator solenoid controls the oil flow that applies the pressure to advance or retard the camshafts.

Conditions for Running the DTC

- DTC P0010, P0016, P0017, P0018, P0019, P0335, P0336, P0340, P0341, P0345, P0346, P0365, P0366, P0390 or P0391, is not set.
- The ignition voltage is greater than 11 V.
- The engine is running.
- The desired camshaft position is greater than 0 degrees.
- The desired camshaft position is not changing greater than 4.5Â° for at least 1 s.
- Both of the desired and actual camshaft position actuator values cannot be greater than 20 degrees or less than 5 degrees.
- DTCs P05CC, P05CD, P05CE, and P05CF run continuously once the above conditions are met.

Conditions for Setting the DTC

The ECM detects the difference between the desired and actual camshaft position angle is greater than 4.5 degrees for greater 1 s.

Action Taken When the DTC Sets

DTCs P05CC, P05CD, P05CE, and P05CF are type B DTCs.

Conditions for Clearing the DTC

DTCs P05CC, P05CD, P05CE, and P05CF are type B DTCs.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Diagnostic Aids

- Verify the correct engine oil type and viscosity were used during recent oil changes.
- The engine oil condition has a major impact on the camshaft actuator system.
- A low oil level condition may set this DTC. The engine may require an oil change. Inquire with the customer when the last oil change was performed. You may also monitor the scan tool Engine Oil Life parameter. Advise the customer an oil change may be required.
- Inspect the engine for any recent engine mechanical repairs. An incorrectly installed camshaft, camshaft actuator, or timing chain can cause this DTC to set.

Circuit/System Verification

NOTE:

- **Correct engine oil type and viscosity are critical to the performance of the camshaft position actuator system.**
- **The engine oil level and the oil pressure are critical to the correct operation of the camshaft position actuator system. Verify that the engine has the correct oil level and the correct oil pressure before continuing with this diagnostic.**

- **The engine oil condition has a major impact on the camshaft actuator system. Debris in the oil can interfere with the camshaft position actuator solenoid and the mechanical camshaft actuator operation. Inspect for dirty or degraded crankcase oil. The engine may require an oil change. Inquire with the customer when the last oil change was performed. You may also monitor the scan tool Engine Oil Life Remaining parameter. Advise the customer an oil change may be required.**

1. Ignition On.
2. Verify the engine has the correct oil level and the correct oil pressure.
   - **If the oil level and the oil pressure are not correct**

     Repair as necessary

   - **If the oil level and the oil pressure are correct**

NOTE: **If a crankshaft or camshaft position sensor DTC is set, the scan tool Camshaft Position Actuator output control will not function.**

3. Verify DTC P0010, P0016, P0017, P0018, P0019, P0335, P0336, P0340, P0341, P0345, P0346, P0365, P0366,P0390 or P0391, is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.

   - **If none of the DTCs are set**
4. Engine idling at normal operating temperature.
5. Verify the scan tool parameters are less than 2Â° in each of the commanded states when commanding the Camshaft Position Actuator from 0Â° to maximum range and back to 0Â° with the scan tool.
   - Intake Camshaft Position Variance Bank 1
   - Exhaust Camshaft Position Variance Bank 1
   - Intake Camshaft Position Variance Bank 2
   - Exhaust Camshaft Position Variance Bank 2
   - **If 2Â° or greater**

     Refer to Circuit/System Testing.

   - **If less than 2Â°**
6. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
   - **If any DTC sets**

     Refer to Circuit/System Testing.

- **If a DTCs does not set**

7. All OK.

Circuit/System Testing

NOTE: **If debris is found on CMP screens, clean the screens and reinspect for damage. If the screens are not damaged, reinstall in the engine.**

1. Remove the Q6 Camshaft Position Actuator Solenoid Valve and verify the following conditions do not exist:
   - Torn, mis-positioned, or missing screens at the CMP actuator solenoid
   - Engine oil leak between the oil sealing lands of the CMP actuator solenoid-Inspect the lands of the CMP actuator solenoid for nicks.
   - Oil seepage at the CMP actuator solenoid connector
   - **If a condition is found**

     Replace the Q6 Camshaft Position Actuator Solenoid Valve.

   - **If no condition is found**

NOTE: **After swapping the solenoids, install jumper wires to the appropriate terminals of the harness connectors and the solenoids.**

2. Ignition Off, swap the intake or exhaust Q6 Camshaft Position Actuator Solenoid Valve with the Q6 Camshaft Position Actuator Solenoid Valve that is operating correctly.
3. Engine idling.
4. Verify the scan tool Camshaft Position Variance parameter is less than 2Â° in each of the commanded states when commanding the Camshaft Position Actuator from 0Â° to maximum range and back to 0Â° with a scan tool.
   - **If 2Â° or greater**

     Replace the mechanical camshaft position actuator.

   - **If less than 2Â°**
5. Test or replace the Q6 Camshaft Position Actuator Solenoid Valve.

Component Testing

1. Ignition Off, disconnect the harness connector at the appropriate Q6 Camshaft Position Actuator Solenoid Valve.
2. Test for 5-12 Ω between the control circuit terminal 1 and the low reference circuit terminal 2 of the Q6 Camshaft Position Actuator Solenoid Valve.
   - **If not between the specified values**

     Replace the Q6 Camshaft Position Actuator Solenoid Valve.

   - **If between the specified values**

3. Test for infinite resistance between each terminal and the Q6 Camshaft Position Actuator Solenoid Valve housing.
    - **If less than infinite resistance**

      Replace the Q6 Camshaft Position Actuator Solenoid Valve.

    - **If infinite resistance**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Camshaft Position Actuator Replacement - Bank 1**
- **Camshaft Position Actuator Replacement - Bank 2**
- **Camshaft Position Actuator Solenoid Valve Solenoid Replacement - Bank 1 (Right Side) Intake**

5 V Reference	0 V	0 V	-
Signal	0 V	0 V	5 V
Low Reference	-	5 V	-

Circuit/System Description

The brake pedal position (BPP) sensor is part of the engine brake pedal override feature. The engine control module (ECM) continuously monitors the vehicle speed and the position of the brake pedal. These two main inputs, along with other ECM inputs are used to determine if the vehicle is decelerating at the proper speed and rate with the brake pedal applied. When the engine brake pedal override system is active, the ECM reduces engine torque to assist in reducing vehicle speed.

The BPP sensor is a six wire sensor, and is part of a dual brake position sensor. One BPP Sensor is used for the stop lamps and the other BPP Sensor is used for the engine brake pedal override feature. The BPP Sensor for engine brake pedal override communicates with the ECM. The ECM supplies a 5 V reference circuit, low reference circuit, and signal circuit to the BPP sensor. The BPP sensor sends a voltage signal to the ECM on the signal circuit. The voltage on the signal circuit will vary from a voltage greater than 0.25 V when the brake pedal is released to a voltage less than 4.75 V when the brake pedal is fully applied.

For information on the Stop Lamps side of the BPP Sensor, refer to **Exterior Lighting Systems Description and Operation** .

Conditions for Running the DTC

P057B

- DTCs P057C, or P057D are not set.
- Ignition voltage is greater than 10 V.
- Shift lever has been in Park at least once during key ON.
- Shift lever is not in Park.
- Vehicle speed is greater than 8 Km/h (5 mph).
- Accelerator Pedal Position is less than 5 %.
- DTC runs once per key cycle when above conditions are met.

P057C or P057D

- Ignition voltage is greater than 10 V.
- DTC runs continuously when above condition is met.

Conditions for Setting the DTC

P057B

ECM detects the BPP sensor signal is stuck in a range for greater than 1 s.

P057C

ECM detects the BPP sensor voltage is less than 0.25 V greater than 1 s.

P057D

ECM detects the BPP sensor voltage is greater than 4.75 V greater than 1 s.

Action Taken When the DTC Sets

- P057B, P057C, and P057D are Type A DTCs.
- Brake Pedal Position Sensor parameter defaults to 0 %.

Conditions for Clearing the DTC

P057B, P057C, and P057D are Type A DTCs

Circuit/System Verification

NOTE: **The Brake Pedal Position sensor scan tool data is located in the ECM automatic transmission data list.**

1. Ignition ON.
2. Verify DTC P0641, P0651, P0697, or P06A3 is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If none of the DTCs are set**
3. Transmission in Park, and service brake pedal released.
4. Verify the scan tool Brake Pedal Position Sensor parameter in the ECM displays greater than 0.25 V.
   - **If 0.25 V or less**

     Refer to Circuit/System Testing.

   - **If greater than 0.25 V**
5. Verify the scan tool Brake Pedal Position Sensor parameter voltage changes as the brake pedal is applied and displays less than 4.75 V when the brake pedal is fully applied.
   - **If the voltage does not change, or is greater than 4.74 V**

     Refer to Circuit/System Testing.

   - **If the voltage changes and less than 4.75 V**
6. Verify the scan tool Brake Pedal Position Sensor Learned Release Position parameter is within 0.1 V of the Brake Pedal Position Sensor parameter when the brake pedal is fully released.
   - **If difference is greater than 0.1 V**

     Perform the **Brake Pedal Position Sensor Learn** .

   - **If difference is 0.1 V or less**
7. Verify the Brake Pedal Position Sensor parameter transitions smoothly without any spikes or dropouts when slowly applying and releasing the brake pedal.
   - **If parameter does not transition smoothly or has spikes or dropouts**

     Refer to Circuit/System Testing.

   - **If parameter transitions smoothly and there are no spikes or dropouts**
8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
9. Verify the DTC does not set.

- **If the DTC sets**

  Refer to Circuit/System Testing.

- **If the DTC does not set**

10. All OK.

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification first.**

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B22 Brake Pedal Position Sensor. It may take up to 2 minutes for all vehicle systems to power down.

NOTE: **All terminal references are for the vehicle harness brake pedal position sensor connector.**

2. Test for less than 10 Ω between the low reference circuit terminal 5 and ground.
   - **If 10 Ω or greater**
   1. Disconnect the X1 harness connector at the K20 Engine Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K20 Engine Control Module.
   - **If less than 10 Ω**
3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 6 and ground.
   - **If less than 4.8 V**
   1. Ignition OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
   2. Test for infinite resistance between the 5 V reference circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance.
   3. Test for less than 2 Ω in the 5 V reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K20 Engine Control Module.
   - **If greater than 5.2 V**
   1. Ignition OFF, disconnect the X1 harness connector at the K20 Engine Control Module, ignition ON.
   2. Test for less than 1 V between the 5 V reference circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K20 Engine Control Module.
   - **If between 4.8-5.2 V**
5. Verify the scan tool Brake Pedal Position Sensor parameter is less than 0.25 V.

- **If 0.25 V or greater**

1. Ignition OFF, disconnect the X1 harness connector at the K20 Engine Control Module, ignition ON.
2. Test for less than 0.25 V between the signal circuit terminal 4 and ground.
    - If 0.25 V or greater, repair the short to voltage on the circuit.
    - If less than 0.25 V, replace the K20 Engine Control Module.

- **If less than 0.25 V**

6. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the 5 V reference circuit terminal 6.
7. Verify the scan tool Brake Pedal Position Sensor parameter is greater than 4.8 V.
    - **If 4.8 V or less**

    1. Ignition OFF, remove the jumper wire, and disconnect the X1 harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the signal circuit terminal 4 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance.
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.

    - **If greater than 4.8 V**

8. Replace the B22 Brake Pedal Position Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Brake Pedal Position Sensor Replacement**
- Perform the **Brake Pedal Position Sensor Learn** following the replacement of the ECM or BPP sensor, or any repair that effects the BPP sensor alignment.
- **Control Module References** for Engine Control Module replacement, programming and setup.

DTC P0601-P0604, P0606, P062B, P062F, P0630, P16F3, OR P262B: CONTROL MODULE MEMORY/CONTROL MODULE PROCESSOR/CONTROL MODULE POWER OFF TIMER (ECM)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each of the diagnostic category.

Control Module Power Off Timer Performance

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM). This diagnostic also addresses if the ECM is not programmed.

Conditions for Running the DTCs

P0601, P0602, P0630

These DTCs run continuously when the ignition is ON.

P0603, P062F

These DTCs run during ECM power up.

P0604

DTC P0604 runs continuously when the ignition is ON for greater than 30 s.

P0606, P062B

- The ignition is ON.
- The system voltage is greater than 11 V.
- These DTCs run continuously when the above conditions are met.

P16F3

- The engine speed is greater than 550 RPM.
- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P2227, P2228, P2229, or P2230 are not set.
- DTC P16F3 runs continuously when the above conditions are met.

P262B

DTC P262B runs during ECM power down.

Conditions for Setting the DTCs

The ECM detects an internal failure or incomplete programming for more than 10 s.

Actions Taken When the DTC Sets

- DTCs P0601, P0602, P0603, P0604, P0606, P062B, P0630, and P16F3 are Type A DTCs.
- DTCs P062F and P262B are Type B DTCs.

Conditions for Clearing the MIL/DTC

- DTCs P0601, P0602, P0603, P0604, P0606, P062B, P0630, and P16F3 are Type A DTCs.
- DTCs P062F and P262B are Type B DTCs.

Diagnostic Aids

Low voltage or a momentary loss of power or ground to the ECM may cause a DTC to set. Verify the following:

- The battery cables are clean and tight, and the battery is fully charged. Refer to **Battery Inspection/Test** .
- The ECM ground circuits do not have an open or high resistance.
- The ECM power circuits do not have an open, short to ground, or high resistance.

Circuit/System Verification

1. Ignition ON, clear the DTC information with a scan tool.
2. Verify no other DTCs are set.
    - **If any other DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.

    - **If no other DTCs are set**
3. Verify DTC P0602 or P0630 is not set.
    - **If any of the DTCs are set**
    1. Program the K20 Engine Control Module. Refer to **Control Module References** .
    2. Verify DTC P0602 or P0630 is not set.
        - If any of the DTCs are set, replace the K20 Engine Control Module.
        - If none of the DTCs are set
    3. All OK.
    - **If none of the DTCs are set**
4. Verify DTC P0601, P0603, P0604, P0606, P062B, P062F, P16F3, or P262B is not set.
    - **If any of the DTCs are set**

      Replace the K20 Engine Control Module.

    - **If none of the DTCs are set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P0628: FUEL PUMP ENABLE CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0628

Fuel Pump Enable Circuit Low Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Fuel Pump Enable	P0628, P069E	P069E	-	-

Circuit/System Description

The engine control module (ECM) provides ignition voltage to the chassis control module whenever the engine is cranking or running. The engine control module enables the chassis control module as long as the engine is cranking or running, and ignition system reference pulses are received. While this enable voltage is being received, the chassis control module supplies a varying voltage to the fuel tank fuel pump module in order to maintain the desired fuel line pressure.

Conditions for Running the DTC

- The engine speed is greater than 0 RPM.
- The ignition voltage is greater than 11 V.
- The DTCs run continuously when the conditions above are met.

Conditions for Setting the DTC

- The engine control module detects that the commanded state of the driver and the actual state of the control circuit do not match.
- The above condition is met for a minimum of 2.5 s.

Action Taken When the DTC Sets

DTC P0628 is a Type B DTC.

Conditions for Clearing the DTC

DTC P0628 is a Type B DTC.

Circuit/System Verification

1. Ignition ON.
2. Verify the parameters listed below display OK or Not Run when commanding the Fuel Pump Enable ON and OFF with a scan tool.
    - Fuel Pump Enable Circuit Low Voltage Test Status
    - Fuel Pump Enable Circuit Open Test Status
    - Fuel Pump Enable Circuit High Voltage Test Status
    - **If OK or Not Run are not displayed**

      Refer to Circuit/System Testing.

    - **If OK or Not Run are displayed**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Ignition OFF, all vehicle system OFF, disconnect the harness connector at the K38 Chassis Control Module. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 1 V between the K38 Chassis Control Module enable circuit terminal 13 and ground.
    - **If 1 V or greater**
    1. Disconnect the X1 harness connector at the K20 Engine Control Module.
    2. Test for less than 1 V between the K38 Chassis Control Module enable circuit terminal 13 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, test or replace the K20 Engine Control Module.
    - **If less than 1 V**
3. Ignition ON, command the Fuel Pump Enable ON with a scan tool.
4. Test for B+ on the enable circuit terminal 13 of the K38 Chassis Control Module.
    - **If less than B+**
    1. Disconnect the X1 harness connector at the K20 Engine Control Module.
    2. Test for infinite between the K38 Chassis Control Module enable circuit terminal 13 and ground.
        - If less than infinite, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω on the K38 Chassis Control Module enable circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the K20 Engine Control Module.
    - **If B+**
5. Test or replace the K38 Chassis Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for K20 Engine Control Module or K38 Chassis Control Module replacement, programming, and setup.

DTC P0641 OR P06A6: 5V REFERENCE (CHASSIS CONTROL MODULE)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0641

5V Reference Circuit

DTC P06A6

5V Reference 1 Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference	P018C, P0641, P06A6	P018C	P018D, P0641, P06A6	P06A6
Signal	P018C	P018B, P018C	P018D	P018B
Low Reference	-	P0641, P06A6	-	P06A6

Circuit/System Description

The fuel pressure sensor is located on the fuel line. The fuel pressure sensor monitors the fuel pressure in the fuel line. The chassis control module monitors the voltage signal from the fuel pressure sensor.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The chassis control module detects that the fuel pressure 5 V reference is above or below a predetermined voltage threshold.

Action Taken When the DTC Sets

DTCs P0641 and P06A6 are Type A DTCs.

Conditions for Clearing the DTC

DTCs P0641 and P06A6 are Type A DTCs.

Diagnostic Aids

Using the failure records data may help locate an intermittent condition. If you cannot duplicate the DTC, the information in the failure records can help determine how many miles since the DTC set. The fail counter and pass counter can help determine how many ignition cycles that the diagnostic test reported a pass and/or a fail.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B47 Fuel Pressure Sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If less than 10 Ω**
3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 3 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If greater than 5.2 V**
    1. Ignition OFF, disconnect the harness connector at the K38 Chassis Control Module, ignition ON.
    2. Test for less than 1 V between the 5 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K38 Chassis Control Module.
    - **If between 4.8-5.2 V**
5. Verify the scan tool Fuel Pressure Sensor Voltage parameter is less than 1 V.
    - **If 1 V or greater**

1. Ignition OFF, disconnect the harness connector at the K38 Chassis Control Module, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K38 Chassis Control Module.

- **If less than 1 V**

6. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the 5 V reference circuit terminal 3, wait 15 seconds.
7. Verify the scan tool Fuel Pressure Sensor Voltage parameter is greater than 4.8 V.

- **If 4.8 V or less**

1. Ignition OFF, disconnect the harness connector at the K38 Chassis Control Module.
2. Test for infinite resistance between the signal circuit terminal 1 and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K38 Chassis Control Module.

- **If greater than 4.8 V**

8. Test or replace the B47 Fuel Pressure Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for chassis control module replacement, programming and setup

DTC P0641, P0651, P0697, OR P06A3: 5 V REFERENCE (ECM)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0641

5 V Reference 1 Circuit

DTC P0651

5 V Reference 2 Circuit

DTC P0697

5 V Reference 3 Circuit

DTC P06A3

5 V Reference 4 Circuit

Circuit/System Description

The engine control module (ECM) has 4 internal 5 V reference circuits. Each internal reference circuit provides external 5 V reference circuits for more than one sensor. A short to ground or short to voltage on one external 5 V reference circuit can affect all the other components connected to the same internal 5 V reference circuit.

Conditions for Running the DTC

- Ignition voltage is greater than 6.4 V.
- DTCs P0641, P0651, P0697, and P06A3 run continuously when the above condition is met.

Conditions for Setting the DTC

The 5 V reference circuit voltage is greater or less than a predetermined threshold.

Action Taken When the DTC Sets

DTCs P0641, P0651, P0697, and P06A3 are Type A DTCs.

Conditions for Clearing the DTC

DTCs P0641, P0651, P0697, and P06A3 are Type A DTCs.

Diagnostic Aids

DTC P0641

The 5 V reference 1 circuit provides 5 V to the following sensors:

- Fuel tank pressure sensor
- Multifunction intake air sensor
- Fuel rail pressure sensor
- A/C refrigerant pressure sensor
- All four camshaft position sensors

DTC P0651

The 5 V reference 2 circuit provides 5 V to the following sensors:

- Crankshaft position sensor
- Brake pedal position sensor
- Both secondary air injection pump solenoid valves (if equipped)

DTC P0697

The 5 V reference 3 circuit provides 5 V to the following sensors:

- Manifold absolute pressure sensor
- Accelerator pedal position sensor 2

DTC P06A3

The 5 V reference 4 circuit provides 5 V to the following sensors:

- Throttle position sensor
- Accelerator pedal position sensor 1

It may be possible to locate the fault by disconnecting one component at a time from the 5 V reference circuit while viewing the 5 V Reference Circuit parameter on the scan tool. The scan tool parameter will change from Fault to OK when the source of the fault is disconnected.

If all 5 V reference components have been disconnected and a fault is still indicated, the fault may exist in the wiring harness.

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the DTC information with a scan tool. DTC P0641, P0651, P0697, or P06A3 should not set.
2. Observe the circuit status parameters listed below:
    - 5 V Reference 1 Circuit Status
    - 5 V Reference 2 Circuit Status

- 5 V Reference 3 Circuit Status
- 5 V Reference 4 Circuit Status

  Each parameter should display OK.

3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

NOTE: Additional DTCs will set when disconnecting the components.

1. Ignition OFF, disconnect the harness connector of all appropriate sensors for the applicable DTC. Refer to Diagnostic Aids.
2. Ignition ON, test for 4.8-5.2 V between one of the affected 5 V reference circuits and ground.
   - If the voltage is less than the specified range, test for a short to ground on the 5 V reference circuit for each of the affected components. If all circuits test normal, replace the K20 engine control module.
   - If the voltage is greater than the specified range, test for a short to voltage on the 5 V reference circuit for each of the affected components. If all circuits test normal, replace the K20 engine control module.

NOTE: A short to voltage on the signal circuit of certain components may cause this DTC to set.

3. Connect each component associated with the affected 5 V reference circuit one at a time while monitoring the appropriate scan tool 5 V Reference Voltage parameter. Verify the voltage remains 4.8-5.2 V.
   - If not within the specified range when a component is connected, test the signal circuit of that component for a short to voltage. If the circuit tests normal, replace the component.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Accelerator Pedal Position Sensor Replacement**
- **Air Conditioning (A/C) Refrigerant Pressure Sensor Replacement**
- **Camshaft Position Sensor Replacement - Bank 1 (Right Side) Intake**
- **Camshaft Position Sensor Replacement - Bank 1 (Right Side) Exhaust**
- **Camshaft Position Sensor Replacement - Bank 2 (Left Side) Intake**
- **Camshaft Position Sensor Replacement - Bank 2 (Left Side) Exhaust**
- **Crankshaft Position Sensor Replacement**
- **Fuel Pressure Sensor Replacement - Fuel Injection Fuel Rail**
- **Fuel Tank Pressure Sensor Replacement (E-85)** **Fuel Tank Pressure Sensor Replacement (E-10)**
- **Manifold Absolute Pressure Sensor Replacement**
- **Mass Airflow Sensor with Intake Air Temperature Sensor Replacement**

- Secondary Air Injection Bypass Valve Replacement - Bank 2
- Secondary Air Injection Bypass Valve Replacement - Bank 1
- Throttle Body Assembly Replacement
- Control Module References for engine control module replacement, setup, and programming

DTC P0650, P263A, OR P263B: MALFUNCTION INDICATOR LAMP

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0650

Malfunction Indicator Lamp (MIL) Control Circuit Open

DTC P263A

Malfunction Indicator Lamp (MIL) Control Circuit Low Voltage

DTC P263B

Malfunction Indicator Lamp (MIL) Control Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition Voltage	P0650	P0650	-	-
Control	P0650, P263A*	P0650, P263A	P263B	-
* The MIL remains ON				

Circuit/System Description

The malfunction indicator lamp (MIL) illuminates to inform the driver that an emission system fault has occurred and the powertrain control system requires service. Ignition voltage is supplied directly to the MIL. The engine control module (ECM) turns the MIL ON by grounding the MIL control circuit when the emission system fault occurs. Under normal operating conditions, the MIL should be ON only when the ignition is ON and the engine is OFF.

Conditions for Running the DTC

- The engine speed is greater than 80 RPM.
- The ignition voltage is between 11-32 V.
- The DTCs run continuously when the above conditions are met .

Conditions for Setting the DTC

DTC P0650 or DTC P263A

The ECM detects low voltage during the MIL control circuit driver OFF state. This indicates either a shorted to ground or an open MIL control circuit.

DTC P263B

The ECM detects high voltage on the MIL control circuit during the driver ON state. This indicates a shorted to voltage MIL control circuit.

Action Taken When the DTC Sets

DTC P0650, P263A, and P263B are Type B DTCs.

Conditions for Clearing the DTC

DTC P0650, P263A, and P263B are Type B DTCs.

Diagnostic Aids

- If the condition is intermittent, move the related harnesses and connectors while monitoring the scan tool MIL control circuit status parameters. Perform this test with the ignition ON and the engine OFF, and with the engine running. The MIL control circuit status parameters will change from OK or Not Run to Malfunction if there is a condition with the circuit or a connection.
- If the ECM detects low voltage on the MIL control circuit during the MIL control circuit driver OFF state, DTCs P0650 and DTC P263A may set simultaneously.

Circuit/System Verification

1. Ignition ON.
2. Verify the parameters listed below do not display Malfunction when commanding the Malfunction Indicator Lamp On and Off with a scan tool.
    - The MIL Control Circuit Low Voltage Test Status
    - The MIL Control Circuit Open Test Status
    - The MIL Control Circuit High Voltage Test Status
    - **If Malfunction is displayed**

      Refer to Circuit/System Testing.

    - **If Malfunction is not displayed**
3. Engine running.
4. Verify the parameters listed below do not display Malfunction when commanding the Malfunction Indicator Lamp On and Off with a scan tool.
    - The MIL Control Circuit Low Voltage Test Status
    - The MIL Control Circuit Open Test Status
    - The MIL Control Circuit High Voltage Test Status
    - **If Malfunction is displayed**

      Refer to Circuit/System Testing.

    - **If Malfunction is not displayed**
5. Verify the malfunction indicator lamp turns ON and OFF when commanding the Malfunction Indicator Lamp On and Off with a scan tool.
    - **If the malfunction indicator lamp does not turn ON and OFF**

      Refer to Circuit/System Testing.

    - **If the malfunction indicator lamp turns ON and OFF**
6. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
    - **If the DTC sets**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.

    - **If the DTC does not set**
7. All OK.

Circuit/System Testing

1. Ignition OFF.
2. Disconnect the X1 harness connector at the K20 Engine Control Module.

3. Ignition ON, verify the malfunction indicator lamp does not illuminate.
    - **If the malfunction indicator lamp illuminates**
    1. Test for infinite resistance between the control circuit terminal X1 46 and ground.
        - If less than infinite resistance, repair the short to ground in the circuit.
        - If infinite resistance, replace the P16 Instrument Cluster.
    - **If the malfunction indicator lamp does not illuminate**
4. Connect a 3 A fused jumper wire between the control circuit terminal X1 46 and ground.
5. Verify the malfunction indicator lamp illuminates.
    - **If the malfunction indicator lamp illuminates**

      Replace the K20 Engine Control Module.

    - **If the malfunction indicator lamp does not illuminate**
    1. Test for less than 1 V between the control circuit terminal X1 46 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    2. Ignition OFF.
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω.
6. Ignition OFF, disconnect the harness connector at the instrument cluster.
7. Ignition ON, verify a test lamp illuminates between the ignition voltage circuit terminal 20 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition OFF.
    2. Test for infinite resistance between the ignition voltage circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ignition voltage circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - **If the test lamp illuminates**
8. Replace the P16 Instrument Cluster.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Instrument Cluster Replacement**
- **Control Module References** for control module replacement, programming, and setup

DTC P0685-P0687, P0689, P0690, OR P1682: ENGINE CONTROLS IGNITION RELAY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Typical Scan Tool Data

Engine Controls Ignition Relay Control Circuit Low Voltage, Open, and High Voltage Test Status - Component Commanded OFF

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Component commanded OFF **Parameter Normal Range:** The following illustrates the normal parameter state with no circuit conditions: • Component OFF - OK for Open/Short Gnd test and Not Run for Short Volts test • Component ON - Not Run for Open/Short Gnd test and OK for Short Volts test			
Battery Voltage	Fault	Fault	-
Engine Controls Ignition Relay Control Circuit	Fault	Fault	Not Run

Engine Controls Ignition Relay Control Circuit Low Voltage, Open, and High Voltage Test Status - Component Commanded ON

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Component commanded ON **Parameter Normal Range:** The following illustrates the normal parameter state with no circuit conditions: • Component OFF - OK for Open/Short Gnd test and Not Run for Short Volts test • Component ON - Not Run for Open/Short Gnd test and OK for Short Volts test			
Battery Voltage	Not Run	Not Run	-
Engine Controls Ignition Relay Control Circuit	Not Run	Not Run	Fault

Circuit/System Description

There are 2 ignition voltage circuits supplied to the engine control module (ECM). One is supplied by the powertrain relay and the other is supplied by the ignition main relay. The ECM monitors and compares the ignition voltage supplied by the two relays.

Conditions for Running the DTC

P0685, P0686, P0687

- The ignition is ON.
- The ignition voltage is greater than 11 V.
- The DTC runs continuously when the above conditions are met.

P0689

- The powertrain relay is commanded ON.
- The ignition voltage is greater than 11 V.
- DTC P0685 is not set.

- The DTC runs continuously when the above conditions are met.

P0690

- The powertrain relay is commanded OFF.
- DTC P0685 is not set.
- The DTC runs continuously when the above conditions are met.

P1682

- The powertrain relay is commanded ON.
- The ignition voltage is greater than 5.5 V.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P0685

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for greater than 2 s.

P0686

The ECM detects a short to ground on the control circuit for greater than 2 s.

P0687

The ECM detects a short to voltage on the control circuit for greater than 2 s.

P0689

The engine controls ignition relay feedback voltage is less than 5 V for greater than 5 s.

P0690

- The ECM detects the engine controls ignition relay feedback circuit is greater than 4 V when the relay is commanded OFF.
- The condition is present for greater than 2 s.

P1682

The ECM detects that there is greater than 3 V difference between the ignition main relay signal and the powertrain relay signal circuits for less than 1 s.

Action Taken When the DTC Sets

- DTC P1682 is a Type A DTC.
- DTCs P0685, P0686, P0687, and P0690 are Type B DTCs.
- DTC P0689 is a Type C DTC.

Conditions for Clearing the DTC

- DTC P1682 is a Type A DTC.
- DTCs P0685, P0686, P0687, and P0690 are Type B DTCs.
- DTC P0689 is a Type C DTC.

Diagnostic Aids

The powertrain relay may also be labeled the engine controls ignition relay, the engine control module relay, or the main relay. The ignition main relay may also be labeled the run/crank relay, the ignition 1 relay, the ignition run relay, or the ignition relay.

Circuit/System Verification

NOTE:

- **A short to voltage on other components may cause DTC P0690 to set. If other DTCs are set, diagnose those DTCs first.**
- **If you were sent here from Engine Cranks But Does Not Run proceed to Circuit/System Testing.**

1. Ignition ON, observe the DTC information with a scan tool. DTC P0685, P0686, P0687, P0689, P0690, or P1682 should not set.
2. Ignition ON, observe the scan tool Ignition 1 Voltage Signal and the Engine Controls Ignition Relay

Feedback Signal parameters. There should be less than 3 V difference between the two parameters.

3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

NOTE: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing, unless sent here from Engine Cranks But Does Not Run.

1. Ignition OFF, disconnect the powertrain relay.
2. Verify that a test lamp illuminates between ground and the relay circuit terminals listed below:
   - Terminal 85
   - Terminal 30
   - If the test lamp does not illuminate, test the relay battery voltage circuit for an open/high resistance.

NOTE: High resistance in the circuit/underhood fuse block for either the powertrain relay or the ignition main relay can cause DTC P1682 to set.

3. Ignition ON, verify that a test lamp does not illuminate between the ignition voltage circuit terminal 87 and ground.
   - If the test lamp illuminates, test the ignition voltage circuit for a short to voltage.
4. Connect a 20 A fused jumper wire between the relay switch B+ circuit terminal 30 and the relay switch ignition voltage circuit terminal 87.
5. Ignition ON, observe the scan tool Engine Controls Ignition Relay Feedback Signal parameter. The K20 Engine Control Module should communicate, and the parameter should display B+.
   - If not the specified value, or the K20 Engine Control Module does not communicate, test the ignition voltage circuit between the powertrain relay and the K20 Engine Control Module for a short to ground or for an open/high resistance. If the circuit/connections test normal, replace the K20 Engine Control Module.
6. Ignition OFF, connect a DMM set to the diode setting between control circuit terminal 86 and ground. Verify the DMM displays OL.
   - If not the specified value, test the control circuit for a short to ground. If the circuit tests normal, replace the K20 Engine Control Module.
7. Ignition ON, verify the DMM displays less than 1 V.
   - If not the specified range, test the control circuit for a short to voltage, or an open/high resistance. If the circuit tests normal, replace the K20 Engine Control Module.
8. If all circuits test normal, replace the powertrain relay.

Component Testing

1. Remove the powertrain relay.

NOTE: Depending on the application, the relay coil resistance will be within one of the following ranges.

2. Test for one of the following resistance specifications between terminals 85 and 86 of the powertrain relay:
    - 70-110 Ω
    - 200-250 Ω
    - If not within the specified range, replace the powertrain relay.
3. Test for infinite resistance between the following terminals of the powertrain relay:
    - 30 and 86
    - 30 and 87
    - 30 and 85
    - 85 and 87
    - If not the specified value, replace the powertrain relay.
4. Install a 20 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground. Test for less than 2 Ω between terminals 30 and 87.
    - If greater than the specified range, replace the powertrain relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Relay Replacement (Attached to Wire Harness)** **Relay Replacement (Within an Electrical Center)**
- **Control Module References** for engine control module replacement, programming, and setup.

DTC P069E: FUEL PUMP CONTROL MODULE REQUESTED MIL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** Prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P069E

Fuel Pump Control Module Requested MIL Illumination

Circuit/System Description

The fuel pump control module constantly monitors the fuel pump control system for any condition which may adversely affect vehicle emissions. If a condition is detected, the fuel pump control module sets a DTC and sends a serial data message to the engine control module (ECM). The ECM sets DTC P069E to inform the technician that the fuel pump control module has set the emission related DTC. The serial data message sent by the fuel pump control module also contains a request for the ECM to illuminate the malfunction indicator lamp (MIL).

The technician can observe the DTC that was set by the fuel pump control module by reviewing the ECM Freeze Frame records on the scan tool. The ECM Freeze Frame records also contain the engine operating

conditions present when the fuel pump control module DTC set.

Conditions for Running the DTC

The ignition is ON, or the engine is running for greater than 3 s.

Conditions for Setting the DTC

The ECM receives a serial data message from the fuel pump control module indicating that an emission related DTC has set in the fuel pump control module.

Action Taken When the DTC Sets

- DTC P069E is a Type A DTC.
- DTC P069E will continue to be current or active as long as the fuel pump control module is requesting MIL illumination.

Conditions for Clearing the DTC

DTC P069E is a Type A DTC.

Diagnostic Aids

Communication codes, U-codes, as well as powertrain codes, P-codes, set in the fuel pump control module will cause the fuel pump control module to request DTC P069E to be set in the ECM.

Reference Information

Circuit/System Verification

NOTE:

- **Do not replace the engine control module for this DTC. DTC P069E is an informational DTC.**
- **Correct any engine control and communication DTCs before diagnosing fuel pump control module DTCs.**

1. Verify there are no engine control or communication DTCs set.
   - **If a DTC is set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If a DTC is not set**
2. Verify there are no fuel pump control module DTCs set.
   - **If a DTC is set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If a DTC is not set**

3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If the DTC does not set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P0700: TRANSMISSION CONTROL MODULE REQUESTED MIL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each of the diagnostic category.

DTC Descriptor

DTC P0700

Transmission Control Module Requested MIL Illumination

Circuit/System Description

The transmission control module (TCM) constantly monitors the transmission system for any condition which may adversely affect vehicle emissions. If a condition is detected, the TCM sets a DTC and sends a serial data message to the engine control module (ECM). The ECM sets DTC P0700 to inform the technician that the TCM has set the emission related DTC. The serial data message sent by the TCM also contains a request for the ECM to illuminate the malfunction indicator lamp (MIL).

The technician can observe the DTC that was set by the TCM by reviewing the ECM Freeze Frame records on the scan tool. The ECM Freeze Frame records also contain the engine operating conditions present when the transmission DTC set.

Conditions for Running the DTC

- The ignition is ON or the engine is operating.
- DTC P0700 runs continuously.

Conditions for Setting the DTC

The ECM receives a serial data message from the TCM indicating that an emission related DTC has set in the TCM.

Action Taken When the DTC Sets

DTC P0700 is a Type A DTC.

Conditions for Clearing the MIL/DTC

DTC P0700 is a Type A DTC.

Diagnostic Aids

Communication codes, U-codes, as well as powertrain codes, P-codes, set in the TCM can cause the TCM to request DTC P0700 to be set in the ECM.

Circuit/System Verification

NOTE:

- **Do not replace the engine control module for this DTC. DTC P0700 is an informational DTC.**
- **Correct any engine controls and communication DTCs before diagnosing transmission control module DTCs.**

1. Verify there are no engine control or communication DTCs set.
   - **If a DTC is set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If a DTC is not set**
2. Verify there are no transmission control module DTCs set.
   - **If a DTC is set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If a DTC is not set**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
   - **If the DTC sets**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If the DTC does not set**

5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P1248-P124D: CYLINDER INJECTOR HIGH CONTROL CIRCUIT

Direct Fuel Injector High Voltage Control Cylinder 6	P0276	P0206	P0277	P124D

Circuit/System Description

The engine control module (ECM) supplies voltage to each fuel injector on the injector high voltage supply circuits. The ECM energizes each fuel injector by grounding the high voltage control circuit of the fuel injector. The ECM monitors the status of the fuel injector high voltage supply circuits and the fuel injector high voltage control circuits. When a fuel injector circuit condition is detected by the ECM, the affected fuel injector(s) is disabled.

Conditions for Running the DTC

- The engine is running.
- The ignition voltage is between 11-18 V.
- The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

The engine control module detects the fuel injector high voltage supply circuit is shorted to the fuel injector high voltage control circuit for greater than 2 s.

Action Taken When the DTC Sets

DTCs P1248, P1249, P124A, P124B, P124C, and P124D are Type A DTCs.

Conditions for Clearing the DTC

DTCs P1248, P1249, P124A, P124B, P124C, and P124D are Type A DTCs.

Diagnostic Aids

- Performing the fuel injector coil test may help isolate an intermittent condition. Refer to **Fuel Injector Solenoid Coil Test**.
- If the condition is intermittent, move the related harnesses and connectors, with the engine operating, while monitoring the scan tool Cylinder 1-6 Injector Control Circuit Status parameters. An Injector Control Circuit Status parameter will change from OK or Not Run to Malfunction if there is a condition with the circuit or a connection.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC P0685 or P1682 is not set.
    - **If DTC P0685 or P1682 is set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If DTC P0685 or P1682 is not set**

3. Engine idling.
4. Verify the scan tool Cylinder 1-6 Injector Control Circuit Status parameters display OK.
    - **If any parameters do not display OK**

      Refer to Circuit/System Testing.

    - **If all parameters display OK**
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify DTC P1248, P1249, P124A, P124B, P124C, or P124D does not set.
    - **If any DTC sets**

      Refer to Circuit/System Testing.

    - **If no DTC sets**
7. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the appropriate multi-way harness connector X160 or X161, at the rear of the intake manifold, ignition ON. It may take up to 2 minutes for all vehicle systems to power down.
2. Verify the scan tool Cylinder 1-6 Injector Control Circuit Status parameters display Open.
    - **If Open is not displayed**
    1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.

       NOTE: Test on the Engine Control Module side of the multi-way harness connector.

    2. Test for infinite resistance between the appropriate Q17 Fuel Injector high voltage supply circuit and high voltage control circuit.
        - If less than infinite, repair the short between the circuits.
        - If infinite resistance, replace the K20 Engine Control Module.
    - **If Open is displayed**

NOTE: Testing for the following steps is performed on the fuel injector side of the multi-way harness connector. It may be necessary to remove the intake manifold to isolate the condition.

3. Ignition OFF, disconnect the harness connector at the appropriate Q17 Fuel Injector.
4. Test for infinite resistance between the appropriate Q17 Fuel Injector high voltage supply circuit and high voltage control circuit.
    - **If less than infinite resistance**

      Repair the short between the circuits.

- **If infinite resistance**

5. Test or replace the appropriate Q17 Fuel Injector.

Component Testing

- **Fuel Injector Solenoid Coil Test**
- **Fuel Injector Balance Test**

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Fuel Injector Replacement**
- **Control Module References** for K20 Engine Control Module replacement, programming, and setup

DTC P1255 OR P064A: FUEL PUMP CONTROL MODULE/MODULE (CHASSIS CONTROL MODULE)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P064A

Fuel Pump Control Module Performance

DTC P1255

Fuel Pump Control Module Driver High Temperature

Circuit/System Description

The engine control module (ECM) supplies voltage to the chassis control module when the ECM detects that the ignition is on. The voltage from the ECM to the chassis control module remains active for 2 seconds, unless the engine is in crank or run. While this voltage is being received, the chassis control module supplies a varying voltage to the fuel tank pump module in order to maintain the desired fuel pressure.

Conditions for Running the DTC

The engine is running.

Conditions for Setting the DTC

The chassis control module detects an over-temperature fault.

Action Taken When the DTC Sets

DTCs P064A and P1255 are Type A DTCs.

Conditions for Clearing the DTC

DTCs P064A and P1255 are Type A DTCs.

Diagnostic Aids

Using the Failure Records data may help locate an intermittent condition. If you cannot duplicate the DTC, the information in the Failure Records can help determine how many miles since the DTC set. The Fail Counter and Pass Counter can help determine how many ignition cycles that the diagnostic test reported a pass and/or a fail.

Beginning in the 2014 model year the K27 Fuel Pump Control Module (FPCM) will now be called the chassis control module (CCM). The component code for the chassis control module will be K38. The chassis control module name will be used in Service Information, the Global Diagnostic System and the Service Programming System.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC P0231, P0232 or P023F is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of the DTCs are set**

3. Verify that the area where the K38 Chassis Control Module is located is free of debris, clutter, or any insulating material that would cause the K38 Chassis Control Module to overheat.
    - **If any debris, clutter, or other material is found**
    1. Clear the area where the K38 Chassis Control Module is located.
    2. Clear the DTC and test drive the vehicle.
    3. Verify DTC P1255 or P064A is not set.
        - If DTC P1255 or P064A is set, replace the K38 Chassis Control Module.
        - If DTC P1255 or P064A is not set
    4. All OK.
    - **If no debris, clutter, or other material is found**
4. Clear the DTC and test drive the vehicle.
5. Verify DTC P1255 or P064A is not set.
    - **If DTC P1255 or P064A is set**

      Replace the K38 Chassis Control Module.

    - **If DTC P1255 or P064A is not set.**
6. All OK.

Circuit/System Description

The ignition system uses an individual ignition coil for each cylinder. The engine control module (ECM) monitors the ignition voltage from the fuse to the individual coils.

Conditions for Running the DTC

- The ignition is ON.
- Ignition Run/Crank and PT relay voltages are greater than 11 V

The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects less than 2.5 V on the ignition coil supply voltage circuit for greater than 313 ms.

Action Taken When the DTC Sets

DTC P135A and P135B are Type A DTCs.

Conditions for Clearing the DTC

DTC P135A and P135B are Type A DTCs.

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**

- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References

Circuit/System Verification

1. Ignition ON.
2. Verify the appropriate scan tool Ignition Coil Supply Voltage parameter displays On.
    - **If On is not displayed**

      Refer to Circuit/System Testing.

    - **If On is displayed**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
2. Connect a 3 A fused jumper wire between the control circuit terminal 72 and ground, ignition ON.
3. Verify a test lamp illuminates between the appropriate ignition circuit terminal listed below and ground.
    - Terminal 62
    - Terminal 67
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition OFF, remove the test lamp.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**

      NOTE: **The ignition circuit may supply voltage to other components. Make sure to test all circuits and components for a short to ground that share the ignition circuit.**

    1. Ignition OFF, remove the test lamp, and disconnect all components on the circuit.
    2. Test for infinite resistance between the ignition circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Replace the fuse, ignition ON.
4. Verify the fuse is good after connecting each of the components one at a time.
    - If the fuse opens, replace the component that opens the fuse when connected.
    - If the fuse is good, all OK.

- **If the test lamp illuminates**

4. Replace the K20 Engine Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Ignition Coil Replacement - Bank 1**
- **Ignition Coil Replacement - Bank 2**
- **Control Module References** for engine control module replacement, programming, and setup

DTC P1400: COLD START EMISSION REDUCTION CONTROL SYSTEM

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

DTC Descriptor

DTC P1400

Cold Start Emission Reduction Control System

Circuit/System Description

The catalytic converter must be warmed to efficiently reduce the emissions. The cold start strategy is to reduce the amount of time it takes to warm the catalytic converter. During a cold start, the engine idle speed is elevated and spark timing is retarded to allow the catalyst to warm quickly. This diagnostic monitors the following to build an exhaust energy model:

- Engine speed
- Spark advance
- Throttle position
- Engine coolant temperature
- Engine runtime
- Park/neutral position
- Vehicle speed

The actual model is then compared to the expected exhaust energy model.

Conditions for Running the DTC

- The engine is running, and a cold start has been detected.
- Vehicle speed is less than 3 km/h (2 MPH).
- The engine is at idle with no input from the accelerator pedal.
- The calculated catalyst temperature is less than 350Â°C (662Â°F).
- Engine coolant is greater than -10Â°C (14Â°F) and less than 56Â°C (132Â°F).
- Barometric pressure is greater than 74 kPa (10.7 psi).
- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0220, P0222, P0223, P0201, P0202, P0203, P0204, P0205, P0206, P0300, P0335, P0336, P0351, P0352, P0353, P0501, P0502, P0506, P0507, P0601, P0602, P0603, P0604, P0606, P0607, P060D, P062F, P0641, P0651, P1101, P1516, P1682, P2101, P2119, P2120, P2122, P2123, P2125, P2127, P2128, P2135, P2138, P2176, P2610 are not set.
- This DTC runs for 10 s within the first 18 s of start-up, or until the calculated catalyst temperature is greater than 900Â°C (1,652Â°F). This diagnostic runs once per trip when a cold start has been determined.

Conditions for Setting the DTC

The actual exhaust energy model does not match the expected exhaust energy model.

Action Taken When the DTC Sets

DTC P1400 is a Type A DTC.

Conditions for Clearing the MIL/DTC

DTC P1400 is a Type A DTC.

Reference Information

Description and Operation

Engine Control Module Description

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Diagnostic Aids

Any loading of the engine that lowers engine RPM, such as with partial application of the clutch, A/C cycling etc., during the first 18 s of engine run time may set this DTC.

Circuit/System Verification

1. Vehicle OFF, allow the engine to cool to be within the temperatures listed in the Conditions for Running

the DTC.

2. Engine running.
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
    - **If the DTC sets**
5. Verify that the conditions listed below do not exist:
    - Damage, restriction, water intrusion or modification of the air intake system.
    - Dirty or deteriorating air filter element
    - Crankcase ventilation system for correct operation-Refer to **Crankcase Ventilation System Inspection/Diagnosis** .
    - Vacuum leak or other un-metered air downstream of the mass air flow (MAF) sensor
    - Intake manifold leak
    - Exhaust leak
    - Water intrusion
    - Damaged, restricted, modified or enhanced exhaust system-Refer to **Symptoms - Engine Exhaust** .
    - **If any of the conditions exist**

      Repair as necessary.

    - **If none of the conditions exist**
6. Verify an engine mechanical condition does not alter the air flow into the combustion chamber. Refer to **Symptoms - Engine Mechanical** .
    - **If the DTC does not set**
7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P150C: TRANSMISSION CONTROL MODULE ENGINE SPEED REQUEST SIGNAL MESSAGE COUNTER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P150C

Transmission Control Module Engine Speed Request Signal Message Counter Incorrect

Circuit/System Description

To improve vehicle shift feel, the transmission control module (TCM) is constantly sending the ECM serial data messages with requests to modify engine speed or torque. These serial data messages are sent through two circuits which are part of a communication network called the controller area network (CAN). The ECM sets DTC P150C when it detects a discrepancy in the structure of this message causing its integrity to be questioned.

An intermittent fault in the controller area network (CAN) circuits will cause DTC P150C to set.

Conditions for Running the DTC

- DTCs P0506, P0507, or U0101 are not set.
- The engine is running for greater than 0.5 s.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the TCM engine speed request does not match the expected engine speed request.

Action Taken When the DTC Sets

DTC P150C is a Type B DTC.

Conditions for Clearing the DTC

DTC P150C is a Type B DTC.

Circuit/System Verification

NOTE:

- **DTC P150C is an informational DTC.**
- **Diagnose all other engine control module DTCs prior to DTC P150C.**

1. Verify that no other DTCs are set except for DTC P150C.
   - **If any other DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If only DTC P150C is set**

2. Replace the K71 Transmission Control Module.
3. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.
4. Verify the DTC does not set.
    - **If the DTC sets**

      Replace the K20 Engine Control Module.

    - **If the DTC does not set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for ECM or TCM replacement, programming, and setup

DTC P1516, P2101, P2119, OR P2176: THROTTLE ACTUATOR CONTROL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P1516

Throttle Actuator Control (TAC) Module Throttle Actuator Position Performance

DTC P2101

Throttle Actuator Position Performance

DTC P2119

Throttle Closed Position Performance

DTC P2176

Minimum Throttle Position Not Learned

Diagnostic Fault Information

Circuit	Short to Ground	Open or High Resistance	Short to Voltage	Signal Performance
TAC Motor Control Closed	P2101	P2101	P2101	P1516, P2101, P2176

Circuit	Short to Ground	Open or High Resistance	Short to Voltage	Signal Performance
TAC Motor Control Open	P2119	P2101	P2101	P1516, P2101, P2176

Circuit/System Description

The throttle body assembly contains a contact-less inductive throttle position sensing element that is managed by a customized integrated circuit. The throttle position (TP) sensor is mounted within the throttle body assembly and is not serviceable. The engine control module (ECM) supplies the throttle body with a 5 V reference circuit, a low reference circuit, an H-bridge motor directional control circuit, and an asynchronous signal/serial data circuit. The asynchronous signal means communication is only going from the throttle body to the ECM. The throttle body cannot receive data from the ECM over the signal/serial data circuit. The TP sensor provides a signal voltage that changes relative to throttle blade angle. The customized integrated circuit translates the voltage based position information into serial data using the Society of Automotive Engineers (SAE) J2716 Single Edge Nibble Transmission (SENT) protocol. The TP sensor information is transmitted between the throttle body and the ECM on the signal/serial data circuit. The ECM decodes the serial data signal into separate voltages which are displayed on a scan tool as the voltage inputs from TP sensors 1 and 2.

The ECM controls the throttle valve by applying a varying voltage to the control circuits of the throttle actuator control (TAC) motor. The ECM monitors the duty cycle that is required to actuate the throttle valve. The ECM monitors the TP sensor signal/serial data circuit to determine the actual throttle valve position.

Conditions for Running the DTC

P1516

- The run/crank or powertrain relay voltage is greater than 6.4 V and reduced power is not active.
- DTC P1516 runs continuously when the above conditions are met.

P2101

- DTC P1682 is not set.
- The run/crank or powertrain relay voltage is greater than 6.4 V and reduced power is not active.
- The engine is running or the following conditions are met:
  - The engine is not running.
  - The ignition voltage is greater than 11 V.
  - The TAC system is not in the Battery Saver mode.
  - The ECM is commanding the throttle.
  - The ECM has learned the minimum throttle position.
- DTC P2101 runs continuously when the above conditions are met.

P2119

- DTCs P0122, P0123, P0222, P0223, or P06A3 is not set.
- The run/crank or powertrain relay voltage is greater than 6.4 V and reduced power is not active.
- The system is not in the Battery Save mode.

- The ECM is not commanding the throttle.
- DTC P2119 runs continuously when the above conditions are met.

P2176

- The run/crank or powertrain relay voltage is greater than 6.4 V and reduced power is not active.
- DTC P2176 runs continuously when the above conditions are met.

Conditions for Setting the DTC

P1516

The ECM detects an unstable throttle position for greater than 1 s.

P2101

- The ECM detects the actual throttle position does not match the predicted throttle position for greater than 1 s.

  OR

- The ECM detects the throttle control is driving the throttle in the incorrect direction or exceed the reduced power limit.

P2119

The ECM determines that the throttle blade did not return to the rest position within 1 s.

P2176

The ECM detects that both throttle position (TP) sensors were greater than a predetermined voltage during the minimum throttle learn procedure for greater than 2 s.

Action Taken When the DTC Sets

- DTCs P2101, and P2176 are Type A DTCs.
- DTC P1516 is a Type B DTC.
- DTC P2119 is a Type C DTC.
- The ECM commands the TAC system to operate in the Reduced Engine Power mode.
- A message center or an indicator displays Reduced Engine Power.
- Under certain conditions, the control module commands the engine OFF.

Conditions for Clearing the MIL/DTC

- DTCs P2101, and P2176 are Type A DTCs.
- DTC P1516 is a Type B DTC.
- DTC P2119 is a Type C DTC.

Diagnostic Aids

- Depending on the Start Up ECT, the Desired Throttle Position percentage maybe greater or less than the Throttle Position with the TAC motor at rest. When the ignition is initially turned ON, or when the engine is cranking or running the Desired and Actual Throttle positions should closely match.
- Inspect for a condition in which the throttle valve may have been held open. For example, ice may have formed in the throttle bore causing the throttle valve not to close.
- A high resistance condition on the throttle position and throttle actuator control circuits could cause a DTC to set.
- A low battery condition may cause a DTC to set.

- **Wiring Repairs**

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.

   NOTE: A low battery voltage or charging system condition may cause a DTC to set.

2. Verify DTC P0121, P0122, P0123, P0222, P0223, P0562, P0621, P0622, or P2135 is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.

- **If none of the DTCs are set**

3. Verify the scan tool Throttle Body Idle Air flow Compensation parameter is less than 90 %.
   - **If 90 % or greater**

     Refer to **Throttle Body Inspection and Cleaning** .

   - **If less than 90 %**
4. Clear the DTCs with a scan tool.
5. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
6. Ignition ON.
7. Verify the scan tool TAC Motor parameter displays Enabled while slowly depressing the accelerator pedal.
   - **If Enabled is Not displayed**

     Refer to Circuit/System Testing.

   - **If Enabled is displayed**
8. Verify DTC P1516, P2101, P2119, or P2176 is not set.
   - **If any of the DTCs are set**

     Refer to Circuit/System Testing.

   - **If none of the DTCs are set**

   NOTE: **If there is a condition with the throttle body, the TAC Motor Command parameter will go to 99 % for a predetermined amount of time and then a DTC sets. Once a DTC is set, the TAC Motor Command parameter will go to 0 % and the TAC Motor parameter will display Disabled.**

9. Verify the scan tool TAC Motor parameter displays Enabled while performing the Throttle Sweep Test with a scan tool.
   - **If Enabled is Not displayed**

     Replace the Q38 Throttle Body assembly.

   - **If Enabled is displayed**
10. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
11. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing.

    - **If the DTC does not set**
12. All OK

Circuit/System Testing

1. Ignition OFF.

WARNING: Turn OFF the ignition before inserting fingers into the throttle bore. Unexpected movement of the throttle blade could cause personal injury.

2. Verify the conditions listed below do not exist with the Q38 Throttle Body:

NOTE:

- **The rest position is defined as the actual Throttle Position percentage when the ignition is OFF or with the ignition ON for greater than 30 seconds.**
- **When the ignition is OFF, spring tension should hold the throttle plate in the rest position. You should be able to open the throttle plate to wide open throttle (WOT) or push the throttle plate to the fully closed position. In each case, the throttle plate should return to the rest position without assistance.**

- A throttle blade that is not in the rest position
- A throttle blade that is binding open or closed
- A throttle blade that is free to move open or closed without spring pressure
- **If a condition is found**

  Replace the Q38 Throttle Body.

- **If a condition is not found**

NOTE: Disconnecting the throttle body harness connector may cause additional DTCs to set.

3. Disconnect the harness connector at the Q38 Throttle Body Assembly, ignition ON.

NOTE: The test lamp may illuminate briefly when the ignition switch is turned on, but should not remain illuminated.

4. Verify that a test lamp does Not illuminate continuously between each motor control circuit listed below and ground.
   - TAC Motor Control Closed circuit terminal 1
   - TAC Motor Control Open circuit terminal 2
   - **If the test lamp is always ON**
   1. Ignition OFF, disconnect the harness connector X2 at the K20 Engine Control Module, ignition ON
   2. Test for less than 1 V between the motor control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K20 Engine Control Module.
   - **If the test lamp is always OFF**

5. Verify that a test lamp does not illuminate between each motor control circuit listed below and B+.
    - TAC Motor Control Closed circuit terminal 1
    - TAC Motor Control Open circuit terminal 2
    - **If the test lamp illuminates**
    1. Ignition OFF, disconnect the harness connector X2 at the K20 Engine Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K20 Engine Control Module.
    - **If the test lamp does not illuminate**
6. Ignition OFF, set the DMM to the 40 V scale, select the Min/Max Recording Mode, and set the Peak Min/Max response time to 1 ms.

NOTE:

- **The test lamp must be connected to circuit before turning ignition on or incorrect diagnosis may occur.**
- **The ignition must be OFF and the ECM completely powered down before testing each circuit or a lower voltage will be recorded. It may take up to 2 min for all vehicle systems to power down.**
- **The DMM Min/Max Recording Mode and the response time of 1 ms must be reset after testing each circuit or a lower voltage will be recorded.**

7. Verify the Max voltage is within 3 V of B+ while using DMM Min/Max Recording Mode function on each control circuit listed below as the ignition is turned ON.
    - TAC Motor Control Closed circuit terminal 1
    - TAC Motor Control Open circuit terminal 2
    - **If not within 3 V of B+**
    1. Ignition OFF, disconnect the harness connector X2 at the K20 Engine Control Module.
    2. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If within 3 V of B+**
8. Replace the Q38 Throttle Body.

Repair Instructions

- **Throttle Body Assembly Replacement**
- **Control Module References** for ECM replacement, programming, and setup

Repair Verification

1. Install any components that have been removed or replaced during diagnosis.
2. Perform any adjustments, programming or setup procedures that are required when a component is removed or replaced.

3. Clear the DTCs with a scan tool.
4. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
5. Ignition ON.
6. Verify the scan tool TAC Motor parameter displays Enabled while performing the Throttle Sweep Test with a scan tool.
    - **If Disabled**

      Test or replace the Q38 Throttle Body assembly.

    - **If Enabled**
7. If the repair was related to a DTC, duplicate the Conditions for Running the DTC and use the Freeze Frame/Failure Records, if applicable, in order to verify the DTC does not set again.
    - **If DTC sets**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.

    - **If DTC does not set**
8. All OK

DTC P163A: CONTROL MODULE FUEL PRESSURE REGULATOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P163A

Control Module Fuel Pressure Regulator 1 Control System Circuitry Performance

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM).

Conditions for Running the DTC

- The engine is running or cranking.
- The ignition voltage is between 8-18 V.
- DTC P163A runs continuously when the conditions are met for greater than 500 mS.

Conditions for Setting the DTC

The ECM detects a condition with the integrated high pressure fuel pump actuator circuits or detects the current used to drive the high pressure fuel pump actuator is out of range for greater than 4 s.

Action Taken When the DTC Sets

DTC P163A is a Type C DTC.

Conditions for Clearing the DTC

DTC P163A is a Type C DTC.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool parameters listed below do not display Malfunction when commanding the Fuel Pressure Regulator On and Off with a scan tool.
    - Fuel Pressure Regulator Control Circuit High Voltage Test Status
    - Fuel Pressure Regulator Control Circuit Open Test Status
    - Fuel Pressure Regulator Control Circuit Low Voltage Test Status
    - Fuel Pressure Regulator High Control Circuit High Voltage Test Status
    - Fuel Pressure Regulator High Control Circuit Open Test Status
    - Fuel Pressure Regulator High Control Circuit Low Voltage Test Status
    - **If Malfunction is displayed**

Refer to Circuit/System Testing.

- **If Malfunction is not displayed**

3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the G18 High Pressure Fuel Pump. It may take up to 2 min for all vehicle systems to power down.
2. Verify that a test lamp does not illuminate between the high pressure fuel pump actuator low control circuit terminal 1 and B+.
   - **If the test lamp illuminates**
   1. Remove the test lamp.
   2. Disconnect the X3 harness connector at the K20 Engine Control Module.
   3. Test for infinite resistance between the low control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, test or replace the K20 Engine Control Module.
   - **If the test lamp does not illuminate**
3. Ignition ON.
4. Verify a test lamp does not illuminate between the high pressure fuel pump actuator high control circuit terminal 2 and ground.
   - **If the test lamp illuminates**
   1. Ignition OFF, remove the test lamp, disconnect the X3 harness connector at the K20 Engine Control Module. Ignition ON.
   2. Test for less than 1 V between the high control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, test or replace the K20 Engine Control Module.
   - **If the test lamp does not illuminate**
5. Verify the test lamp illuminates when the Fuel Pressure Regulator is commanded On with a scan tool.
   - **If the test lamp does not illuminate**
   1. Ignition OFF, remove the test lamp, disconnect the X3 harness connector at the K20 Engine Control Module.
   2. Test for less than 2 Ω in the high control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω, test or replace the K20 Engine Control Module.

- **If the test lamp illuminates**

6. Ignition OFF, connect a test lamp between the high pressure fuel pump actuator low control circuit terminal 1 and B+. Ignition ON.
7. Verify the test lamp illuminates when the Fuel Pressure Regulator is commanded On with a scan tool.
    - **If the test lamp does not illuminate**
    1. Ignition OFF, remove the test lamp, disconnect the X3 harness connector at the K20 Engine Control Module. Ignition ON.
    2. Test for less than 1 V between the low control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the low control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the K20 Engine Control Module.
    - **If the test lamp illuminates**
8. Test or replace the G18 High Pressure Fuel Pump.

Component Testing

Static Test

1. Ignition OFF, disconnect the harness connector at the G18 High Pressure Fuel Pump.

    NOTE: **The DMM and test leads must be calibrated to 0 Ω in order to prevent misdiagnosis.**

2. Test for 9-12 Ω between low control circuit terminal 1 and high control circuit terminal 2.
    - **If not within the specified range**

      Replace the G18 High Pressure Fuel Pump.

    - **If within the specified range**
3. Test for infinite resistance between each terminal and the high pressure fuel pump housing/case.
    - **If less than infinite resistance**

      Replace the G18 High Pressure Fuel Pump.

    - **If infinite resistance**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Fuel Pump Replacement** for G18 High Pressure Fuel Pump replacement
- **Control Module References** for K20 Engine Control Module replacement, programming, and setup

NOTE: **Some vehicles do not support the Fuel Rail Pressure Relief Valve Reset procedure. Applications not supporting this procedure will return an error message stating "Parameter ID not supported. Check for proper vehicle selection."**

- Perform the Fuel Rail Pressure Relief Valve Reset procedure.

DTC P2096 OR P2098: POST CATALYST FUEL TRIM SYSTEM LOW

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P2096

Post Catalyst Fuel Trim System Low Limit Bank 1

DTC P2098

Post Catalyst Fuel Trim System Low Limit Bank 2

Circuit Description

Fuel trim bias is used to keep the post catalyst air/fuel ratio within a predetermined range. This allows optimal catalyst efficiency under various operating conditions. The engine control module (ECM) constantly monitors how lean or rich the fuel trim bias is commanded, to determine if the fuel trim bias is greater than a calibrated amount.

Conditions for Running the DTC

- DTC P0016, P0017, P0018, P0019, P0030, P0036, P0050, P0053, P0054, P0056, P0059, P0060, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0128, P0131-P0135, P0137, P0138, P013A-P013F, P0140, P0141, P014A, P014B, P0151-P0155, P0157, P0158, P015A-P015D, P0160, P0161, P0178, P0179, P0201-P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P0300-P0306, P0340, P0341, P0345, P0346, P0365, P0366, P0390, P0391, P0442, P0443, P0446, P0449, P0452, P0453, P0455, P0496, P0498, P0499, P1248, P1249, P124A, P124B, P124C, P124D, P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, P216F, P219A, P219B, P2227, P2228, P2229, P2230, P2269, P2270, P2271, P2272, or P2273 is not set.
- The barometric pressure (BARO) is greater than 70 kPa (10.2 PSI).
- The manifold absolute pressure (MAP) is between 10-255 kPa (1.5-37 PSI).
- The intake air temperature (IAT) is between -20 and +150Â°C (-4 and +302Â°F).
- The engine start-up coolant temperature is warmer than -20Â°C (-4Â°F).
- The engine is in Closed Loop status.
- The fuel control intrusive diagnostics are not active.

- DTCs P2096 and P2098 run continuously when the conditions above have been met.

Conditions for Setting the DTC

The lean correction limit for a condition causing a rich air/fuel ratio has been exceeded.

Action Taken when the DTC Sets

DTCs P2096 and P2098 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P2096 and P2098 are Type B DTCs.

Diagnostic Aids

- The post catalyst fuel trim diagnostic is very sensitive to heated oxygen sensor (HO2S) design. A non-OE sensor or an incorrect part number may cause a DTC to set.
- Failure to perform the scan tool Heated Oxygen Sensor Resistance Learn Reset after replacing an HO2S, clearing HO2S diagnostic trouble codes, or after battery disconnection may cause inaccurate post catalyst fuel trim readings.
- Certain aftermarket air filters may cause a DTC to set.
- Certain aftermarket air induction systems or modifications to the air induction system may cause a DTC to set.
- Certain aftermarket exhaust system components may cause a DTC to set.

Circuit/System Verification

1. Ignition ON.
2. Verify no other HO2S or fuel trim DTC is set.
   - **If any other HO2S or fuel trim DTC is set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If no other HO2S or fuel trim DTC is set**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed in the Freeze Frame/Failure Records data.
4. Verify DTC P2096 or P2098 is not set.
   - **If a DTC is set**

     Refer to Circuit/System Testing.

   - **If no DTC is set**
5. All OK.

Circuit/System Testing

Verify the conditions listed below do not exist:

- Air intake duct collapsed or restricted.
- Air filter dirty or restricted.
- Objects blocking the throttle body.
- Excessive fuel in the crankcase. Change engine oil as necessary.
- Rich fuel injectors. Refer to **Fuel Injector Solenoid Coil Test**.
- High fuel system pressure. Refer to **Fuel System Diagnosis**.
- Contaminated fuel. Refer to **Alcohol/Contaminants-in-Fuel Diagnosis**.
- Fuel saturation of the evaporative emissions (EVAP) canister
- EVAP purge valve stuck open or leaking
- Restricted exhaust
- Incorrect crankcase ventilation system operation. Refer to **Crankcase Ventilation System Inspection/Diagnosis**

- **If a condition is found**

  Repair as necessary.

- **If no condition is found**

  Test fuel trim cylinder balance. Refer to **DTC P219A or P219B**.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Perform the scan tool Fuel Trim Reset after completing the repair.

DTC P2097 OR P2099: POST CATALYST FUEL TRIM SYSTEM

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P2097

Post Catalyst Fuel Trim System High Limit Bank 1

DTC P2099

Post Catalyst Fuel Trim System High Limit Bank 2

Circuit Description

Fuel trim bias is used to keep the post catalyst air/fuel ratio within a predetermined range. This allows optimal catalyst efficiency under various operating conditions. The engine control module (ECM) constantly monitors how lean or rich the fuel trim bias is commanded, to determine if the fuel trim bias is greater than a calibrated amount.

Conditions for Running the DTC

Operating Conditions: The engine is operating at idle. **Parameter Normal Range:** APP Sensor 1 0.88-1.08 V			
APP Sensor 1 5 V Reference	0.00 V	0.00 V	2-3 V
APP Sensor 1 Signal	0.00 V	0.00 V	4-5 V
APP Sensor 1 Low Reference	-	4-5 V	-

APP Sensor 2

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: The engine is operating at idle. **Parameter Normal Range:** APP Sensor 2 0.39-0.59 V			
APP Sensor 2 5 V Reference	0.00 V	0.00 V	1-3 V
APP Sensor 2 Signal	0.00 V	0.00 V	2-5 V
APP Sensor 2 Low Reference	-	4-5 V	-

Circuit/System Description

The accelerator pedal assembly contains 2 accelerator pedal position (APP) sensors. The APP sensors are mounted to the accelerator pedal assembly and are not serviceable. The APP sensors provide a signal voltage that changes relative to pedal position. The engine control module (ECM) supplies each APP sensor with a 5 V reference circuit, a low reference circuit, and a signal circuit.

Both the APP sensors 1 and 2 signal percentages increase as the pedal is depressed, from approximately 0 percent at rest to above 95 percent when fully depressed.

Conditions for Running the DTC

P2122, P2123, P2127, or P2128

- DTC P06A3 or P0697 are not set.
- The ignition is ON or the engine is operating.
- The ignition voltage is greater than 6 V.
- The ECM is not commanding reduced power.
- The DTCs run continuously when the above conditions are met.

P2138

- DTCs P06A3, P0697, P2122, P2123, P2127, or P2128 are not set.
- The ignition is ON or the engine is operating.
- The ignition voltage is greater than 6 V.
- The ECM is not commanding reduced power.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P2122

The ECM detects that the APP sensor 1 voltage is less than 0.46 V for less than 1 s.

P2123

The ECM detects that the APP sensor 1 voltage is greater than 4.7 V for less than 1 s.

P2127

The ECM detects that the APP sensor 2 voltage is less than 0.32 V for less than 1 s.

P2128

The ECM detects that the APP sensor 2 voltage is greater than 2.6 V for less than 1 s.

P2138

The ECM detects that APP sensor 1 and APP sensor 2 disagree greater than 10 percent for less than 1 s.

OR

The ECM detects that both APP sensor 1 and APP sensor 2 are 5 percent greater than the learned minimum position for less than 1 s.

Action Taken When the DTC Sets

- DTCs P2122, P2123, P2127, P2128, and P2138 are type A DTCs.
- The ECM commands the TAC system to operate in a Reduced Engine Power mode.

Conditions for Clearing the DTC

DTCs P2122, P2123, P2127, P2128, and P2138 are type A DTCs.

Diagnostic Aids

- A high resistance condition on the accelerator pedal position circuits could cause a DTC to set.
- Ensure that the in-line harness connector seals are installed correctly. Improper installation could result in water intrusion into the connector and cause a DTC to set.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC P0697 or P06A3 is not set.
   - **If any of the DTCs are set**

     Refer to **DTC P0641, P0651, P0697, or P06A3 (ECM)** for further diagnosis.

   - **If none of the DTCs are set**
3. Verify the APP Sensor 1 Circuit Status and APP Sensor 2 Circuit Status displays OK.
   - **If Malfunction is displayed**

     Refer to Circuit/System Testing

   - **If OK is displayed**
4. Verify the scan tool APP Sensor 1 and 2 Agree/Disagree parameter displays Agree while performing the tests listed below:
   - Rapidly depress the accelerator pedal from the rest position to the wide open throttle position (WOT) and release pedal. Repeat the procedure several times.
   - Slowly depress the accelerator pedal to WOT and then slowly return the pedal to closed throttle. Repeat the procedure several times.
   - **If Disagree**

     Refer to Circuit/System Testing

   - **If Agree**
5. Verify that DTC P2122, P2123, P2127, P2128, or P2138 is not set.
   - **If any of the DTCs are set**

     Refer to Circuit/System Testing

   - **If none of the DTCs set**

6. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
7. Verify the DTC does not set.
    - **If the DTC sets**

      Refer to Circuit/System Testing

    - **If the DTC does not set**
8. All OK

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B107 accelerator pedal assembly. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 Ω between each low reference circuit terminal listed below and ground.
    - Low reference circuit terminal 4 or A
    - Low reference circuit terminal 5 or D
    - **If 5 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K20 engine control module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 engine control module.
    - **If less than 5 Ω**
3. Ignition ON.
4. Test for 4.8-5.2 V between each 5 V reference circuit terminal listed below and ground.
    - 5 V reference circuit terminal 1 or C
    - 5 V reference circuit terminal 2 or F
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the harness connector at the K20 engine control module.
    2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 engine control module.
    - **If greater than 5.2 V**
    1. Ignition OFF, disconnect the harness connector at the K20 engine control module, ignition ON.
    2. Test for less than 1 V between the 5 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 engine control module.
    - **If between 4.8-5.2 V**

5. Verify each APP sensor voltage parameter is less than 0.2 V.
    - **If 0.2 V or greater**
    1. Ignition OFF, disconnect the harness connector at the K20 engine control module, ignition ON.
    2. Test for less than 1 V between the signal circuit terminal listed below and ground.
    - APP sensor 1 signal circuit terminal 3 or E
    - APP sensor 2 signal circuit terminal 6 or B
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K20 engine control module.
    - **If less than 0.2 V**
6. Install a 3 A fused jumper wire between each signal circuit terminal listed below and the 5 V reference circuit terminal 1 or C.
    - APP sensor 1 signal circuit terminal 3 or E
    - APP sensor 2 signal circuit terminal 6 or B
7. Verify the scan tool APP sensor voltage parameter is greater than 4.8 V.
    - **If 4.8 V or less**
    1. Ignition OFF, disconnect the harness connector at the K20 engine control module.
    2. Test for infinite resistance between the signal circuit terminal and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 engine control module.
    - **If greater than 4.8 V**
8. Test or replace the B107 accelerator pedal assembly.

Circuit/System Description

The engine control module (ECM) supplies voltage to each fuel injector on the high control circuits. The ECM energizes each fuel injector by grounding the low control circuit of the fuel injector. The ECM monitors the status of the fuel injector circuits. When a fuel injector circuit condition is detected by the ECM, the affected fuel injector(s) is disabled.

Conditions for Running the DTC

- The engine is running.
- The ignition voltage is between 11-18 V.
- The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

P2147, P2150, P2153, P2156, P216B, or P216E

The engine control module detects the fuel injector high voltage supply circuit is shorted to ground for greater than 2 s.

P2148, P2151, P2154, P2157, P216C, or P216F

The engine control module detects the fuel injector high voltage supply circuit is shorted to voltage for greater than 2 s.

Action Taken When the DTC Sets

DTCs P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, and P216F are Type A DTCs.

Conditions for Clearing the DTC

DTCs P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, and P216F are Type A DTCs.

Diagnostic Aids

- Performing the fuel injector coil test may help isolate an intermittent condition. Refer to **Fuel Injector Solenoid Coil Test**.
- If the condition is intermittent, move the related harnesses and connectors, with the engine operating, while monitoring the scan tool Injector Control Circuit Status parameters. An Injector Control Circuit Status parameter will change from OK or Not Run to Malfunction if there is a condition with the circuit or a connection.

    - **If the DTC is set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If the DTC does not set**
3. Engine idling.
4. Verify the scan tool Cylinder 1-6 Injector Control Circuit Status parameters display OK.

- **If OK is not displayed**

  Refer to Circuit/System Testing.

- **If OK is displayed**

5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify DTC P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, or P216F does not set.
   - **If any DTC sets**

     Refer to Circuit/System Testing.

   - **If no DTC sets**
7. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the appropriate multi-way harness connector X160 or X161, at the rear of the intake manifold, ignition ON. It may take up to 2 min for all vehicle systems to power down.
2. Verify the scan tool Cylinder 1-6 Injector Control Circuit Status parameters display Open.
   - **If Open is not displayed**
   1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.

      NOTE: **Test on the Engine Control Module side of the multi-way harness connector.**

   2. Test for infinite resistance between the appropriate Q17 Fuel Injector low control circuit and ground.
      - If less than infinite, repair the short to ground on the circuit.
      - If infinite resistance
   3. Ignition ON.
   4. Test for less than 1 V between the Q17 Fuel Injector low control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, test or replace the K20 Engine Control Module.
   - **If Open is displayed**
3. Ignition ON, connect a test lamp between the Q17 Fuel Injector high control circuit and low control circuit.
4. Verify the appropriate Cylinder 1-6 Injector Control Circuit Status transitions from Open to OK.
   - **If OK is not displayed**
   1. Ignition OFF, remove the test lamp, disconnect the X3 harness connector at the K20 Engine Control Module.
   2. Test for less than 2 Ω on the Q17 Fuel Injector high control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω

3. Test for less than 2 Ω on the Q17 Fuel Injector low control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, test or replace the K20 Engine Control Module.

- **If OK is displayed**

NOTE: **Testing for the following steps is performed on the fuel injector side of the multi-way harness connector. It may be necessary to remove the intake manifold to isolate the condition.**

5. Test for 2-3 Ω between the appropriate Q17 Fuel Injector high control circuit and low control circuit.
    - **If less than 2 Ω**
    1. Disconnect the harness connector at the Q17 Fuel Injector.
    2. Test for infinite resistance between the Q17 Fuel Injector high control circuit and low control circuit.
        - If less than infinite, repair the short between the circuits.
        - If infinite resistance, test or replace the Q17 Fuel Injector.
    - **If greater than 3 Ω**
    1. Disconnect the harness connector at the Q17 Fuel Injector.
    2. Test for less the 2 Ω in the Q17 Fuel Injector high control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω
    3. Test for less the 2 Ω in the Q17 Fuel Injector low control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, test or replace the Q17 Fuel Injector.
    - **If between 2-3 Ω**
6. Test for infinite resistance between the Q17 Fuel Injector low control circuit and ground.
    - **If less than infinite resistance**
    1. Disconnect the harness connector at the Q17 Fuel Injector.
    2. Test for infinite resistance between the Q17 Fuel Injector high control circuit and ground.
        - If less than infinite, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for infinite resistance between the Q17 Fuel Injector low control circuit and ground.
        - If less than infinite, repair the short to ground on the circuit.
        - If infinite resistance, test or replace the Q17 Fuel Injector.
    - **If infinite resistance**
7. Ignition ON.
8. Test for less than 1 V between the Q17 Fuel Injector low control circuit and ground.
    - **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

9. All OK.

Component Testing

- **Fuel Injector Solenoid Coil Test**
- **Fuel Injector Balance Test**

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Fuel Injector Replacement**
- **Control Module References** for K20 Engine Control Module replacement, programming, and setup

DTC P2199: INTAKE AIR TEMPERATURE (IAT) SENSORS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P2199

Intake Air Temperature (IAT) Sensors 1-2 Not Plausible

Diagnostic Fault Information

IAT 1 Sensor

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P0112, P0114, P2199	P0111, P0113, P0114, P2199	P0113, P0114, P2199*	P0111, P2199
Low Reference	-	P0111, P0113, P0114, P2199, P2227, P2228, P2229	P0113, P0114, P2199, P2227, P2229*	-
*Internal ECM or sensor damage may occur if the circuit is shorted to B+.				

IAT Sensor 2

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition Voltage	P0096, P0097, P00F4, P0102,	P0096, P0097, P00F4, P0101,	P0690	P0096, P0101, P0103

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

*Internal ECM or sensor damage may occur if the circuit is shorted to B+.				

Typical Scan Tool Data

IAT 1 Sensor

Circuit	Short to Ground	Open or High Resistance	Short to Voltage
Operating Conditions: Engine Running **Parameter Normal Range:** Varies with ambient temperature; and engine bay conditions			
Signal	150Â°C (302Â°F)	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)*
Low Reference	-	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)*
*Internal ECM or sensor damage may occur if the circuit is shorted to B+			

IAT Sensor 2

Circuit	Short to Ground	Open or High Resistance	Short to Voltage
Operating Conditions: Engine Running **Parameter Normal Range:** Varies with ambient temperature			
Ignition Voltage	-40Â°C (-40Â°F) 10 Hz	-40Â°C (-40Â°F) 10 Hz	-
Signal	-40Â°C (-40Â°F) 10 Hz	-40Â°C (-40Â°F) 10 Hz	-40Â°C (-40Â°F)* 10 Hz
Ground	-	-40Â°C (-40Â°F) 10 Hz	-
*Internal ECM or sensor damage may occur if the circuit is shorted to B+.			

Circuit/System Description

The sensors listed below are integrated within the mass air flow/multifunction intake air sensor:

- IAT sensor 1
- IAT sensor 2
- Humidity sensor

- MAF sensor
- BARO pressure sensor

The intake air temperature (IAT) sensor 1 is a variable resistor that changes the voltage on the engine control module (ECM) supplied 5 V signal circuit. The signal varies with inlet air temperature in the sensor bore and is displayed by the scan tool as Â°C (Â°F). The IAT sensor 2 and the humidity sensor share the same circuit. The IAT sensor 2 signal is displayed by the scan tool as Hertz (Hz) and Â°C (Â°F).

The sensors listed below share an ECM supplied 5 V reference circuit:

- IAT sensor 2
- Humidity sensor
- Barometric pressure (BARO) sensor

The sensors listed below share an ECM supplied low reference circuit:

- IAT sensor 1
- IAT sensor 2
- Humidity sensor
- Barometric pressure (BARO) sensor

IAT Sensor 1 - Temperature, Resistance, Voltage Table

IAT Sensor 1	IAT Sensor 1 Resistance	IAT Sensor 1 Signal Voltage
Cold	High	High
Warm	Low	Low

IAT Sensor 2 - Temperature, Frequency Table

IAT Sensor 2	IAT Sensor 2 Frequency	IAT Sensor 2 Temperature
Cold	45 Hz	-40Â°C (-40Â°F)
Warm	302 Hz	104Â°C (219Â°F)

Conditions for Running the DTC

- DTC P1682 is not set.
- The ignition is ON.
- Ignition voltage is at least 11 V.
- This DTC runs continuously within the enabling conditions.

Conditions for Setting the DTC

The ECM detects that the absolute difference between the IAT sensor 1 and the IAT sensor 2 temperatures is greater than 55Â°C (99Â°F) for longer than 5 s.

Action Taken When the DTC Sets

DTC P2199 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P2199 is a Type B DTC.

Diagnostic Aids

- With the ignition ON, the engine OFF and the engine is cold, a properly functioning IAT sensor 2 will gradually increase the scan tool IAT Sensor 2 parameter. This is due to the heat that is generated by the multifunction intake air sensor heating elements.
- The humidity sensor and the IAT sensor 2 signals are sent to the ECM on the same circuit. If the IAT Sensor 2 parameter displays the values: 10 Hz; -40Â°C (-40Â°F), and there are Humidity Sensor DTCs, check for a circuit problem.

Special Tools

EL-38522-A Variable Signal Generator

For equivalent regional tools, refer to **Special Tools (Diagnostic Tools)** **Special Tools (Repair Tools)** .

Circuit/System Verification

NOTE: **To minimize the effects of residual engine heat and sensor internal heating elements, perform Steps 1 and 2 of this verification procedure only if the ignition has been OFF for 8 hours or more.**

1. Ignition ON.
2. Verify the following scan tool parameters are within 55Â°C (99Â°F) of each other.
    - Start-Up IAT Sensor 1
    - IAT Sensor 2
    - Start-Up ECT
    - **If not within 55Â°C (99Â°F)**

      Refer to Circuit/System Testing.

    - **If within 55Â°C (99Â°F)**
3. Engine idling, verify the following scan tool parameters are between: -38 and +149Â°C (-36 and +300Â°F).
    - IAT Sensor 1
    - IAT Sensor 2
    - ECT Sensor
    - **If not between: -38 and +149Â°C (-36 and +300Â°F)**

      Refer to Circuit System Testing.

    - **If between: -38 and +149Â°C (-36 and +300Â°F)**
4. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.
5. Verify the DTC does not set.
    - **If the DTC sets.**

      Refer to Circuit/System Testing.

    - **If the DTC does not set.**
6. All OK

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.**

1. Verify none of the following conditions exist:
    - A restricted or collapsed air intake duct
    - An intake manifold leak
    - A MAP sensor seal that is leaking, missing, or damaged
    - A misaligned or damaged air intake duct
    - Any water intrusion in the induction system
    - An Intake Manifold Resonator with a leaking seal, or a cracked or broken housing
    - **If a condition exists**

Repair or replace the component as appropriate.

- **If no condition exists**

2. Ignition OFF and all systems OFF, it may take up to for 2 minutes for all vehicle systems to power down. Disconnect the harness connector at the B75C Multifunction Intake Air sensor.
3. Test for less than 2 Ω between the low reference circuit terminal 3 and ground.
    - **If 2 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open or high resistance in the circuit.
        - If less than 2 Ω replace the K20 Engine Control Module.
    - **If less than 2 Ω**
4. Ignition OFF, all vehicle systems OFF, test for less than 2 Ω between the ground circuit terminal 7 and ground.
    - **If 2 Ω or greater**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open or high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 2 Ω**
5. Ignition ON, verify that a test lamp illuminates between the ignition circuit terminal 5 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition OFF, remove the test lamp and remove the fuse for the ignition voltage circuit.
    2. Test for less than 2 Ω in the ignition voltage circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition OFF, remove the test lamp and remove the fuse for the ignition voltage circuit.
    2. Test for infinite resistance between the ignition voltage circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, test all components connected to the ignition circuit, replace as necessary.
    - **If a test lamp illuminates**
6. Ignition ON, test for 4.8-5.2 V between the intake air temperature signal 1 circuit terminal 1 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K20 Engine Control Module.
- **If greater than 5.2 V**

NOTE: **If the signal circuit is shorted to a voltage the engine control module or the sensor may be damaged.**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Ignition ON, test for less than 1 V between the signal circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K20 Engine Control Module.
- **If between 4.8-5.2 V**

7. Ignition ON, verify the scan tool IAT Sensor 1 parameter is colder than -39Â°C (-38Â°F).
    - **If warmer than -39Â°C (-38Â°F).**
    1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
    2. Test for infinite resistance between the signal circuit terminal 1 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If colder than -39Â°C (-38Â°F).**
8. Ignition OFF, install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 3.
9. Verify the scan tool IAT Sensor 3 parameter is warmer than 150Â°C (302Â°F).
    - **If colder than 150Â°C (302Â°F).**
    1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Ignition OFF.
    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If warmer than 150Â°C (302Â°F).**
10. Ignition ON, test for 4.8-5.2 V between the Intake Air Temperature sensor 2 signal circuit terminal 8 and ground.
    - **If less than 4.8 V**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the signal circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K20 Engine Control Module.

- **If greater than 5.2 V**

NOTE: **If the signal circuit is shorted to a voltage the engine control module or the sensor may be damaged.**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Ignition ON, test for less than 1 V between the signal circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K20 Engine Control Module.

- **If between 4.8-5.2 V**

11. Determine if **EL-38522-A** Variable Signal Generator or equivalent is available.
    - **EL-38522-A, Variable Signal Generator; or equivalent is not available**
    1. Test or replace the B75C Multifunction Intake Air sensor.
    2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.
    3. Verify the DTC does not set.
        - **If the DTC sets**

          Replace the K20 Engine Control Module.

        - **If the DTC does not set**
    4. All OK.
    - **EL-38522-A, Variable Signal Generator; or equivalent is available**
12. Ignition OFF, connect the leads of the **EL-38522-A** Variable Signal Generator as follows:
    - Red lead to the signal circuit terminal 8 at the harness connector
    - Black leads to ground
    - Battery voltage supply lead to B+
13. Set the **EL-38522-A** Variable Signal Generator to the following specifications.
    - Signal switch to 5 V
    - Duty Cycle switch to 50 % (Normal)
    - Frequency switch to 30 Hz
14. Ignition ON, verify the scan tool IAT Sensor 2 parameter is between 28-32 Hz.
    - **If not between 28-32 Hz**

Replace the K20 Engine Control Module.

- **If between 28-32 Hz**

15. Test or replace the B75C Multifunction Intake Air sensor.

Component Testing

Multifunction Intake Air Sensor

1. Ignition OFF, disconnect the harness connector at the B75C Multifunction Intake Air sensor.

NOTE: A thermometer can be used to test the sensor off the vehicle.

2. Test the IAT sensor 1 by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the **Temperature Versus Resistance - Intake Air Temperature Sensor (Hitachi Sensor)** table for Hitachi Sensors. The resistance values should be in range of the table values.
   - **If not within the table values.**

     Replace the B75C Multifunction Intake Air sensor.

   - **If within the table values.**
3. All OK

Multifunction Intake Air Sensor

1. Test the IAT Sensor 2 by varying the sensor temperature while monitoring the air temperature with a thermometer. Compare the readings with the scan tool IAT Sensor 2 parameter. The values should be within 5%.
   - **If not within 5%**

     Replace the B75C Multifunction Intake Air sensor.

   - **If within 5%**
2. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Mass Airflow Sensor with Intake Air Temperature Sensor Replacement** for multifunction intake air sensor replacement.
- **Control Module References** for engine control module replacement, programming, and setup

DTC P219A OR P219B: FUEL TRIM CYLINDER BALANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P219A

Fuel Trim Cylinder Balance Bank 1

DTC P219B

Fuel Trim Cylinder Balance Bank 2

Circuit/System Description

The Fuel Trim Cylinder Balance diagnostic detects a rich or lean cylinder to cylinder air/fuel ratio imbalance in each bank. The diagnostic monitors the pre-catalyst heated oxygen sensor (HO2S) signal's frequency and amplitude characteristics by calculating an accumulated voltage over a predetermined sample period. An imbalance is indicated when multiple samples of the accumulated voltage are consistently higher than the desired value.

Conditions for Running the DTC

- DTCs P0016, P0017, P0018, P0019, P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0116, P0117, P0118, P0119, P0122, P0123, P0128, P0201-P0206, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P0300, P0301-P0306, P0340, P0341, P0345, P0346, P0365, P0366, P0390, P0391, P0442, P0455, P0458, P0496, P1248, P1249, P124A, P124B, P124C, P124D, P16A0, P16A1, P16A2, P16F3, P2101, P2135, P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, or P216F are not set.
- The EVAP device controls and intrusive diagnostics are not active .
- The secondary air injection reaction pump is not on, if equipped.
- The engine overspeed protection is not active.
- Engine run time is greater than 30 s.
- The engine is in Closed Loop status for greater than 5 s.
- The fuel level is greater than 10% and no fuel level sensor fault is present.
- The system voltage is greater than 11 V.
- The engine coolant temperature (ECT) is warmer than -20Â°C (-4Â°F).
- The engine speed is between 1,600-4,000 RPM.
- The mass air flow is between 0-1,000 g/s.
- DTCs P219A and P219B run continuously when the above conditions have been met.

Conditions for Setting the DTC

Multiple samples of the pre-catalyst HO2S accumulated voltage are consistently greater than the desired value.

Action Taken When the DTC Sets

DTCs P219A and P219B are Type A DTCs.

Conditions for Clearing the MIL/DTC

DTCs P219A and P219B are Type A DTCs.

Diagnostic Aids

- The fuel trim cylinder balance diagnostic is very sensitive to heated oxygen sensor (HO2S) design. A non-OE sensor or an incorrect part number may cause a DTC to set.
- Monitoring the misfire current counters, or misfire graph, may help to isolate the cylinder that is causing the condition.
- Certain aftermarket air filters may cause a DTC to set.
- Certain aftermarket air induction systems or modifications to the air induction system may cause a DTC to set.
- Certain aftermarket exhaust system components may cause a DTC to set.

Circuit/System Verification

1. Ignition ON.
2. Verify no other DTCs are set.
    - **If any other DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.

- **If no other DTCs are set**

3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed in the Freeze Frame/Failure Records data.
4. Verify DTC P219A or P219B is not set.
   - **If a DTC is set**

     Refer to Circuit/System Testing.

   - **If no DTC is set**
5. All OK.

Circuit/System Testing

1. Engine idling, transmission in Park or Neutral, verify the manifold absolute pressure (MAP) sensor parameter is between 20-48 kPa.
   - **If not within the specified range** .

     Refer to **DTC P0106** .

   - **If within the specified range**
2. Verify the conditions listed below do not exist:
   - Modified, damaged, leaking, or restricted air induction system components.
   - Vacuum leaks at the intake manifold, the throttle body, and the injector O-rings.
   - Improperly operating crankcase ventilation system. Refer to **Crankcase Ventilation System Inspection/Diagnosis** .
   - Split, kinked, or improperly connected vacuum hoses.
   - Restricted, damaged, leaking, or modified exhaust system from the catalytic converter forward. Refer to **Symptoms - Engine Exhaust** .
   - Improperly operating fuel injectors. Refer to **Fuel Injector Solenoid Coil Test**.
   - Fuel contamination. Refer to **Alcohol/Contaminants-in-Fuel Diagnosis**.
   - Excessive fuel in the crankcase due to leaking injectors. Change engine oil as necessary.
   - Improperly operating ignition system. Refer to **Electronic Ignition System Diagnosis**.
   - **If a condition is found**

     Repair as necessary.

   - **If no condition is found**
3. Test the engine for any mechanical conditions such as sticking valves, lifters, etc., which could alter the flow into the combustion chamber. Refer to **Symptoms - Engine Mechanical** .

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Perform the scan tool Fuel Trim Reset after completing the repair.

DTC P2227-P2230: BAROMETRIC PRESSURE (BARO) SENSO

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Operating Conditions: Ignition On, Engine Off **Parameter Normal Range:** 56-105 kPa (8.1-15.2 psi), varies with altitude			
5 V Reference	0 kPa (0 psi)	0 kPa (0 psi)	128 kPa (18.6 psi)
Signal	0 kPa (0 psi)	0 kPa (0 psi)	128 kPa (18.6 psi)

Circuit	Short to Ground	Open	Short to Voltage
Low Reference	-	128 kPa (18.6 psi)	-

Circuit/System Description

The barometric pressure (BARO) sensor is integral to the multifunction intake air sensor and responds to changes in altitude and atmospheric conditions. This gives the ECM an indication of barometric pressure. The ECM uses this information to calculate fuel delivery. The BARO sensor provides a voltage signal to the ECM relative to the atmospheric pressure changes. The ECM monitors the BARO sensor signal for a voltage outside of the normal range.

Conditions for Running the DTC

P2227

- DTC P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0117, P0118, P0119, P0121, P0122, P0123, P0222, P0223, P2101, P2135, P2228, or P2229 is not set.
- The engine is running.

OR

- DTC P0106, P0107, P0108, P2228, P2229, P2230, or P2610 is not set and P0107, P0108, P2228, or P2229 is not pending.
- Ignition On, engine Off
- The time between the current ignition cycle and the last time the engine was running is greater than 7 min.
- DTC P2227 runs continuously when the above conditions are met.

P2228 or P2229

- The engine is running.
- The DTCs run continuously when the above condition is met .

P2230

- DTC P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0117, P0118, P0119, P0121, P0122, P0123, P0222, P0223, P2101, P2135, P2228, or P2229 is not set.
- The ignition is On.
- DTC P2230 runs continuously when the above conditions are met.

Conditions for Setting the DTC

P2227

- The engine is running.
- The ECM detects that the difference between the BARO signal and the calculated BARO is greater than

15 kPa (2.2 psi) if the vehicle has traveled at most 2.0 km (1.2 mi) since the last calculated BARO update, or the ECM detects that the difference between the BARO signal and the calculated BARO is greater than 20 kPa (2.9 psi) if the vehicle has traveled greater than 2.0 km (1.2 mi) since the last calculated BARO update.

OR

- Ignition On, engine Off
- The ECM detects that the BARO pressure is less than 50 kPa (7.3 psi) or greater than 115 kPa (16.7 psi).

P2228

The ECM detects that the BARO sensor voltage is less than 2.0 V for greater than 4 s.

P2229

The ECM detects that the BARO sensor voltage is greater than 4.5 V for greater than 4 s.

P2230

The ECM detects that the cumulative difference between BARO sensor readings, over a specific length of time, is greater than a calibrated threshold.

Action Taken When the DTC Sets

DTCs P2227, P2228, P2229, and P2230 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P2227, P2228, P2229, and P2230 are Type B DTCs.

Diagnostic Aids

Inspect the inlet port on the BARO sensor for moisture or debris and attempt to dry or clean the inlet, if contaminated.

Circuit/System Verification

1. Ignition On.
2. Verify DTC P0106, P0107, P0108, or P0697 is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If none of the DTCs are set**
3. Verify the scan tool MAP Sensor parameter is within the range specified in the **Altitude Versus Barometric Pressure (With LFX)** table.
   - **If not within the specified range**

     Refer to **DTC P0106** .

   - **If within the specified range**
4. Verify the scan tool BARO pressure parameter is within the range specified in the **Altitude Versus Barometric Pressure (With LFX)** table.
   - **If not within the specified range**

     Refer to Circuit/System Testing.

   - **If within the specified range**
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed in the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
   - **If the DTC sets**

     Refer to Circuit/System Testing.

   - **If the DTC does not set**
7. All OK.

Circuit/System Testing

1. Verify the conditions listed below do not exist with the B75C Multifunction Intake Air Sensor:
   - Damage
   - Restrictions in the inlet port

- **If a condition exists**

  Repair or replace the B75C Multifunction Intake Air Sensor as necessary.

- **If none of the conditions exist**

2. Ignition Off, and all vehicle systems Off, it may take up to 2 minutes for all vehicle systems to power down. Disconnect the harness connector at the B75C Multifunction Intake Air Sensor.
3. Test for less than 5 Ω between the low reference circuit terminal 3 and ground.
   - **If 5 Ω or greater**
   1. Ignition Off, disconnect the harness connector at the K20 Engine Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If greater than the specified value, repair the open or high resistance in the circuit.
      - If 2 Ω or less replace the K20 Engine Control Module.
   - **If less than 5 Ω**
4. Ignition On.
5. Test for 4.8-5.2 V between the 5 V reference circuit terminal 2 and ground.
   - **If less than 4.8 V**
   1. Ignition Off, disconnect the harness connector at the K20 Engine Control Module.
   2. Test for infinite resistance between the 5 V reference circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the 5 V reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K20 Engine Control Module.
   - **If greater than 5.2 V**
   1. Ignition Off, disconnect the harness connector at the K20 Engine Control Module, ignition On.
   2. Test for less than 1 V between the 5 V reference circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K20 Engine Control Module.
   - **If between 4.8-5.2 V**
6. Verify the scan tool BARO Sensor parameter is less than 0.2 V.
   - **If 0.2 V or greater**
   1. Ignition Off, disconnect the harness connector at the K20 Engine Control Module, ignition On.
   2. Test for less than 1 V between the signal circuit terminal 4 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K20 Engine Control Module.
   - **If less than 0.2 V**
7. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the 5 V reference circuit terminal 2.
8. Verify the scan tool BARO Sensor parameter is greater than 4.5 V.

- **If 4.5 V or less**

1. Ignition Off, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the signal circuit terminal 4 and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K20 Engine Control Module.

- **If greater than 4.5 V**

9. Test or replace the B75C Multifunction Intake Air Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Mass Airflow Sensor with Intake Air Temperature Sensor Replacement** for multifunction intake air sensor replacement
- **Control Module References** for engine control module replacement, programming, and setup

DTC P2269: WATER IN FUEL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P2269

Water in Fuel

Circuit/System Description

Alcohol content information is supplied to the engine control module from the fuel composition sensor. The fuel composition sensor has a battery positive circuit, a signal circuit, and a ground circuit. The fuel composition sensor uses a microprocessor inside the sensor to measure the ethanol percentage and changes the output signal accordingly. The signal circuit carries the ethanol percentage via the frequency signal. The ECM provides an internal pull up to 5 V on the signal circuit, and the fuel composition sensor pulls the 5 V to ground in pulses. The normal range of operating frequency is between 50-150 Hz. The microprocessor inside the sensor is capable of a certain amount of self-diagnosis. An output frequency between 180 Hz and 190 Hz indicates that the fuel is contaminated.

Conditions for Running the DTC

- The ignition voltage is greater than 11 V.

- The DTC runs continuously when the above condition is met.

Conditions for Setting the DTC

The engine control module detects that the fuel composition sensor output frequency is greater than 185 Hz for greater than 6 s.

Action Taken When the DTC Sets

DTC P2269 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P2269 is a Type B DTC.

Diagnostic Aids

A momentary slug of water in the fuel system may set this DTC.

Special Tools

- **CH 44175-A** Alcohol Tester Kit
- **EL 38522-A** Variable Signal Generator

For equivalent regional tools, Refer to **Special Tools (Diagnostic Tools)** **Special Tools (Repair Tools)**

Circuit/System Verification

1. Engine running, verify the scan tool Fuel Composition Sensor parameter is between 50-150 Hz.
    - **If not between 50-150 Hz**

      Refer to Circuit/System Testing.

    - **If between 50-150 Hz**
2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
3. Verify the DTC does not set.
    - **If DTC is set**

      Refer to Circuit/System Testing.

    - **If DTC is not set**
4. All OK.

Circuit/System Testing

1. Verify that there are no contaminants, water, or too high of a concentration of ethanol in the fuel. Refer to **Alcohol/Contaminants-in-Fuel Diagnosis** and the **CH 44175-A** Instruction Manual.
    - **If the fuel tested is not within acceptable levels**

      Refer to **Fuel System Cleaning**

    - **If the fuel tested is within acceptable levels**
2. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B198 Fuel Composition Sensor. It may take up to 2 minutes for all vehicle systems to power down.
3. Test for less than 5 Ω between the ground circuit terminal 2 and ground.
    - **If 5 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the ground connection.
    - **If less than 5 Ω**
4. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal 1 and ground.
    - **If the test lamp does not illuminate and the fuse is not opened**
    1. Ignition OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is good and voltage is supplied to the fuse.
    - **If the test lamp does not illuminate and the fuse is opened**
    1. Ignition OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground

- If less than infinite, repair the short to ground in the circuit.
- If infinite, test all the components connected to the circuit, and repair or replace as necessary.

- **If the test lamp illuminates**

5. Ignition ON, test for 4.8-5.2 V between the signal circuit terminal 3 and ground.
   - **If less than 4.8 V**
   1. Ignition OFF, disconnect the harness connector X1 at the K20 Engine Control Module.
   2. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, test or replace the K20 Engine Control Module.
   - **If greater than 5.2 V**
   1. Ignition OFF, disconnect the harness connector X1 at the K20 Engine Control Module, ignition ON.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, test or replace the K20 Engine Control Module.
   - **If within 4.8-5.2 V**
6. Ignition OFF, connect the red lead of the **EL 38522-A** Variable Signal Generator to the signal circuit terminal 3 at the B198 Fuel Composition Sensor harness connector. Connect the battery voltage supply to B+, and the black lead to ground.
7. Set the **EL 38522-A** Variable Signal Generator Signal to 5 V, the Frequency to 60 Hz, and the Duty Cycle to Normal.
8. Ignition ON.
9. Clear the DTCs with a scan tool.
10. Verify the scan tool Fuel Composition Sensor parameter is at 60 Hz.
    - **If not 60 Hz**

      Test or replace the K20 Engine Control Module.

    - **If 60 Hz**
11. Test or replace the B198 Fuel Composition Sensor.

Component Testing

1. Test the fuel composition using the **CH 44175-A** Alcohol Tester Kit and the CH 44175-A Instruction Manual. Record the frequency.
2. Compare the special tool test frequency and the scan tool Fuel Composition Sensor frequency parameter.
3. Verify the difference between the tool and the sensor is 12 Hz or less.
   - **If greater than the specified value**

     Replace the B198 Fuel Composition Sensor.

   - **If less than the specified value**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Flexible Fuel Sensor Replacement**
- **Fuel System Cleaning**
- **Control Module References** for K20 Engine Control Module replacement, programming, and setup.

DTC P2544: TRANSMISSION TORQUE REQUEST SIGNAL MESSAGE COUNTER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for a overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P2544

Transmission Torque Request Signal Message Counter Incorrect

Circuit/System Description

To improve shift feel, the transmission control module (TCM) is constantly sending the engine control module (ECM) serial data messages with requests to modify engine speed or torque. These serial data messages are sent through two circuits which are part of a communication network called the controller area network (CAN). The ECM sets DTC P2544 when it detects a discrepancy in the structure of the message causing the integrity of the message to be questioned.

Conditions for Running the DTC

- The engine run time is greater than 0.5 s.
- No other CAN errors are present.

Conditions for Setting the DTC

The ECM detects that the engine speed and torque modification messages from the TCM are either corrupted or intermittently missing for greater than 4 s.

Action Taken When the DTC Sets

- DTC P2544 is a Type B DTC.
- The TCM commands maximum line pressure during shifts, which results in harsh shifts.
- The TCM freezes adaptive functions.

Conditions for Clearing the DTC

DTC P2544 is a Type B DTC.

Diagnostic Aids

An intermittent fault in the CAN circuits will cause the ECM to set DTC P2544.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

NOTE:

- **DTC P2544 is an informational DTC.**
- **Diagnose all other engine control module DTCs prior to DTC P2544.**

1. Verify that no other DTCs are set except for DTC P2544.
   - **If any other DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If only DTC P2544 is set**
2. Replace the K71 Transmission Control Module.
3. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.
4. Verify the DTC does not set.
   - **If DTC sets**

     Replace the K20 Engine Control Module.

   - **If DTC does not set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for ECM or TCM replacement, programming, and setup

DTC P2635: FUEL PUMP FLOW PERFORMANCE (CHASSIS CONTROL MODULE)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P2635

Fuel Pump Flow Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	P0231	P023F	P0232	P023F, P2635
Low Reference	-	P023F	-	P023F, P2635

Circuit/System Description

The engine control module (ECM) supplies voltage to the chassis control module when the ECM detects that the ignition is on. The voltage from the ECM to the chassis control module remains active for two seconds, unless the engine is in crank or run. While this voltage is being received, the chassis control module closes the ground switch of the fuel pump and also supplies a varying voltage to the fuel tank pump module in order to maintain the desired fuel line pressure.

Conditions for Running the DTC

- DTC P018B, P018C, P018D, P0231, P0232, P023F, P064A, P1255 or P06A6 are not active.
- DTC P0641 has not failed this ignition cycle.
- Fuel pump control is enabled and the fuel pump control state is normal.
- The system voltage is greater than 11 V.
- The engine has been running for more than 30 seconds.
- Low fuel level warning not present.

Conditions for Setting the DTC

This DTC sets when the chassis control module detects a predetermined fuel pressure performance degradation between the desired fuel pressure and the current fuel pressure.

Action Taken When the DTC Sets

DTC P2635 is a Type B DTC.

Conditions for Clearing the DTC

DTC P2635 is a Type B DTC.

Diagnostic Aids

Using the failure records data may help locate an intermittent condition. If you cannot duplicate the DTC, the information in the failure records can help determine how many miles since the DTC set. The fail counter and pass counter can help determine how many ignition cycles that the diagnostic test reported a pass and/or a fail.

On vehicles equipped with a high pressure mechanical pump on direct injection engines, the vehicle may continue to run even though the pump in the fuel tank is not operating.

Control Module References for scan tool information

Circuit/System Testing

NOTE: **Do not replace the chassis control module based on a history DTC P2635. The DTC P2635 may be stored but that does not indicate a failure of the chassis control module. Refer to Strategy Based Diagnosis for further history DTC diagnostics.**

1. Ignition ON.
2. Verify DTC P018B, P018C, P018D, P0231, P0232 or P023F is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If none of the DTCs are set**
3. Verify the proper fuel system pressure. Perform the fuel system pressure test, refer to **Fuel System Diagnosis**.
   - **If the fuel system pressure test is not normal**

     Replace the A7 Fuel Pump and Level Sensor Assembly.

   - **If the fuel system pressure test is normal**
4. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the A7 Fuel Pump and Level Sensor Assembly. It may take up to 2 minutes for all vehicle systems to power down.
5. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.

- **If 10 Ω or greater**

1. Ignition OFF, disconnect the harness connector at the K38 Chassis Control Module.
2. Test for less than 2 Ω in the low reference circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the K38 Chassis Control Module.

- **If less than 10 Ω**

6. Connect a test lamp between the control circuit terminal 1 and the low reference circuit terminal 2.
7. Ignition ON.
8. Verify the test lamp turns On and Off when commanding the fuel pump On and Off using the scan tool ECM fuel pump enable control function.
    - **If the test lamp is always Off**

    1. Ignition OFF, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.

    - **If the test lamp is always On**

    1. Ignition OFF, disconnect the harness connector at the K38 Chassis Control Module, ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K38 Chassis Control Module.

    - **If the test lamp turns On and Off**

9. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for chassis control module replacement, programming, and setup.

SYMPTOMS - ENGINE CONTROLS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Symptoms Description

Symptoms covers conditions that are not covered by DTCs. Certain conditions can cause multiple symptoms.

These conditions are listed together under Symptoms Testing. Conditions that may only cause specific symptoms are listed separately under Additional Symptoms Testing. Perform the Symptoms Testing before using the Additional Symptoms Testing.

Symptoms Definition

Backfire

The fuel ignites in the intake manifold or in the exhaust system, making a loud popping noise.

Cuts Out, Misses

A steady pulsation or jerking that follows engine speed, which is usually more pronounced as the engine load increases. This condition is not normally felt above 1,500 RPM or 48 km/h (30 mph). The exhaust has a steady spitting sound at idle or at low speed.

Engine Control Module (ECM) Commanded Reduced Engine Power

The ECM illuminates the Reduced Engine Power lamp and will limit engine power under potential engine/vehicle damaging or emissions related conditions. A DTC may not be set.

Detonation/Spark Knock

A mild to severe ping which usually occurs worse while under acceleration. The engine makes sharp metallic knocks that change with throttle opening.

Dieseling, Run-On

The engine continues to run after the key is turned OFF, but runs very rough.

Fuel Odor

A noticeable smell of unburned fuel.

Hard Start

The engine cranks OK, but does not start for a long time. The vehicle does eventually run, or may start but immediately stall.

Hesitation, Sag, Stumble

A momentary lack of response as the accelerator is pushed down. This condition can occur at any vehicle speed. This condition is usually more pronounced when first trying to make the vehicle move, as from a stop. This condition may cause the engine to stall in severe conditions.

Lack of Power, Sluggishness, or Sponginess

The engine delivers less than expected power. Little or no increase in vehicle speed when the accelerator pedal is pushed down part way.

Poor Fuel Economy

Fuel economy, as measured by an actual road test, is noticeably lower than expected. Also, the fuel economy is noticeably lower than it was on this vehicle at one time, as previously shown by an actual road test.

Rough, Unstable, or Incorrect Idle and Stalling

The engine runs unevenly at idle. If severe, the engine or the vehicle may shake. Engine idle speed may vary. Either condition may be severe enough to stall the engine.

Surges/Chuggles

An engine power variation under steady throttle or cruise. Feels like the vehicle speeds up and slows down with no change in the accelerator pedal position.

Symptoms Verification

Before using the Symptom tables, perform the following verifications:

- Verify that the malfunction indicator lamp (MIL) is operating correctly. Use the scan tool to command the lamp ON and OFF.
- Verify there are no DTCs that are stored.
- Verify that the scan tool data is within a normal operating range. Refer to **Control Module References** for scan tool information.
- Verify the customer concern.
- Perform the Visual/Physical Inspection in this section. The visual/physical inspection is extremely important, and can lead to correcting a condition without additional testing. It may also help reveal the cause of an intermittent condition.

Identifying Intermittent Conditions

Many intermittent conditions occur with harness or connector movement due to engine torque, rough pavement, vibration or physical movements of a component. Refer to the following for a list of issues that may cause an intermittent condition:

- Moisture and water intrusion in connectors, terminals, and components
- Incomplete connector mating
- Poor terminal contact
- High circuit or component resistance-High resistance can include any resistance, regardless of the amount, which can interrupt the operation of the component.
- Wiring harness that is too short or tight
- Wire insulation that is chaffed or cut
- High or low ambient temperature
- High or low engine coolant temperatures
- High underhood temperatures
- Heat build up in component or circuit due to circuit resistance, poor terminal contact, or high electrical load

- High or low system voltage
- High vehicle load conditions
- Rough road surfaces
- Electro-magnetic interference (EMI)/circuit interference from relays, solenoids or other electrical surge
- Incorrect installation of aftermarket, add on accessories

Visual/Physical Check

- Verify that the control module grounds are clean, tight, and correctly located.
- Verify that the vacuum hoses are not split or kinked, and are properly connected.
- Verify that the air filter is clean and free from restrictions.
- Verify that there is no water intrusion in connectors terminals and components.
- Inspect the air intake ducts for the conditions listed below:
    - Collapsed
    - Damaged areas
    - Looseness
    - Incorrect installation
    - Leaking

      If any condition listed above has allowed non-metered air to enter the air induction system, the **Q38 Throttle Body: Throttle/Idle Learn** procedure must be performed after the repair is complete.
- Inspect for air leaks at the throttle body mounting area, the mass air flow (MAF) sensor and intake manifold sealing surfaces.
- Inspect the wiring harness for the following conditions:
    - Poor connections
    - Pinches
    - Cuts
- Inspect for loose, damaged, unseated, or missing sensors/components.
- Inspect the terminals for corrosion and correct contact.

Symptoms Testing

Backfire, Cuts Out/Misses, Detonation/Spark Knock, Dieseling/Run-On, Engine Control Module (ECM) Commanded Reduced Engine Power, Hard Start, Hesitation/Sag/Stumble, Lack of Power/Sluggishness /Sponginess, Poor Fuel Economy, Rough, Unstable, or Incorrect Idle and Stalling, or Surges/Chuggles

- Test/inspect the fuel system for the conditions listed below:
    - Incorrect system operation or fuel pressure-Refer to **Fuel System Diagnosis**.
    - Leaking or incorrectly operating fuel injectors-Refer to **Fuel Injector Solenoid Coil Test**.
    - Contaminated or poor quality fuel-Refer to **Alcohol/Contaminants-in-Fuel Diagnosis**.
- Test/inspect the ignition system for the conditions listed below:
    - Spark plugs with incorrect heat range or an abnormal condition-Refer to **Spark Plug Inspection** ,

and **Ignition System Specifications** .

- Coolant or oil fouled spark plugs-Refer to **Coolant in Combustion Chamber** , or **Oil Consumption Diagnosis** for diagnosis.
- Secondary ignition system susceptible to moisture. Wet down the secondary ignition system with water from a spray bottle to help locate damaged or deteriorated components. Engine running, look/listen for arcing or misfiring as the water is applied.
- Weak spark using the **J 26792** HEI spark tester -Refer to **Electronic Ignition System Diagnosis**.

- Test/inspect for the conditions listed below:
  - Non-metered air flow into the air induction system. If a leak is found, repair as necessary. The **Q38 Throttle Body: Throttle/Idle Learn** procedure must be performed when the repair is complete.
  - Incorrectly operating transmission torque converter clutch (TCC) - The scan tool should indicate an engine speed drop when the TCC is commanded ON. Refer to **Torque Converter Diagnosis** .
  - Incorrectly operating A/C compressor
  - An engine that runs lean or rich-Observe the Fuel Trim parameters with a scan tool.
  - Slow responding heated oxygen sensors (HO2S)-The HO2S should respond quickly to different throttle positions.

    CAUTION: Refer to Heated Oxygen and Oxygen Sensor Caution .

  - Water intrusion in the HO2S connector

    NOTE: The embossed arrows on the mass air flow (MAF) sensor indicate the direction of the intake air flow. The arrows must point toward the engine.

  - Incorrect mass air flow (MAF) sensor installation. A MAF sensor that is incorrectly installed may cause a hard start. Install the MAF in the correct direction. Refer to **Mass Airflow Sensor with Intake Air Temperature Sensor Replacement** .
  - Incorrect MAF sensor connections.
  - Engine oil contaminated by fuel
  - Split or kinked vacuum hoses-Verify that the routing and connections are correct.
  - Excessive knock sensor system spark retard activity-Observe the scan tool Knock Retard parameter for activity greater than 0Â°.
  - Electromagnetic interference (EMI) on reference circuits, which can cause a misfire condition. You can usually detect EMI with a scan tool by monitoring the engine speed parameter. A sudden increase in the engine speed parameter with little change in actual engine speed indicates that EMI is present. Inspect the high voltage components near the ignition control circuit if a condition exists.
  - Incorrectly operating crankcase ventilation valve-Refer to **Crankcase Ventilation System Inspection/Diagnosis** .
  - A stuck open evaporative emission (EVAP) canister purge solenoid.
  - A crankshaft position (CKP) sensor with an intermittent condition-Observe the scan tool Crankshaft Position Resync Counter parameter. The parameter should remain at 0 during all operating conditions, and when moving the related harnesses and connectors between the

crankshaft position sensor and the ECM.

- Test/inspect the engine cooling system for the conditions listed below:
  - A thermostat with an incorrect heat range-Refer to **Thermostat Diagnosis** .
  - Incorrect engine coolant level-If the level is low, refer to **Loss of Coolant** .

  For additional information, refer to **Symptoms - Engine Cooling**

- Test/inspect the exhaust system components for the conditions listed below:
  - Physical damage or possible internal failure
  - Restricted three-way catalytic converters

  For more information, refer to **Symptoms - Engine Exhaust** .

- Test/inspect the engine for the mechanical conditions listed below:
  - Excessive oil in the combustion chamber or leaking valve seals
  - Oil consumption
  - Incorrect cylinder compression
  - Sticking or leaking valves
  - Worn camshaft lobes
  - Incorrect valve timing
  - Worn rocker arms
  - Broken valve springs
  - Excessive carbon buildup in the combustion chambers-Clean the chambers with Top Engine Cleaner, if necessary. Follow the instructions on the can.
  - Incorrect engine parts

  For additional information, refer to **Symptoms - Engine Mechanical**

- If the above conditions do not address the symptom, refer to the additional symptoms tests.

Additional Symptoms Tests

Detonation/Spark Knock

- Test for an engine overheating condition. Refer to **Engine Overheating** .
- Verify that the engine coolant temperature (ECT) has not shifted in value. Allow the engine to run and reach operating temperature. Observe the ECT Sensor parameter with a scan tool and compare the reading to that parameter listed on the **K20 Engine Control Module: Scan Tool Information** , list. If the reading is not in the range specified in the list, test the resistance of the ECT sensor. Refer to **Temperature Versus Resistance - Engine Coolant Temperature Sensor** , for resistance specifications. Replace the ECT sensor if the resistance is not within specification. Refer to **Engine Coolant Temperature Sensor Replacement** . If the sensor is within the specification, test the ECT sensor circuits for high resistance.
- Inspect for excessive carbon buildup in the combustion chambers. Clean the chambers with Top Engine Cleaner, if necessary. Follow the instructions on the can.

- If there are no engine mechanical faults, fill the fuel tank with a known high quality fuel that meets the vehicle minimum octane requirements.

Engine Control Module (ECM) Commanded Reduced Engine Power

Under certain conditions the engine control module may limit engine power by reducing engine torque and, for some vehicles, fuel pressure as well. For most, but not all of the conditions, the engine control module will illuminate the reduced engine power lamp on the instrument cluster. If equipped with the driver information center feature, a reduced engine power message may be displayed as well. A DTC may not be set.

A repair may not be necessary. Observe the scan tool Reduced Engine Power History parameter or refer to **K20 Engine Control Module: Scan Tool Information** to determine the reason for the reduced engine power event.

Verify or inspect for the following:

- Vehicle being operated at sustained high engine speeds, or, towing heavy loads up an incline for an extended period of time, which may cause the engine oil or coolant to overheat. Inspect the airflow passageways in front of the engine for obstructions and clear away any debris or foreign material that is found. If no obstructions are found, review approved driving habits with the customer. The customer may need to operate the vehicle at a higher engine speed to improve cooling system performance, or, at a slower engine speed to reduce engine load.
- A cooling fan condition which may cause the ECM to reduce engine power. Refer to **Cooling Fan Description and Operation** , and **Cooling System Description and Operation** to verify correct operation of the cooling fan.
- Temporarily reduced engine power. Under extremely cold ambient temperatures some SIDI equipped vehicles may experience ECM commanded reduced engine power for a few minutes during engine warm-up. This would be a normal condition, noticeable only at wide open throttle, and the reduced engine power lamp would not be illuminated.
- Fuel temperature out of range too high.
- A high pressure fuel system condition. Refer to **Fuel System Diagnosis**, and **Fuel System Description** to verify high pressure fuel system pressure and operation.
- Intake air temperature out of range too high. Engine running, observe the scan tool IAT sensor parameter. The readings should be between -40Â° C and +149Â° C (-40Â° F and +300Â° F. Refer to **DTC P0112, P0113, or P0114** for additional information.
- Reduced engine power due to OnStarÂ® remote command. Verify the vehicle is not in the OnStarÂ® initiated Stolen Vehicle Slowdown mode. Refer to **OnStar Stolen Vehicle Slowdown Active** , and **Remote Vehicle Speed Limiting Description and Operation** for additional information.
- If equipped with MH7 (6T45) or MHH (6T40) automatic transmission, an incorrect learned brake pedal position (BPP) sensor. Verify the following actions have not occurred:
    - An engine control module has been replaced
    - A BPP sensor that has been replaced
    - A BPP sensor is misaligned or incorrectly installed

      If any of the above actions have occurred, the **Brake Pedal Position Sensor Learn** procedure must be performed.

Fuel Odor

- Inspect for leaking, damaged, or deteriorated fuel lines.
- Inspect for a saturated EVAP canister-Refer to **Evaporative Emission Control System Description** .
- Inspect for a condition with the internal components of the fuel tank assembly-Refer to **Fuel System Description** .

Hard Start

- Observe the scan tool Throttle Body Idle Airflow Compensation parameter. A value greater than 90% may indicate an excessive accumulation of deposits in the throttle bore. Inspect the throttle body and clean, if necessary. Refer to **Throttle Body Inspection and Cleaning** .
- Test the engine coolant temperature (ECT) sensor. Compare the ECT sensor value to the intake air temperature (IAT) sensor value on a cold engine. The ECT and IAT sensor values should be within Â± 3Â°C (5Â°F). If the ECT sensor is out of range with the IAT sensor, test the resistance of the ECT sensor. Refer to **Temperature Versus Resistance - Engine Coolant Temperature Sensor** , for resistance specifications. Replace the ECT sensor if the resistance is not within specification. Refer to **Engine Coolant Temperature Sensor Replacement** . If the sensor is within the specification, test the ECT sensor circuits for high resistance.
- Verify that the fuel system has adequate pressure for engine start-up. Observe the scan tool Fuel Pressure Sensor parameter and refer to **Fuel System Diagnosis** for correct pressure specifications.
- Inspect for excessive crankshaft endplay that will cause the crankshaft position (CKP) sensor reluctor wheel to move out of alignment with the CKP sensor. Refer to **Crankshaft and Bearing Cleaning and Inspection** , and **Engine Mechanical Specifications** .

Hesitation, Sag, Stumble

- Test the fuel pressure. Refer to **Fuel System Diagnosis**.
- Inspect the mass air flow (MAF) sensor for obstruction, contamination, and damage. Refer to **Mass Airflow Sensor with Intake Air Temperature Sensor Replacement** .
- Test the generator. Refer to **Symptoms - Engine Electrical** . Repair the charging system if the generator output voltage is less than 9 volts or more than 16 volts.
- Verify that each injector harness is connected to the correct injector.
- Inspect for excessive crankshaft endplay that will cause the crankshaft position (CKP) sensor reluctor wheel to move out of alignment with the CKP sensor. Refer to **Crankshaft and Bearing Cleaning and Inspection** , and **Engine Mechanical Specifications** .
- Test the manifold absolute pressure (MAP) sensor. Refer to **DTC P0106** .

NOTE: **The following actions may need to be repeated in order to verify an intermittent intake or exhaust camshaft actuator condition.**

- Engine warm and idling, verify the correct operation of the camshaft actuator system. Command the intake and exhaust camshaft actuator for each cylinder bank from 0 degrees to 20 degrees and back to zero while observing the appropriate scan tool Intake Camshaft Position Variance and Exhaust Camshaft Position Variance parameters. Each parameter should be less than 2 degrees in each of the commanded states.

- If any of the parameters is greater than 2 degrees, inspect the suspect camshaft actuator and camshaft actuator solenoid valve and valve bore for contamination, obstruction, and damage. Refer to **Camshaft Timing Drive Components Cleaning and Inspection** , and **Camshaft Actuator System Description** for additional information.

Poor Fuel Economy

- Inspect for heavy loads being carried or towed
- Inspect for acceleration rate too much or too often
- Observe the scan tool Throttle Body Idle Airflow Compensation parameter. A value greater than 90% may indicate an excessive accumulation of deposits in the throttle bore. Inspect the throttle body and clean, if necessary. Refer to **Throttle Body Inspection and Cleaning** .
- Inspect the brake system for brake drag.
- Inspect for incorrect operation of the speedometer.
- Verify that the engine coolant temperature (ECT) has not shifted in value. Allow the engine to run and reach operating temperature. Observe the ECT Sensor parameter with a scan tool and compare the reading to the parameter listed in the **K20 Engine Control Module: Scan Tool Information** , list. If the reading is not in the range specified in the list, test the resistance of the ECT sensor. Refer to **Temperature Versus Resistance - Engine Coolant Temperature Sensor** , for resistance specifications. Replace the ECT sensor if the resistance is not within specification. Refer to **Engine Coolant Temperature Sensor Replacement** . If the sensor is within the specification, test the ECT sensor circuits for high resistance.
- Inspect the mass air flow (MAF) sensor for obstruction, contamination, and damage. Refer to **Mass Airflow Sensor with Intake Air Temperature Sensor Replacement** .

Rough, Unstable, or Incorrect Idle and Stalling

- An excessively high idle may be due to the floor mat interfering with the accelerator pedal. With this condition present, it may not be possible to shift the transmission into gear. Inspect the accelerator pedal for binding and verify that the floor mat is not interfering with the accelerator pedal movement.
- Engine idle speed may be unstable or the engine may stall if the ECM has learned an incorrect idle/airflow compensation value. A DTC may also set. Observe the scan tool Throttle Body Idle Airflow Compensation parameter. A value greater than 90% may indicate an excessive accumulation of deposits in the throttle bore. If the throttle body needs cleaning, refer to **Throttle Body Inspection and Cleaning** .

  The actions listed below may also cause the ECM to learn an incorrect idle value.

  - The engine control module has been replaced
  - The throttle body has been replaced
  - The throttle body has been cleaned but the idle learn procedure was not performed after completing the cleaning
  - The air induction system was leaking, allowing non-metered air to enter the combustion chamber. The leak was repaired but the idle learn procedure was not performed after repairing the leak

    If any of the actions listed above have occurred, the **Q38 Throttle Body: Throttle/Idle Learn** procedure must be performed.

- Inspect the mass air flow (MAF) sensor for obstruction, contamination, and damage. Refer to **Mass Airflow Sensor with Intake Air Temperature Sensor Replacement** .
- Inspect the engine mounts. Refer to **Engine Mount Inspection**
- Inspect the intake and exhaust manifolds for casting flash.

NOTE: **The ECM uses the bank 1 exhaust camshaft position sensor to determine camshaft to crankshaft relationship in order to control fuel injector and ignition system synchronization. If the bank 1 exhaust camshaft position sensor signal to the ECM is intermittent, a stalling condition will occur and a DTC will not set.**

- Inspect all bank 1 exhaust camshaft position sensor wiring for poor connections. Start the engine and observe for engine stalling while wiggling the bank 1 exhaust camshaft position sensor wiring harness. Refer to **Inducing Intermittent Fault Conditions** for further diagnosis.

Surges/Chuggles

- Inspect the mass air flow (MAF) sensor for obstruction, contamination, and damage. Refer to **Mass Airflow Sensor with Intake Air Temperature Sensor Replacement** .
- Inspect for slow responding heated oxygen sensors (HO2S). The HO2S should respond quickly to a change in throttle position. If the HO2S do not respond to different throttle positions, inspect for contamination from fuel, silicon, or the incorrect use of RTV sealant. The sensors may have a white powdery coating and result in a high, but false, signal voltage, which gives a rich exhaust indication. The PCM reduces the amount of fuel delivered to the engine, causing a driveability condition.
- Verify that each injector harness is connected to the correct injector.

POOR FUEL FILL QUALITY

Problem	Causes
DEFINITION: During the fueling process a continual, occasional, or no-fuel nozzle shut-off condition has occurred.	
Difficult to fill	• Fuel fill limiter vent valve stuck closed • Evaporative emission (EVAP) canister restricted • EVAP vent valve stuck closed • Hose between canister and canister vent solenoid twisted or kinked if applicable • High fuel temperature • Fuel filler hose is kinked • Faulty dispensing nozzle • Ignition switch ON, vent valve closed
Over fill	• Fill limiter vent valve stuck open or leaking • Fuel inlet check valve stuck open

Problem	Causes
Pre-mature shut-off of the fuel dispensing nozzle occurs immediately after engaging dispensing nozzle, tank empty	• Restricted vapor lines or fuel fill pipe • High fuel temperature • Inlet check valve at tank stuck closed, fill pipe full of fuel • Fuel tank full, gauge not accurate
Pre-mature shut-off of the fuel dispensing nozzle, more than 1/8 of tank capacity dispensed	• Kinked, pinched or plugged lines in fuel tank vent system • EVAP vent valve stuck closed or restricted • EVAP canister restricted • Fuel limiting vent valve stuck closed or obstruction at top of fuel tank
Fuel Spitback	• Restricted EVAP canister • High fuel temperature • Ignition switch ON, EVAP vent valve closed

MALFUNCTION INDICATOR LAMP (MIL) DIAGNOSIS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The malfunction indicator lamp (MIL) illuminates to inform the driver that an emission system fault has occurred and the powertrain control system requires service. Ignition voltage is supplied directly to the MIL. The engine control module (ECM) turns the MIL ON by grounding the MIL control circuit when the emission system fault occurs. Under normal operating conditions, the MIL should be ON only when the ignition is ON and the engine is OFF.

Diagnostic Aids

If the condition is intermittent, move the related harnesses and connectors while monitoring the scan tool MIL control circuit status parameters. Perform this test with the ignition ON and the engine OFF, and with the engine running. The MIL control circuit status parameters change from OK or Not Run to Malfunction if there is a condition with a circuit or a connection.

Circuit/System Verification

NOTE: Any MIL requesting DTCs that may be set should be diagnosed first.

1. Ignition ON.
2. Verify the parameters listed below do not display Malfunction when commanding the Malfunction Indicator Lamp On and Off with a scan tool.
    - The MIL Control Circuit Low Voltage Test Status
    - The MIL Control Circuit Open Test Status
    - The MIL Control Circuit High Voltage Test Status
    - **If Malfunction is displayed**

      Refer to Circuit/System Testing

    - **If Malfunction is not displayed**
3. Engine running.
4. Verify the parameters listed below do not display Malfunction when commanding the Malfunction Indicator Lamp On and Off with a scan tool.
    - The MIL Control Circuit Low Voltage Test Status
    - The MIL Control Circuit Open Test Status
    - The MIL Control Circuit High Voltage Test Status
    - **If Malfunction is displayed**

      Refer to Circuit/System Testing

    - **If Malfunction is not displayed**
5. Verify the malfunction indicator lamp turns ON and OFF when commanding the Malfunction Indicator Lamp On and Off with a scan tool.
    - **If the malfunction indicator lamp does not turn ON and OFF**

      Refer to Circuit/System Testing

- **If the malfunction indicator lamp turns ON and OFF**

6. All OK.

Circuit/System Testing

1. Ignition OFF.
2. Disconnect the X1 harness connector at the K20 Engine Control Module.
3. Ignition ON, verify the malfunction indicator lamp does not illuminate.
    - **If the malfunction indicator lamp illuminates**
    1. Test for infinite resistance between the control circuit terminal X1 46 and ground.
        - If less than infinite resistance, repair the short to ground in the circuit.
        - If infinite resistance, replace the P16 Instrument Cluster.
    - **If the malfunction indicator lamp does not illuminate**
4. Connect a 3 A fused jumper wire between the control circuit terminal X1 46 and ground.
5. Verify the malfunction indicator lamp illuminates.
    - **If the malfunction indicator lamp illuminates**

      Replace the K20 Engine Control Module.

    - **If the malfunction indicator lamp does not illuminate**
    1. Test for less than 1 V between the control circuit terminal X1 46 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    2. Ignition OFF.
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω.
6. Ignition OFF, disconnect the harness connector at the instrument cluster.
7. Ignition ON, verify a test lamp illuminates between the ignition voltage circuit terminal 20 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition OFF.
    2. Test for infinite resistance between the ignition voltage circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ignition voltage circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - **If the test lamp illuminates**
8. Replace the P16 Instrument Cluster.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Instrument Cluster Replacement**
- **Control Module References** for control module replacement. programming, and setup

ENGINE CRANKS BUT DOES NOT RUN

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

This Engine Cranks But Does Not Run diagnostic is an organized approach to identify a condition which causes the engine to crank but not start. This diagnostic directs the technician to the appropriate system diagnosis.

Diagnostic Aids

Inspect for any of the conditions listed below:

- If equipped with a key type ignition system, a partially retracted or folded over ignition key. When attempting to start the engine, the mechanical portion of the vehicle key must be locked in the fully extended position with the fob parallel to the key. Leaving the key partially retracted or folded over when starting may interrupt transponder authentication and result in an intermittent no-start condition. In such instances, DTC B3055 may also be set. If an intermittent no-start complaint is received, it may be necessary to discuss with the customer their starting habits and verify they are locking the key in the fully extended position, fob parallel to the key, before starting.
- A crankshaft position sensor condition. When this condition is present, the engine control module (ECM) uses the camshaft position sensors to determine engine speed and position. If the condition exists in the signal circuit of the sensor, the engine will go into a limp home mode after a hard restart. The ECM then calculates engine speed from one of the camshaft position sensors. However, the engine will operate with a crankshaft position sensor condition only if the ECM has stored the learned reference position of the camshafts in memory.
- An in-tank fuel pump condition. The fuel pump flow control module controls and monitors the operation of the in-tank fuel pump. If the fuel pump flow control module detects a fault, a DTC sets in the fuel pump flow control module. The fuel pump flow control module will then send a serial data message to the engine control module (ECM) requesting the illumination of the malfunction indicator lamp (MIL).
- Insufficient fuel. Thoroughly inspect the fuel delivery system for sufficient fuel volume to the fuel injectors. Inspect the fuel supply components for partial blockage or restrictions.
- Fuel injectors with partially blocked and restricted nozzles, or a malfunctioning solenoid. Refer to **Fuel Injector Solenoid Coil Test** for diagnosis.
- Fuel injector ON time inadequate. When this condition is present, there may be fuel spray at the fuel injectors and the indicated fuel pressure may be correct, yet there may not be enough fuel to start the engine. If the engine control module (ECM) receives incorrect inputs from the various information sensors, the fuel delivered by the fuel injectors may be inadequate to start the engine. Check all the engine data parameters with a scan tool and compare the values indicated with the expected values or the values

from a known good vehicle.

- Loose unsecured engine electrical grounds. Inspect the engine for good secure electrical grounds.
- Water or foreign material in the fuel, which can cause either a no start or a engine will not stay running condition. During freezing weather water can freeze inside the fuel system. The engine may start after 30 min in a heated repair shop. The malfunction may not recur until parked overnight in freezing temperatures. Extreme weather conditions can cause contaminated fuel to prevent the vehicle from starting.
- An ignition system that is susceptible to moisture. An engine that starts and runs after being brought into a warm, dry repair shop, may be susceptible to moisture. Spray water on the ignition system components and wiring while cranking the engine in order to check for an engine starting or will not stay running concern.

Circuit/System Verification

NOTE: **This diagnostic assumes the following:**

- **The battery is completely charged.**
- **The engine cranking speed is acceptable.**
- **There is adequate fuel in the fuel tank.**

1. Crank the engine for up tp 15 s.
2. Verify that DTC P0116, P0118, P0201-P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P0335, P0336, P0513, P0601, P0602, P0603-P0606, P062B, P0627, P0628, P0629, P0633, P069E, P1631, P1649, P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, P216F, or U0109 is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
   - **If none of the DTCs are set**
3. Ignition ON.
4. Verify the Security Indicator on the instrument cluster illuminates momentarily.
   - **If the security indicator stays ON or is flashing**

     Review the **Diagnostic Trouble Code (DTC) List - Vehicle** , for immobilizer system DTCs. For additional information, refer to **Immobilizer Description and Operation** .
   - **If the security indicator does not stay ON and is not flashing**
5. Verify the scan tool Engine Speed parameter displays greater than 0 RPM while cranking the engine.
   - **If 0 RPM**

     Refer to **DTC P0335 or P0336** .
   - **If greater than 0 RPM**

NOTE: **A MAF sensor circuit condition may cause an Engine Cranks But Does Not Run condition without setting a DTC.**

6. Verify that the scan tool Mass Airflow Sensor parameter displays greater than 0 Hz while cranking the engine.
   - **If 0 Hz**

     Refer to **DTC P0102 or P0103**
   - **If greater than 0 Hz**
7. Ignition OFF, connect the **J 26792** HEI Spark Tester between the spark plug boot of a T8 Ignition Coil and ground.

NOTE:
- **Perform the spark test on at least three of the cylinders.**
- **An erratic or weak spark is considered to be a no spark condition.**

8. Verify the spark tester sparks while cranking the engine.
   - **If the spark tester does not spark**

     Refer to **Electronic Ignition System Diagnosis**.
   - **If the spark tester sparks**

9. Ignition OFF, all accessories OFF.
10. Install a **CH-48027** Digital Pressure Gauge. Refer to **Fuel Pressure Gauge Installation and Removal**
11. Ignition ON, engine OFF

NOTE:

- **If the engine is too hot, high fuel pressure readings may result due to hot soak fuel boiling. Allow the engine coolant temperature to cool to less than 60Â° C (150Â° F) before attempting to verify fuel pressure.**
- **The Fuel Pump Enable may need to be commanded On a few times in order to obtain the highest possible fuel pressure.**
- **Additional DTCs may set when using the fuel pump output control.**

12. Command the Fuel Pump Enable ON several times with a scan tool.
13. Verify the fuel pressure is between 345-690 kPa (50-100 psi) while the fuel pump is running.
    - **If not within the specified range**

      Refer to **Fuel System Diagnosis**

    - **If within the specified range**

NOTE: **The fuel pressure may vary slightly when the fuel pump stops operating. After the fuel pump stops operating, the fuel pressure should stabilize and remain constant.**

14. Verify that the fuel pressure, after the fuel pump has turned OFF, decreases to 500-599 kPa (72-87 psi), and does not decrease greater than 34 kPa (5 psi) in 1 minute from that point.
    - **If not within the specified range**

      Refer to **Fuel System Diagnosis**

    - **If within the specified range**

NOTE: **Allow the vehicle to stabilize at an ambient temperature between 20-32Â° C (68-90Â° F) before performing the following step.**

15. Verify the Fuel Rail Pressure Sensor parameter is between 1.9-2.1 MPa (279-305 psi) while cranking the engine.
    - **If not within the specified range**

      Perform the Circuit/System Testing section of the **Fuel Injector Circuit Diagnosis**.

    - **If within the specified range**
16. Verify none of the conditions listed below exist:
    - Collapsed air intake duct to the throttle body
    - Restricted air filter element
    - Gas or coolant fouled spark plugs
    - A skewed engine coolant temperature (ECT) sensor-Refer to **Temperature Versus Resistance -**

Engine Coolant Temperature Sensor .

- Restricted exhaust system-Refer to **Restricted Exhaust** .
- Contaminated fuel-Refer to **Alcohol/Contaminants-in-Fuel Diagnosis**.
- An engine mechanical condition, for example, worn timing chain and gears, low compression-Refer to **Symptoms - Engine Mechanical** .
  - **If a condition exists**

    Repair as necessary.
  - **If no conditions exist**

17. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

FUEL SYSTEM DIAGNOSIS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The engine control module (ECM) supplies voltage to the fuel pump control module when the ECM detects that the ignition is ON. The voltage from the ECM to the fuel pump control module remains active for 2 s, unless the engine is in Crank or Run. While this voltage is being received, the fuel pump control module closes the ground switch of the fuel pump and also supplies a varying voltage to the fuel tank pump module in order to maintain the desired fuel rail pressure.

The fuel system is an electronic returnless on-demand design. A returnless fuel system reduces the internal temperature of the fuel tank by not returning hot fuel from the engine to the fuel tank. Reducing the internal temperature of the fuel tank results in lower evaporative emissions.

An electric turbine style fuel pump attaches to the primary fuel tank fuel pump module inside the fuel tank. The fuel pump supplies fuel through the fuel feed pipe to the high pressure fuel pump. The high pressure fuel pump supplies fuel to a variable-pressure fuel rail. Fuel enters the combustion chamber through precision multi-hole fuel injectors. The high pressure fuel pump, fuel rail pressure, fuel injection timing, and injection duration are controlled by the engine control module (ECM).

The primary fuel tank fuel pump module also contains a primary jet pump and a secondary jet pump. Fuel pump flow loss, caused by vapor expulsion in the pump inlet chamber, is diverted to the primary jet pump and the secondary jet pump through a restrictive orifice located on the pump cover. The primary jet pump fills the reservoir of the primary fuel tank fuel pump module. The secondary jet pump creates a venturi action which causes the fuel to be drawn from the secondary side of the fuel tank, through the fuel transfer pipe, to the primary side of the fuel tank.

Diagnostic Aids

Observe the Misfire Counters or perform the Fuel Injector Balance Test to help identify a leaking fuel injector.

Special Tools

J-37287-FF Fuel Line Shut-Off Adapter

For equivalent regional tools, refer to **Special Tools (Diagnostic Tools)** **Special Tools (Repair Tools)** .

Circuit/System Verification

NOTE:

- **Repair all fuel system related DTCs before performing this diagnostic.**
- **Inspect the fuel system for damage or external leaks before proceeding.**
- **Verify that adequate fuel is in the fuel tank before proceeding.**
- **The Fuel Pump Enable may need to be commanded On a few times in order to obtain the highest possible fuel pressure.**
- **DO NOT perform the Fuel System Diagnosis if the engine coolant temperature is above 60Â°C (150Â°F). High fuel pressure readings may result due to hot soak fuel boiling. With the engine OFF, the fuel pressure may increase beyond the pressure relief regulator valve's setting point of 690 kPa (100 PSI) Â± 5 percent.**

1. Ignition ON, engine OFF, command the Fuel Pump Enable On several times with a scan tool.
2. Verify the Chassis Control Module Fuel Pressure Sensor parameter is between 345-690 kPa (50-100 PSI) with the fuel pump running.
    - **If less than 345 kPa (50 PSI)**

      Refer to Circuit/System Testing - Fuel Pressure Low.

    - **If greater than 690 kPa (100 PSI)**

Replace the G12 Fuel Pump.

- **If between 345-690 kPa (50-100 PSI)**

NOTE: **The fuel pressure may vary slightly when the fuel pump stops operating. After the fuel pump stops operating, the fuel pressure should stabilize and remain constant.**

3. Verify that the Chassis Control Module Fuel Pressure Sensor parameter decreases to 500-599 kPa (72-87 PSI) after the fuel pump is turned off.
   - **If the fuel pressure does not decrease to 500-599 kPa (72-87 PSI)**

     Replace the G12 Fuel Pump.

   - **If the fuel pressure decreases to 500-599 kPa (72-87 PSI)**
4. Verify the Chassis Control Module Fuel Pressure Sensor parameter does not decrease greater than 34 kPa (5 PSI) in 1 min.
   - **If the fuel pressure decreases greater than 34 kPa (5 PSI)**

     Refer to Circuit/System Testing - Fuel Pressure Leaks Down.

   - **If the fuel pressure does not decrease greater than 34 kPa (5 PSI)**
5. Engine idling.
6. Verify that the Chassis Control Module Fuel Pressure Sensor parameter is between 300-400 kPa (43-58 PSI)
   - **If less than 300 kPa (43 PSI)**

     Refer to Circuit/System Testing - Fuel Pressure Low.

   - **If greater than 400 kPa (58 PSI)**

     Replace the G12 Fuel Pump.

7. Verify the scan tool Chassis Control Module Short Term Fuel Pump Trim and the Long Term Fuel Pump Trim when multiplied together are less than 1.5.
   - **If greater than 1.5**

     Refer to Circuit/System Testing - Fuel Pressure Low.

   - **If less than 1.5**

WARNING: **Road test a vehicle under safe conditions and while obeying all traffic laws. Do not attempt any maneuvers that could jeopardize vehicle control. Failure to adhere to these precautions could lead to serious personal injury and vehicle damage.**

8. Verify the scan tool Chassis Control Module Fuel Pressure Sensor and the Desired Fuel Pressure are within 45 kPa (6.5 PSI) at 300 kPa (43.5 PSI) request or 60 kPa (8.7 PSI) at 400 kPa (58 PSI) request of

each other while operating the vehicle through varying loads.

- **If greater than 45 kPa (6.5 PSI) / 60 kPa (8.7 PSI)**

  Refer to Circuit/System Testing - Fuel Pressure Drops OFF.

- **If less than 45 kPa (6.5 PSI) / 60 kPa (8.7 PSI)**

9. If the fuel system components test normal, refer to **Symptoms - Engine Controls**, **Fuel Injector Solenoid Coil Test**, and **Fuel Injector Balance Test**.

Circuit/System Testing

Fuel Pressure Low

1. Verify none of the conditions listed below exist:
   - Restricted fuel feed pipe
   - Restricted or plugged strainer
   - Inspect the harness connectors and the ground circuits of the fuel pump for poor connections.
   - **If a condition exist**

     Repair as necessary.

   - **If a condition does not exist**
2. Test or replace the G12 Fuel Pump.

Fuel Pressure Leaks Down

1. Ignition OFF, relieve the fuel pressure. Refer to **Fuel Pressure Relief (Without CH 48027)** **Fuel Pressure Relief (CH 48027)** **Fuel Pressure Relief (High Side)** .
2. Install the **EN-37287** Fuel Line Shut-Off Adapters between the fuel feed pipe and the fuel rail.
3. Open the valve on the **EN-37287** Fuel Line Shut-Off Adapters.
4. Ignition ON, command the Fuel Pump Enable On with a scan tool.
5. Close the valve on the **EN-37287** Fuel Line Shut-Off Adapters.
6. Verify the Chassis Control Module Fuel Rail Fuel Pressure parameter does not decrease greater than 34 kPa (5 PSI) in 1 min.
   - **If the fuel pressure drops**

     Replace the G12 Fuel Pump.

   - **If the fuel pressure does not drop**
7. Locate and replace the leaking Q17 Fuel Injector.

Fuel Pressure Drops OFF

1. Verify none of the conditions listed below exist:
   - Restricted fuel feed pipe
   - Restricted or plugged strainer

- Inspect the harness connectors and the ground circuits of the fuel pump for poor connections.
- **If a condition exist**

  Repair as necessary.

- **If a condition does not exist**

2. Test or replace the G12 Fuel Pump.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Fuel Feed Pipe Replacement**
- **Fuel Pump Fuel Feed Hose Replacement**
- **Fuel Injector Replacement**
- **Fuel Tank Fuel Pump Module Replacement** for G12 Fuel Pump replacement

FUEL INJECTOR SOLENOID COIL TEST

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The engine control module (ECM) supplies a separate high voltage supply circuit and a high voltage control circuit for each fuel injector. The fuel injector high voltage supply circuit and the high voltage control circuit are both controlled by the ECM. The ECM energizes each fuel injector by grounding the control circuit. The ECM controls each fuel injector with 65 V. This is controlled by a boost capacitor in the ECM. During the 65 V boost phase, the capacitor is discharged through a fuel injector, allowing for initial injector opening. The fuel injector is then held open with 12 V. A fuel injector coil winding resistance that is too high or too low will affect the engine driveability. The fuel injector coil windings are affected by temperature. The resistance of the fuel injector coil windings will increase as the temperature of the fuel injector increases.

Component Testing

NOTE:

- **The resistance test must be performed at the fuel injector or mis-diagnosis will occur.**
- **The DMM and test leads must be calibrated to 0 Ω in order to prevent mis-diagnosis.**

1. Ignition OFF, all vehicle system OFF, Disconnect the harness connector at the appropriate Q17 Fuel Injector. It may take up to 2 m for all vehicle systems to power down.
2. Test for 1.9-2.3 Ω at 18-23Â°C (65-75Â°F) between the high voltage supply circuit terminal 2 and the high voltage control circuit terminal 1 at the Q17 fuel injector.
   - **If not within the specified range**

     Replace the Q17 Fuel Injector.

   - **If within the specified range**
3. Test for infinite resistance between each terminal at the Q17 Fuel Injector and the Q17 Fuel Injector housing/case.
   - **If less than infinite resistance**

     Replace the Q17 Fuel Injector.

   - **If infinite resistance**
4. All OK, perform the Fuel Injector Balance Test.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Fuel Injector Replacement

FUEL INJECTOR BALANCE TEST

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit/System Description

Two methods of testing fuel injector balance are available, the Active Fuel Injector Tester (AFIT) or a scan tool. The Active Fuel Injector Tester and SIDI adaptor connects to the engine control module harness connectors to test the high pressure fuel pump performance, fuel injector wiring, and fuel injector operation. The AFIT displays step by step instructions to precisely determine pressure drop of each fuel injector. The scan tool fuel

injector balance test is performed while the engine is running at idle. The scan tool pressurizes the fuel rail to a predetermined pressure before each fuel injector is pulsed for a precise amount of time allowing a measured amount of the fuel to be injected. This causes a drop in the system fuel pressure that is recorded and used to compare each fuel injector.

Diagnostic Aids

- Monitoring the Current Misfire Counters may help to isolate the fuel injector that is causing the condition.
- Operating the vehicle over a wide temperature range may help isolate the fuel injector that is causing the condition.

For equivalent regional tools, refer to **Special Tools (Diagnostic Tools)** **Special Tools (Repair Tools)**

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Fuel Remaining parameter is greater than 10%.
   - **If the Fuel Remaining parameter is less than 10%** , add fuel to the fuel tank.
   - **If the Fuel Remaining parameter is 10% or greater**
3. Verify the scan tool ECT Sensor parameter is less than 60Â°C (140Â°F).
   - **If the ECT Sensor parameter is greater than 60Â°C (140Â°F)** , allow the engine temperature to cool.
   - **If the ECT Sensor parameter is 60Â°C (140Â°F) or less**
4. Verify the battery is fully charged and all accessories are Off.
   - **If the battery is not fully charged** , charge or repair battery as necessary.

- **If the battery is fully charged**

5. Preform the appropriate Fuel Injector Balance Test in Circuit System Testing.

Circuit System Testing

Fuel Injector Balance Test with Active Fuel Injector Tester

1. Ignition OFF, all vehicle systems OFF. Install the **CH-47976** Active Fuel Injector Tester and the **CH-47976-500** Active Fuel Injection Tester (AFIT) SIDI Adapter Kit , refer to the Active Fuel Injector Tester User Guide. It may take up to 2 minutes for all vehicle systems to power down.
2. Turn ON the Active Fuel Injector Tester and select the vehicle.
3. Ignition ON, perform the Injector Test with the Active Fuel Injector Tester.
   - **If the Active Fuel Injector Tester aborts testing due to fuel pressure or fuel leak down**

     Refer to **Fuel System Diagnosis**.

   - **If the Active Fuel Injector Tester does not abort testing**
4. Compare the test results with the appropriate recommended tolerance.
   - **If any fuel injector exceeds the recommended tolerance**

     Replace the appropriate Q17 Fuel Injector(s).

   - **If all fuel injectors are within the recommended tolerance**
5. Perform **Fuel Injector Circuit Diagnosis**.

Fuel Injector Balance Test with Scan Tool

1. Ignition ON.
2. Command the Fuel Pump Enable ON with a scan tool.
3. Verify the fuel pressure is between 345-690 kPa (50-100 PSI) with the fuel pump running.
   - **If not within 345-690 kPa (50-100 PSI)**

     Refer to **Fuel System Diagnosis**.

   - **If within 345-690 kPa (50-100 PSI)**

NOTE: **The fuel pressure may vary slightly when the fuel pump stops operating. After the fuel pump stops operating, the fuel pressure should stabilize and remain constant.**

4. Verify the fuel pressure does not decrease greater than 34 kPa (5 PSI) within 1 minute.
   - **If greater than the specified value**

     Refer to **Fuel System Diagnosis**.

   - **If less than the specified value**
5. Engine idling.

6. Verify the scan tool Fuel Rail Pressure Sensor 1 parameter is between 1.9-5.0 MPa (276-725 PSI).
    - **If not between 1.9-5.0 MPa (276-725 PSI)**

      Refer to **Fuel System Diagnosis**.

    - **If between 1.9-5.0 MPa (276-725 PSI)**

NOTE: **The engine speed must be between 600-1,000 RPM to perform this test.**

7. Select the Fuel Injector Balance function within the Control Functions menu of a scan tool.
8. Select and test a Q17 Fuel Injector. Repeat for each Q17 Fuel Injector.
9. Obtain and record a pressure drop value for each Q17 Fuel Injector.
10. Add all of the individual pressure drop values except for the fuel injector suspected of being faulty. This is the total pressure drop.
11. Divide the total pressure drop by the number of fuel injectors that were added together. This is the average pressure drop.
12. Multiply the average pressure drop by 0.20. This is the acceptable variance from the average pressure drop, 20%.
13. Verify the difference between any individual pressure drop and the average pressure drop is not greater than the acceptable variance.
    - **If greater than the acceptable variance**

      Replace the Q17 Fuel Injector.

    - **If within the acceptable variance**
14. Perform **Fuel Injector Circuit Diagnosis**.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Circuit/System Description

The engine control module (ECM) supplies voltage to each fuel injector on the injector high voltage supply circuits. The ECM energizes each fuel injector by grounding the high voltage control circuit of the fuel injector. The ECM monitors the status of the injector high voltage supply circuits and the injector high voltage control circuits. When a fuel injector circuit condition is detected by the ECM, the affected fuel injector(s) is disabled.

Diagnostic Aids

- Performing the fuel injector coil test may help isolate an intermittent condition. Refer to **Fuel Injector Solenoid Coil Test**.
- If the condition is intermittent, move the related harnesses and connectors, with the engine operating, while monitoring the scan tool Injector Control Circuit Status parameters. An Injector Control Circuit Status parameter will change from OK or Not Run to Malfunction if there is a condition with the circuit or a connection.

Control Module References for scan tool information

Circuit/System Verification

NOTE: **Do Not perform this procedure unless directed here from the Fuel Injector Balance Test.**

1. Engine idling.
2. Verify the scan tool Cylinder 1-6 Current Misfire Counter parameters do not increment.
    - **If the Cylinder 1-6 Current Misfire Counters increment**

      Refer to Circuit/System Testing.

    - **If the Cylinder 1-6 Current Misfire Counters do not increment**
3. Verify the scan tool Cylinder 1-6 Injector Control Circuit Status parameters display OK.
    - **If the Cylinder 1-6 Injector Control Circuit Status parameters do not display OK**

      Refer to Circuit/System Testing.

    - **If the Cylinder 1-6 Injector Control Circuit Status parameters display OK**
4. All OK.

Circuit/System Testing

1. Ignition OFF, all vehicle systems OFF. Disconnect the X3 harness connector at the K20 Engine Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for infinite resistance between the appropriate Q17 Fuel Injector control + circuit and ground.
    - **If less than infinite resistance**
    1. Disconnect the harness connector of the Q17 Fuel Injector.
    2. Test for infinite resistance between the Q17 Fuel Injector control + circuit and ground.
        - If infinite resistance
    3. Test for infinite resistance between the Q17 Fuel Injector control - circuit and ground.
        - If less than infinite, repair the short to ground in the circuit.
        - If infinite, replace the Q17 Fuel Injector.
    - **If infinite resistance**
3. Ignition ON.
4. Test for less than 1 V between the Q17 Fuel Injector control + circuit and ground.
    - **If 1 V or greater**
    1. Disconnect the harness connector of the Q17 Fuel Injector, ignition ON.
    2. Test for less than 1 V between the Q17 Fuel Injector control + circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, repair the short to voltage on the control - circuit.
    - **If less than 1 V**
5. Ignition OFF.
6. Test for less than 3 Ω between the Q17 Fuel Injector control + circuit and control - circuit.
    - **If 3 Ω or greater**

1. Disconnect the harness connector of the Q17 Fuel Injector.
2. Test for less than 2 Ω on the control + circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω
3. Test for less than 2 Ω on the control - circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the Q17 Fuel Injector.

- **If less than 3 Ω**

7. Replace the K20 Engine Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Fuel Injector Replacement**
- **Control Module References** for K20 Engine Control Module replacement, programming, and setup

ALCOHOL/CONTAMINANTS-IN-FUEL DIAGNOSIS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

Water contamination in the fuel system may cause driveability conditions such as hesitation, stalling, no start, or misfires in one or more cylinders. Water may collect near a single fuel injector at the lowest point in the fuel injection system and cause a misfire in that cylinder. If the fuel system is contaminated with water, inspect the fuel system components for rust or deterioration.

Ethanol concentrations of greater than 10% in non-blended gasoline or greater than 85% with E85 blended gasoline for flexible fuel applications can cause driveability conditions such as hesitation, lack of power, stalling, or no start. Excessive concentrations of ethanol used in vehicles not designed for it may cause fuel system corrosion, deterioration of rubber components, and fuel filter restriction.

Reference Information

Special Tools

CH 44175-A Alcohol Tester Kit , if available

For equivalent regional tools, refer to **Special Tools (Diagnostic Tools)** **Special Tools (Repair Tools)** .

Circuit/System Verification

1. Remove a sample of fuel from the bottom of the fuel tank and place in a clean, clear container.

2. Place the sample on a level surface for 2 minutes.
3. Verify the sample is clear and bright in color.
    - **If the sample appears cloudy, or contaminated with water, as indicated by a water layer at the bottom of the sample**

      Refer to Circuit/System Testing - Particulate Contaminants in Fuel.

    - **If alcohol contamination is suspected**

      Refer to Circuit/System Testing - Alcohol in Fuel Testing.

    - **If the sample remains clear and bright**
4. All OK.

Circuit/System Testing

Alcohol in Fuel Testing with Special Tool, If Available

1. Test the fuel composition using **CH 44175-A** and Instruction Manual.
2. Verify no water appears in the fuel sample.
    - **If water appears in the fuel sample**

      Clean the fuel system.

    - **If no water appears in the fuel sample**
3. Subtract 50 from the reading on the DMM in order to obtain the percentage of alcohol in the fuel sample.
4. Verify the non-blended gasoline fuel sample does not measure greater than 15% or an E85 blended gasoline fuel sample does not measure greater than 91% ethanol.
    - **If greater than the specified value**
    1. Add fresh regular gasoline to the vehicle's fuel tank.
    2. Remove a new sample of fuel from the tank.
    3. Test the fuel composition using **CH 44175-A** and Instruction Manual.
    4. Subtract 50 from the reading on the DMM in order to obtain the percentage of alcohol in the fuel sample.
    5. Verify the non-blended gasoline fuel sample does not measure greater than 15% or an E85 blended gasoline fuel sample does not measure greater than 91% ethanol.
        - If additional testing indicates that the ethanol percentage is still above 15% for a non-blended gasoline sample, drain and replace the vehicle's fuel. Refer to **Fuel Tank Draining (E-85)** .
        - If additional testing indicates that the E85 blended gasoline sample still measures above 91%, continue adding fresh, regular gasoline until the ethanol content is 85% or less.
    - **If the specified value or less**
5. All OK.

Alcohol in Fuel Testing without Special Tool

NOTE: **This procedure is for non-blended gasoline only. If excessive alcohol content is suspected with E85 fuel add 15% tank volume of fresh, regular gasoline to the fuel tank.**

1. Using a 100 ml (3.38 oz) specified cylinder with 1 ml (0.034 oz) graduation marks, fill the cylinder with fuel to the 90 ml (3.04 oz) mark.
2. Add 10 ml (0.34 oz) of water in order to bring the total fluid volume to 100 ml (3.38 oz) and install a stopper.
3. Shake the cylinder vigorously for 10-15 seconds.
4. Carefully loosen the stopper in order to release the pressure.
5. Re-install the stopper and shake the cylinder vigorously again for 10-15 seconds.
6. Put the cylinder on a level surface for approximately 5 minutes to allow adequate liquid separation. If alcohol is present in the fuel, the volume of the lower layer, which would now contain both alcohol and water, will be more than 10 ml (0.34 oz). For example, if the volume of the lower layer is increased to 15 ml (0.51 oz), this indicates at least 5% alcohol in the fuel. The actual amount of alcohol may be somewhat more because this procedure does not extract all of the alcohol from the fuel.
7. Verify the non-blended gasoline fuel sample does not measure greater than 15%.
    - **If greater than the specified value**
    1. Add fresh regular gasoline to the vehicle's fuel tank.
    2. Remove a new sample of fuel from the tank.
    3. Test the fuel composition of the new sample.
    4. Verify the non-blended gasoline fuel sample does not measure greater than 15% .
        - If greater than the specified value, drain and replace the vehicle's fuel. Refer to **Fuel Tank Draining (E-85)** .
        - If the specified value or less, all OK.
    - **If the specified value or less**
8. All OK.

Particulate Contaminants in Fuel

1. Using an approved fuel container, draw approximately 0.5 liter (0.53 qt) of fuel from the bottom of the fuel tank.
2. Place the container on a level surface for approximately 5 minutes in order to allow settling of the particulate contamination. Particulate contamination will show up in various shapes and colors. Sand will typically be identified by a white or light brown crystals. Rubber will appear as black and irregular particles.
3. Verify there are no physical contaminants or water present in the fuel sample.
    - **If any physical contaminants or water are present**

      Clean the fuel system.

    - **If no physical contaminants or water are present**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Fuel System Cleaning**
- **Fuel Tank Draining (E-85)**

EVAPORATIVE EMISSION SYSTEM DIAGNOSIS

Special Tools

EN 41413-VLV EVAP Service Port Vent Fitting

Operating Instructions for the Evaporative Emission System Tester

Vehicle Setup

WARNING: **Refer to Fuel and Evaporative Emission Pipe Warning .**

CAUTION: **Refer to Clean, Dry, Low Pressure Gas Source Caution .**

NOTE: **When servicing the evaporative emission (EVAP) system, test pressure must not exceed 13 in H20 (0.5 PSI) as pressure in excess of this could cause system components to perform inaccurately.**

NOTE: **A large difference between the vehicle temperature and shop temperature will seriously affect the accuracy of the tests. Always allow at least 15 min for the vehicle temperature to adjust to the shop temperature. Refer to Temperature Variation Instructions for more information about vehicle versus shop temperatures.**

1. Engine OFF, open the hood. Position a large fan to blow air under the vehicle onto the fuel tank area.
2. Connect the red battery clip from the tester to the positive battery terminal.

   NOTE: **The vehicle battery must be fully charged for optimum tester performance.**

3. Connect the black battery clip from the tester to chassis ground.

Flow Meter Test - Leak Detection

CAUTION: **Refer to Fuel and Evaporative Emission Hose/Pipe Connection Cleaning Caution .**

1. Open the Nitrogen tank valve and turn the NITROGEN / SMOKE valve on the front control panel to NITROGEN.
2. Connect the hose to the correct test orifice on the bottom front of the tester. For orifice size, refer to the vehicle specific information found in service procedures for DTCs that relate to EVAP system leaks.
3. Press and release the remote switch to activate the tester.

NOTE: **The tester will time out after about 15 min. You may press the remote switch to reactivate the tester as desired.**

4. Position the sliding red flag on the flow meter to align with the floating indicator. When the red flag is set, press and release the remote switch to deactivate the tester.
5. Remove the hose from the test orifice and install the hose onto the vehicle. For proper connection location, and the special tool numbers for any adapters that may be required, refer to the service procedures for DTCs that relate to EVAP system leaks.
6. Ignition ON, seal the EVAP system per instructions in the service procedures for DTCs that relate to EVAP system leaks. Most systems can be sealed using a scan tool output control for the EVAP Vent Solenoid Valve, other systems require that the vent system be plugged.

NOTE:

- **Larger volume fuel tanks, and/or those with lower fuel levels, may require several minutes to fill with nitrogen.**
- **Static buildup may cause the float indicator to stick. It may be necessary to tap on the flow meter to free up the float.**
- **If fuel level is 90% or greater it will take longer to fill the system with smoke because the fuel fill tube check valve will be closed and force any smoke to pass through the on-board refueling vapor recovery pipe and orifice.**

7. Press and release the remote switch to activate the nitrogen flow and fill the system.
8. Verify the stable floating indicator position to the red flag.
    - **Above the red flag, result is unacceptable - fail**

      Go to the Smoke Procedure

    - **Below the red flag - pass. Test complete**
9. Press and release the remote switch to deactivate the tester.

Smoke Procedure - Locate the Leak

NOTE: **It is not recommended to use the tester in an outside repair bay area because wind and sunlight may affect temperature and your ability to see the smoke.**

1. Turn OFF any fans that may cause air movement around or near the vehicle.

NOTE: **Completely unwind the nitrogen/smoke hose from the bracket to optimize the tester's performance.**

2. Connect the nitrogen/smoke hose to the vehicle as directed in the service procedures. Some vehicles require that the nitrogen/smoke hose be connected at the front of the EVAP system at the EVAP service port. An adapter may be necessary. Other vehicles require the connection be made at the rear of the system using an adapter at the fuel fill cap or capless fuel fill. Consult the service procedures for DTCs that relate to EVAP system leaks for vehicle specific instructions regarding connection location and adapters.

3. Open the Nitrogen tank valve and turn the nitrogen/smoke valve on the control panel to smoke.

NOTE: **The remote switch operates on a push ON, push OFF fashion.**

4. Press and release the remote switch to activate the tester and inject smoke into the EVAP system.
5. Verify smoke has filled the EVAP system by opening the system opposite the end where smoke is injected.

NOTE:

- **When injecting smoke at the service port, remove the fuel fill cap until smoke is observed. Then close the system and continue testing.**
- **If using a special tool fuel fill cap adapter at the filler neck, vent the system at the service port, with special tool EN 41413-VLV until smoke is observed then remove the vent fitting tool and close the system to continue with the test.**
- **Inject smoke in less than 2 min cycles for optimum tester performance.**

6. Press and release the remote switch to deactivate the tester.

NOTE: **For optimum visual smoke performance, deactivate the smoke flow and allow the system pressure to drop. Allowing the smoke to exit small holes at a low flow rate greatly enhances visibility.**

7. Introduce smoke into the system for an additional 60 s. Continue introducing smoke at 15 s intervals, as necessary until leak source is identified.
8. Using a high-intensity white light, inspect the entire EVAP system path, and look for the source of the leak indicated by the exiting smoke.
    - **Smoke seen leaking**

      Repair or replace the affected component.

    - **No smoke seen leaking**
9. All OK

Temperature Variation Instructions

The Concern

Ideal circumstances for conducting the EVAP flow meter test require equal temperatures between the Nitrogen gas and the vehicle EVAP system. Significant differences in temperature between them can result in a flow or pressure change during testing, causing misleading results. Typically, the evaporative emission system tester is stored indoors, approximately 21Â°C (70Â°F). Vehicles brought in for diagnosis may have an EVAP system at significantly different temperatures.

For Example

NOTE: **With no temperature difference between the Nitrogen gas and EVAP system, the resulting vehicle EVAP system pressure will remain stable at 13 in. H2O (0.5**

PSI) once pressurized, providing no leaks are present.

When the EVAP flow meter tests are performed with significant differences in temperature between the Nitrogen gas and the vehicle EVAP system, the following results can occur:

- An increase in flow during the flow meter test can be caused by a vehicle's warm EVAP system cooling down.
- A decrease in flow during the flow meter test can be caused by a vehicle's cool EVAP system warming up.

The Solution

When working on a vehicle with significant temperature differences between the vehicle EVAP system and the Nitrogen gas, allow the vehicle EVAP system temperature to stabilize as close as possible to the temperature of the Nitrogen gas before conducting the flow meter test.

ELECTRONIC IGNITION SYSTEM DIAGNOSIS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

This ignition system uses an individual ignition coil for each cylinder. The Engine Control Module (ECM) controls the spark events by transmitting the timing pulses on the ignition control circuits to the individual ignition coil in firing order sequence.

Diagnostic Aids

- This engine application may use 2 fuses, one for each bank, to supply ignition voltage to the ignition module/coil assemblies. A good indication that a fuse is open is that all misfire counters are incrementing on one side of the engine.
- An open/high resistance on the low reference circuit to the ignition coil may cause a misfire.
- An erratic or weak spark is considered a no spark condition.

Circuit/System Testing

NOTE: **Do not perform this diagnostic procedure unless you were sent here from a misfire DTC or the Engine Cranks But Does Not Run diagnostic.**

1. Ignition OFF and all vehicle systems OFF. Disconnect the harness connector at the appropriate T8 Ignition Coil. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the ground circuit terminal A and ground.
    - **If 5 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 5 Ω**
3. Test for less than 5 Ω between the low reference circuit terminal B and ground.
    - **If 5 Ω or greater**
    1. Ignition OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If less than 5 Ω**
4. Ignition ON.

5. Verify a test lamp illuminates between the ignition circuit terminal D and ground.
    - **If the test lamp does not illuminate**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp illuminates**
6. Ignition OFF, exchange the suspect T8 Ignition Coil with the T8 Ignition Coil of a known functioning cylinder.
7. Engine Running.
8. Verify the scan tool Cylinder 1-6 Current Misfire Counter does not increment for the same cylinder that the suspect T8 Ignition Coil was removed from.
    - **If increments**

      Replace the K20 Engine Control Module.

    - **If does not increment**
9. Test or replace the T8 Ignition Coil.

Component Testing

NOTE: **You must perform the Circuit/System Testing before proceeding with Component Testing.**

1. Ignition OFF, connect the **EL 26792** to the appropriate T8 Ignition Coil.
2. Engine Running.
3. Verify the spark output of the T8 Ignition Coil.
    - **If no output or the output is weak**

      Replace the T8 Ignition Coil

    - **If the output is good**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Ignition Coil Replacement - Bank 1**
- **Ignition Coil Replacement - Bank 2**
- **Control Module References** for engine control module replacement, programming, and setup.

INSPECTION/MAINTENANCE SYSTEM CHECK

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Description

Several states require that a vehicle pass on-board diagnostic (OBD) system tests and inspection/maintenance (I/M) emission inspections in order to renew license plates. This is accomplished by viewing the Inspection/Maintenance System Status or Data display on a scan tool. Using a scan tool, the technician can observe the I/M status in order to verify that the vehicle meets the criteria that complies with the local area requirements.

While testing in the I/M System Status mode, some DTCs may occur that are called I/M Test DTCs. An I/M Test DTC is defined as a fault code that is currently commanding the malfunction indicator lamp (MIL) ON, and is stored in non-volatile memory. The intended use of this data is to prevent vehicles from passing I/M inspection without proper repair to the vehicle. These fault codes are not erasable from any scan tool command or by disconnecting power to the controller. I/M Test DTCs are supported by all emissions related electronic control units, such as engine control modules (ECMs), transmission control modules (TCMs), fuel pump control modules, etc. An I/M Test DTC will not be stored or erased from the electronic control unit except at the end of trip processing which occurs 5 s after ignition OFF.

Conditions for Updating the I/M System Status

NOTE: **New vehicles may not report an Inspection/Maintenance System Check pass or fail status for certain post catalyst oxygen sensor or heated oxygen sensor 2 diagnostics prior to 700 miles. After replacing a catalytic converter on a vehicle with greater than 700 miles, it may require up to an additional 700 miles to prevent a false failure status.**

Each system requires at least one, and sometimes several, diagnostic tests. The results of these tests are reported by a DTC. A system monitor is complete when either all of the DTCs comprising the monitor have Run and Passed, or any one of the DTCs comprising the monitor have illuminated the MIL. Once all of the tests are completed, the Inspection/Maintenance System Status or Data will indicate YES in the Completed or Value column.

For example, when the HO2S Heater Status indicates YES, either all of the oxygen sensor heater tests have passed or one of the tests has illuminated the MIL. If the vehicle has four heated oxygen sensors, either all four heater circuit tests have passed or one of the heater circuit tests has illuminated the MIL. The Inspection/Maintenance System Status or Data will indicate NO under the Completed or Value column when any of the required tests for that system have not run. The following is a list of conditions that would set the Inspection/Maintenance System or Data indicator to NO:

- The vehicle is new from the factory and has not yet been driven through the necessary drive conditions to complete the tests.
- The battery has been disconnected or discharged below operating voltage.
- The control module power or ground has been interrupted.
- The control module has been reprogrammed.
- The control module DTCs have been cleared as part of a service procedure.

Conditions for Clearing I/M Test DTCs

1. Only the OBD II System can erase I/M Test DTCs. The OBD II system must determine that the malfunction that caused the I/M Test DTC to be stored is no longer present and is not commanding the MIL. Each of the following represents ways to clear an I/M Test DTC:
    - If the MIL goes off due to 3 passing drive cycles, and the scan tool code clear is not used, the I/M Test DTC is erased at power down of the last drive cycle.
    - If a scan tool code clear is used to turn OFF the MIL, the I/M Test DTC is not erased, therefore the DTC must PASS and not FAIL during the drive cycle. The I/M Test DTC is erased at power down of the drive cycle.
    - If the controller is reflashed/reprogrammed, all I/M Test DTCs are erased.
2. For the OBD II System to run a single drive cycle for clearing an I/M Test DTC, all of the following conditions must occur:
    - Cumulative time of engine run time greater than 600 s.
    - Cumulative vehicle operation above 41 km/h (25 mph) over 300 s.
    - Continuous vehicle idle greater than 30 s.
    - Ignition OFF for 5 s to allow the code to clear.

Monitored Emission Control Systems

The OBD II system monitors all emission control systems that are on-board, but not all vehicles need every possible emission control system. For example, a vehicle may not be equipped with secondary air injection or exhaust gas recirculation (EGR). The OBD II regulations require monitoring of the following; if equipped:

- The air conditioning system
- The catalytic converter efficiency
- Comprehensive component monitoring-Emission related inputs and outputs
- The evaporative emission (EVAP) system
- The fuel delivery system
- Heated catalyst monitoring
- Misfire monitoring
- The oxygen sensor system (O2S or HO2S)
- The oxygen sensor heater system (HO2S heater)

For the specific DTCs required for each system, refer to **Inspection/Maintenance (I/M) System DTC Table**. Systems such as misfire and comprehensive components may not be listed in a system status list. These tests run continuously and do not require an I/M System Status indicator.

Diagnostic Aids

The Inspection/Maintenance System Status or Data display provides an indication of when the control module has completed the required tests. This does not necessarily mean that the test has passed, only that a decision was made. If the diagnostic fails, a DTC will indicate the failure. If a failure indication is present for a DTC associated with one of the I/M regulated systems, it may prevent other required tests from running. For example, a DTC for the control circuit of the EVAP purge solenoid may not be listed in the

Inspection/Maintenance System DTC Table because it is a continuous test. If this DTC is set, the Active Tests for the EVAP system may not run.

The Inspection/Maintenance System Status or Data information may be useful for a technician to determine if diagnostics have run when verifying repairs.

Circuit/System Verification

1. Verify that all Inspection/Maintenance System Status or Data indicators report YES, and that no I/M Test DTCs are present.
    - **If any I/M Test DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If no I/M Test DTCs are set**
2. All OK.

Circuit/System Testing

NOTE: **Many DTC related repairs will instruct the technician to clear the DTC information. Clearing the DTC will reset the Inspection/Maintenance System Status or Data indicators to NO. Performing the I/M Complete System Set Procedure will set each of the I/M System Status indicators to YES.**

1. Verify no I/M DTCs are present.
    - **If an I/M DTC is set that would prevent the I/M System Status tests from completing, diagnose that DTC before continuing.**

      Refer to **Inspection/Maintenance (I/M) System DTC Table**.

    - **If no I/M DTCs are set**
2. Review applicable service bulletins for software updates that would prevent the I/M System Status tests from completing.
    - **If a control module re-program or other repair is required,**

      Perform the **Inspection/Maintenance Complete System Set Procedure** after repair.

    - **If no repair is required**
3. Observe the Inspection/Maintenance System Status or Data indicators.
    - **If any Inspection/Maintenance System Status or Data indicators report NO**

      Perform the **Inspection/Maintenance Complete System Set Procedure**.

    - **If no Inspection/Maintenance System Status or Data indicators report NO**
4. All OK.

INSPECTION/MAINTENANCE COMPLETE SYSTEM SET PROCEDURE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Description

The purpose of the Inspection/Maintenance (I/M) complete system set procedure is to satisfy the enable criteria necessary to execute all of the I/M readiness diagnostics and complete the trips for those particular diagnostics. When all I/M monitored diagnostic tests are completed, the I/M System Status indicators are set to YES. Perform the Inspection/Maintenance (I/M) Complete System Set Procedure if any I/M System Status indicators are set to NO.

Conditions for Meeting a Cold Start

- The ignition voltage between 10 and 15 V.
- The barometric pressure (BARO) is more than 75 kPa (10.9 PSI).
- The engine coolant temperature (ECT) at start-up is less than 42Â°C (108Â°F).
- The intake air temperature (IAT) is between 2-32Â°C (36-90Â°F).
- The engine is OFF for greater than 6 hours or the following conditions must be met:
  - The start-up IAT minus start-up ECT are within 12Â°C (22Â°F).
  - The start-up ECT minus start-up IAT are within 50Â°C (90Â°F).
- Fuel level is between 25 and 75%.

Circuit/System Verification

1. Verify that all I/M System Status indicators report YES, and that no I/M Test DTCs are present.
   - **If any I/M Test DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If no I/M Test DTCs are set**
2. All OK.

Inspection/Maintenance (I/M) System Set Procedure

1. Ensure that the vehicle meets the conditions for a cold start listed above.
   - If the EVAP I/M System Status indicator displays NO, perform the EVAP Service bay test if applicable.
2. Turn OFF all accessories; HVAC system, other electrical loads, including aftermarket/add-on equipment, etc., and open the hood.
3. Set the vehicle parking brake and ensure the vehicle is in park for automatic transmission or neutral for manual transmission.
4. Start and idle the engine for 2 min.

WARNING: Refer to Road Test Warning .

5. Close the hood, release the parking brake and Accelerate at part throttle to 72-80 km/h (45-50 MPH) with this speed maintained until the engine reaches operating temperature, 8-10 min .
6. Continue operation under these conditions for an additional 6 min.
7. Accelerate at part throttle to 90 km/h (55 MPH) with this speed maintained for 2 min.
8. Release the accelerator pedal for at least 10 s. This will allow the vehicle to enter the decel fuel cut off.

NOTE: **Do NOT touch the accelerator pedal until told to do so. A change in throttle position or an increase in engine speed may invalidate this portion of the test.**

9. Safely stop the vehicle, with the engine in drive for automatic or neutral with the clutch pedal depressed and parking brake applied for manual. Allow the vehicle to idle for 2 min.
10. Shift the vehicle to park for automatic and neutral for manual. Turn OFF the ignition and exit the vehicle. Do NOT disturb the vehicle for 45 min.
11. Observe the Inspection/Maintenance (I/M) System Status with a scan tool. All of the I/M System Status indicators should display YES.
    - If the EVAP I/M System Status indicator displays NO, turn OFF the ignition, ensure that the vehicle meets the conditions for a cold start, and repeat steps 6-11 three more times, or until the EVAP I/M System Status indicator transitions to YES. If the indicator continues to display NO, refer to the **Inspection/Maintenance (I/M) System DTC Table** to identify the DTCs that did not run.
    - If any of the I/M System Status indicators display NO, refer to the **Inspection/Maintenance (I/M) System DTC Table** for the indicator which did not display YES. The I/M System DTC Table identifies the DTCs associated with each I/M System Status Indicator.

NOTE: **An I/M Test DTC will not be stored or erased from the ECU except at the end of trip processing, which occurs 5 s after ignition OFF.**

12. Observe the I/M Test DTC information with a scan tool. Verify there are no I/M Test DTCs present.
    - If an I/M Test DTC is set, diagnose the DTC using the **Diagnostic Trouble Code (DTC) List - Vehicle** , and refer to **Inspection/Maintenance System Check**.
13. Observe the engine DTC information with a scan tool. Verify no DTCs are present.
    - If a DTC is set, diagnose using the **Diagnostic Trouble Code (DTC) List - Vehicle** , . After repairs, perform the **Inspection/Maintenance Complete System Set Procedure** to verify no further DTCs are set.

INSPECTION/MAINTENANCE (I/M) SYSTEM DTC TABLE

System	DTCs Required to Set System Status to YES
If an I/M System Status indicator did NOT update to YES during the **Inspection/Maintenance Complete System Set Procedure** , review each indicator and reference this table to determine each DTC associated with the I/M System Status Indicator. Each DTC listed below has specific conditions that must be met for the diagnostic to run. Included within the conditions are additional DTCs, which if set, may inhibit the DTCs listed below from running. Reviewing and operating the vehicle within the Conditions for Running for each DTC listed below will allow the I/M System Status Indicators to transition to YES.	

System	DTCs Required to Set System Status to YES
Catalyst	**DTC P0420 or P0430**
EVAP	• **DTC P0442** • **DTC P0446** • **DTC P0455**
Fuel System	**DTC P219A or P219B**
Oxygen Sensor	• **DTC P0131, P0132, P0134, P0137, P0138, P0140, P0151, P0152, P0154, P0157, P0158, or P0160** • **DTC P0133, P013A-P013F, P014A, P014B, P0153, P015A-P015D, or P2270-P2273 (LFX)**
Oxygen Sensor Heater	**DTC P0030-P0032, P0036-P0038, P0050-P0054, P0056-P0060, P0135, P0141, P0155, or P0161 (LFX)**
Camshaft System	**DTC P0011, P0014, P0021, or P0024**

Article GUID: A00737204

REPAIR INSTRUCTIONS

BRAKE PEDAL POSITION SENSOR LEARN

NOTE: **Brake system does not use a brake switch, stoplight switch or brakelight switch. System uses a Brake Pedal Position Sensor to control these functions.**

Calibration Criteria

NOTE: **Do not apply the brake pedal during the brake pedal position sensor calibration procedure. Any movement of the brake pedal during this procedure will cause the calibration procedure to fail. If this occurs, the brake pedal position sensor calibration must be repeated.**

Brake pedal position sensor calibration must be performed after the brake pedal position sensor, body control module (BCM), or engine control module (ECM) have been serviced. The calibration procedure will set the brake pedal position sensor home value. This value is used by the BCM and ECM to determine the action of the driver applying the brake system and to provide this information to the vehicle subsystems via serial data.

Calibration Procedure

1. Apply the parking brake.
2. Ignition ON, engine OFF, place the transmission in the PARK position for automatic transmission or NEUTRAL position for manual transmission.
3. Install a scan tool.
4. Clear all DTCs before proceeding.
5. Navigate to the Configuration/Reset Functions menu of the BCM.
6. Select the Brake Pedal Position Sensor Learn procedure and follow the directions displayed on the screen.
7. Navigate to the Configuration/Reset Functions menu of the ECM.
8. Select the Learn Functions menu.
9. Select the Brake Pedal Position Sensor Learn procedure and follow the directions displayed on the screen.

CRANKSHAFT POSITION SYSTEM VARIATION LEARN

The Crankshaft Position Variation Learn procedure is required when the following service procedures have been performed, regardless of whether DTC P0315 is set:

- An engine replacement.
- A engine control module (ECM) replacement.
- A crankshaft balancer replacement.
- A crankshaft replacement.
- A crankshaft position sensor replacement.

- Any engine repairs which disturb the crankshaft to crankshaft position sensor relationship.

The ECM monitors certain component signals to determine if all the conditions are met to continue with the Crankshaft Position Variation Learn procedure. The scan tool only displays the condition that inhibits the procedure. The scan tool displays the signals of the components listed below:

- Crankshaft position sensors activity: If there is a crankshaft position sensor condition, refer to the applicable DTC set.
- Camshaft position sensor signal activity: If there is a camshaft position sensor signal condition, refer to the applicable DTC set.
- Engine coolant temperature (ECT): If the engine coolant temperature is not warm enough, idle the engine until the engine coolant temperature reaches the correct temperature.

1. Verify no DTCs are set.
    - **If any DTCs other than P0300-P0308, or P0315 are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If DTC P0300-P0308, P0315, or no DTCs are set**

    NOTE: The Crankshaft Position Variation Learn may have to be repeated up to 5 times before the procedure is successful.

2. Engine Running at normal operating temperature, perform the scan tool Crankshaft Position Variation Learn procedure and follow the on screen instructions.
3. Verify the scan tool displays Test Passed Successfully when completed.
    - **If Test Passed Successfully is not displayed**

      Verify that none of the conditions listed below exist:

      - The ignition switch is in the ON position until there is insufficient system voltage.
      - An ECM power disconnect with the ignition ON that may have erased the crankshaft position system variation values and set DTC P0315.
      - Interference in the signal circuit of the crankshaft position sensor.
      - Debris between the crankshaft position sensor and the reluctor wheel.
      - A damaged or misaligned reluctor wheel.
      - Worn crankshaft main bearings.
      - Excessive crankshaft runout.
      - A damaged crankshaft.
      - If a condition is exists, repair or replace as necessary.
      - If no conditions exist, replace the K20 Engine Control Module.
    - **If Test Passed Successfully is displayed**
4. Clear all DTCs.
5. Engine Running.
6. Verify a DTC is not set.

- **If a DTC is set**

  Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If a DTC is not set**

7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for engine control module replacement, programming, and setup.

ENGINE CONTROL MODULE REPLACEMENT

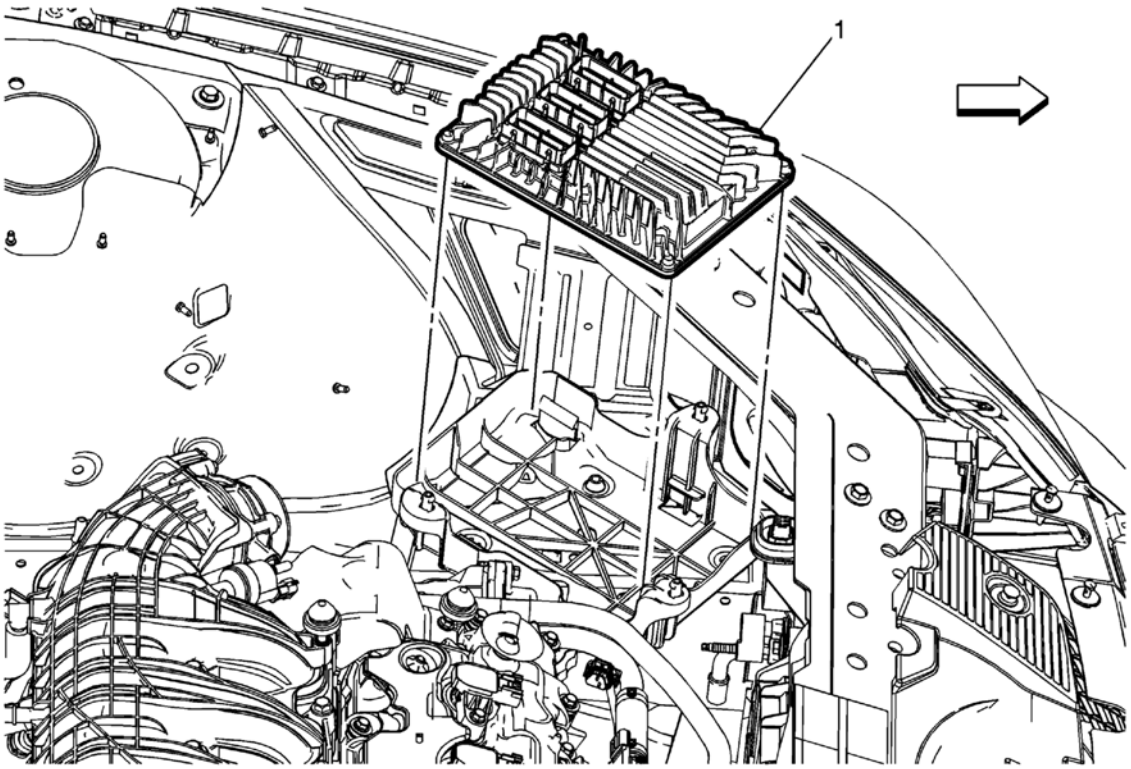

Fig. 1: Engine Control Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** . 2. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement**	
1	Electronic Control Module

Callout	Component Name
	WARNING: **Refer to Safety Glasses Warning .** **CAUTION:** • **Turn the ignition OFF when installing or removing the control module connectors and disconnecting or reconnecting the power to the control module (battery cable, powertrain control module (PCM)/engine control module (ECM)/transaxle control module (TCM) pigtail, control module fuse, jumper cables, etc.) in order to prevent internal control module damage.** • **Control module damage may result when the metal case contacts battery voltage. DO NOT contact the control module metal case with battery voltage when servicing a control**

Callout	Component Name
	module, using battery booster cables, or when charging the vehicle battery. • **In order to prevent any possible electrostatic discharge damage to the control module, do no touch the connector pins or the soldered components on the circuit board.** • **Remove any debris from around the control module connector surfaces before servicing the control module. Inspect the control module connector gaskets when diagnosing or replacing the control module. Ensure that the gaskets are installed correctly. The gaskets prevent contaminant intrusion into the control module.** • **The replacement control module must be**

Callout	Component Name
	programmed. **Procedure** 1. Disconnect the electrical connectors. 2. Release the retaining tab. 3. If replacing, program the ECM. Refer to **Control Module References** . **NOTE:** **Before removing the engine control module (ECM), use the scan tool to capture the ECM data. This captured data will then need to be restored into the NEW ECM. Refer to Control Module References .**

Q38 THROTTLE BODY: THROTTLE/IDLE LEARN

Description

The engine control module (ECM) learns the airflow through the throttle body to ensure the correct idle. The learned airflow values are stored within the ECM. These values are learned to adjust for production variation and will continuously learn during the life of the vehicle to compensate for reduced airflow due to throttle body coking. Anytime the throttle body airflow rate changes, for example due to cleaning or replacing, the values must be relearned.

An engine that had a heavily coked throttle body that has been cleaned or replaced may take several drive cycles to unlearn the coking. To accelerate the process, the scan tool has the ability to reset all learned values back to zero. A new ECM will also have values set to zero.

The idle may be unstable or a DTC may set if the learned values do not match the actual airflow.

Conditions for Running the Throttle Learn Procedure

Scan tool Idle Learn or Idle Learn Reset Procedure

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0116, P0117, P0118, P0120, P0122, P0123, P0128, P0171, P0172, P0174, P0175, P0201-P0208, P0220, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P0279, P0280, P0282, P0283, P0300-P0308, P0351-P0358, P0496, P0601, P0604, P0606, P060D, P0641, P0651, P0697, P06A3, P06D2, P1248, P1249, P124A, P124B, P1516, P16A0-P16A2, P2101, P2119, P2120, P2122, P2123, P2125, P2127, P2128, P2135, P2138, P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, P216F, P217B, P217C, P217E, P217F, P2176, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, P2316, P2318, P2319, P2321, or P2322 are not set.
- Ignition ON, engine OFF.
- The vehicle speed sensor (VSS) is 0 km/h (0 mph).

Service Bay/On Road Learn Procedure

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0116, P0117, P0118, P0120, P0122, P0123, P0128, P0171, P0172, P0174, P0175, P0201-P0208, P0220, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P0279, P0280, P0282, P0283, P0300-P0308, P0351-P0358, P0496, P0601, P0604, P0606, P060D, P0641, P0651, P0697, P06A3, P06D2, P1248, P1249, P124A, P124B, P1516, P16A0-P16A2, P2101, P2119, P2120, P2122, P2123, P2125, P2127, P2128, P2135, P2138, P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, P216F, P217B, P217C, P217E, P217F, P2176, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, P2316, P2318, P2319, P2321, or P2322 are not set.
- The engine speed is between 450-4,000 RPM.
- The manifold absolute pressure (MAP) is greater than 5 kPa.
- The mass air flow (MAF) is greater than 2 g/s.
- The ignition voltage is greater than 10 volts.

Diagnostic Aids

A un-metered air leak in the induction system or a small vacuum leak may not set a DTC. If the condition goes undetected, the ECM may learn an incorrect Throttle Body Idle Airflow Compensation value over time. The incorrectly learned value may cause various symptoms to occur such as rough or unstable idle speeds, and/or engine stall. If this condition is detected and repaired it will be necessary perform the Idle Learn procedure to ensure any symptoms are corrected.

Throttle Learn

Scan Tool Idle Learn or Idle Learn Reset Procedure - Performed after the throttle body is cleaned or replaced

1. Ignition ON, engine OFF, perform the Idle Learn or Idle Learn Reset in Configuration/Reset or Module Setup.
2. Engine idling, verify the scan tool Throttle Body Idle Airflow Compensation value is equal 0% and the engine is idling at a normal idle speed.
3. Clear the DTCs and return to the diagnostic that referred you here.

Service Bay/On Road Idle Learn Procedure - Performed after the ECM is programmed or replaced

NOTE: **Do NOT perform this procedure if any DTCs are set. Refer to Diagnostic Trouble Code (DTC) List - Vehicle .**

1. Engine idling for 3 m.
2. The ECM will start to learn the new idle cells and the scan tool Desired Idle Speed should start to decrease.
3. Ignition OFF for 60 s.
4. Start and idle the engine for 3 m.
5. Verify the engine is idling normally.
    - **If the engine idle is not correct**

      NOTE: **During the drive cycle the check engine light may come on with idle speed DTCs. If idle speed codes are set, clear codes so the ECM can continue to learn.**

        1. Operate the vehicle at speeds above 70 km/h (44 mph) with several decelerations and extended idles.
        2. Verify the engine is idling normally.
            - If the engine idle is not correct.

              Ignition OFF for 60 s, repeat step 5.1.

            - If the engine idle is correct.
        3. Clear any DTCs and return to the diagnostic that referred you here.
    - **If the engine idle is correct**
6. Clear any DTCs and return to the diagnostic that referred you here.

ENGINE COOLANT TEMPERATURE SENSOR REPLACEMENT

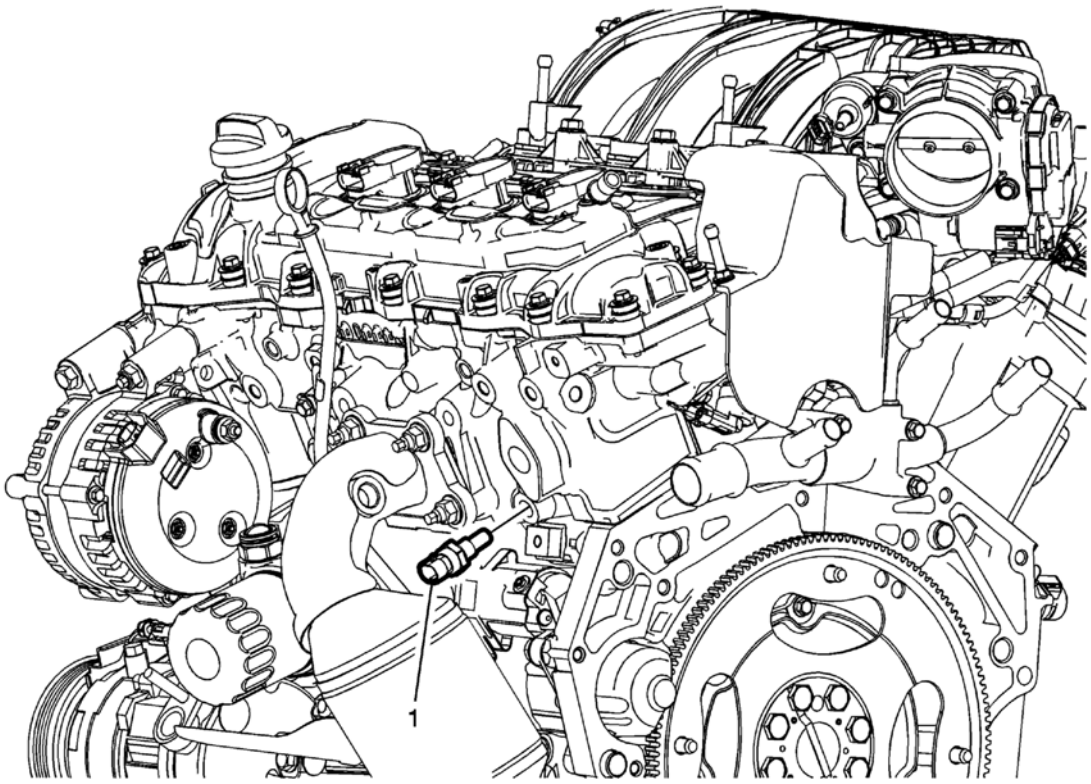

Fig. 2: Engine Coolant Temperature Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
	Preliminary Procedure **Partially drain the cooling system. Refer to Cooling System Draining and Filling .**
1	Engine Coolant Temperature Sensor **CAUTION:** **Refer to Fastener Caution .** **Procedure** Disconnect the ECT sensor harness connector. **Tighten** 20 N.m (14.7 lb ft)

MASS AIRFLOW SENSOR WITH INTAKE AIR TEMPERATURE SENSOR REPLACEMENT

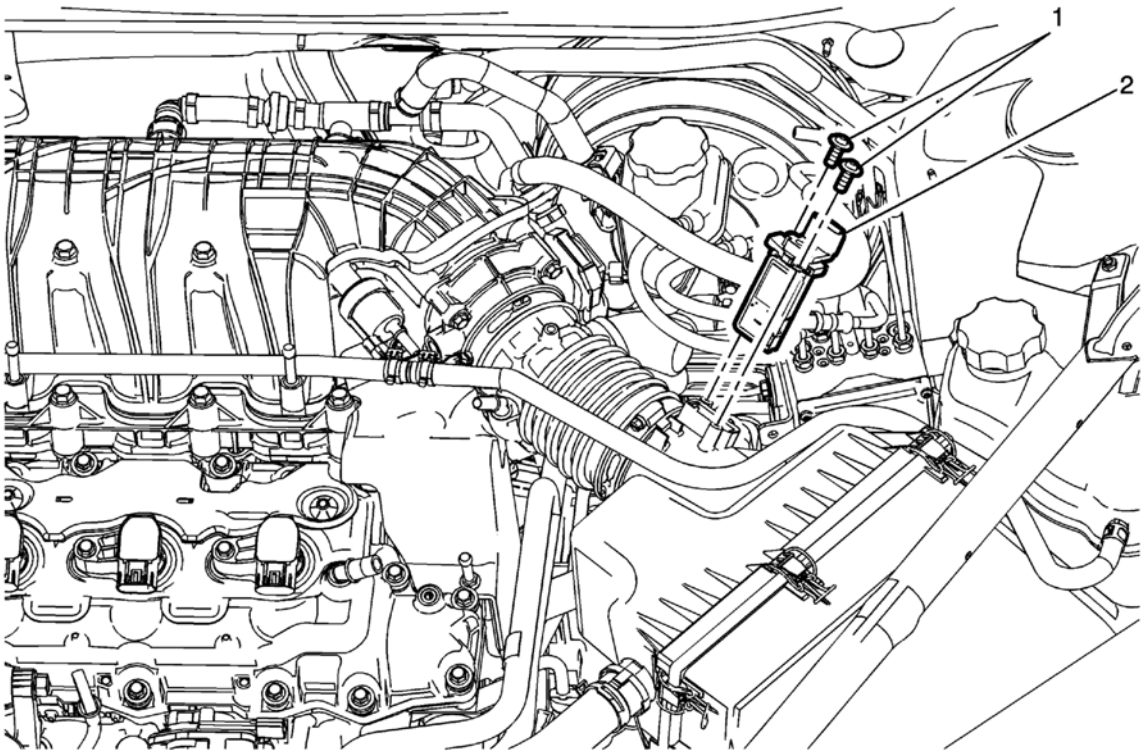

Fig. 3: Mass Airflow Sensor with Intake Air Temperature Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Bolt (Qty: 2) **CAUTION:** **Refer to** **Fastener Caution .** **Tighten** 3 N.m (27 lb in)
2	Mass Airflow Sensor **Procedure** Disconnect the mass airflow sensor harness connector.

MANIFOLD ABSOLUTE PRESSURE SENSOR REPLACEMENT

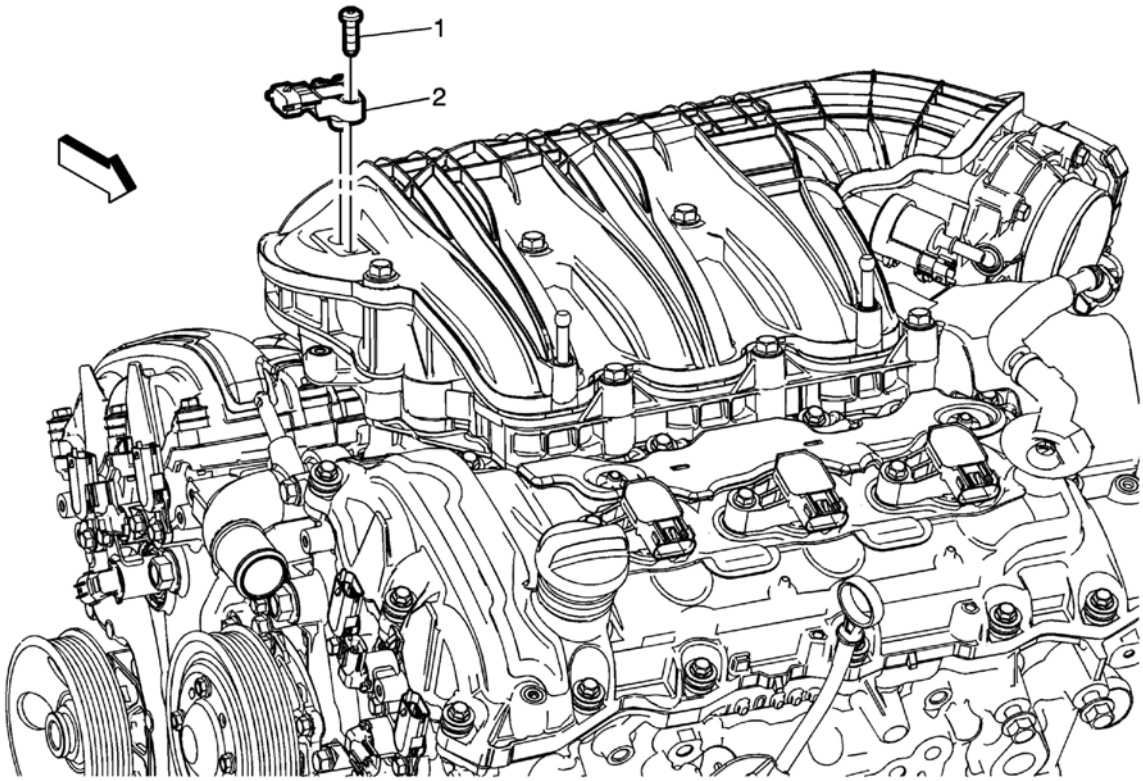

Fig. 4: Manifold Absolute Pressure Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
	Preliminary Procedure **Remove the intake manifold cover. Refer to Intake Manifold Cover Replacement .**
1	Manifold Absolute Pressure Sensor Bolt. **CAUTION:** **Refer to Fastener Caution .** **Tighten** 5 N.m (44 lb in)
2	Manifold Absolute Pressure Sensor. **Procedure** Disconnect the MAP sensor harness connector.

HEATED OXYGEN SENSOR REPLACEMENT - BANK 1 SENSOR 1

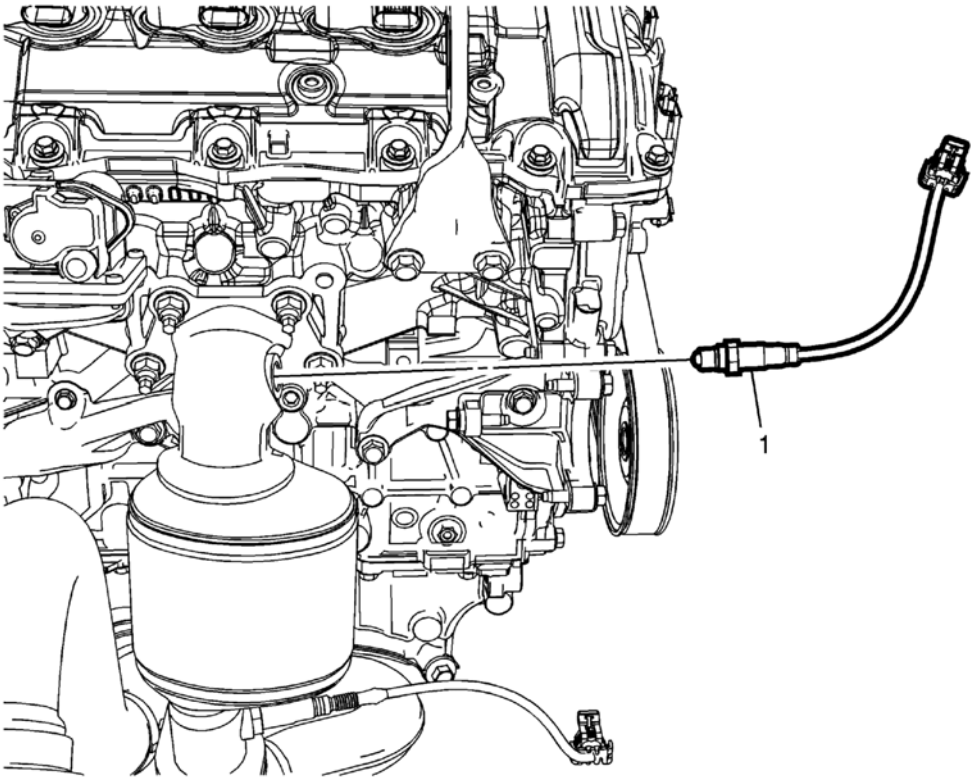

Fig. 5: Heated Oxygen Sensor - Bank 1 Sensor 1
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .	
1	Heated Oxygen Sensor **CAUTION:** **Refer to Heated Oxygen and Oxygen Sensor Caution .** **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Disconnect the heated oxygen sensor harness connector. 2. If reinstalling the old sensor, coat the threads with anti-seize compound. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

Callout	Component Name
	• The in-line connector and louvered end must be kept clear of grease, dirt or other contaminants. Avoid using cleaning solvents of any type. DO NOT drop or roughly handle the heated oxygen sensor (HO2S). • The HO2S may be difficult to remove when the engine temperature is less than 48Â°C (120Â°F). • A special anti-seize compound is used in the HO2S threads. The compound consists of liquid graphite and glass beads. The graphite tends to burn away, but the glass beads remain, making the sensor easier to remove. New, or service replacement sensors already have the compound applied to the threads. If the sensor is removed from an exhaust component and if for any reason the sensor is to be reinstalled, the threads must have anti-seize compound applied before reinstallation. **Tighten** 42 N.m (31 lb in)

HEATED OXYGEN SENSOR REPLACEMENT - BANK 1 SENSOR 2

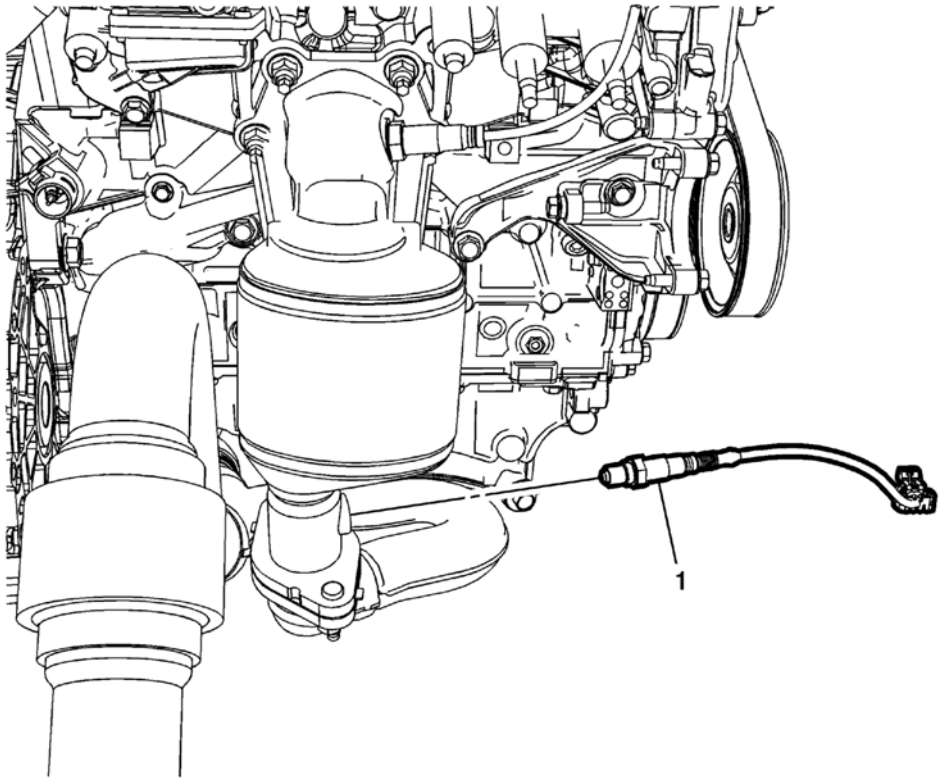

Fig. 6: Heated Oxygen Sensor - Bank 1 Sensor 2
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .	

Callout	Component Name
1	Heated Oxygen Sensor **CAUTION:** **Refer to Heated Oxygen and Oxygen Sensor Caution .** **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Disconnect the heated oxygen sensor harness connector. 2. If reinstalling the old sensor, coat the threads with anti-seize compound. Refer to **Adhesives, Fluids, Lubricants, and Sealers** . • The in-line connector and louvered end must be kept clear of grease, dirt or other contaminants. Avoid using cleaning solvents of any type. DO NOT drop or roughly handle the heated oxygen sensor (HO2S). • The HO2S may be difficult to remove when the engine temperature is less than 48Â°C (120Â°F). • A special anti-seize compound is used in the HO2S threads. The compound consists of liquid graphite and glass beads. The graphite tends to burn away, but the glass beads remain, making the sensor easier to remove. New, or service replacement sensors already have the compound applied to the threads. If the sensor is removed from an exhaust component and if for any reason the sensor is to be reinstalled, the threads must have anti-seize compound applied before reinstallation. **Tighten** 42 N.m (31 lb in)

HEATED OXYGEN SENSOR REPLACEMENT - BANK 2 SENSOR 1

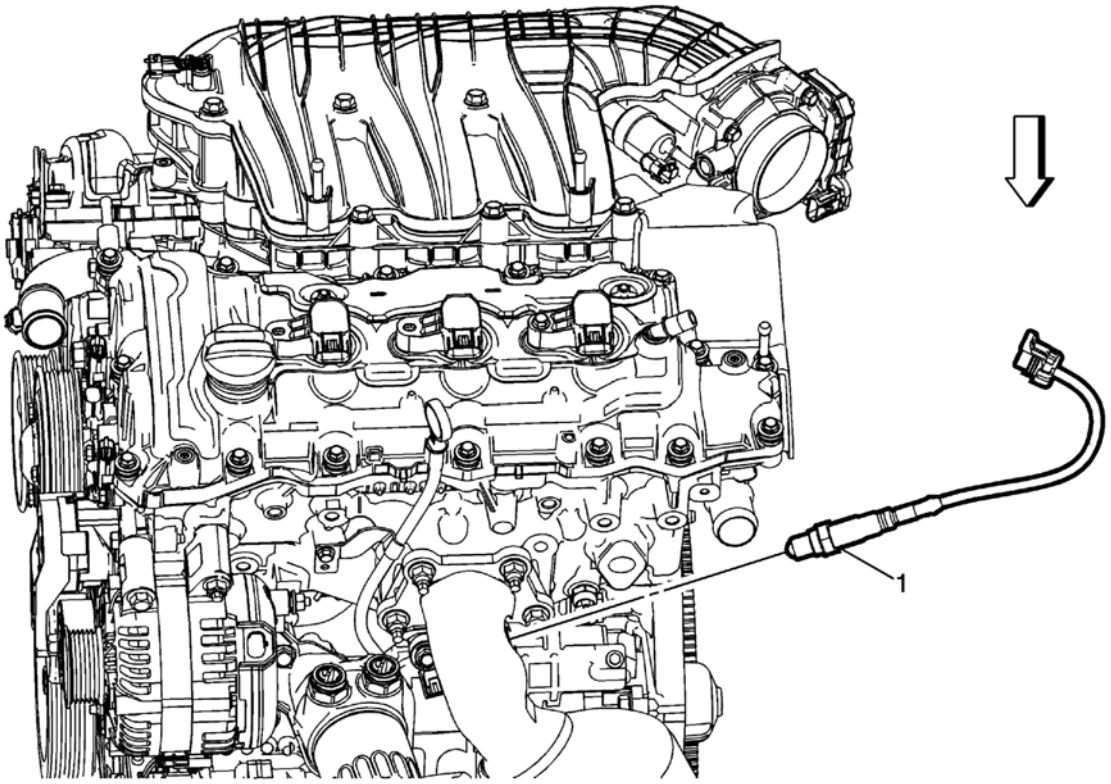

Fig. 7: Heated Oxygen Sensor - Bank 2 Sensor 1
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Heated Oxygen Sensor **CAUTION:** **Refer to Heated Oxygen and Oxygen Sensor Caution .** **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Disconnect the heated oxygen sensor harness connector. 2. If reinstalling the old sensor, coat the threads with anti-seize compound. Refer to **Adhesives, Fluids, Lubricants, and Sealers** . • The in-line connector and louvered end must be kept clear of grease, dirt or other

Callout	Component Name
	contaminants. Avoid using cleaning solvents of any type. DO NOT drop or roughly handle the heated oxygen sensor (HO2S). • The HO2S may be difficult to remove when the engine temperature is less than 48Â°C (120Â°F). • A special anti-seize compound is used in the HO2S threads. The compound consists of liquid graphite and glass beads. The graphite tends to burn away, but the glass beads remain, making the sensor easier to remove. New, or service replacement sensors already have the compound applied to the threads. If the sensor is removed from an exhaust component and if for any reason the sensor is to be reinstalled, the threads must have anti-seize compound applied before reinstallation. **Tighten** 42 N.m (31 lb in)

HEATED OXYGEN SENSOR REPLACEMENT - BANK 2 SENSOR 2

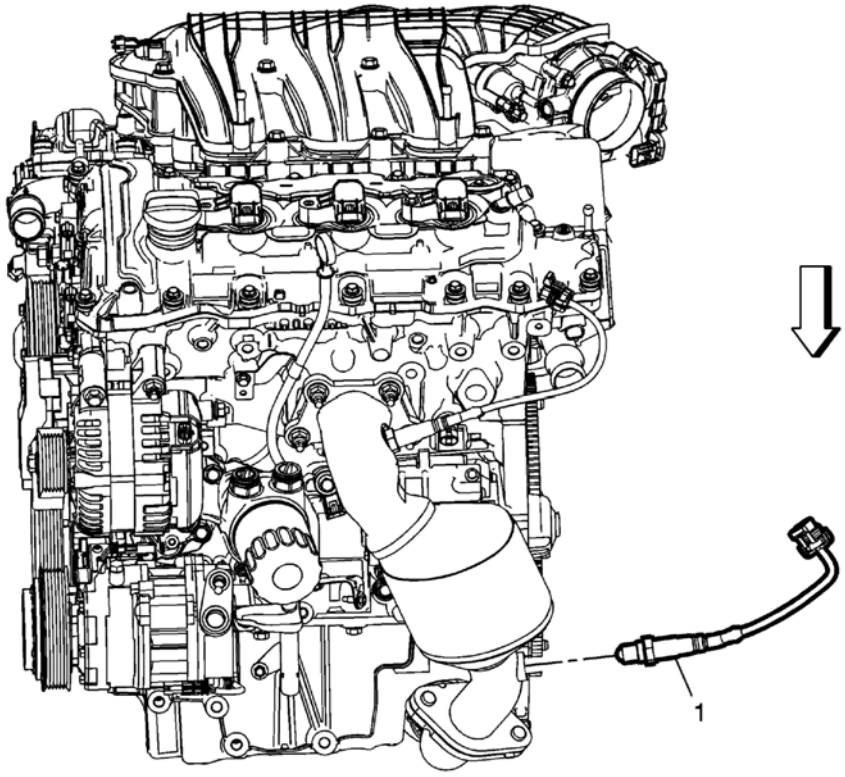

Fig. 8: Heated Oxygen Sensor - Bank 2 Sensor 2
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .	

Callout	Component Name
1	Heated Oxygen Sensor **CAUTION:** **Refer to Heated Oxygen and Oxygen Sensor Caution .** **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Disconnect the heated oxygen sensor harness connector. 2. If reinstalling the old sensor, coat the threads with anti-seize compound. Refer to **Adhesives, Fluids, Lubricants, and Sealers** . • The in-line connector and louvered end must be kept clear of grease, dirt or other contaminants. Avoid using cleaning solvents of any type. DO NOT drop or roughly handle the heated oxygen sensor (HO2S). • The HO2S may be difficult to remove when the engine temperature is less than 48Â°C (120Â°F). • A special anti-seize compound is used in the HO2S threads. The compound consists of liquid graphite and glass beads. The graphite tends to burn away, but the glass beads remain, making the sensor easier to remove. New, or service replacement sensors already have the compound applied to the threads. If the sensor is removed from an exhaust component and if for any reason the sensor is to be reinstalled, the threads must have anti-seize compound applied before reinstallation. **Tighten** 42 N.m (31 lb in)

ACCELERATOR PEDAL POSITION SENSOR REPLACEMENT

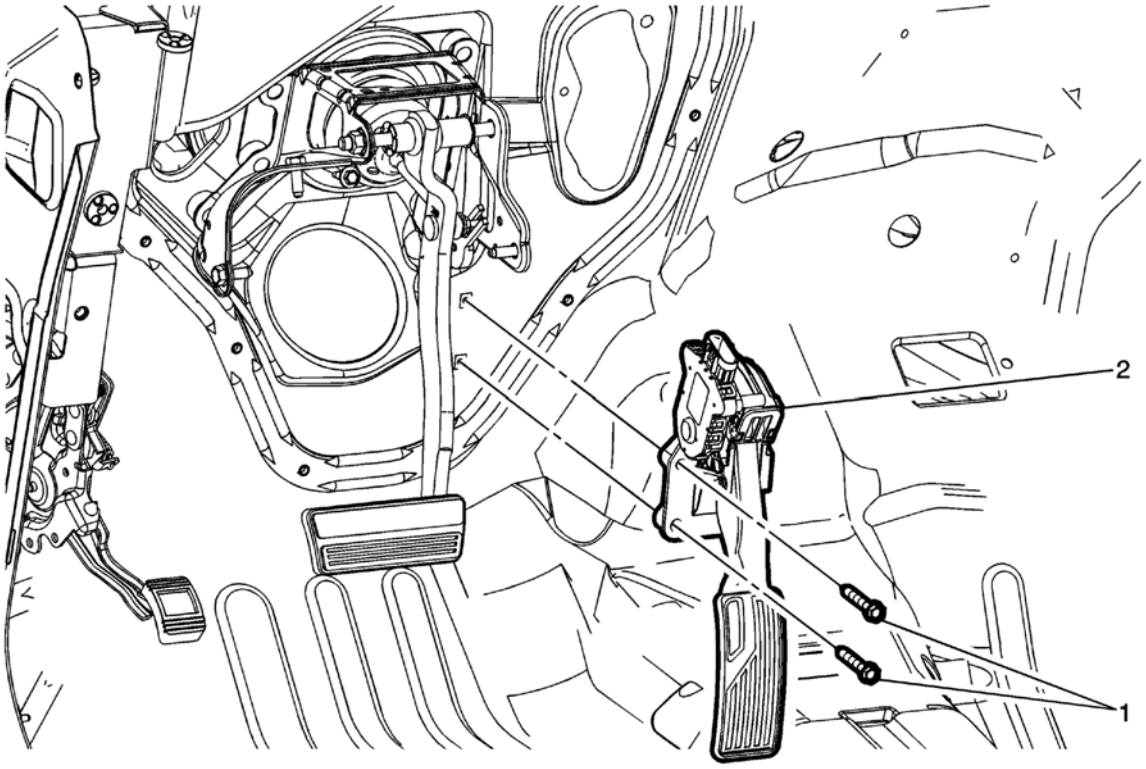

Fig. 9: Accelerator Pedal Position Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove the left instrument panel (I/P) sound insulator. Refer to **Instrument Panel Insulator Panel Replacement - Left Side** . 2. Disconnect the accelerator pedal position sensor electrical connector.	
1	Accelerator Pedal Position Sensor Bolts (Qty: 2) **CAUTION:** **Refer to** **Fastener Caution** **Tighten** 9 N.m(80 lb in)
2	Accelerator Pedal Position Sensor

THROTTLE BODY ASSEMBLY REPLACEMENT

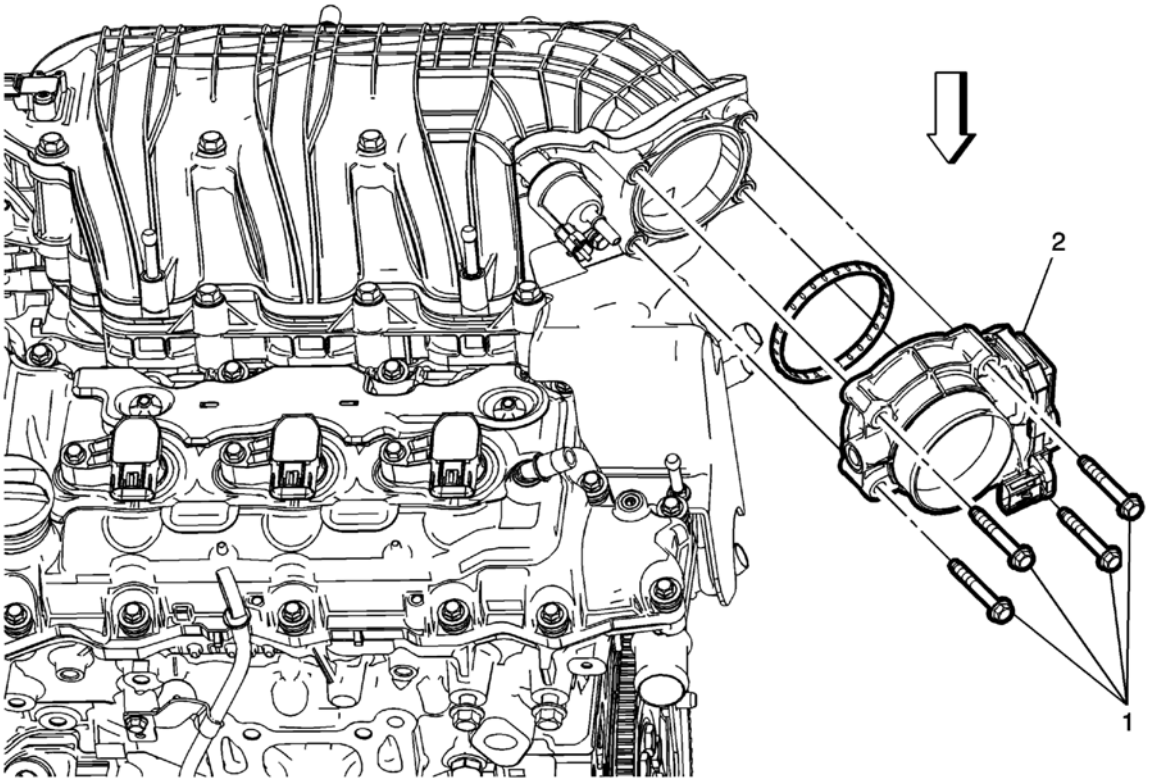

Fig. 10: Throttle Body Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures **1. Remove the intake manifold cover. Refer to Intake Manifold Cover Replacement** **2. Remove the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement**	
1	Throttle Body Bolts (Qty: 4). **CAUTION:** **Refer to Fastener Caution .** **Tighten** 10 N.m (89 lb in)
2	Throttle Body. **Procedure** 1. Disconnect the throttle body electrical connector. 2. Install a NEW throttle body seal. 3. Perform the throttle learn procedure. Refer to **Q38 Throttle Body: Throttle/Idle**

Callout	Component Name
Preliminary Procedures **1. Remove the intake manifold cover. Refer to Intake Manifold Cover Replacement** **2. Remove the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement**	
	Learn .

THROTTLE BODY INSPECTION AND CLEANING

1. Remove the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement**.

WARNING: Turn OFF the ignition before inserting fingers into the throttle bore. Unexpected movement of the throttle blade could cause personal injury.

CAUTION: Do not insert any tools into the throttle body bore in order to avoid damage to the throttle valve plate.

2. Inspect the throttle body bore and the throttle plate for deposits. You will need to open the throttle plate in order to inspect all surfaces.

CAUTION: Do not use any solvent that contains Methyl Ethyl Ketone (MEK). This solvent may damage fuel system components.

3. Clean the throttle body bore and the throttle plate using a clean shop towel with GM Top Engine Cleaner, P/N 1052626 or ACDelco Carburetor Tune-Up Conditioner, P/N X66-P, or an equivalent product.
4. Install the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement**.
5. Perform the Throttle/Idle Learn procedure. Refer to **Q38 Throttle Body: Throttle/Idle Learn**.

FUEL PRESSURE RELIEF (WITHOUT CH 48027)

WARNING: Refer to Gasoline/Gasoline Vapors Warning .

WARNING: Refer to Relieving Fuel Pressure Warning .

1. If the fuel system requires repair, prevent fuel spillage by removing the fuel pump fuse. Refer to **Electrical Center Identification Views** .
2. Loosen the fuel fill cap in order to relieve the fuel tank vapor pressure.
3. Remove the engine cover, if required.
4. Remove the fuel rail service port cap.
5. Wrap a shop towel around the fuel rail service port and using a small flat-bladed tool, depress (open) the fuel rail test port valve.
6. Remove the shop towel from around the fuel rail service port, and place in an approved gasoline container.
7. Install the fuel rail service port cap.

8. Install the engine cover, if required.
9. Tighten the fuel fill cap.

FUEL PRESSURE RELIEF (CH 48027)

Special Tools

CH-48027 Digital Pressure Gauge

WARNING: Refer to Gasoline/Gasoline Vapors Warning .

WARNING: Refer to Relieving Fuel Pressure Warning .

1. If the fuel system requires repair, prevent fuel spillage by removing the fuel pump fuse. Refer to **Electrical Center Identification Views** .

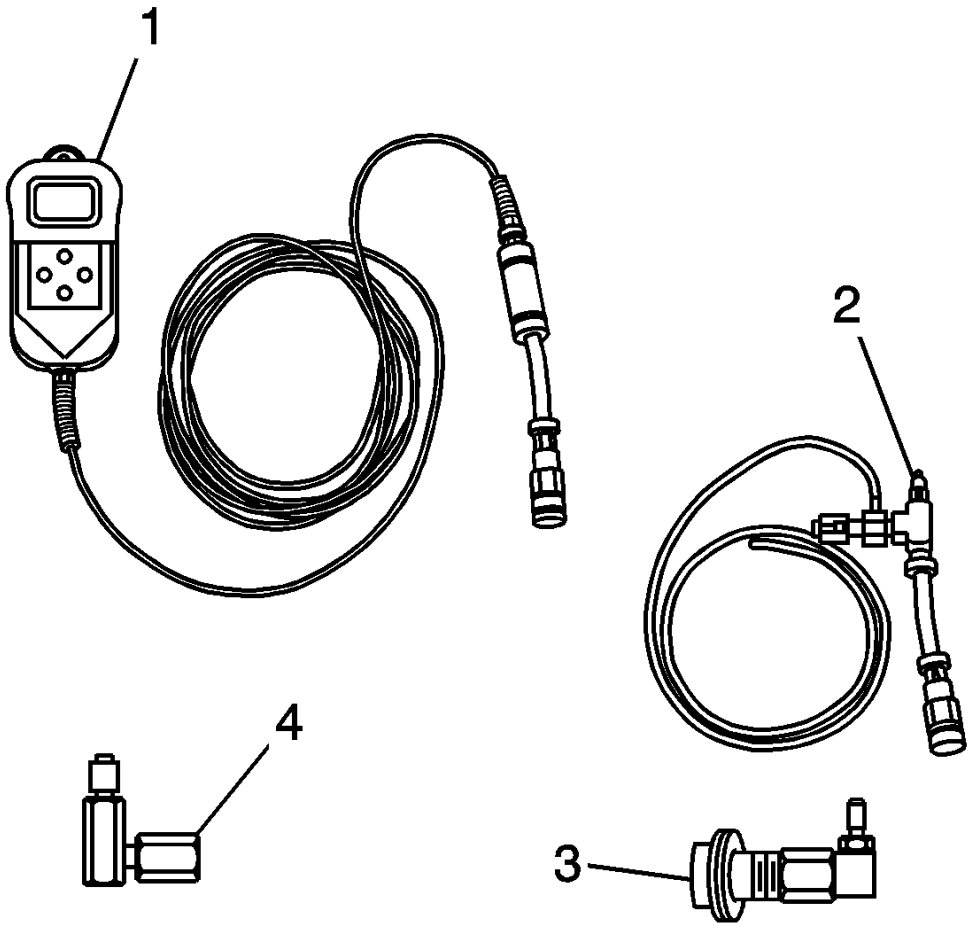

Fig. 11: View Of Digital Pressure Gauge, Special Tools & Components
Courtesy of GENERAL MOTORS COMPANY

2. Remove the engine cover, if required.

3. Loosen the fuel fill cap in order to relieve the fuel tank vapor pressure.
4. Remove the fuel rail service port cap.

WARNING: **Wrap a shop towel around the fuel pressure connection in order to reduce the risk of fire and personal injury. The towel will absorb any fuel leakage that occurs during the connection of the fuel pressure gauge. Place the towel in an approved container when the connection of the fuel pressure gauge is complete.**

5. Wrap a shop towel around the fuel rail service port.
6. Connect the CH-48027-3 (4) to the fuel rail service port.
7. Connect the CH-48027-2 (2) to the CH-48027-3 (4).
8. Place the hose on the CH-48027-2 (2) into an approved gasoline container.
9. Open the valve on the CH-48027-2 (2) in order to bleed any fuel from the fuel rail.
10. Close the valve on the CH-48027-2 (2).
11. Remove the hose on the CH-48027-2 (2) from the approved gasoline container.

CAUTION: **Clean all of the following areas before performing any disconnections in order to avoid possible contamination in the system:**

- **The fuel pipe connections**
- **The hose connections**
- **The areas surrounding the connections**

NOTE: **If relieving the fuel pressure for the fuel pressure gauge installation and removal, it is NOT necessary to proceed with the following steps.**

12. Disconnect the CH-48027-2 (2) from the CH-48027-3 (4).
13. Disconnect the CH-48027-3 (4) from the fuel rail service port.
14. Remove the shop towel from around the fuel rail service port, and place in an approved gasoline container.
15. Install the fuel rail service port cap.
16. Install the engine cover, if required.
17. Tighten the fuel fill cap.

FUEL PRESSURE RELIEF (HIGH SIDE)

WARNING: **Fuel that flows out at high pressure can cause serious injury to the skin and eyes. ALWAYS depressurize the fuel system before removing components that are under high fuel pressure.**

1. Remove the fuel pump control module 20A fuse from the underhood electrical center. Refer to **Electrical Center Identification Views** .
2. Start the vehicle and allow the engine to idle until the engine stops. The engine will stop in approximately 20-30 seconds.

3. Turn the ignition OFF.

FUEL PRESSURE GAUGE INSTALLATION AND REMOVAL

Special Tools

CH-48027 Digital Pressure Gauge

Installation Procedure

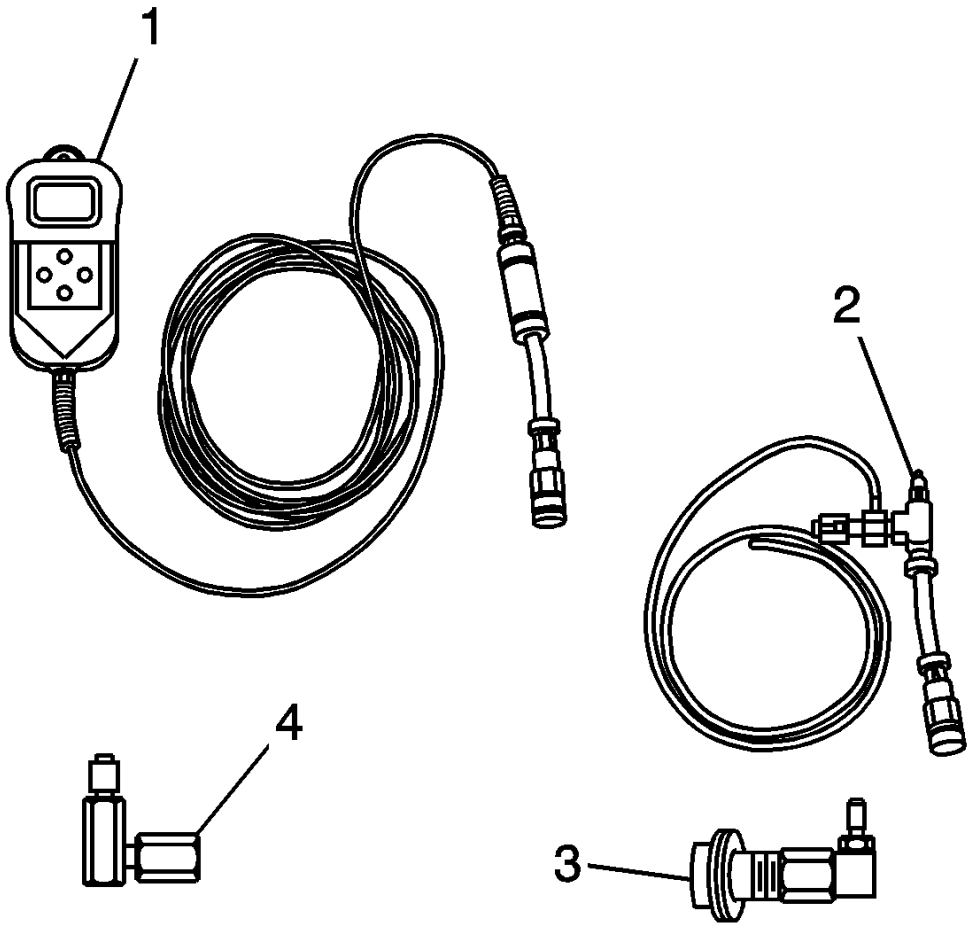

Fig. 12: View Of Digital Pressure Gauge, Special Tools & Components
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to Gasoline/Gasoline Vapors Warning .**

WARNING: **Remove the fuel tank cap and relieve the fuel system pressure before servicing the fuel system in order to reduce the risk of personal injury. After you relieve the fuel system pressure, a small amount of fuel may be released when servicing the fuel lines, the fuel injection pump, or the connections. In order to reduce the risk of personal injury, cover the fuel system components with a shop towel before disconnection. This will**

catch any fuel that may leak out. Place the towel in an approved container when the disconnection is complete.

1. Relieve the fuel system pressure. Refer to **Fuel Pressure Relief (Without CH 48027)Fuel Pressure Relief (CH 48027)Fuel Pressure Relief (High Side)**.
2. Connect the CH-48027-1 (1) to the CH-48027-2 (2).
3. Remove the shop towel from around the fuel rail service port, and place in an approved gasoline container.
4. Perform any tests and/or diagnostics as needed. For the proper usage of the **CH-48027** digital pressure gauge , refer to the manufacture's directions.

Removal Procedure

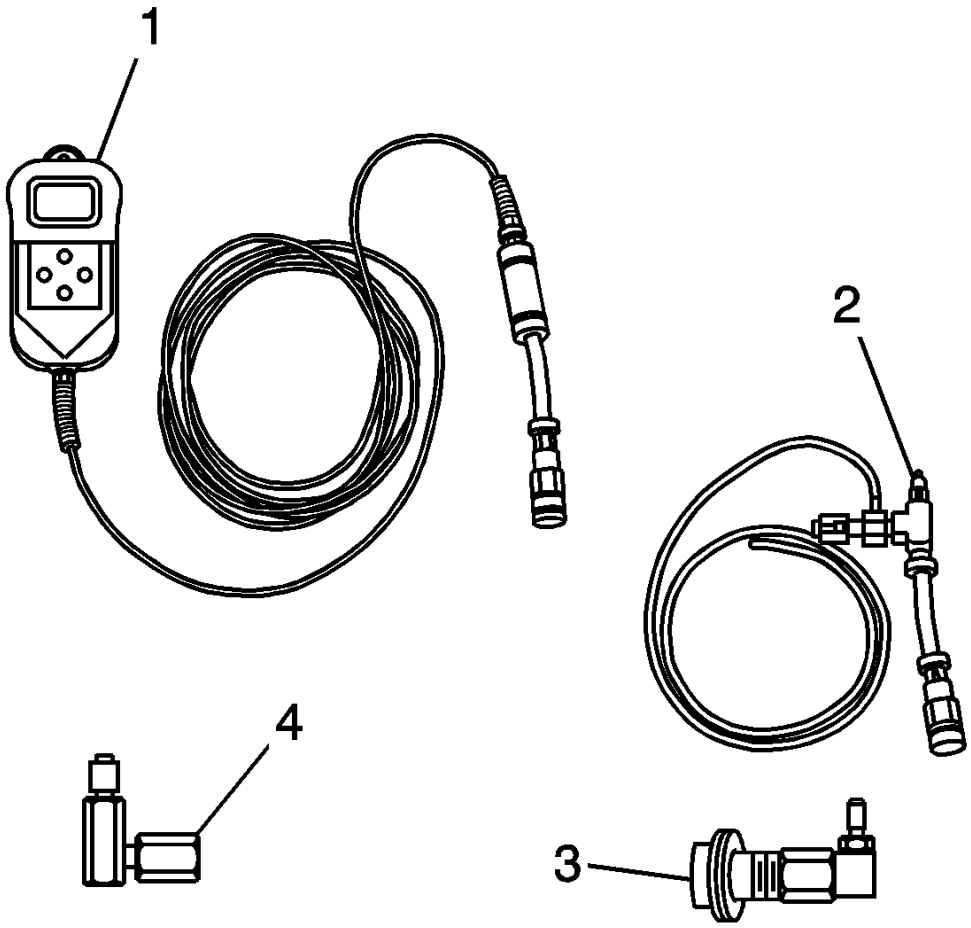

Fig. 13: View Of Digital Pressure Gauge, Special Tools & Components
Courtesy of GENERAL MOTORS COMPANY

1. Relieve the fuel system pressure, if required. Perform the following steps:

WARNING: Wrap a shop towel around the fuel pressure connection in order to reduce the risk of fire and personal injury. The towel will absorb any

fuel leakage that occurs during the connection of the fuel pressure gauge. Place the towel in an approved container when the connection of the fuel pressure gauge is complete.

1. Wrap a shop towel around the fuel rail service port.
2. Place the hose on the CH-48027-2 (2) into an approved gasoline container.
3. Open the valve on the CH-48027-2 (2) in order to bleed any fuel from the fuel rail.
4. Close the valve on the CH-48027-2 (2).
5. Remove the hose on the CH-48027-2 (2) from the approved gasoline container.
6. Remove the shop towel from around the fuel rail service port, and place in an approved gasoline container.

CAUTION: Clean all of the following areas before performing any disconnections in order to avoid possible contamination in the system:

- **The fuel pipe connections**
- **The hose connections**
- **The areas surrounding the connections**

2. Disconnect the CH-48027-1 (1) from the CH-48027-2 (2).
3. Disconnect the CH-48027-2 (2) from the CH-48027-3 (4).
4. Disconnect the CH-48027-3 (4) from the fuel rail service port.
5. Install the fuel rail service port cap.
6. Install the engine cover, if required.
7. Tighten the fuel fill cap.

METAL COLLAR QUICK CONNECT FITTING SERVICE

Special Tools

J 37088-A Fuel Line Disconnect Tool Set

Removal Procedure

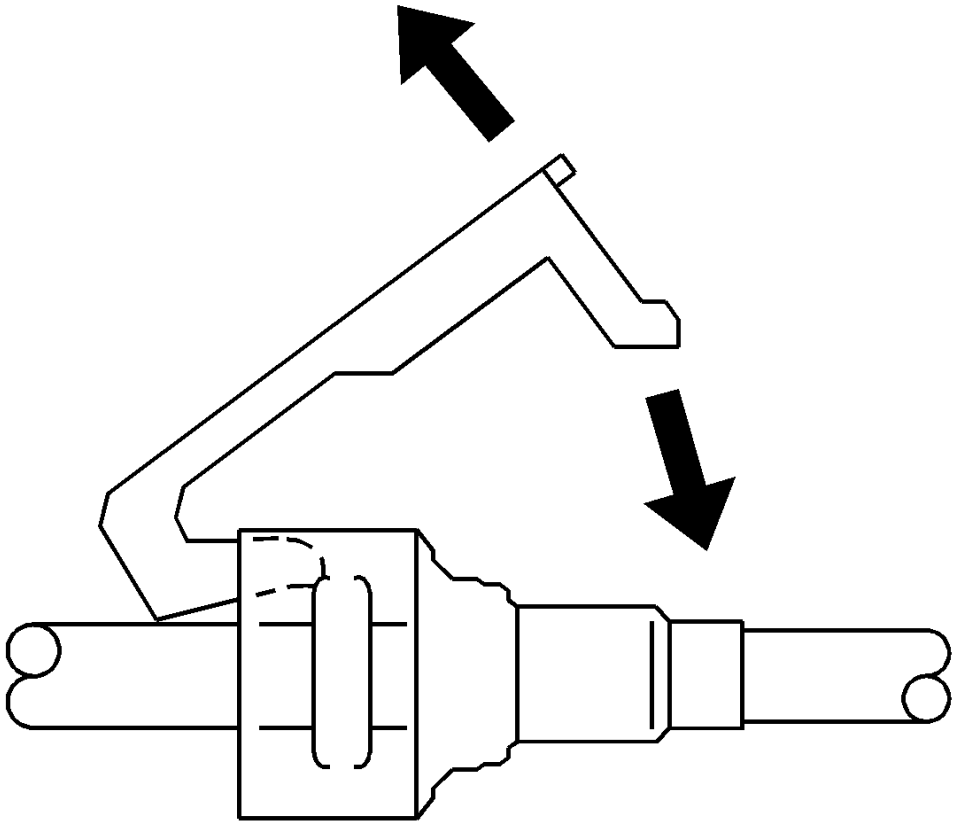

Fig. 14: Relieve Fuel System Pressure
Courtesy of GENERAL MOTORS COMPANY

1. Relieve the fuel system pressure. Refer to the **Fuel Pressure Relief (Without CH 48027)Fuel Pressure Relief (CH 48027)Fuel Pressure Relief (High Side)**.
2. Remove the retainer from the fuel feed quick-connect fitting.

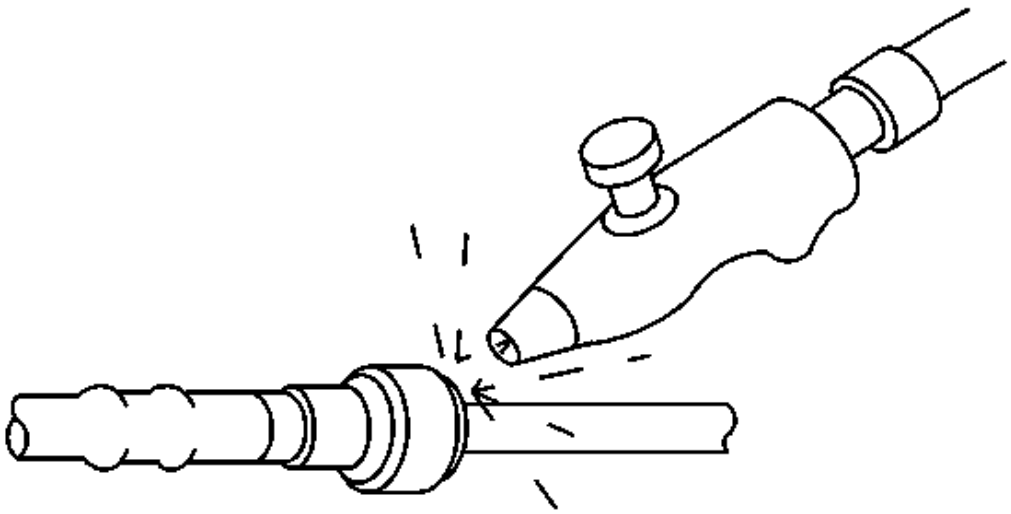

Fig. 15: Blowing Dirt Out Of Fitting (Metal Collar)
Courtesy of GENERAL MOTORS COMPANY

WARNING: Wear safety glasses when using compressed air, as flying dirt particles may cause eye injury.

3. Using compressed air, blow any dirt or debris from around the fitting.

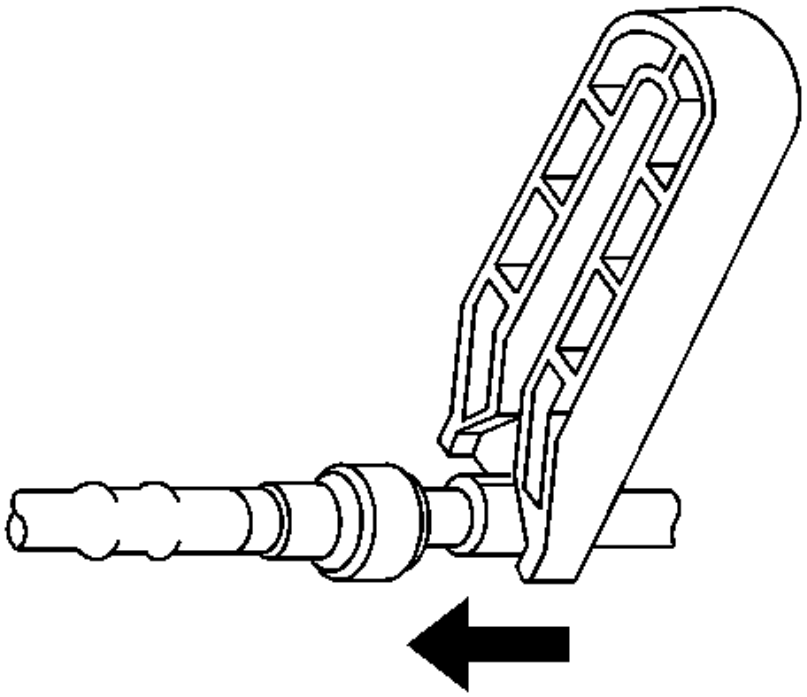

Fig. 16: View Of Quick Connect Locking Tabs (Metal Collar)
Courtesy of GENERAL MOTORS COMPANY

4. Using the correct tool from the **J 37088-A** fuel line disconnect tool set , insert the tool into the female connector, then push inward in order to release the quick connect locking tabs.

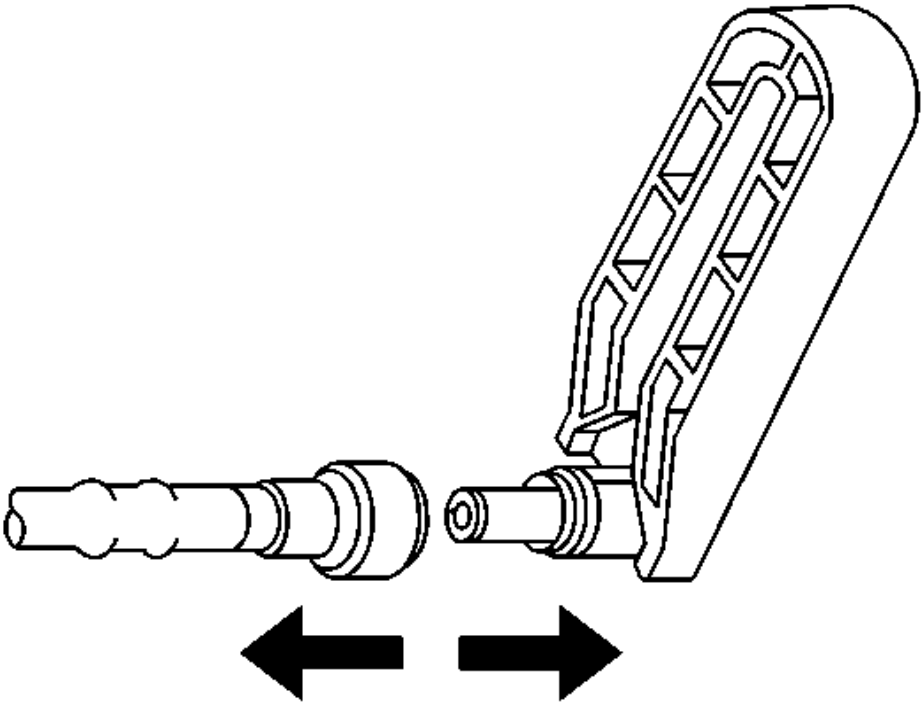

Fig. 17: View Of Quick Connect Locking Tabs (Metal Collar)
Courtesy of GENERAL MOTORS COMPANY

5. Pull the fuel line connection apart.

CAUTION: If necessary, remove rust or burrs from the fuel pipes with an emery cloth. Use a radial motion with the fuel pipe end in order to prevent damage to the O-ring sealing surface. Use a clean shop towel in order to wipe off the male tube ends. Inspect all the connections for dirt and burrs. Clean or replace the components and assemblies as required.

6. Use a clean shop towel in order to wipe off the male pipe end.
7. Inspect both ends of the fitting for dirt and burrs. Clean or replace the components, as required.

Installation Procedure

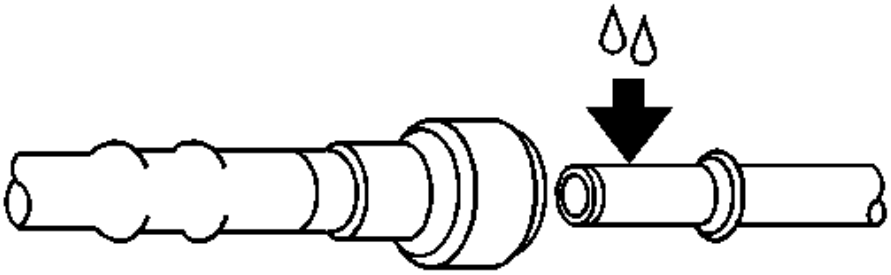

Fig. 18: Oiling Male Pipe Ends (Metal Collar)
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Fuel Pipe Fitting Warning .

1. Apply a few drops of clean engine oil to the male pipe end.

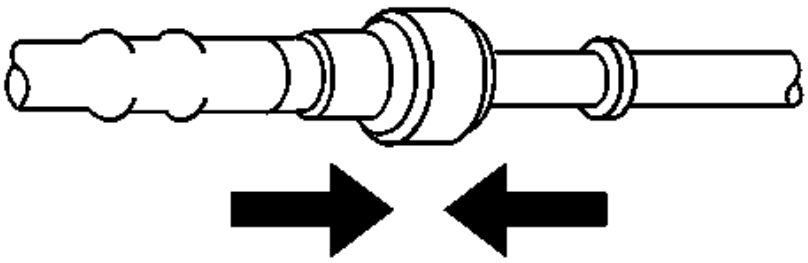

Fig. 19: View Of Connectors (Metal Collar)
Courtesy of GENERAL MOTORS COMPANY

2. Push both sides of the fitting together in order to snap the retaining tabs into place.

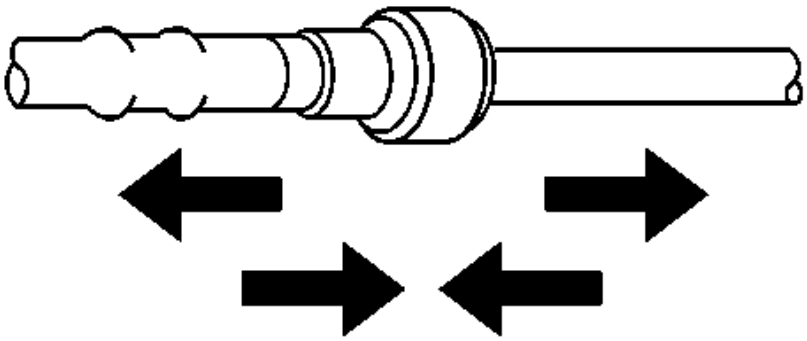

Fig. 20: Ensuring Connection (Metal Collar) Is Secure
Courtesy of GENERAL MOTORS COMPANY

3. Once installed, pull on both sides of the fitting in order to make sure the connection is secure.

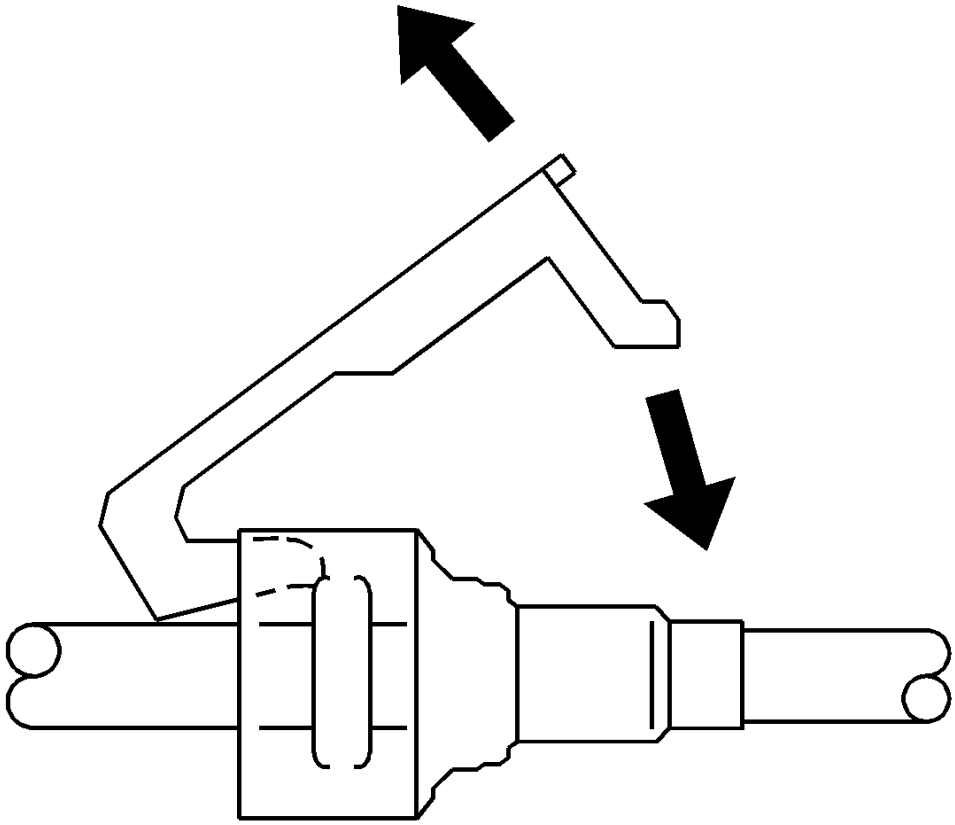

Fig. 21: Relieve Fuel System Pressure
Courtesy of GENERAL MOTORS COMPANY

4. Install the retainer to the fuel feed quick-connect fitting.

PLASTIC COLLAR QUICK CONNECT FITTING SERVICE

Removal Procedure

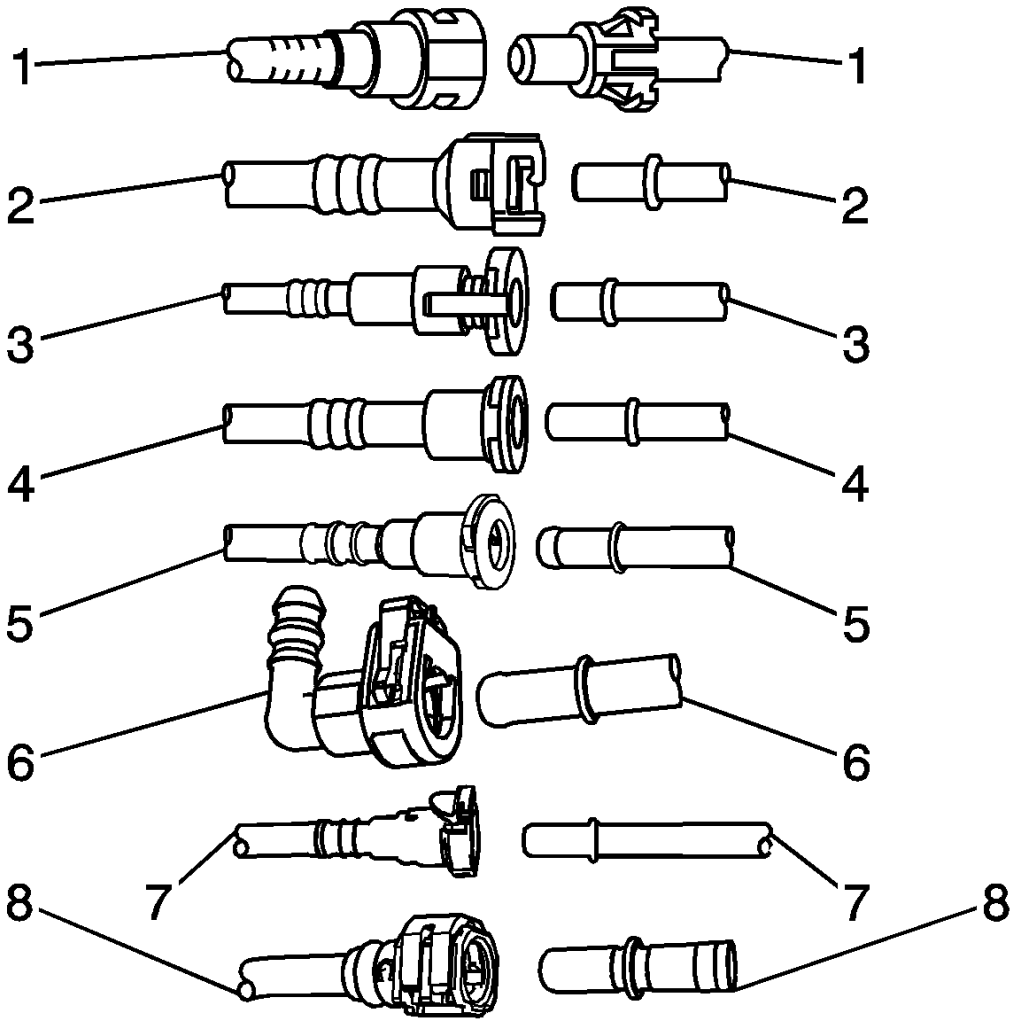

Fig. 22: Plastic Collar Quick Connect Fitting Service
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Refer to Gasoline/Gasoline Vapors Warning .**

NOTE: **There are several types of Plastic Collar Fuel and Evaporative Emission Quick Connect Fittings used on this vehicle.**

- **Bartholomew (1)**
- **Q Release (2)**
- **Squeeze to Release (3)**
- **Sliding Retainer (4)**
- **Global Connect (5)**
- **TI Loc (6)**
- **Safe Lock (7)**

The following instructions apply to all of these types of Plastic Collar Quick Connect Fittings except where indicated.

1. Relieve the fuel system pressure before servicing any fuel system connection. Refer to the **Fuel Pressure Relief (Without CH 48027)Fuel Pressure Relief (CH 48027)Fuel Pressure Relief (High Side)**.

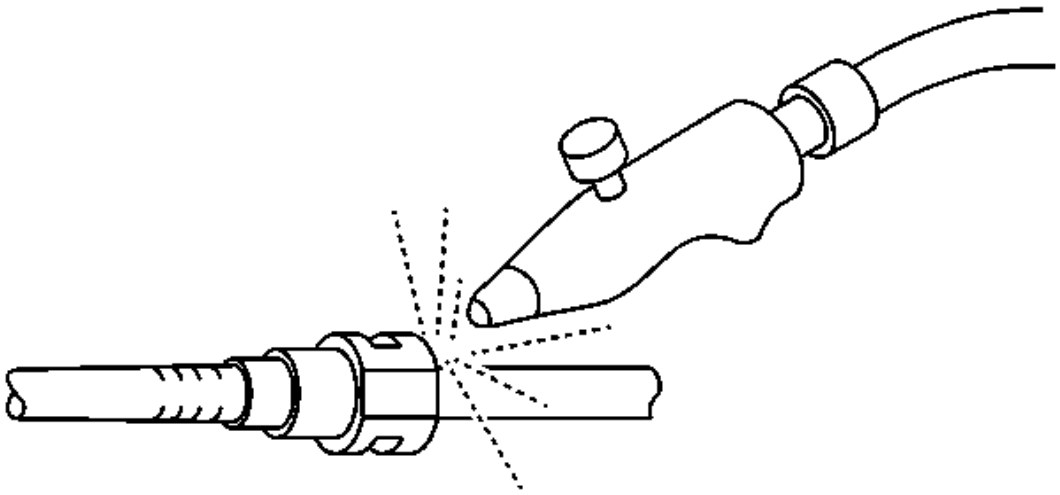

Fig. 23: Blowing Dirt Out Of Fitting (Plastic Collar)
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Safety Glasses and Compressed Air Warning .

2. Using compressed air, blow any dirt out of the quick-connect fitting.

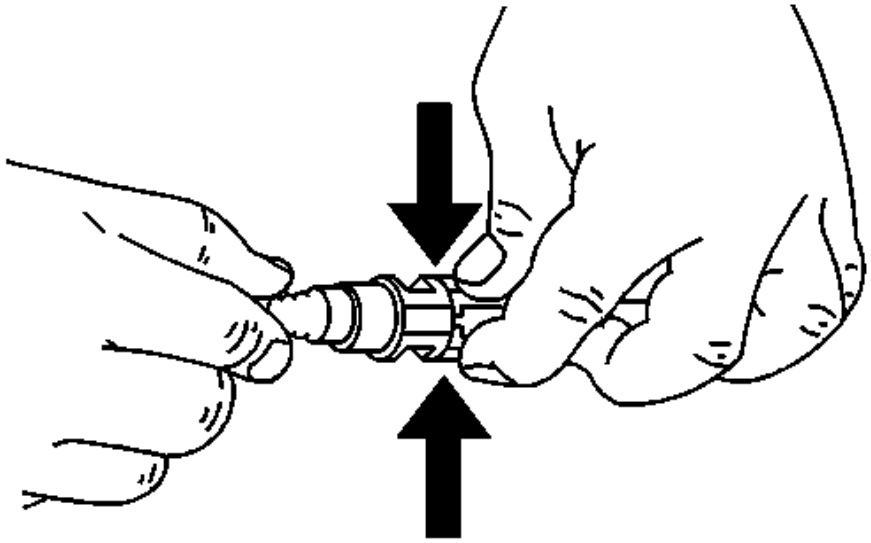

Fig. 24: View Of Quick Connect Fitting Release Tabs (Plastic Collar)
Courtesy of GENERAL MOTORS COMPANY

3. This step applies to Bartholomew style connectors ONLY. Squeeze the plastic quick-connect fitting release tabs.

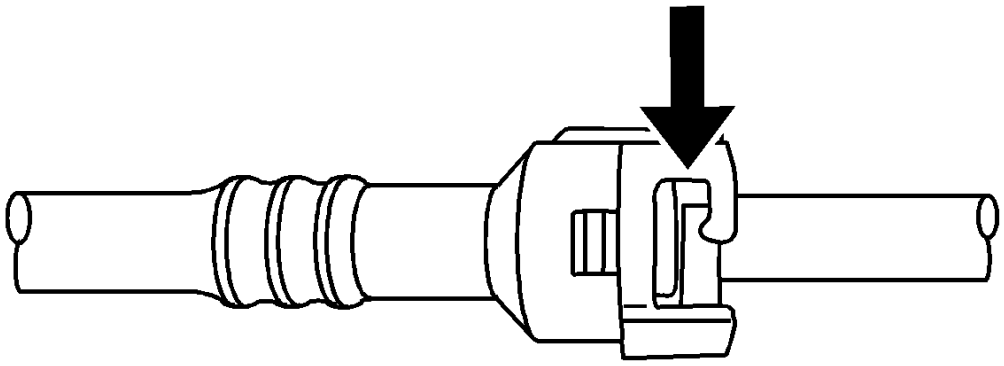

Fig. 25: Releasing Q Release Style Connectors (Plastic Collar)
Courtesy of GENERAL MOTORS COMPANY

4. This step applies to Q Release style connectors ONLY. Release the fitting by Pushing the tab toward the other side of the slot in the fitting.

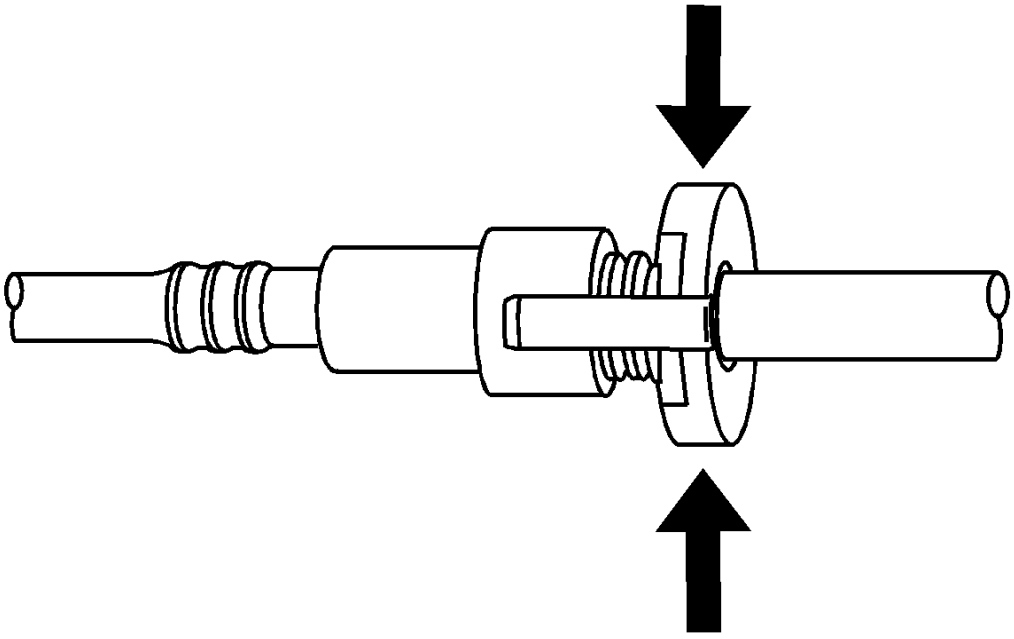

Fig. 26: Disengaging Quick Connect Fitting (Plastic Collar)
Courtesy of GENERAL MOTORS COMPANY

5. This step applies to Squeeze to Release style connectors ONLY. Squeeze where indicated by arrows on both sides of the plastic ring surrounding the quick-connect fitting.

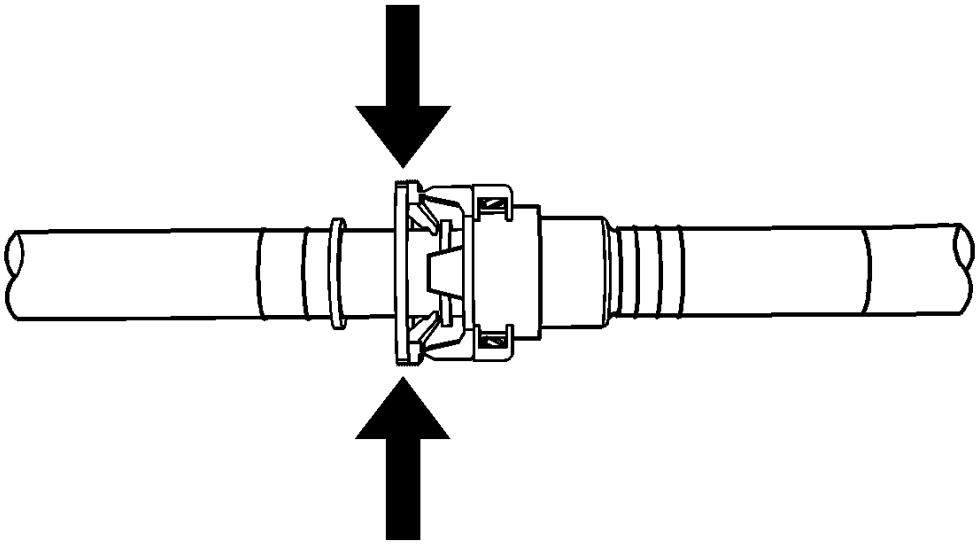

Fig. 27: Pushing In Male Side Of Connector
Courtesy of GENERAL MOTORS COMPANY

6. This step applies to Squeeze to Release style connectors ONLY. Push in the male side slightly in order to slide the retainer away from the retainers, squeeze where indicated by arrows on both sides of the plastic ring surrounding the quick-connect fitting.

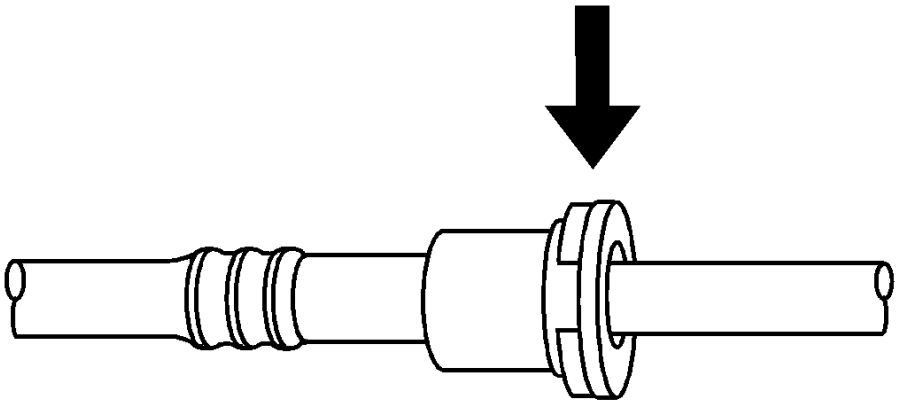

Fig. 28: View Of Sliding Retainer Style Connector
Courtesy of GENERAL MOTORS COMPANY

7. This step applies to Sliding Retainer style connectors ONLY. Release the fitting by pressing on one side of the release tab causing it to push in slightly. If the tab doesn't move try pressing the tab in from the opposite side. The tab will only move in one direction.

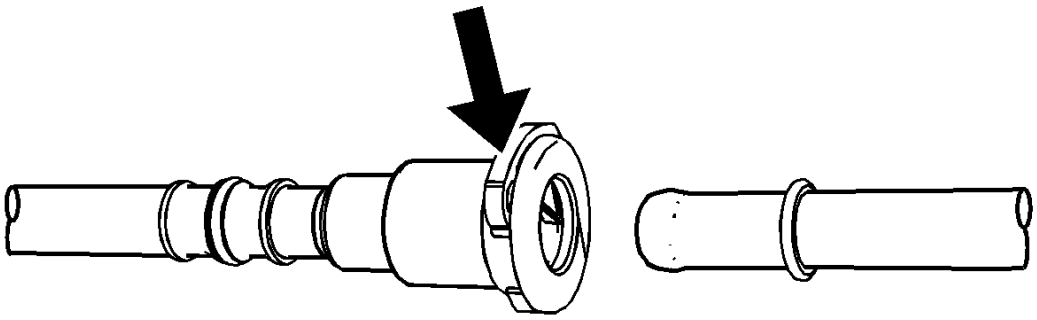

Fig. 29: Global Connector Style
Courtesy of GENERAL MOTORS COMPANY

8. This step applies to the Global Connector style only. Push the connector toward the tube in order to release the pressure. Press and hold down the release mechanism, and pull the connector straight out.

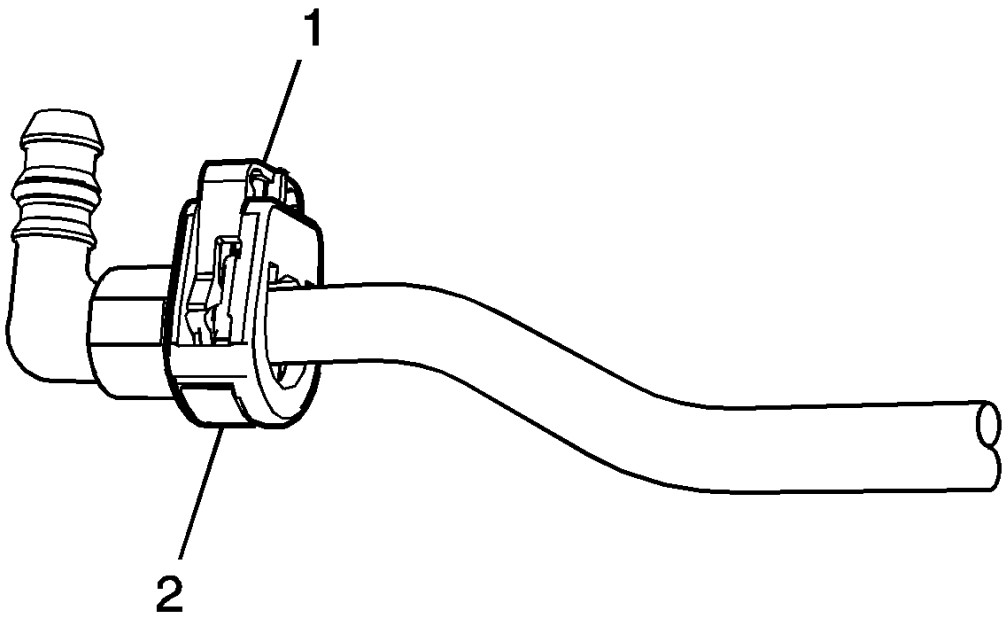

Fig. 30: TI Loc style
Courtesy of GENERAL MOTORS COMPANY

9. This step applies to the TI Loc style only. Push the connector toward the tube in order to release the pressure. Release the redundant latch (1) with two fingers or a flat bladed tool. Then press and hold down the bottom release mechanism (2) and pull the connector straight out.

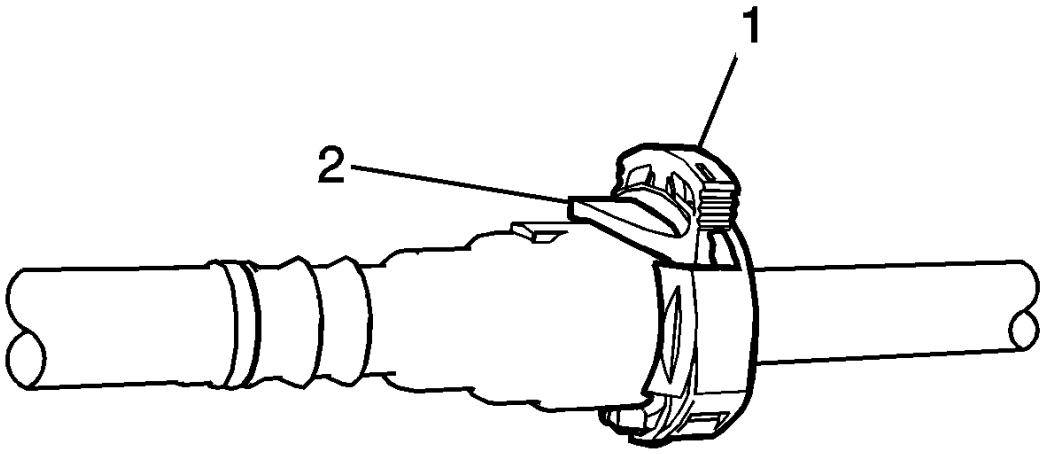

Fig. 31: Safe Lock Style
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Relieving Fuel Pressure Warning .

10. This step applies to the Safe Lock style only. Push the connector toward the tube in order to release the pressure. Release the second latch (1) with two fingers. Then press and hold down the bottom release mechanism (2) and pull the connector straight out.
11. Using a clean shop towel, wipe off the male pipe end.
12. Inspect both ends of the fitting for dirt and burrs.
13. Clean or replace components as necessary.

Installation Procedure

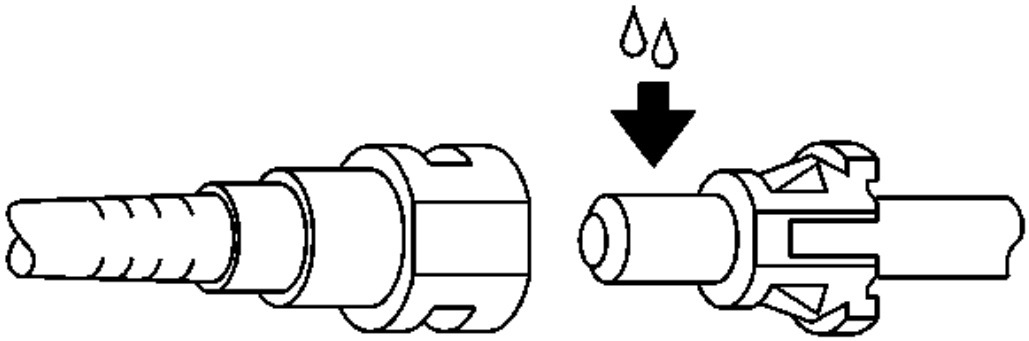

Fig. 32: Lubricating Male Pipe End
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Fuel Pipe Fitting Warning .

1. Apply a few drops of clean engine oil to the male pipe end.

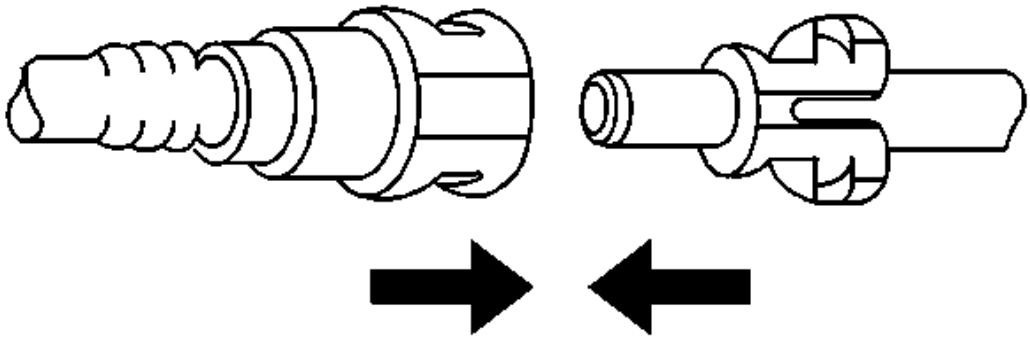

Fig. 33: Connecting Quick-Connect Fittings
Courtesy of GENERAL MOTORS COMPANY

2. Push both sides of the quick-connect fitting together in order to cause the retaining feature to snap into place.

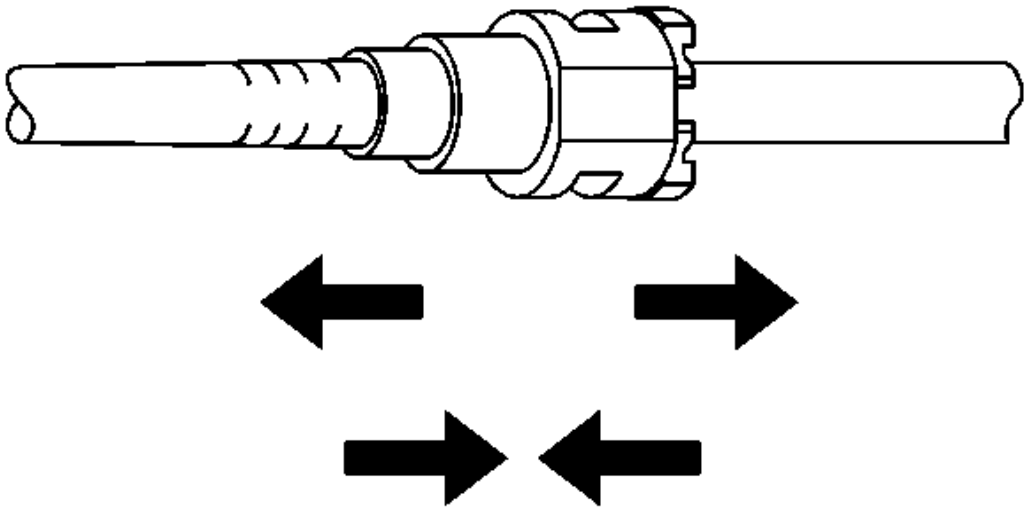

Fig. 34: View Of Quick-Connect Fitting
Courtesy of GENERAL MOTORS COMPANY

3. Pull on both sides of the quick-connect fitting to make sure the connection is secure.

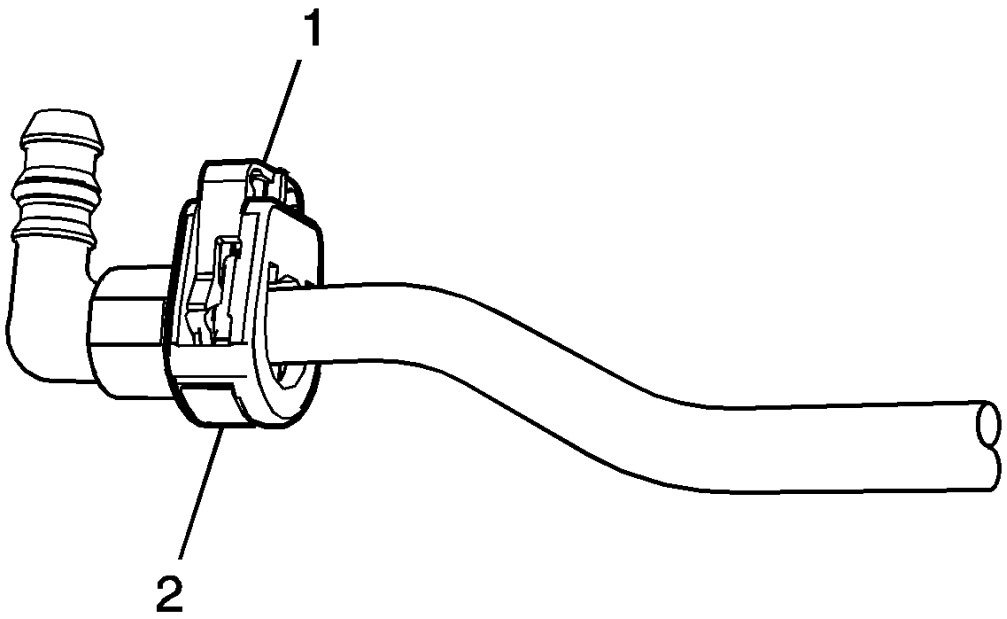

Fig. 35: TI Loc style
Courtesy of GENERAL MOTORS COMPANY

4. Insert the tube in the connector until the retainer snaps in place.
5. Push down on the redundant latch (1) until it is fully engaged and snapped into position.

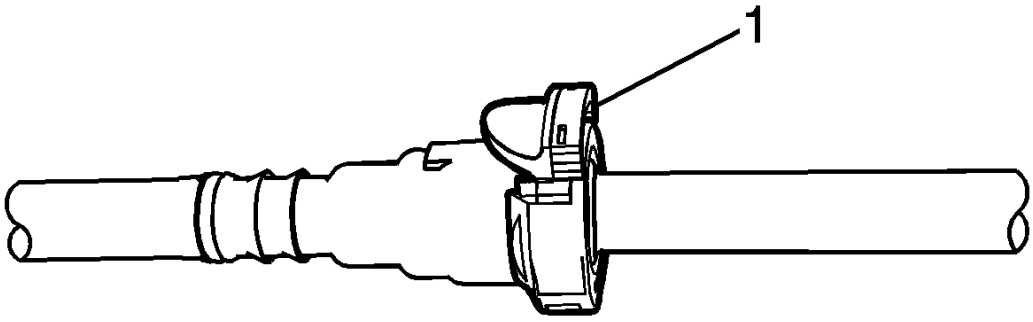

Fig. 36: Redundant Latch
Courtesy of GENERAL MOTORS COMPANY

6. Insert the tube in the connector until the retainer snaps in place.
7. Push down on the second latch (1) in order to secure the connection.
8. Inspect for leaks using the following procedure:
    1. Turn the ignition ON, with the engine OFF for 2 seconds.
    2. Turn the ignition OFF, for 10 seconds.
    3. Turn the ignition ON, with the engine OFF for 2 seconds.
    4. Turn the ignition OFF.
    5. Inspect for leaks.

FUEL TANK DRAINING (E-85)

Special Tools

- **J 36850** Transjel Lubricant
- **J 45004** Fuel Tank Drain Hose

WARNING: Never drain or store fuel in an open container. Always use an approved fuel storage container in order to reduce the chance of fire or explosion.

WARNING: Place a dry chemical (Class B) fire extinguisher nearby before performing any on-vehicle service procedures. Failure to follow these precautions may result in personal injury.

1. Raise and Support the Vehicle. Refer to **Lifting and Jacking the Vehicle**

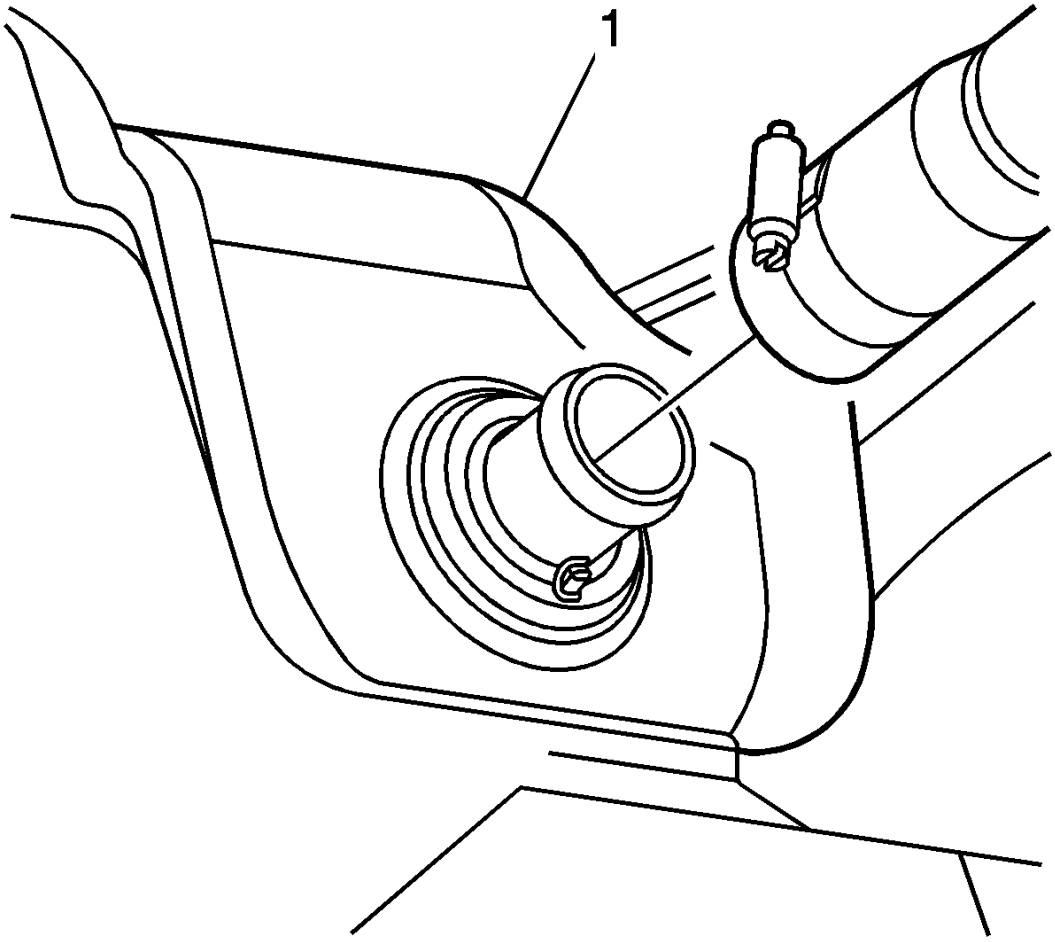

Fig. 37: Inserting Fuel Tank Drain Hose Into Fuel Tank
Courtesy of GENERAL MOTORS COMPANY

NOTE: Lubricate the fuel drain hose with J 36850 Transjel Lubricant or equivalent to aid in hose insertion. Do not use an unapproved lubricant.

2. Loosen the lower drain hose clamp in order to separate the drain hose from the fuel tank (1).
3. Insert the **J 45004** Fuel Tank Drain Hose into the fuel tank (1) until the hose reaches the bottom of the fuel tank.
4. Use a hand or air operated pump device in order to drain as much fuel from the fuel tank as possible.

FUEL TANK PROTECTOR REPLACEMENT

Removal Procedure

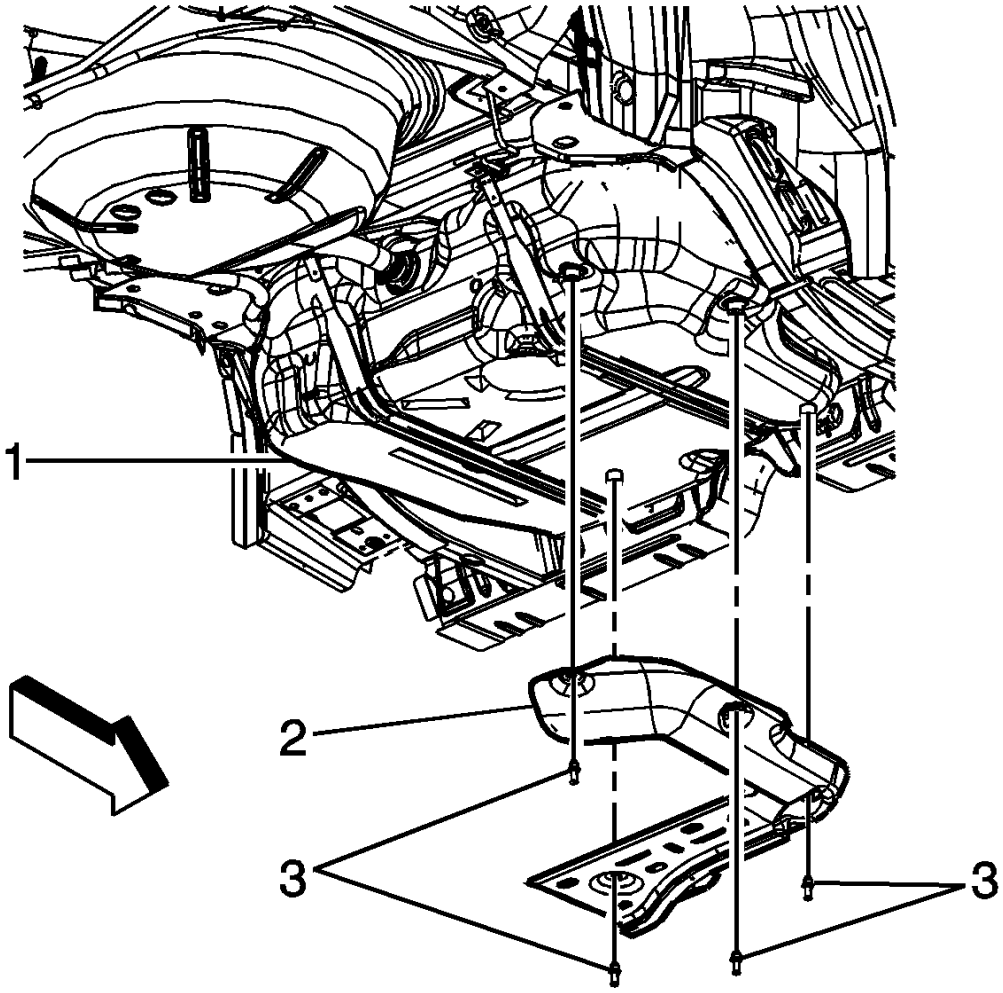

Fig. 38: View Of Fuel Tank Shield
Courtesy of GENERAL MOTORS COMPANY

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the fuel tank shield retainers (3).
3. Remove the fuel tank shield (2) from the fuel tank (1).

Installation Procedure

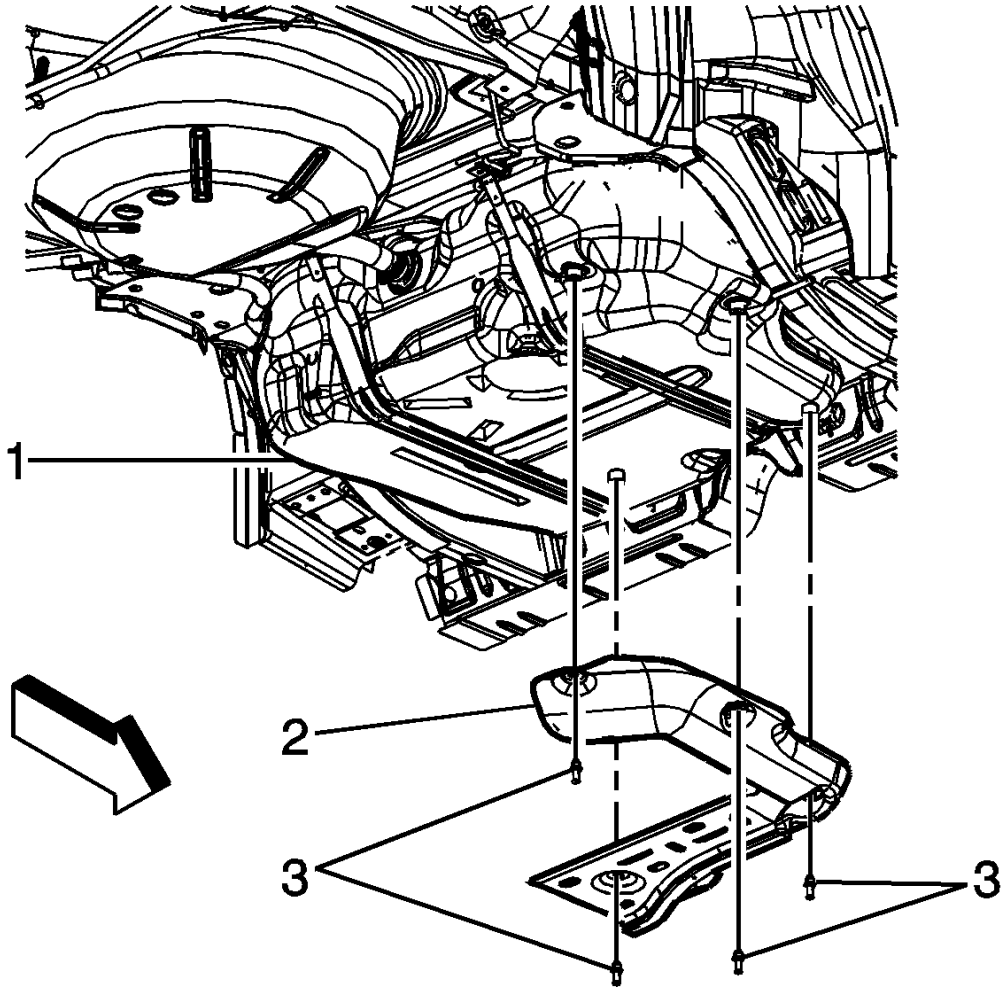

Fig. 39: View Of Fuel Tank Shield
Courtesy of GENERAL MOTORS COMPANY

1. Install the fuel tank shield (2) from the fuel tank (1).

CAUTION: Refer to Fastener Caution .

2. Install the fuel tank shield retainers (3).
3. Lower the vehicle.

FUEL TANK REPLACEMENT

Removal Procedure

NOTE: Clean the fuel and evaporative emission (EVAP) connections and surrounding areas prior to disconnecting the lines in order to avoid possible system contamination.

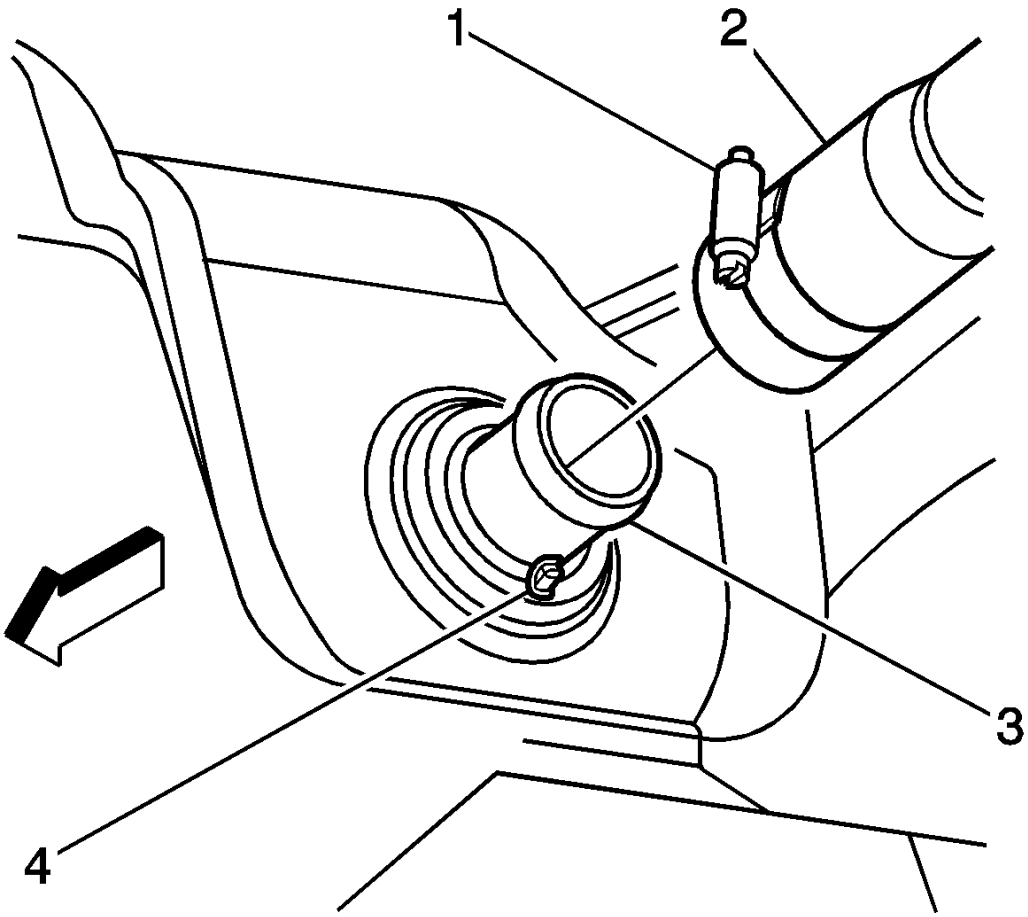

Fig. 40: Fuel Tank Clamp, Fuel Tank Hose and Fuel Tank
Courtesy of GENERAL MOTORS COMPANY

1. Relieve the fuel system pressure. Refer to **Fuel Pressure Relief (Without CH 48027)Fuel Pressure Relief (CH 48027)Fuel Pressure Relief (High Side)**.
2. Drain the fuel tank. Refer to **Fuel Tank Draining (E-85)**.
3. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
4. Loosen the fuel fill hose clamp (1) at the fuel tank.
5. Remove the fuel tank fill hose (2) from the fuel tank (3).
6. Disconnect the EVAP vent pipe quick connect fitting from the fill pipe EVAP vent pipe quick connect fitting. **Plastic Collar Quick Connect Fitting Service**.

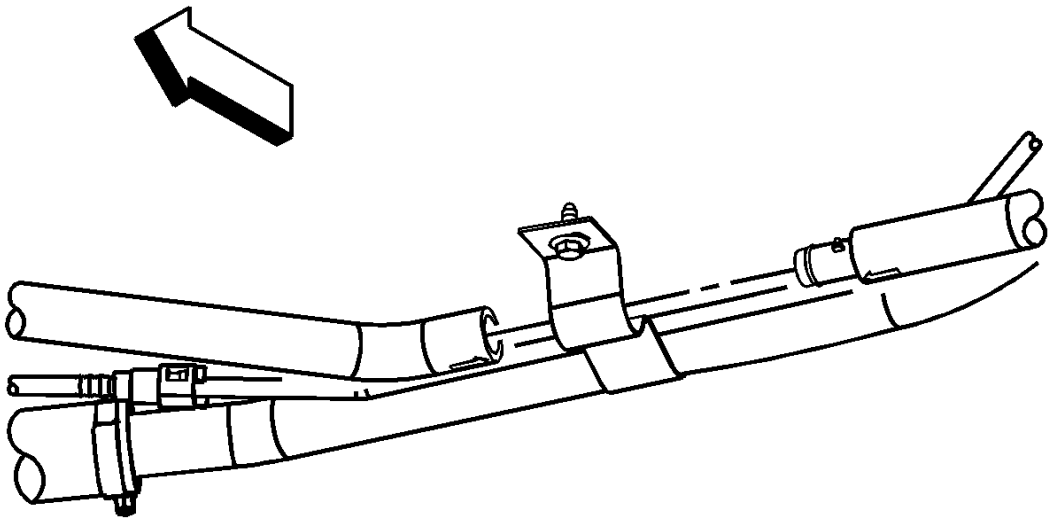

Fig. 41: EVAP Canister Vent Solenoid Valve And EVAP Emission Canister Hose
Courtesy of GENERAL MOTORS COMPANY

7. Disconnect the EVAP vent solenoid hose on the tank from the vent valve solenoid hose.

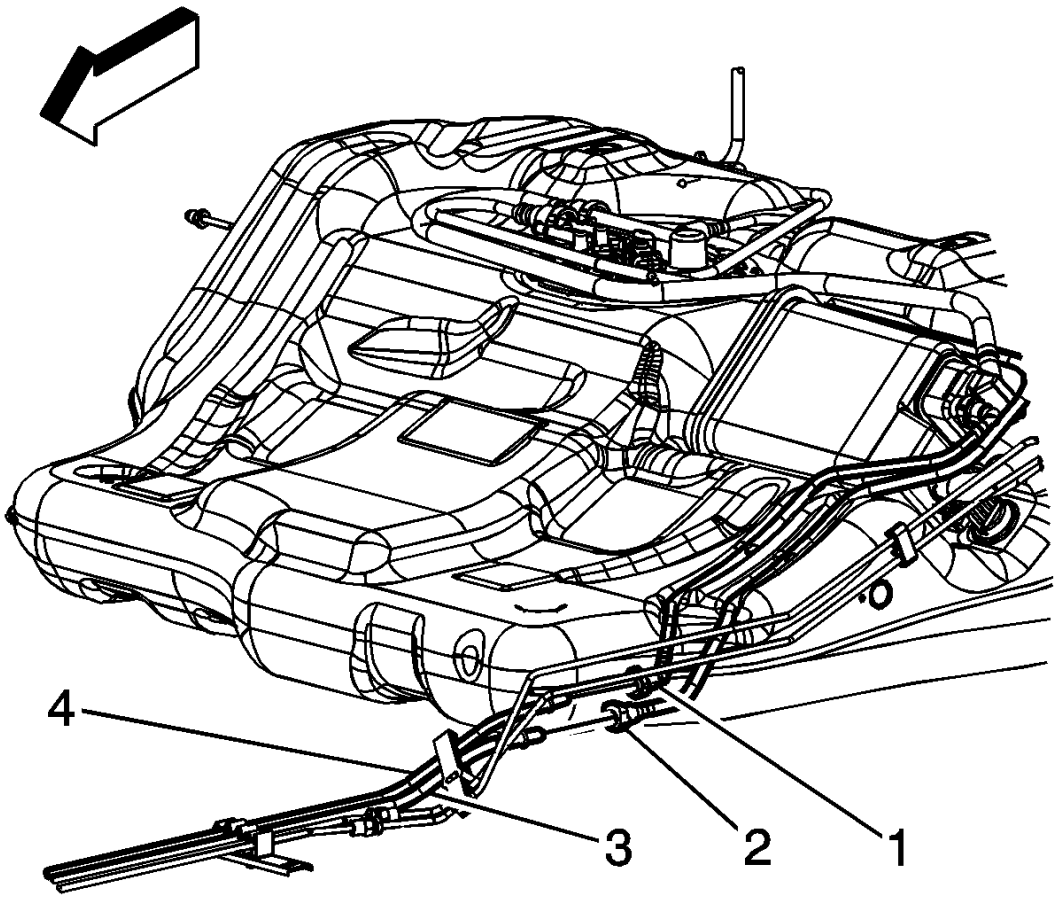

Fig. 42: View Of Fuel Feed, EVAP and Fuel Tank Lines
Courtesy of GENERAL MOTORS COMPANY

8. Disconnect the fuel feed (3), and the EVAP (4) lines from the fuel tank lines (1, 2). Refer to **Plastic Collar Quick Connect Fitting Service**.
9. Support the exhaust system.
10. Remove the rubber exhaust pipe hangers in order to allow the exhaust system to drop slightly.

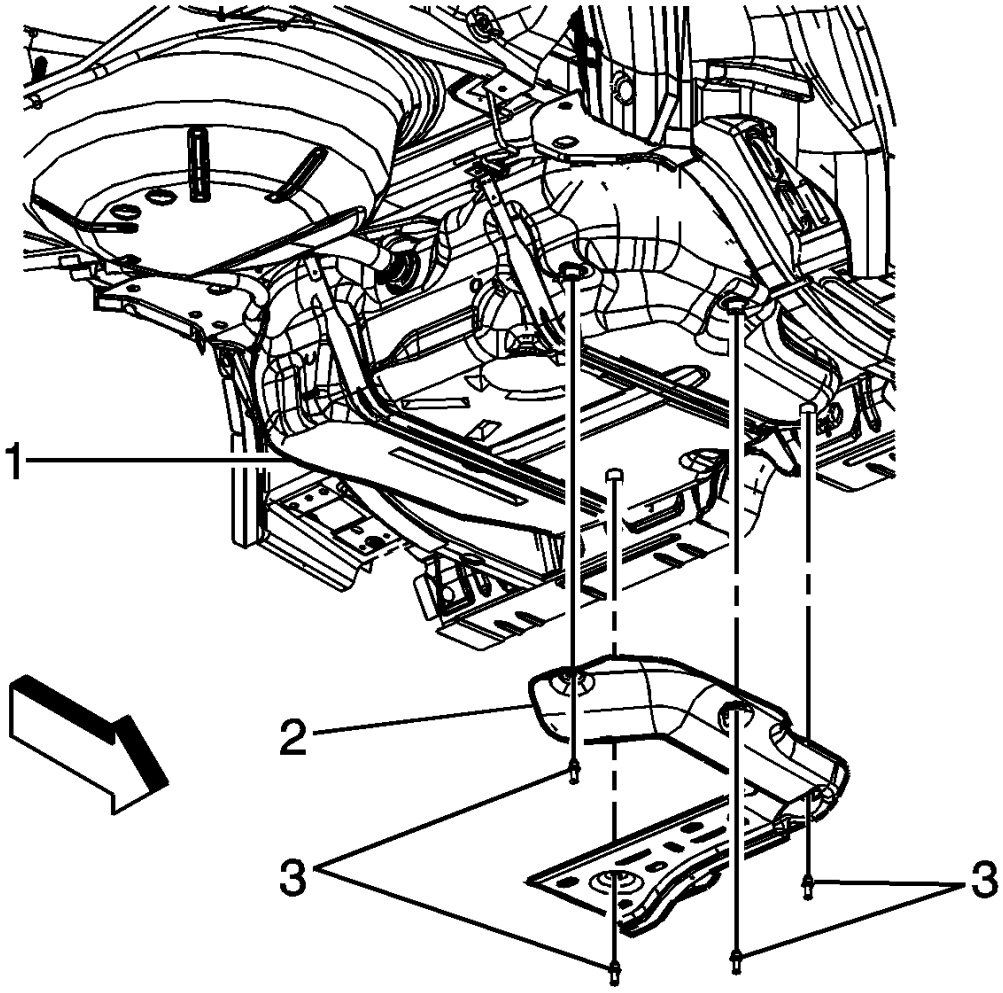

Fig. 43: View Of Fuel Tank Shield
Courtesy of GENERAL MOTORS COMPANY

11. Remove the fuel tank shield retainers (3).
12. Remove the fuel tank shield (2).

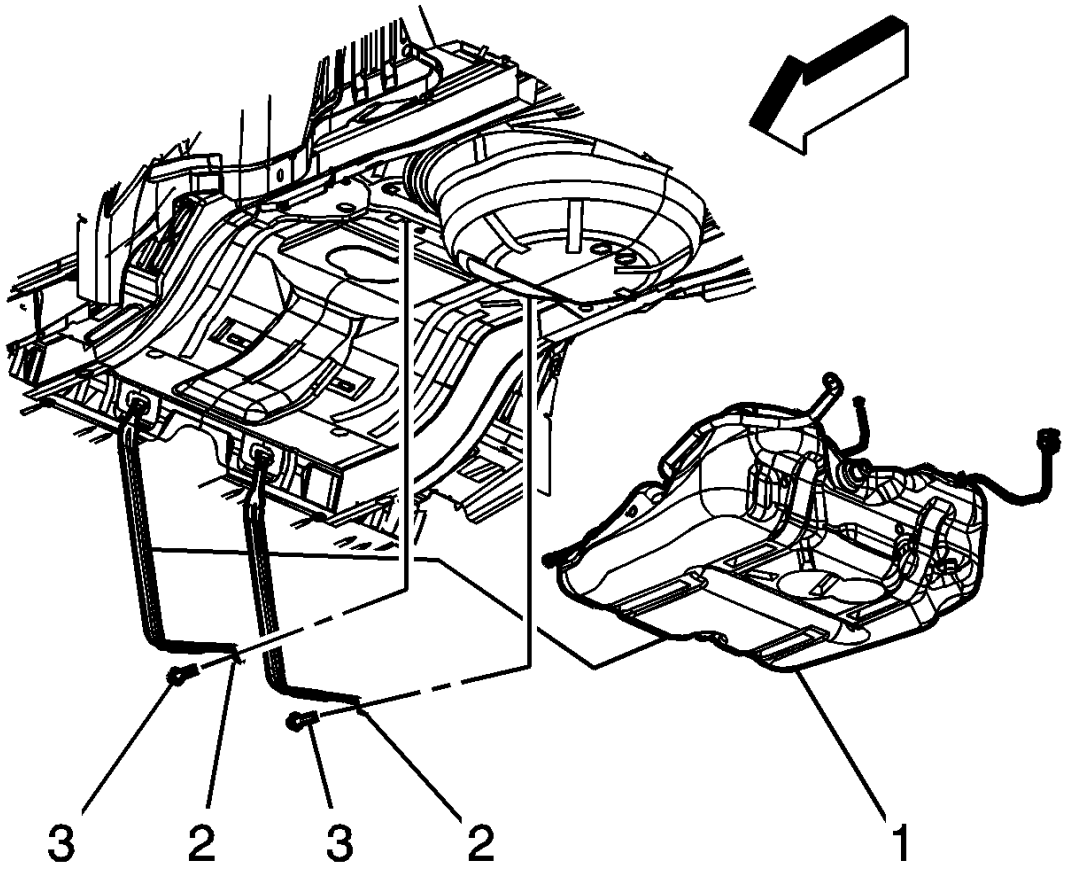

Fig. 44: View Of Fuel Tank & Straps
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Do not bend the fuel tank straps. Bending the fuel tank straps may damage the straps.

13. Support the fuel tank with a suitable adjustable jack.
14. Remove the fuel tank strap bolts (3).
15. Using the jack lower the fuel tank.

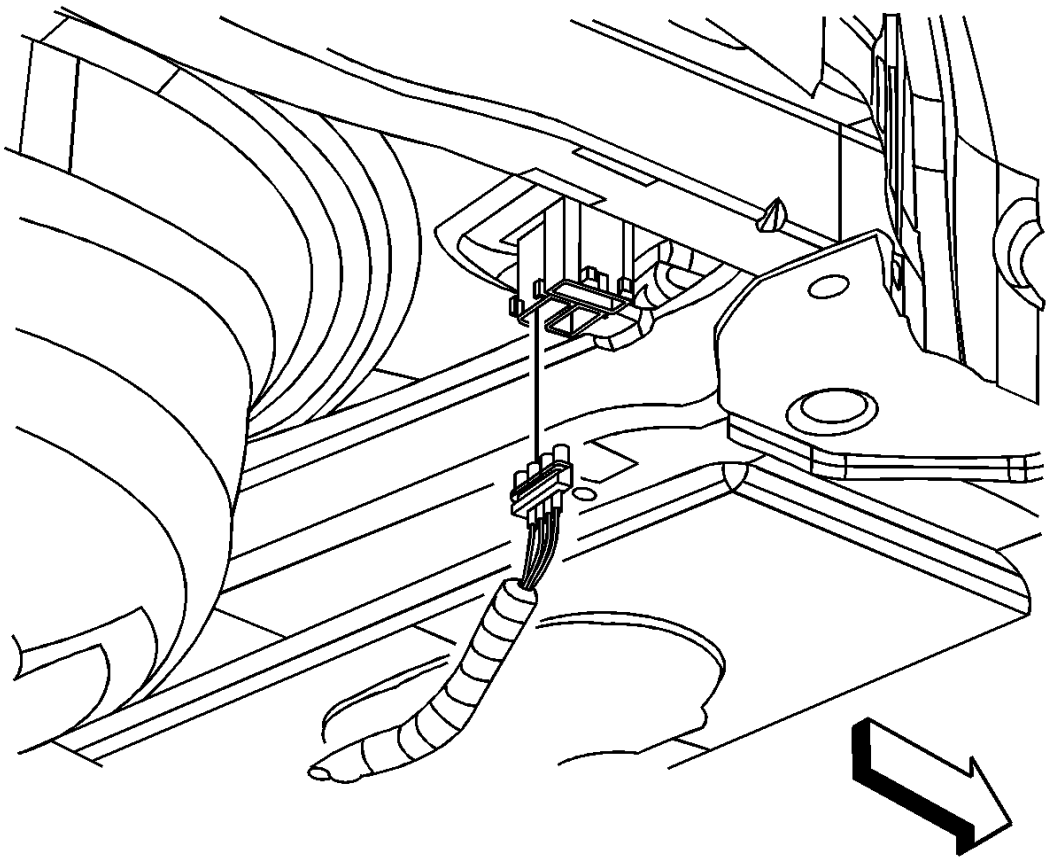

Fig. 45: View Of Fuel Sender Jumper Harness Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

16. Disconnect the fuel sender jumper harness electrical connector.
17. Remove the fuel tank and place the tank in a suitable work area.

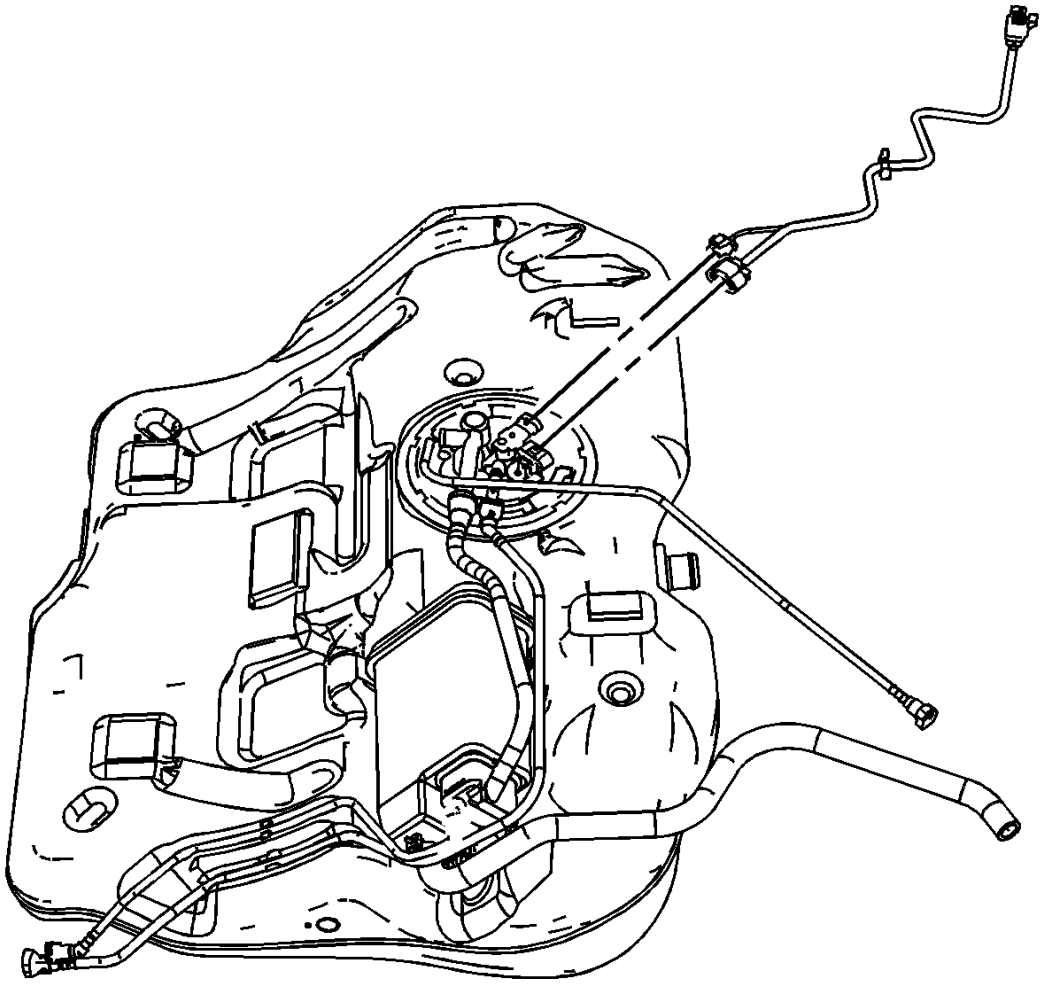

Fig. 46: View Of Top Of Fuel Tank
Courtesy of GENERAL MOTORS COMPANY

18. Disconnect and remove the fuel pressure sensor and fuel sender jumper harness electrical connectors.

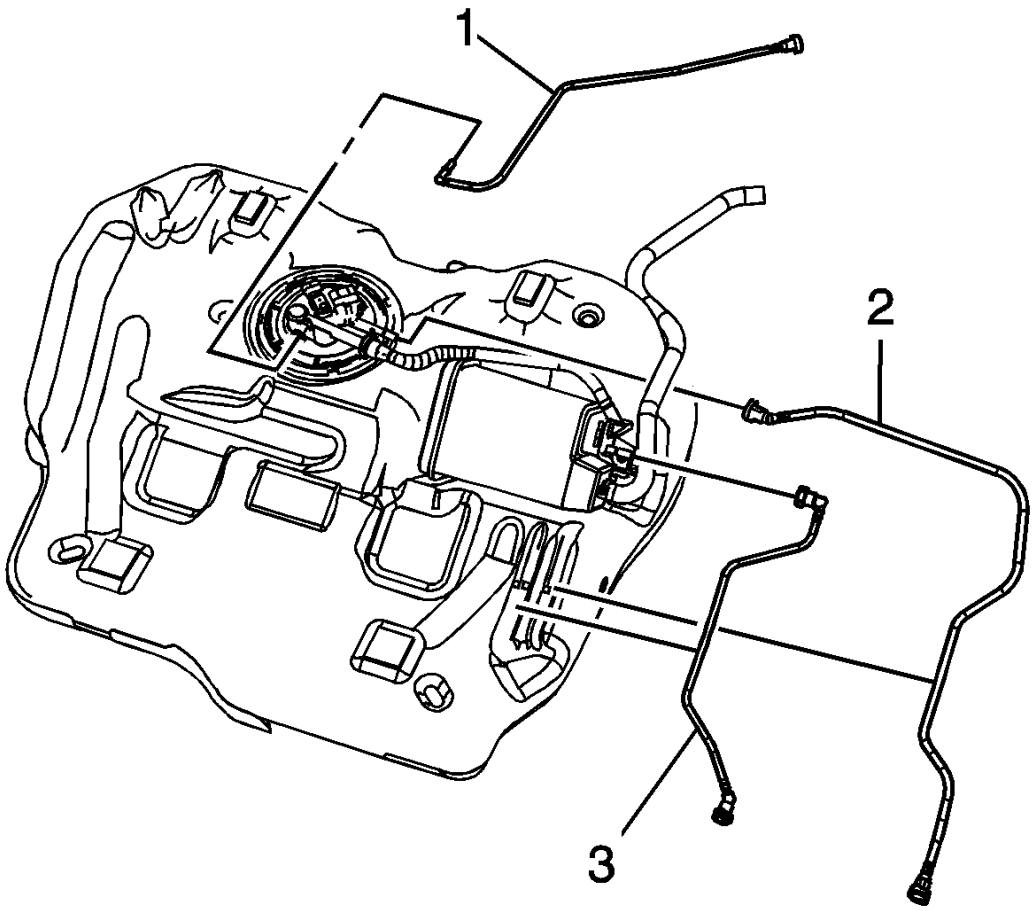

Fig. 47: View Of Fuel Tank Lines
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Note the routing of the lines for installation.**

19. Disconnect and remove the fuel feed line (2), and the EVAP lines (1, 3). Refer to **Plastic Collar Quick Connect Fitting Service**.
20. Remove the EVAP canister. Refer to **Evaporative Emission Canister Replacement**.
21. Remove the insulator pads from the fuel tank. Note the location of the insulator pads for installation. Replace with new insulator pads.

Installation Procedure

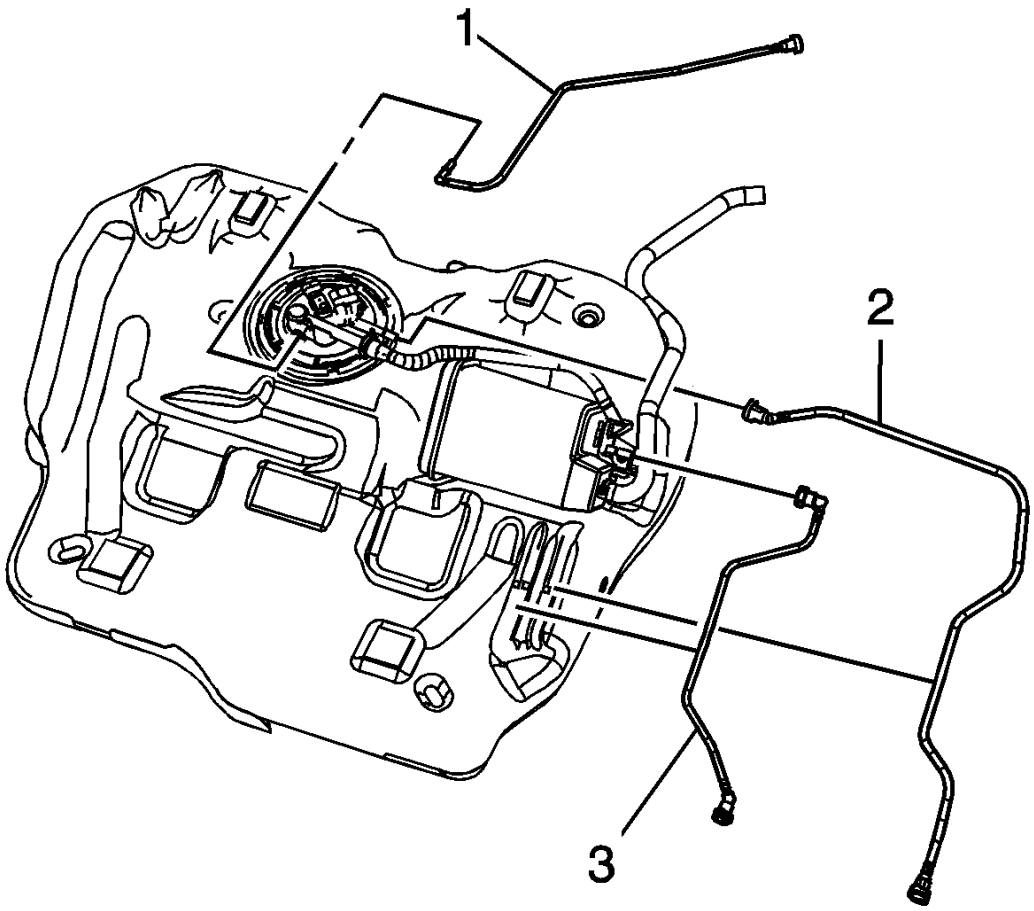

Fig. 48: View Of Fuel Tank Lines
Courtesy of GENERAL MOTORS COMPANY

1. Install the NEW insulator pads to the fuel tank.
2. Install the EVAP canister. Refer to **Evaporative Emission Canister Replacement**.

CAUTION:

- **Do not attempt to straighten kinked nylon pipes. Replace any kinked nylon pipes in order to prevent damage to the vehicle.**
- **Do not attempt to repair sections of nylon pipes. Replace damaged nylon pipes.**
- **Replace the vapor pipes with original equipment or parts that meet GM specifications.**
- **Replace the vapor hoses with original equipment or parts meeting GM specifications. Use only reinforced fuel-resistant hose identified with the word Fluoroelastomer or GM 6163M on the hose.**

3. Install and connect the fuel feed line (2), and the EVAP lines (1, 3). Refer to **Plastic Collar Quick Connect Fitting Service**.

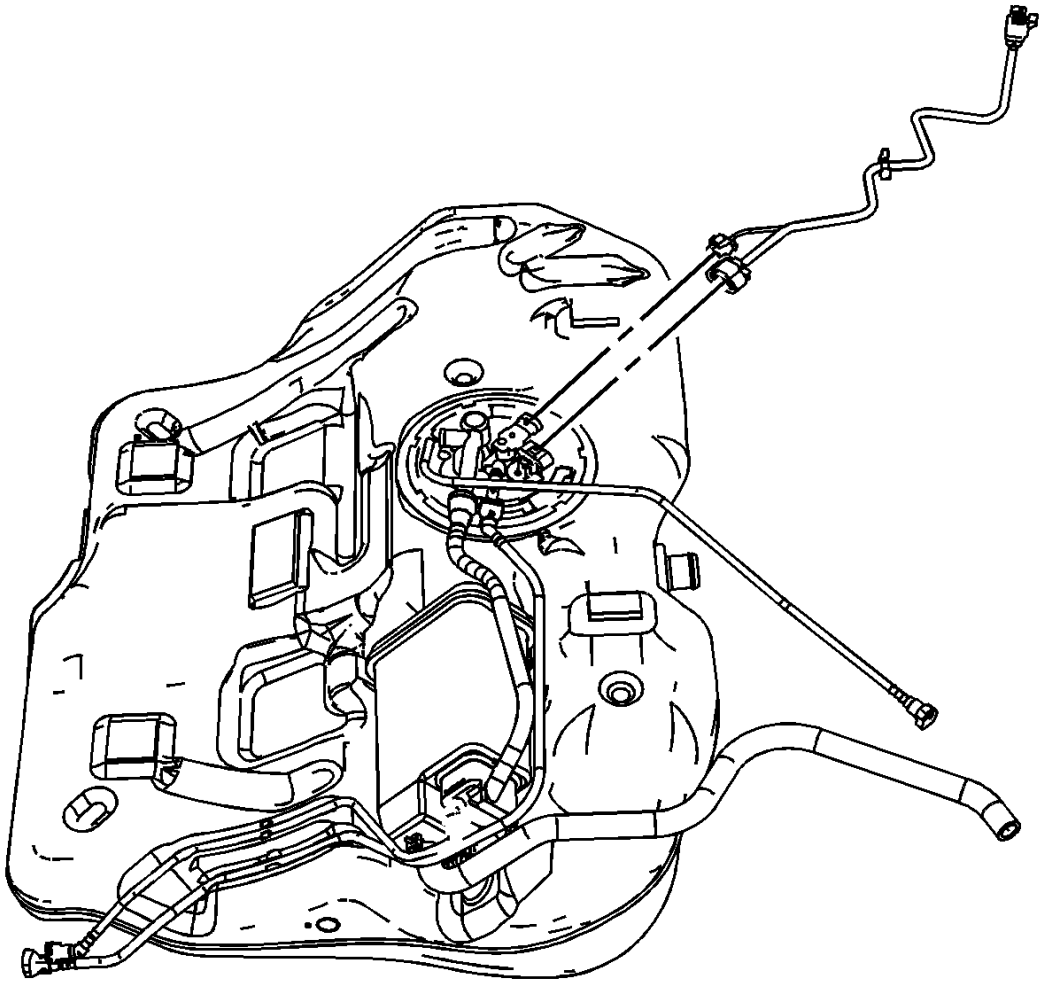

Fig. 49: View Of Top Of Fuel Tank
Courtesy of GENERAL MOTORS COMPANY

4. Install and connect the fuel pressure sensor and fuel sender jumper harness electrical connectors.
5. Install the fuel tank onto a suitable jack.
6. Partially raise the fuel tank until the electrical connection can be made.

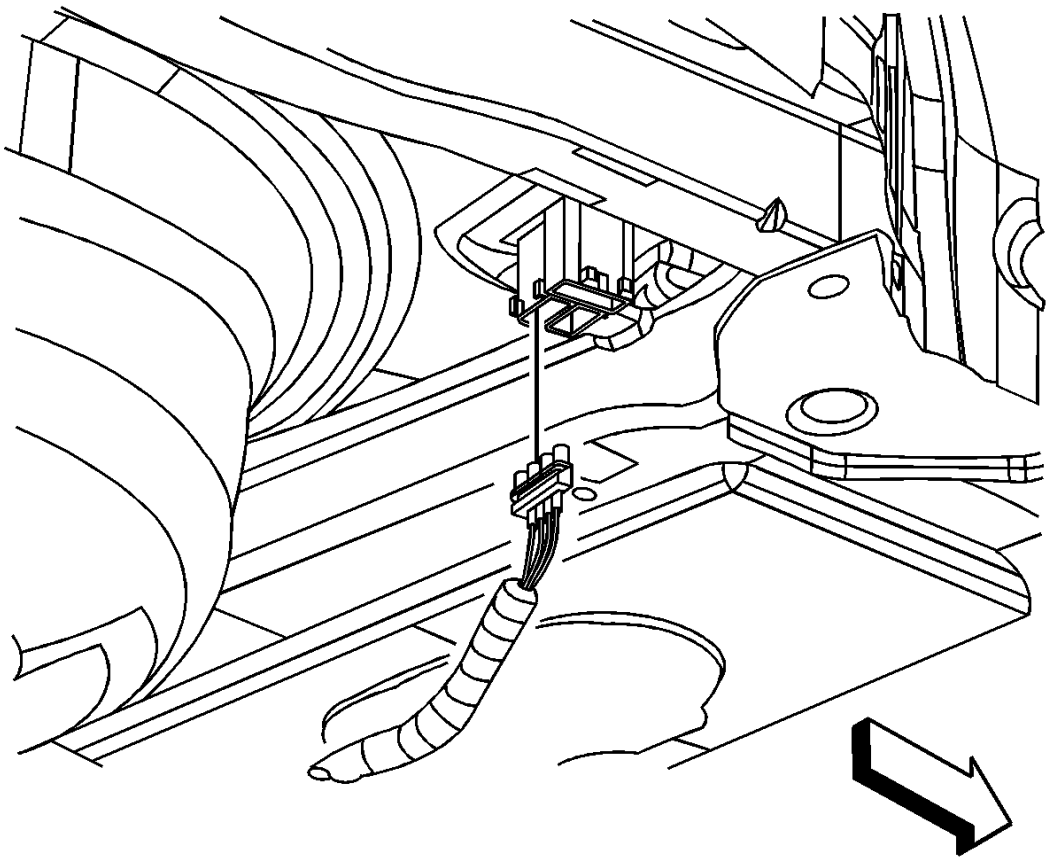

Fig. 50: View Of Fuel Sender Jumper Harness Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

7. Connect the fuel sender jumper harness electrical connector.

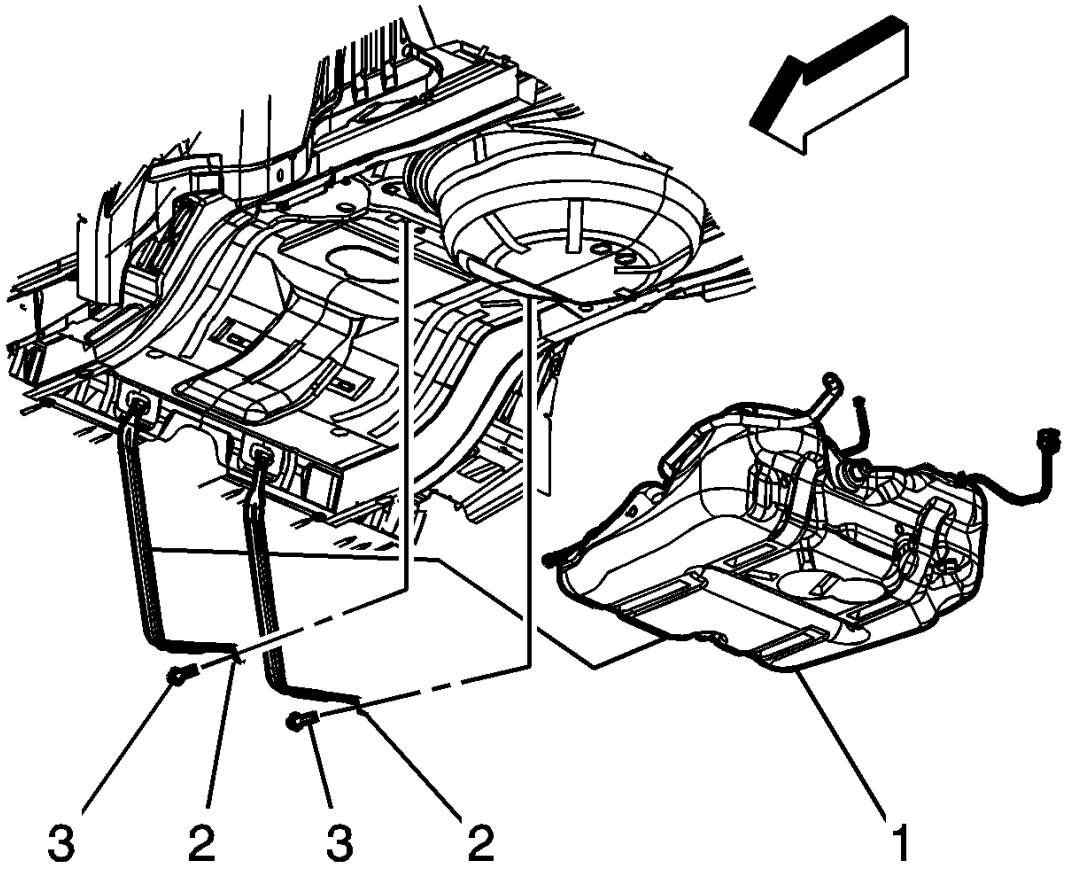

Fig. 51: View Of Fuel Tank & Straps
Courtesy of GENERAL MOTORS COMPANY

8. Completely raise the tank.

CAUTION: Refer to Fastener Caution .

9. Install the fuel tank strap bolts (3).

Tighten

Tighten the bolts to 48 N.m (35 lb ft).

10. Remove the jack from the fuel tank.

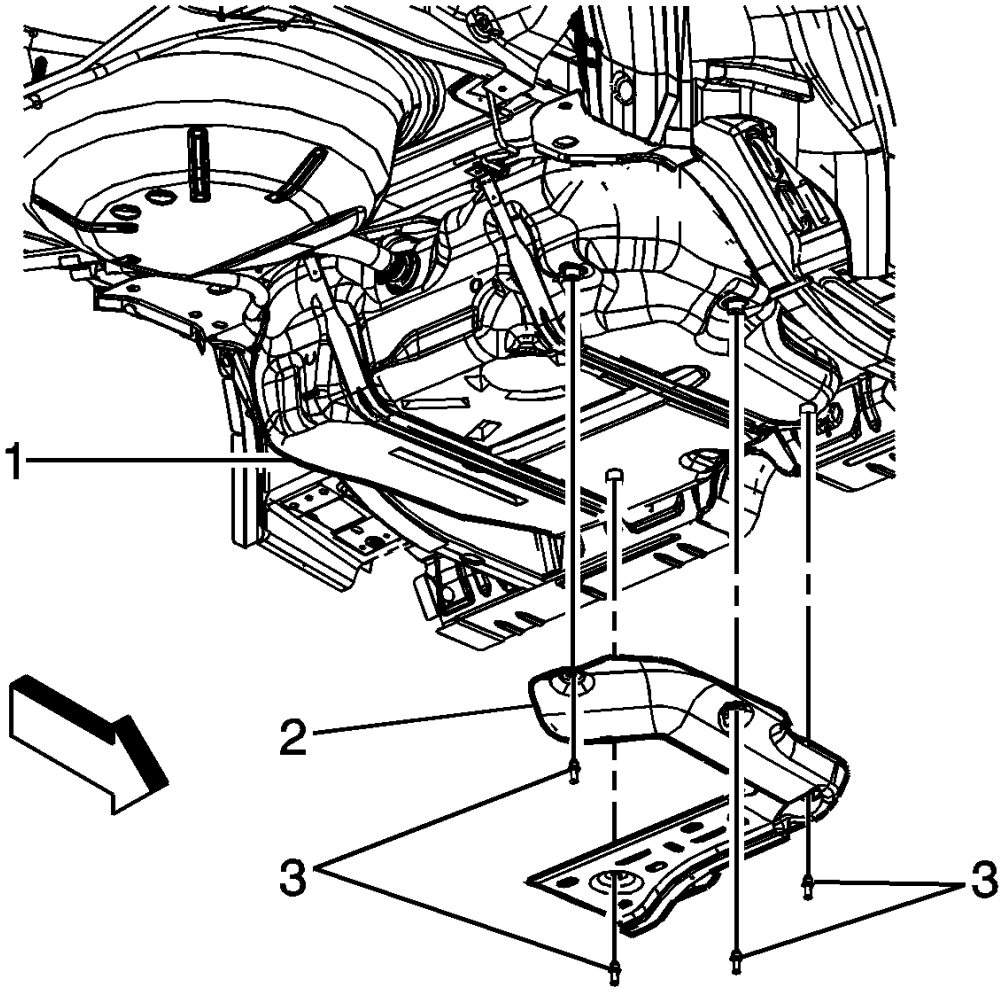

Fig. 52: View Of Fuel Tank Shield
Courtesy of GENERAL MOTORS COMPANY

11. Position the fuel tank shield (2) to the fuel tank.
12. Install the shield retainers (3).

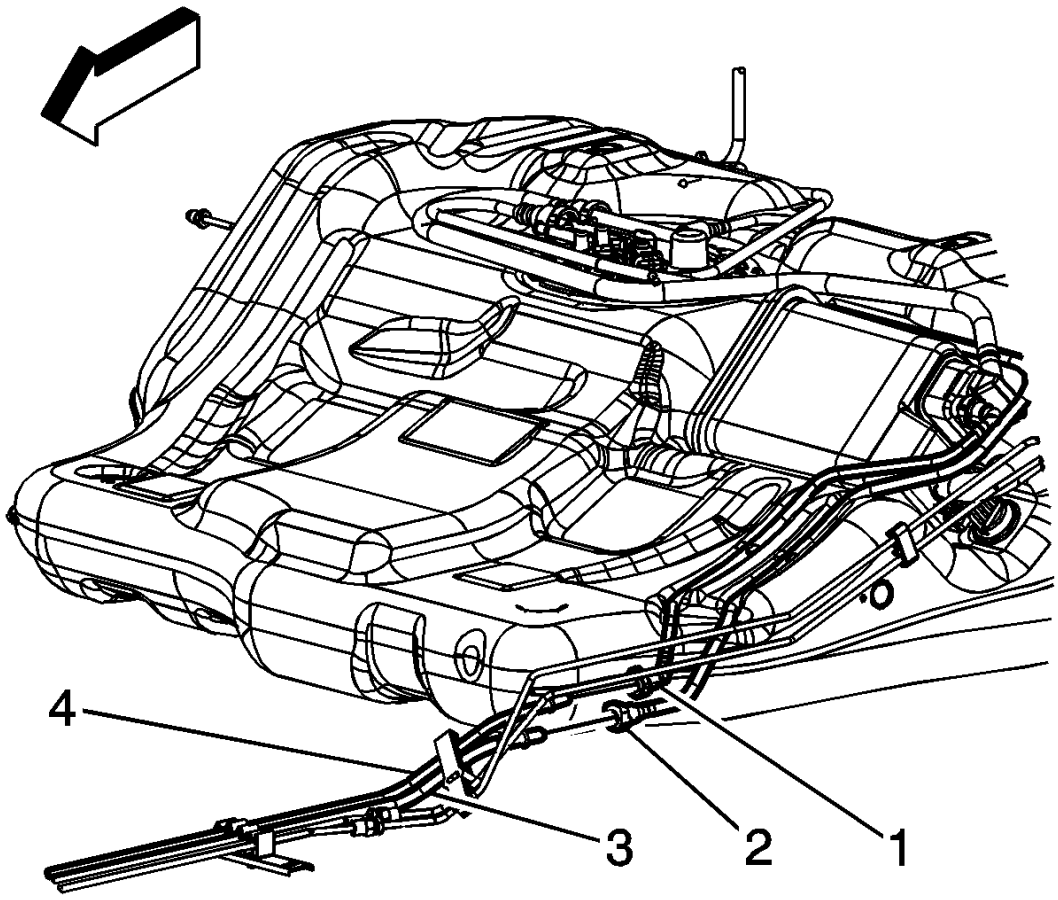

Fig. 53: View Of Fuel Feed, EVAP and Fuel Tank Lines
Courtesy of GENERAL MOTORS COMPANY

13. Install the rubber exhaust pipe hangers.
14. Remove the support from the exhaust system.
15. Connect the fuel feed (3) , and EVAP (4) lines to the fuel tank lines (1, 2). Refer to **Plastic Collar Quick Connect Fitting Service**.

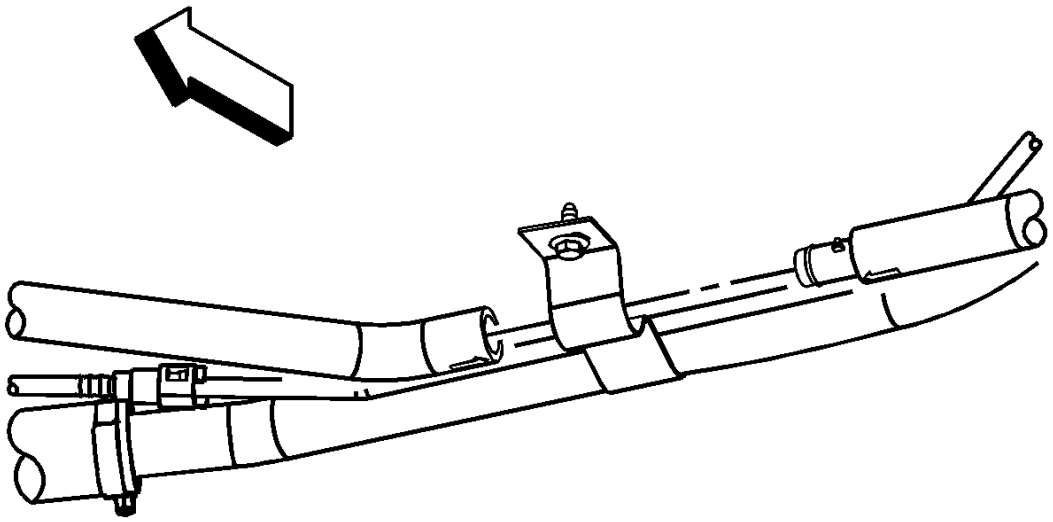

Fig. 54: EVAP Canister Vent Solenoid Valve And EVAP Emission Canister Hose
Courtesy of GENERAL MOTORS COMPANY

16. Connect the EVAP vent solenoid hose on the tank to the EVAP vent valve solenoid hose.

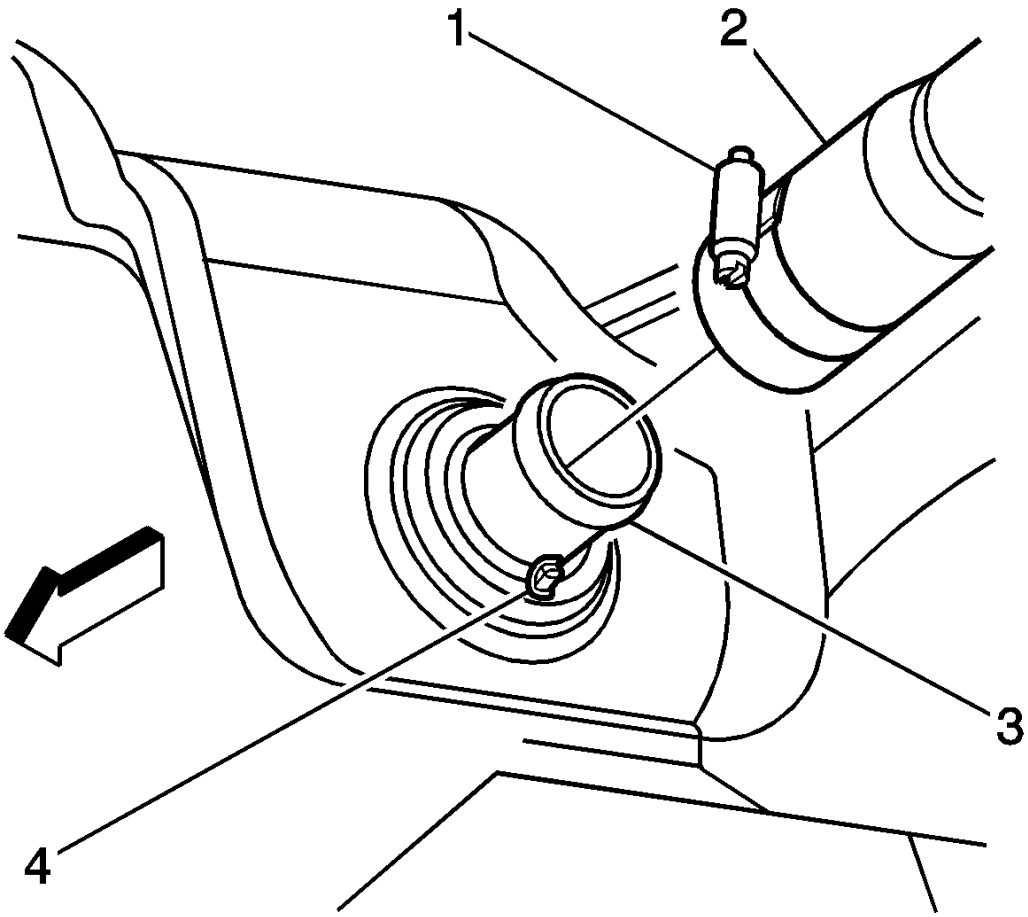

Fig. 55: Fuel Tank Clamp, Fuel Tank Hose and Fuel Tank
Courtesy of GENERAL MOTORS COMPANY

17. Connect the EVAP vent pipe quick connect fitting to the fill pipe EVAP vent pipe quick connect fitting. **Plastic Collar Quick Connect Fitting Service**.
18. Install the fuel tank fill hose (2) onto the fuel tank (3). Install the hose over the orientation feature (4) on the tank until fully seated to the tank.
19. Tighten the fuel fill hose clamp (1) at the fuel tank.

    Tighten

    Tighten the clamp to 2.5 N.m (22 lb in).

20. Lower the vehicle.
21. Add fuel and install the fuel fill cap.
22. Inspect the fuel system for leaks by performing the following steps:
    1. Turn ON the ignition for 2 seconds.
    2. Turn OFF the ignition for 10 seconds.
    3. Turn ON the ignition.

4. Inspect for fuel leaks.

FUEL TANK FUEL PUMP MODULE REPLACEMENT

Special Tools

J 45722 Fuel Sender Lock Ring Wrench

Removal Procedure

1. Remove the fuel tank. Refer to **Fuel Tank Replacement**.
2. Disconnect the evaporative emission (EVAP) lines from the sender. Refer to **Plastic Collar Quick Connect Fitting Service**.
3. Disconnect the fuel line from the sender. Refer to **Plastic Collar Quick Connect Fitting Service**.
4. Reposition the fuel feed and EVAP lines in order to access the lock ring.

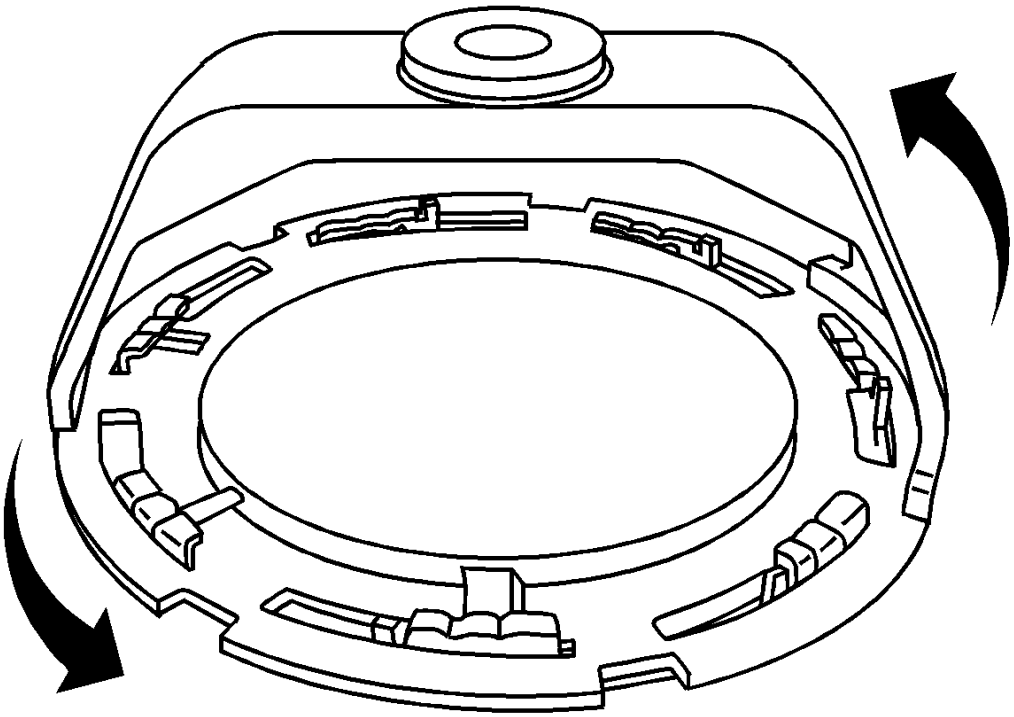

Fig. 56: Identifying Lock Ring
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Avoid damaging the lock ring. Use only J-45722 to prevent damage to the

lock ring.

CAUTION: Do Not handle the fuel sender assembly by the fuel pipes. The amount of leverage generated by handling the fuel pipes could damage the joints.

NOTE: Do NOT use impact tools. Significant force will be required to release the lock ring. The use of a hammer and screwdriver is not recommended. Secure the fuel tank in order to prevent fuel tank rotation.

5. Use the **J 45722** Fuel Sender Lock Ring Wrench and a long breaker-bar in order to unlock the fuel sender lock ring. Turn the fuel sender lock ring in a counterclockwise direction.

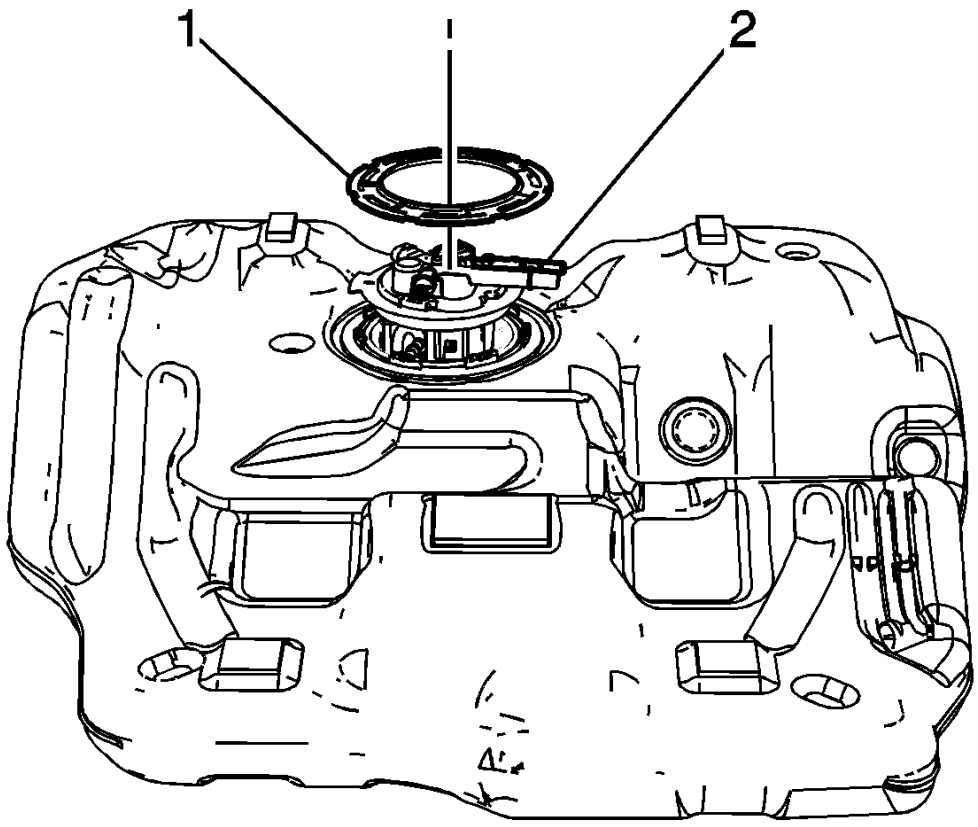

Fig. 57: Identifying Fuel Sender Assembly & Lock Ring
Courtesy of GENERAL MOTORS COMPANY

6. Remove the fuel sender (2) from the fuel tank.
7. Remove and discard the fuel sender O-ring seal.
8. Clean and inspect the fuel sender assembly O-ring seal sealing surfaces.

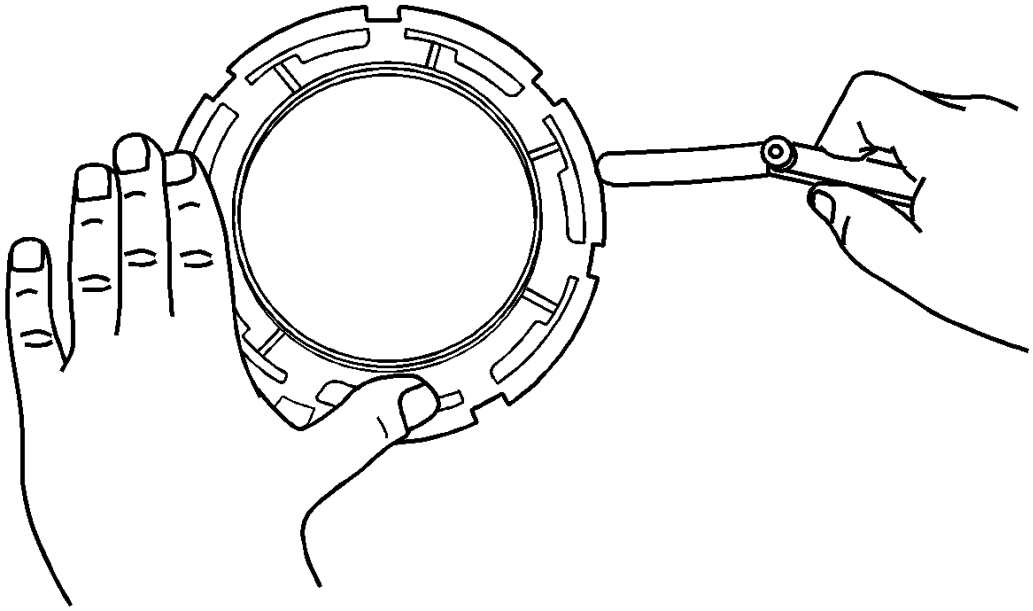

Fig. 58: Checking Lock Ring For Flatness
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Some lock ring were manufactured with DO NOT REUSE stamped into them. These lock rings may be reused if they are not damaged or warped.**

NOTE: **Inspect the lock ring for damage due to improper removal or installation procedures. If damage is found, install a NEW lock ring.**

NOTE: **Check the lock ring for flatness.**

9. Place the lock ring on a flat surface. Measure the clearance between to lock ring and the flat surface using a feeler gauge at 7 points.
10. If the warpage is less than 0.41 mm (0.016 in), the lock ring does not require replacement.
11. If the warpage is greater than 0.41 mm (0.016 in), the lock ring must be replaced.

Installation Procedure

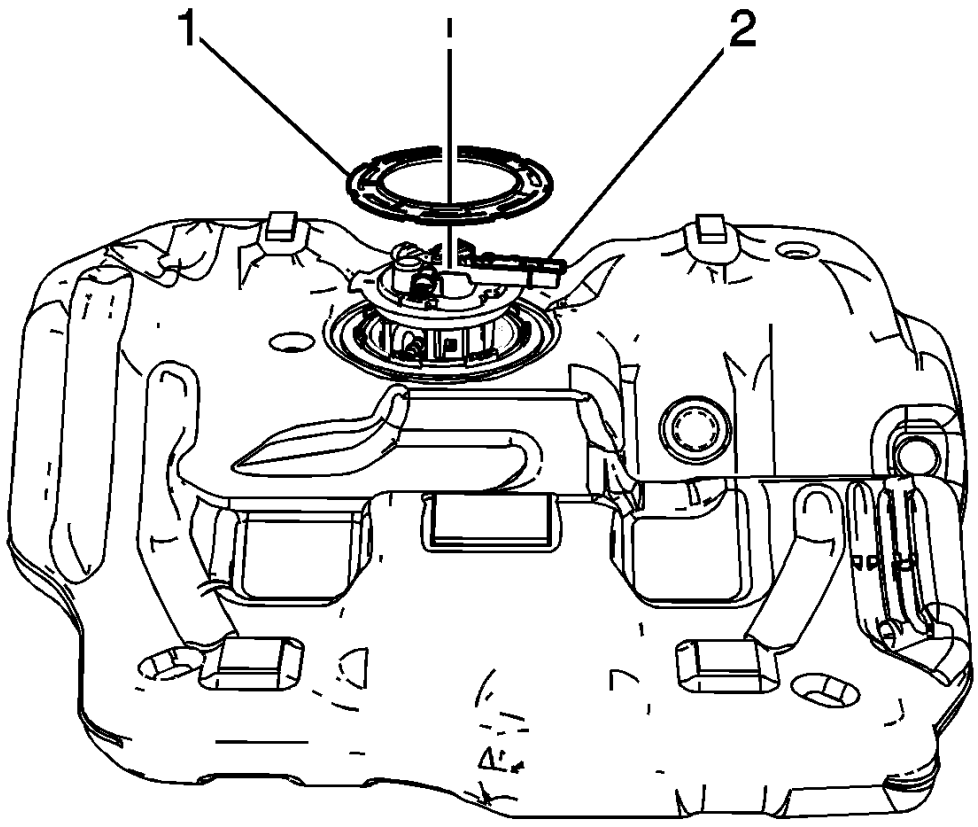

Fig. 59: Identifying Fuel Sender Assembly & Lock Ring
Courtesy of GENERAL MOTORS COMPANY

1. Position the NEW fuel sender O-ring seal onto the fuel tank.
2. Install the fuel sender (2) into the fuel tank. Ensure that the align tab is in the proper location.
3. Push down the fuel sender and position the lock ring (1) onto the fuel tank.

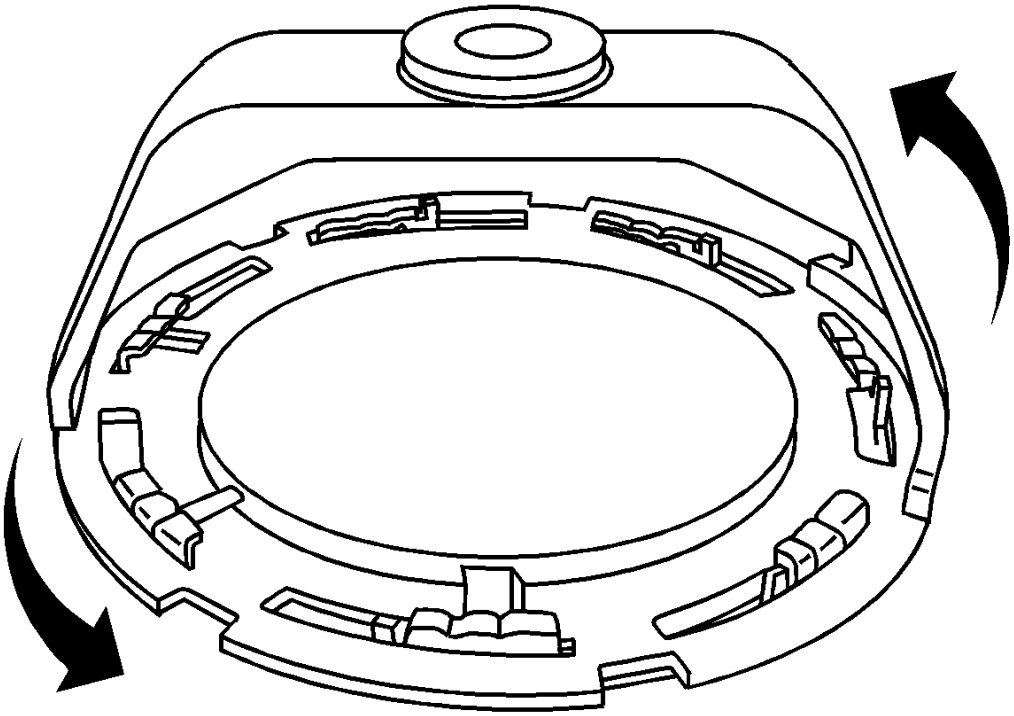

Fig. 60: Identifying Lock Ring
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Always replace the fuel sender seal when installing the fuel sender assembly. Replace the lock ring if necessary. Do not apply any type of lubrication in the seal groove.**

Ensure the lock ring is installed with the correct side facing upward. A correctly installed lock ring will only turn in a clockwise direction.

4. Use the **J 45722** Fuel Sender Lock Ring Wrench in order to install the fuel sender lock ring. Turn the fuel sender lock ring in a clockwise direction.
5. Connect the fuel line to the sender. Refer to **Plastic Collar Quick Connect Fitting Service**.
6. Connect the EVAP lines to the sender. Refer to **Plastic Collar Quick Connect Fitting Service**.
7. Install the fuel tank. Refer to **Fuel Tank Replacement**.

FUEL PUMP FLOW CONTROL MODULE REPLACEMENT

Removal Procedure

1. Remove the rear compartment side trim panel right side. Refer to **Rear Compartment Side Trim Replacement - Right Side**

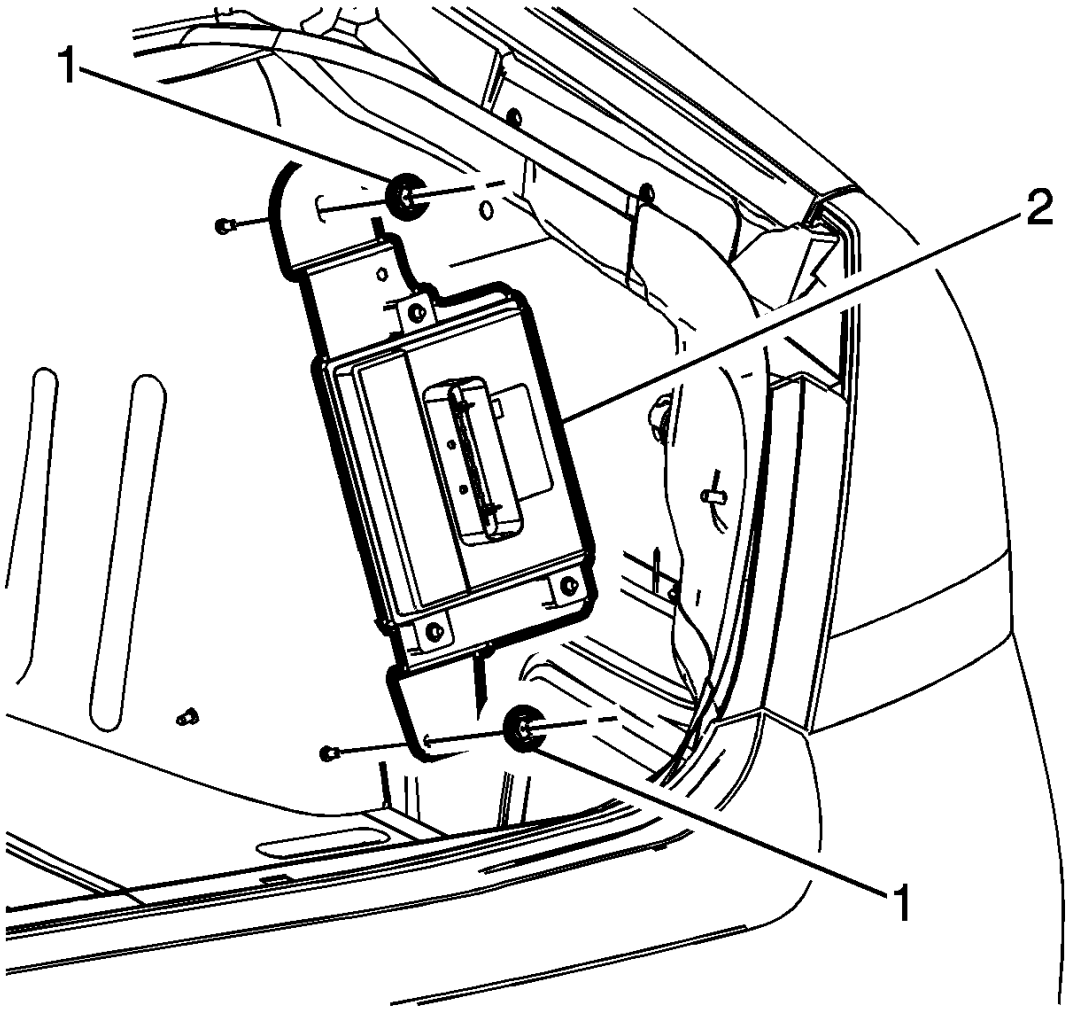

Fig. 61: Fuel Pump Flow Control Module Bracket And Nuts
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the electrical connector.
3. Remove the fuel pump flow control module bracket nuts (1).
4. Remove the fuel pump flow control module and bracket (2).

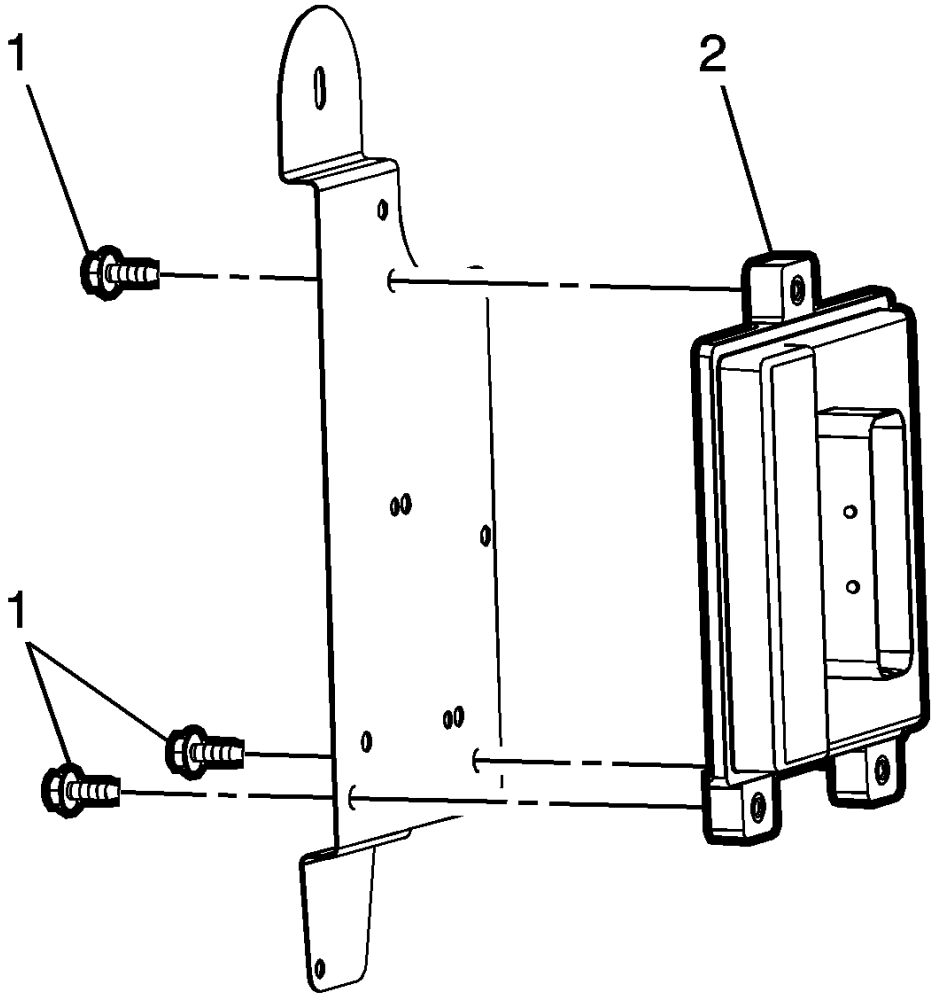

Fig. 62: Fuel Pump Flow Control Module And Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the fuel pump flow control module bolts (1).
6. Remove the fuel pump flow control module (2).

Installation Procedure

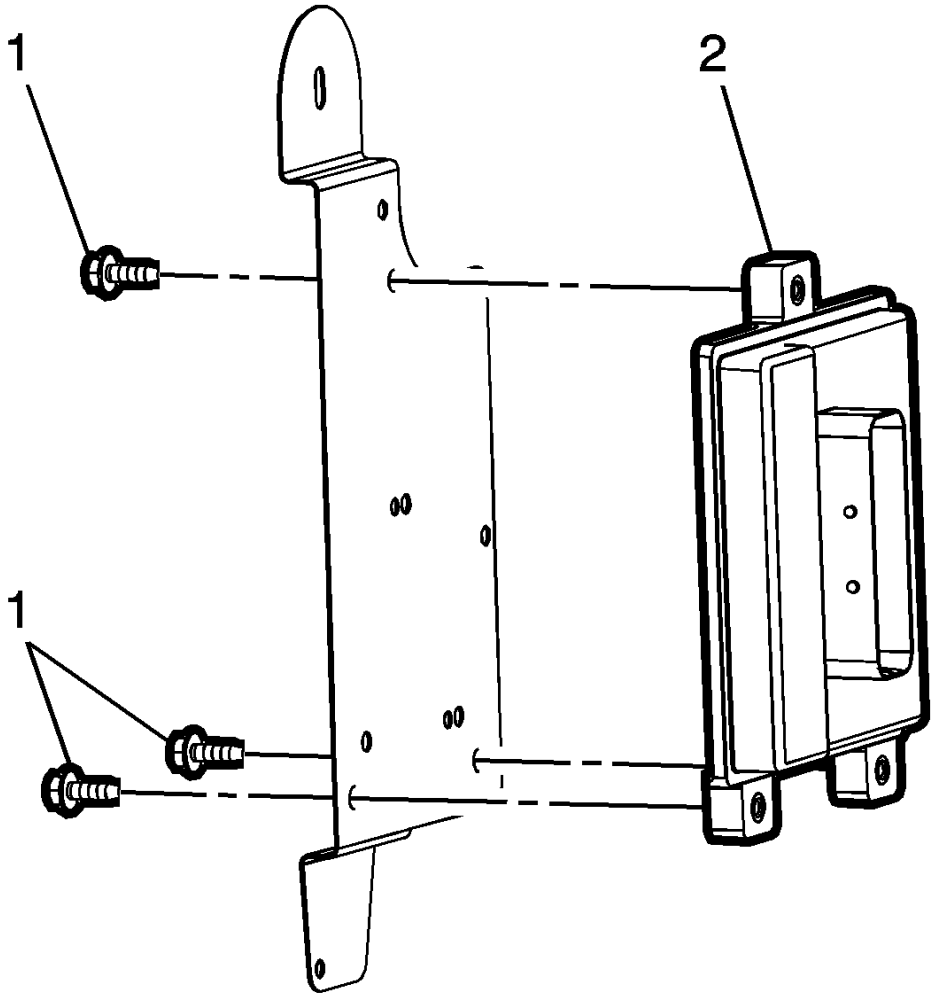

Fig. 63: Fuel Pump Flow Control Module And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the fuel pump flow control module (2).

CAUTION: Refer to Fastener Caution .

2. Install the fuel pump flow control module bolts (1) and tighten to 6.5 N.m (58 lb in).

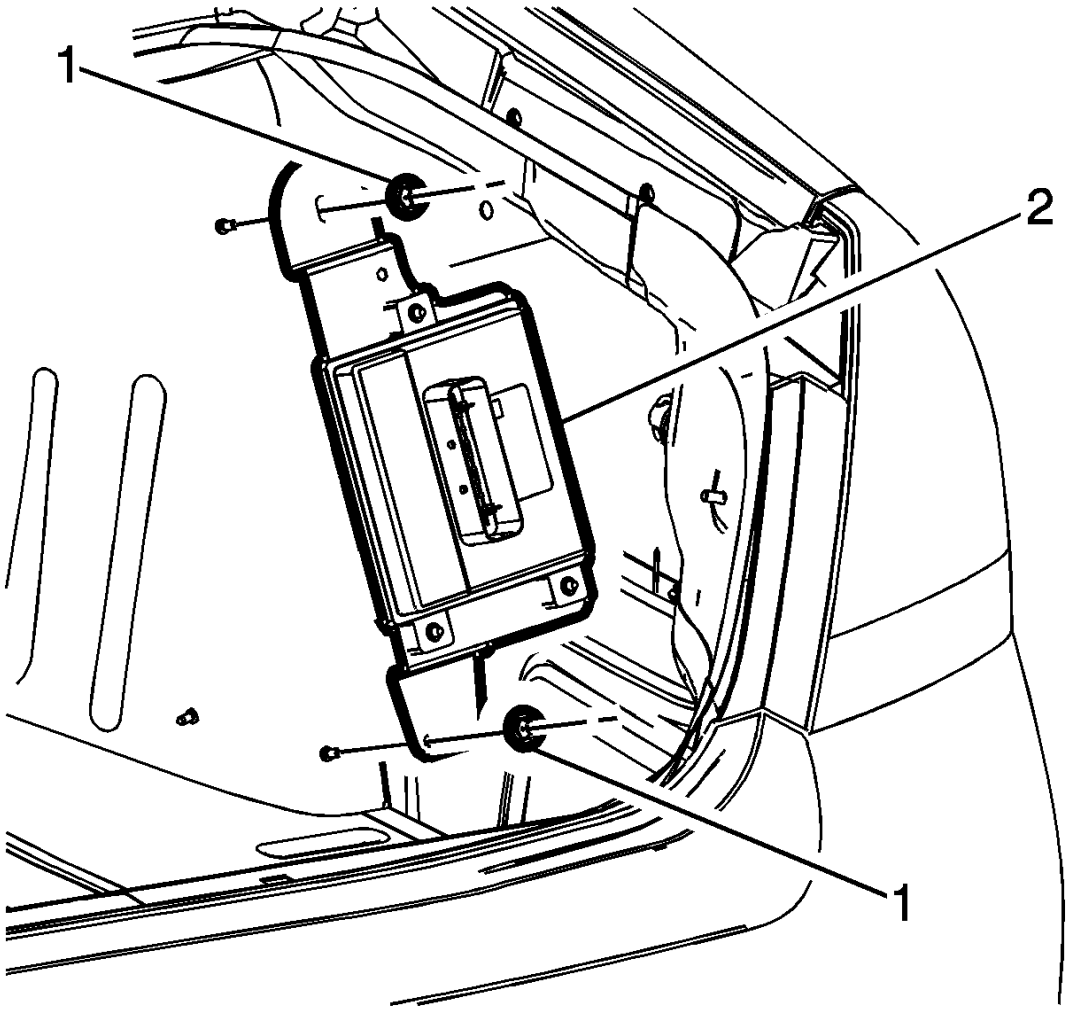

Fig. 64: Fuel Pump Flow Control Module Bracket And Nuts
Courtesy of GENERAL MOTORS COMPANY

3. Install the fuel pump flow control module and bracket (2).
4. Install the fuel pump flow control module bracket nuts (1) and tighten to 5 N.m (44 lb in).
5. Connect the electrical connector.
6. Install the rear compartment side trim panel right side. Refer to **Rear Compartment Side Trim Replacement - Right Side**
7. If replacing, reprogram the module. Refer to **Control Module References**

FUEL TANK PRESSURE SENSOR REPLACEMENT (E-85)

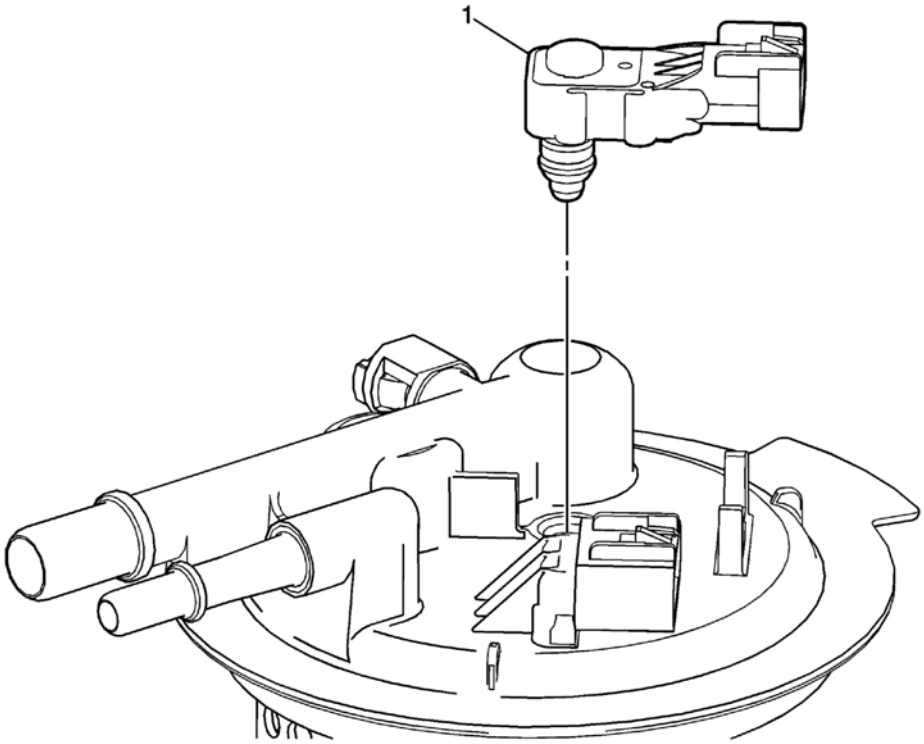

Fig. 65: Fuel Tank Pressure Sensor (E-85)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the fuel tank. Refer to **Fuel Tank Replacement**.	
1	Fuel Tank Pressure Sensor **Procedure** Disconnect the electrical connector.

FUEL TANK PRESSURE SENSOR REPLACEMENT (E-10)

Removal Procedure

1. Remove the fuel tank. Refer to **Fuel Tank Replacement**.

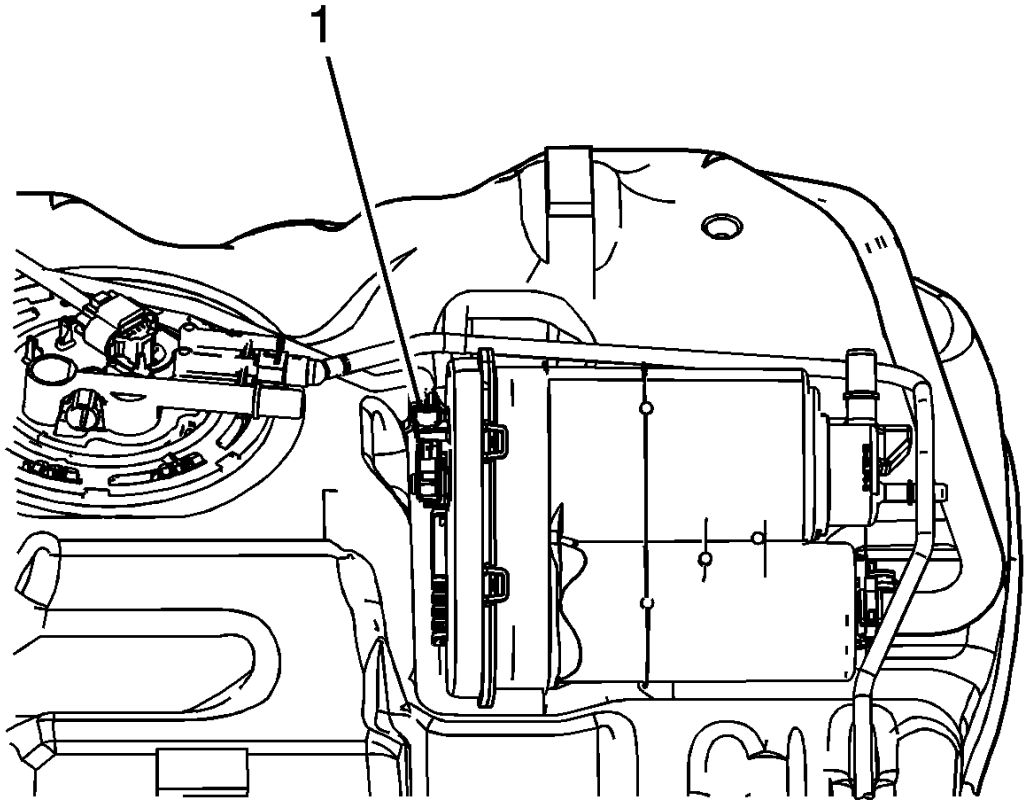

Fig. 66: Identifying Fuel Tank Wiring Harness Electrical Connectors
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the fuel tank wiring harness electrical connector from the fuel pressure sensor (1).

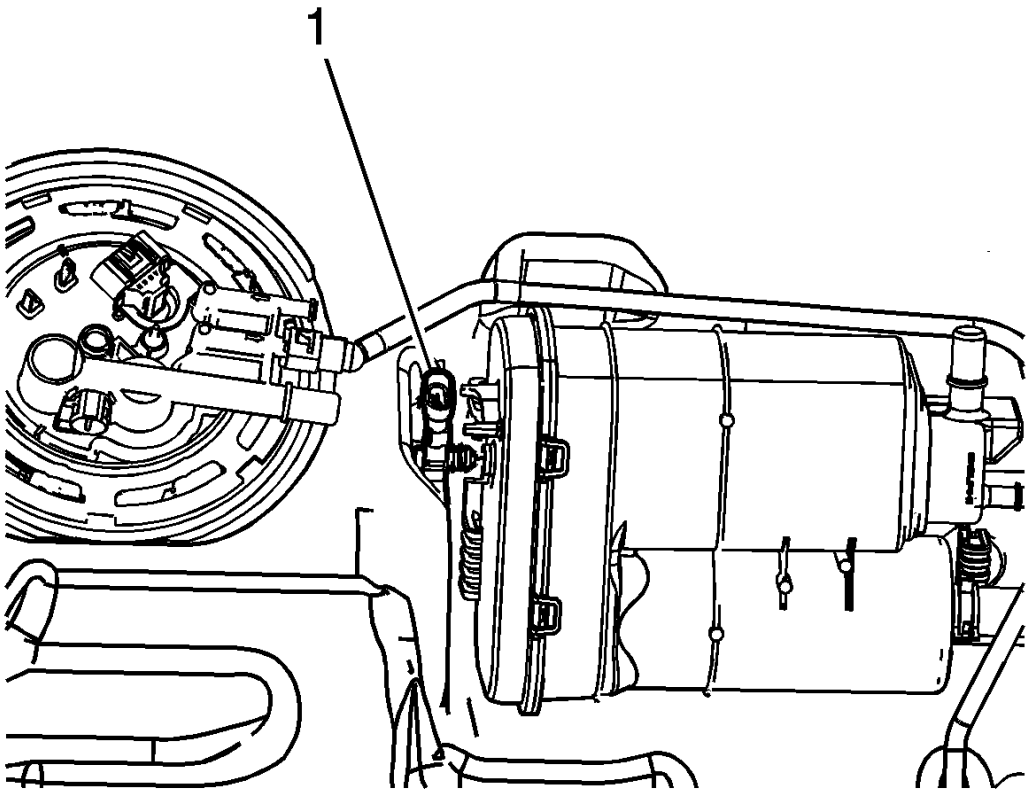

Fig. 67: Identifying Fuel Pressure Sensor & EVAP Canister
Courtesy of GENERAL MOTORS COMPANY

NOTE: **It is not necessary to remove the evaporative emission (EVAP) canister in order to remove the fuel pressure sensor.**

3. Using a small flat-bladed tool, gently pry the fuel pressure sensor (1) out of the EVAP canister in order to remove the sensor.

Installation Procedure

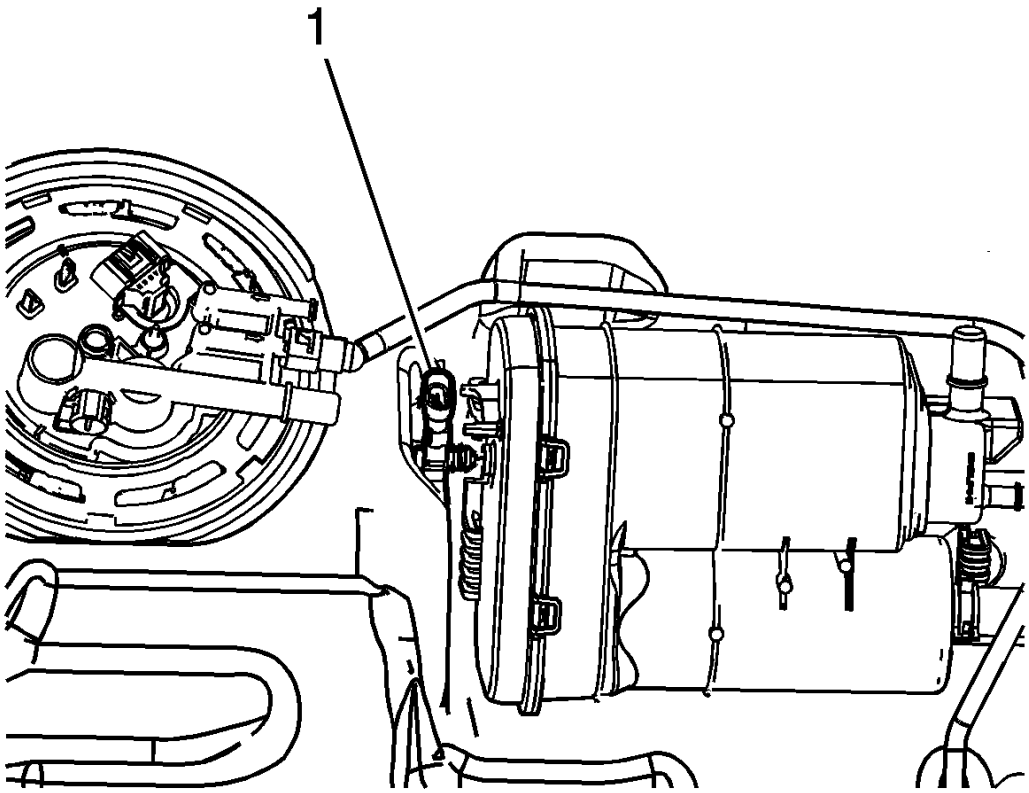

Fig. 68: Identifying Fuel Pressure Sensor & EVAP Canister
Courtesy of GENERAL MOTORS COMPANY

1. Lubricate the fuel pressure seal with a very small amount of clean engine oil.
2. Install the fuel pressure sensor (1) to the EVAP canister.

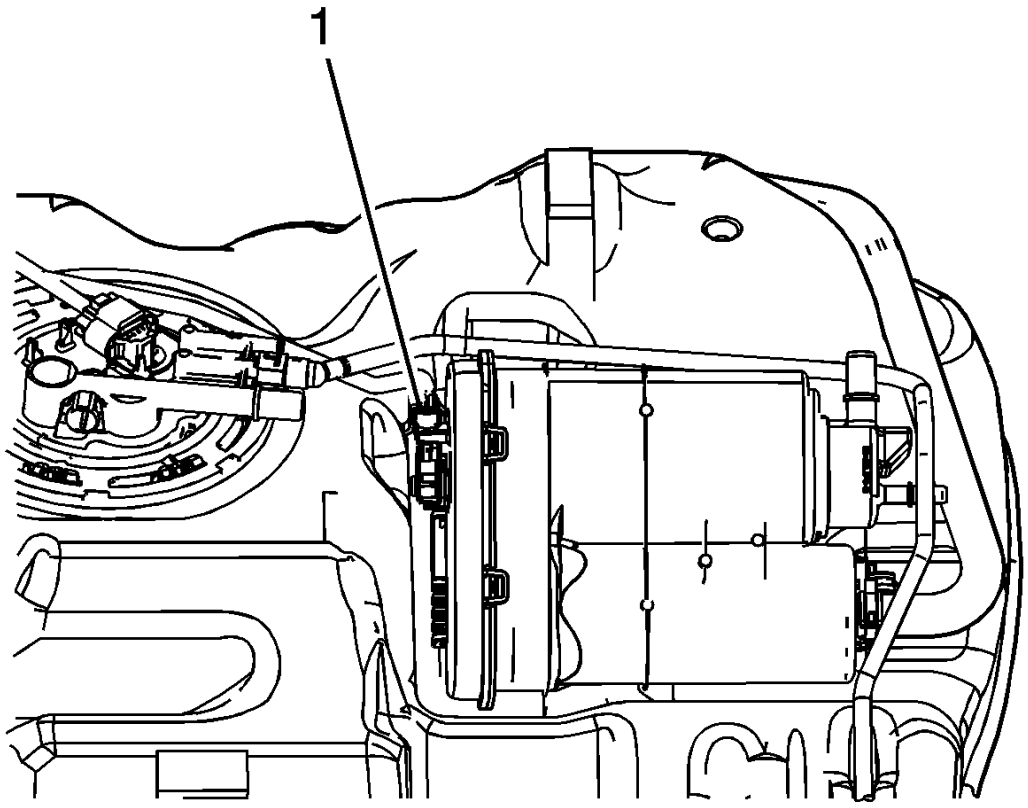

Fig. 69: Identifying Fuel Tank Wiring Harness Electrical Connectors
Courtesy of GENERAL MOTORS COMPANY

3. Connect the fuel tank wiring harness electrical connector to the fuel pressure sensor (1).
4. Install the fuel tank. Refer to **Fuel Tank Replacement**.

FUEL TANK FILLER PIPE REPLACEMENT

Removal Procedure

NOTE: **Clean the fuel and evaporative emission (EVAP) connections and surrounding areas prior to disconnecting the lines in order to avoid possible system contamination.**

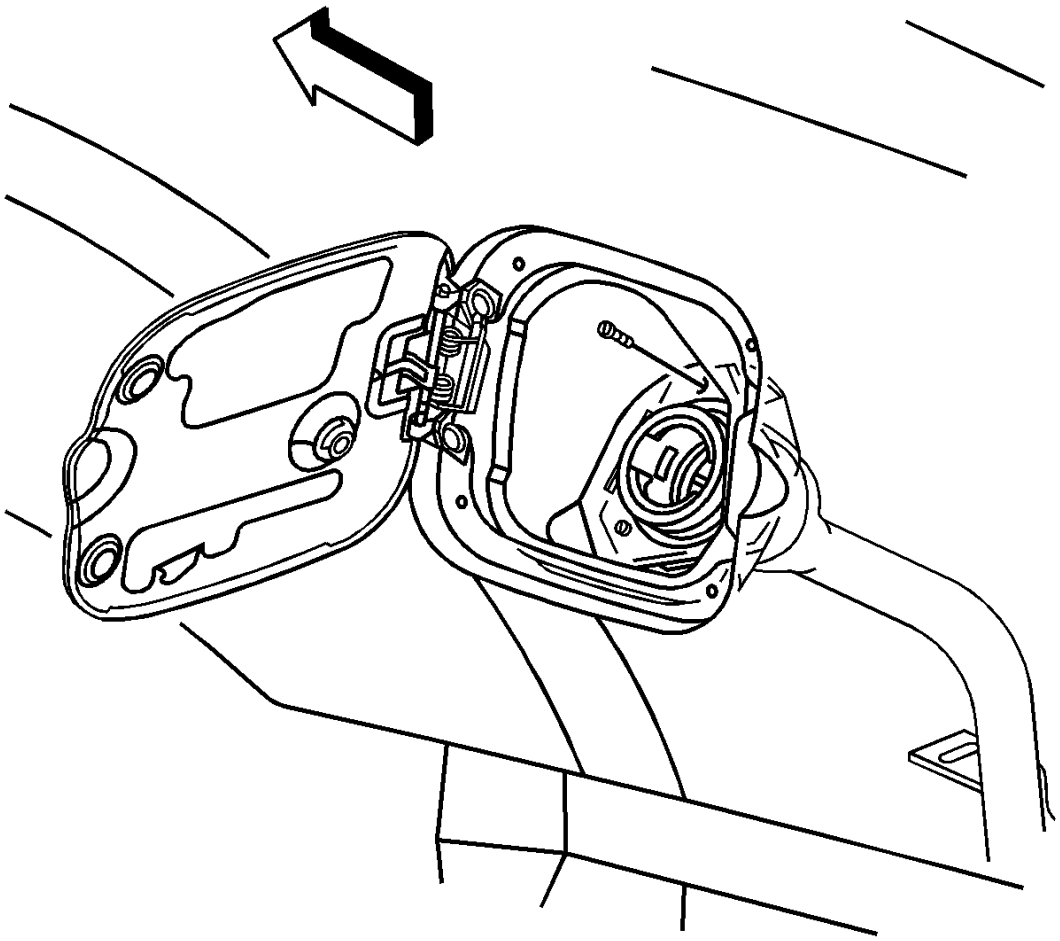

Fig. 70: Locating Fuel Fill Pipe Screws To Fuel Filler Pocket
Courtesy of GENERAL MOTORS COMPANY

1. Relieve the fuel system pressure. Refer to **Fuel Pressure Relief (Without CH 48027)Fuel Pressure Relief (CH 48027)Fuel Pressure Relief (High Side)**.
2. Remove the fuel fill pipe screws from the fuel filler pocket.

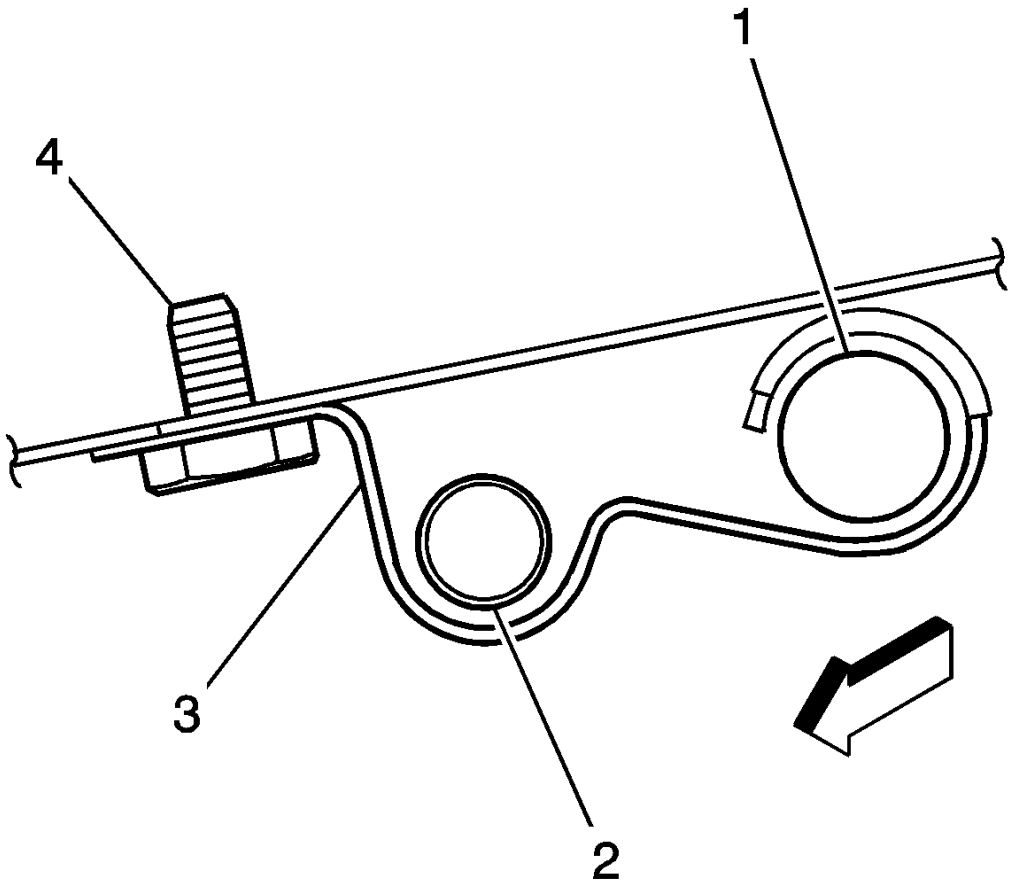

Fig. 71: Fill Pipe Bracket
Courtesy of GENERAL MOTORS COMPANY

3. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
4. Remove the fill pipe bracket bolt (4) from the underbody rail.
5. Remove the EVAP line (2) from the bracket (3).

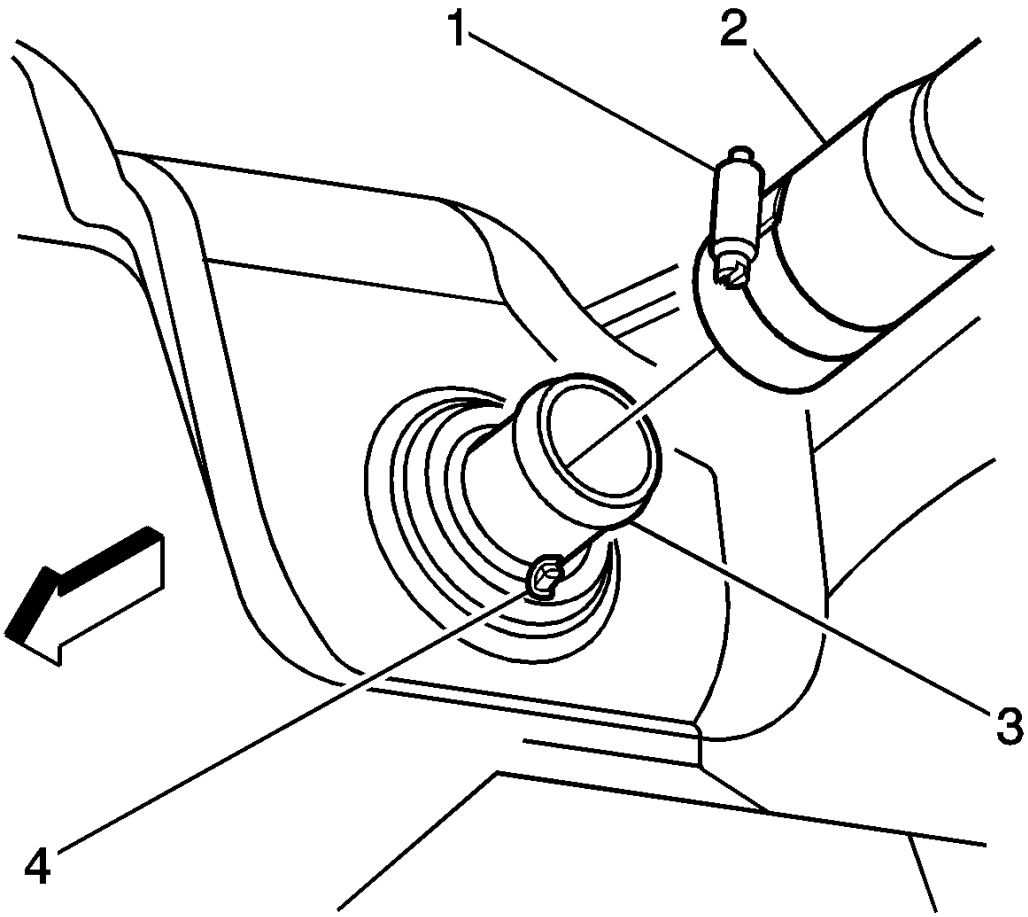

Fig. 72: Fuel Tank Clamp, Fuel Tank Hose and Fuel Tank
Courtesy of GENERAL MOTORS COMPANY

6. Loosen the fuel fill pipe clamp (1) at the fuel tank.
7. Remove the fuel fill pipe hose (2) from the fuel tank (3).
8. Disconnect the vent pipe quick connect fitting from the fuel tank vent pipe quick connect fitting. Refer to **Plastic Collar Quick Connect Fitting Service**.

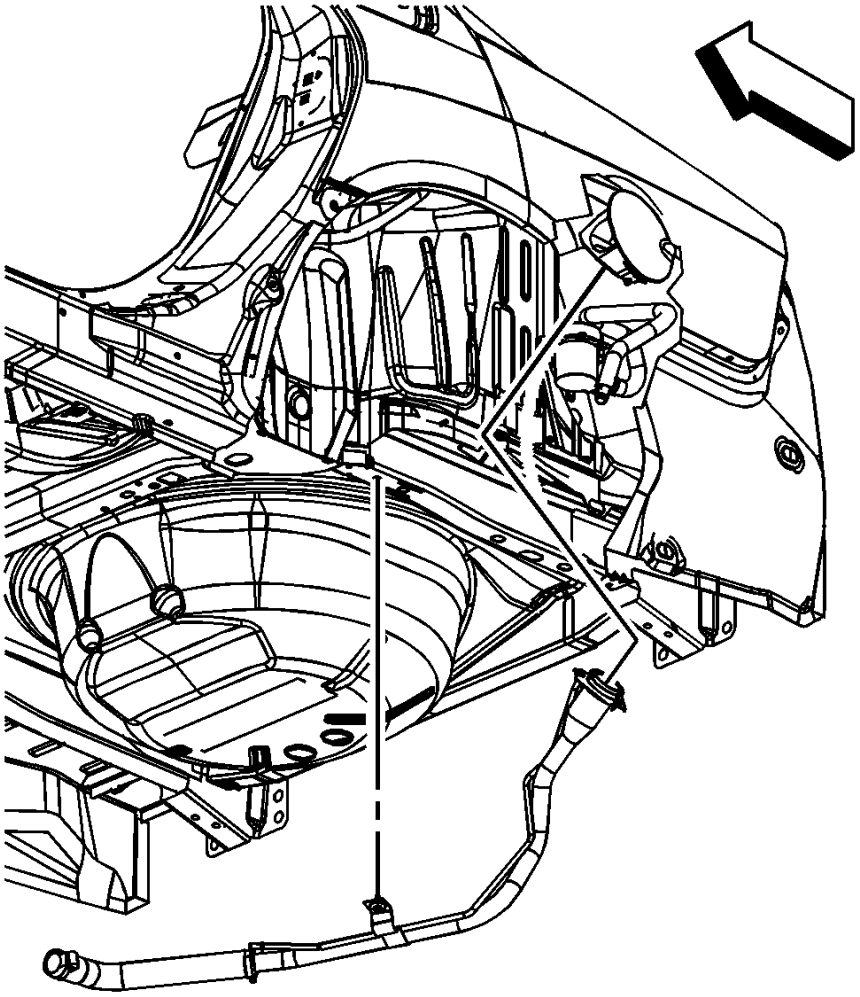

Fig. 73: Identifying Fuel Tank Fill Pipe
Courtesy of GENERAL MOTORS COMPANY

9. Remove the fuel tank fill pipe.

Installation Procedure

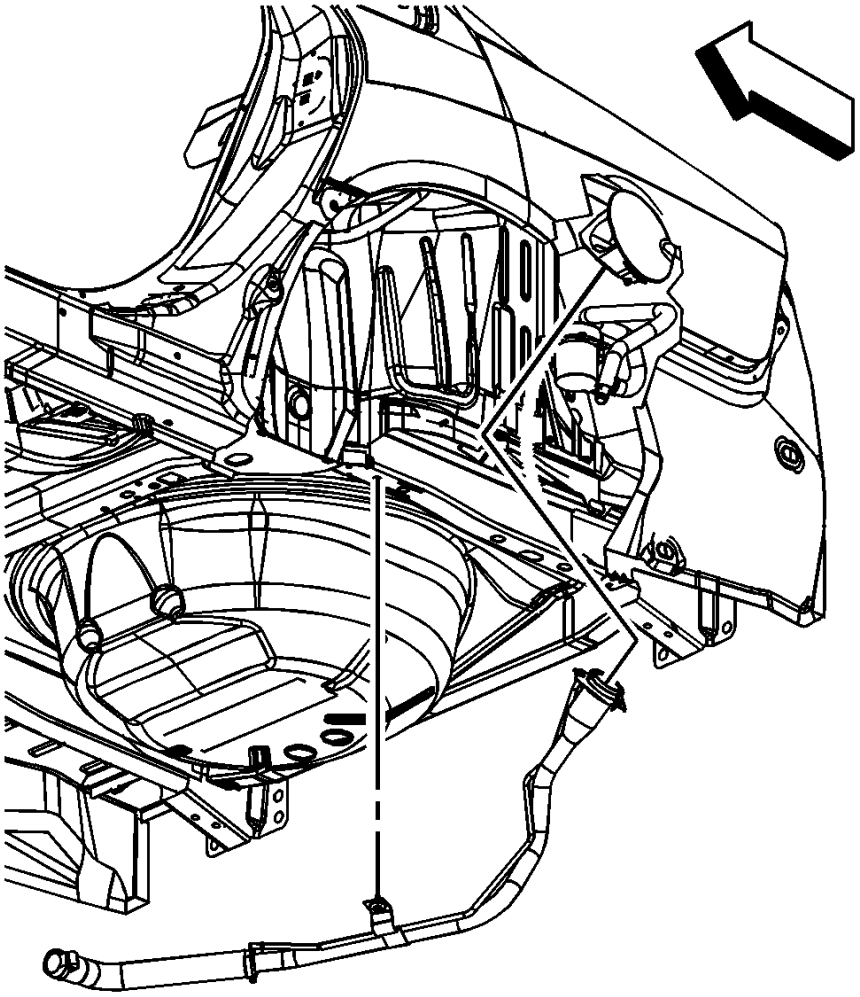

Fig. 74: Identifying Fuel Tank Fill Pipe
Courtesy of GENERAL MOTORS COMPANY

1. Install the fuel tank fill pipe.

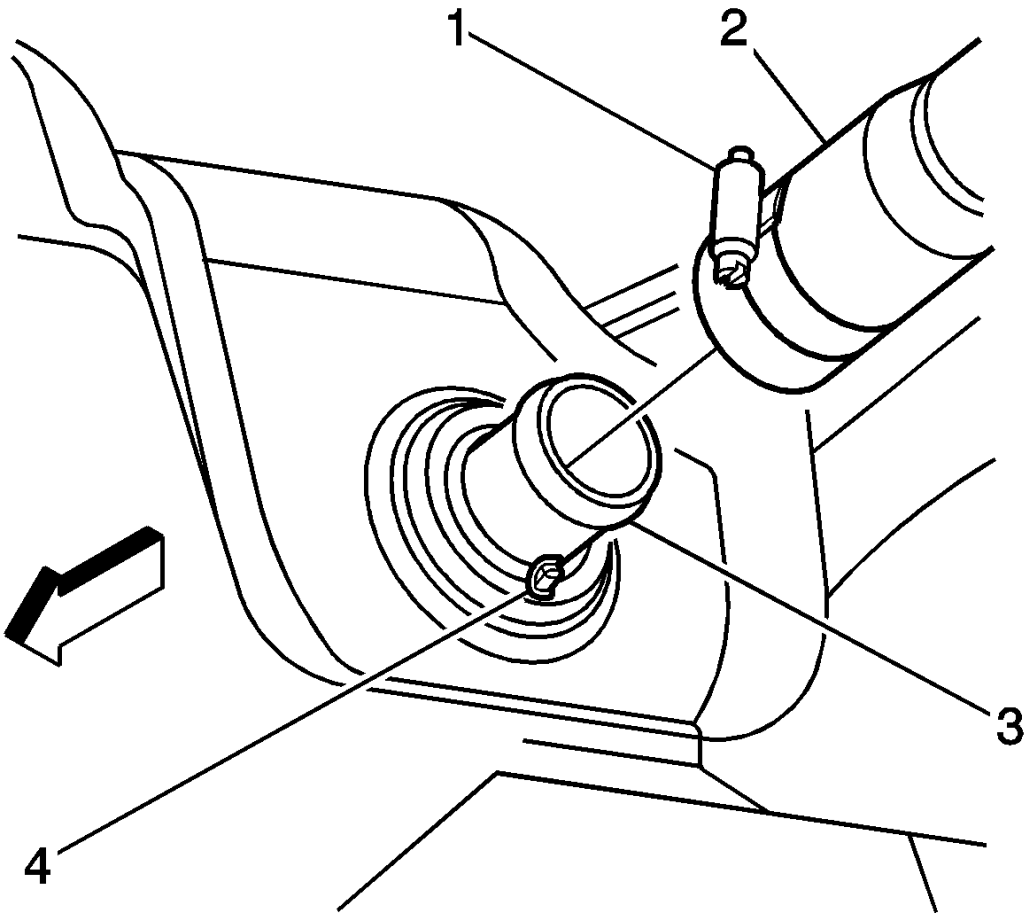

Fig. 75: Fuel Tank Clamp, Fuel Tank Hose and Fuel Tank
Courtesy of GENERAL MOTORS COMPANY

2. Install the fuel tank fill pipe hose (2) onto the fuel tank (3)
3. Connect the vent pipe quick connect fitting to the fuel tank vent pipe quick connect fitting. Refer to **Plastic Collar Quick Connect Fitting Service**.

CAUTION: Refer to Fastener Caution .

4. Tighten the fuel fill pipe clamp (1) at the fuel tank and tighten to 2.5 N.m (22 lb in).

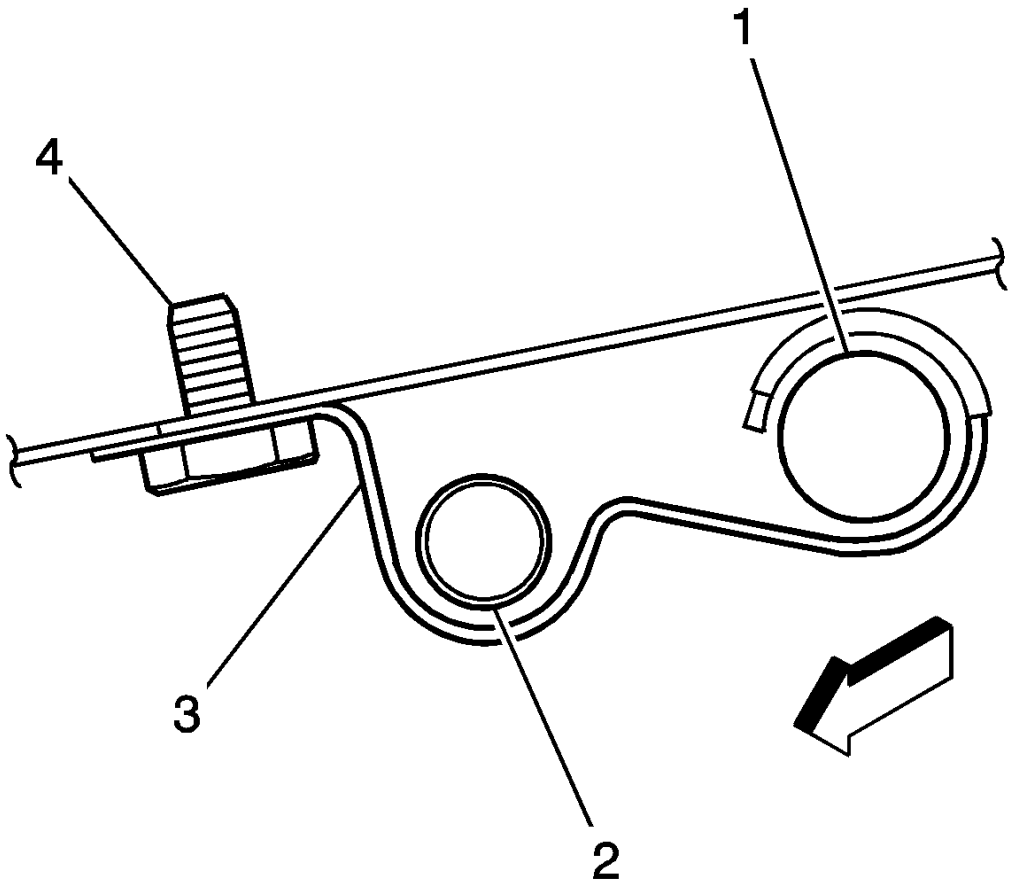

Fig. 76: Fill Pipe Bracket
Courtesy of GENERAL MOTORS COMPANY

5. Install the EVAP line (2) to the bracket (3).
6. Install the fill pipe bracket bolt (4) to the underbody rail and tighten to 13 N.m (115 lb in).
7. Lower the vehicle.

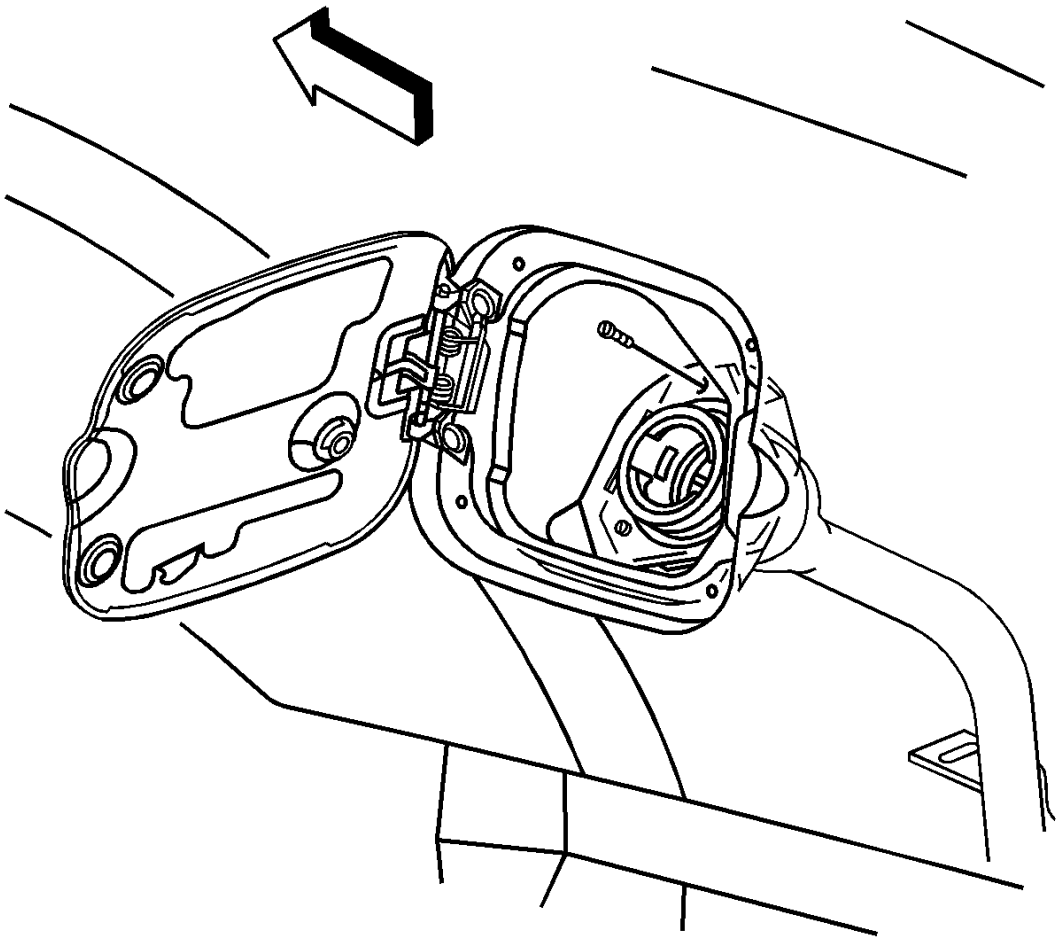

Fig. 77: Locating Fuel Fill Pipe Screws To Fuel Filler Pocket
Courtesy of GENERAL MOTORS COMPANY

8. Install the fuel fill pipe screws to the fuel filler pocket and tighten to 2.5 N.m (22 lb in).

FUEL LEVEL SENSOR REPLACEMENT

Removal Procedure

WARNING: Fuel Vapors can collect while servicing fuel system parts in enclosed areas such as a trunk. To reduce the risk of fire and increased exposure to vapors:

- **Use forced air ventilation such as a fan set outside of the trunk.**
- **Plug or cap any fuel system openings in order to reduce fuel vapor formation.**
- **Clean up any spilled fuel immediately.**
- **Avoid sparks and any source of ignition.**
- **Use signs to alert others in the work area that fuel system work is in process.**

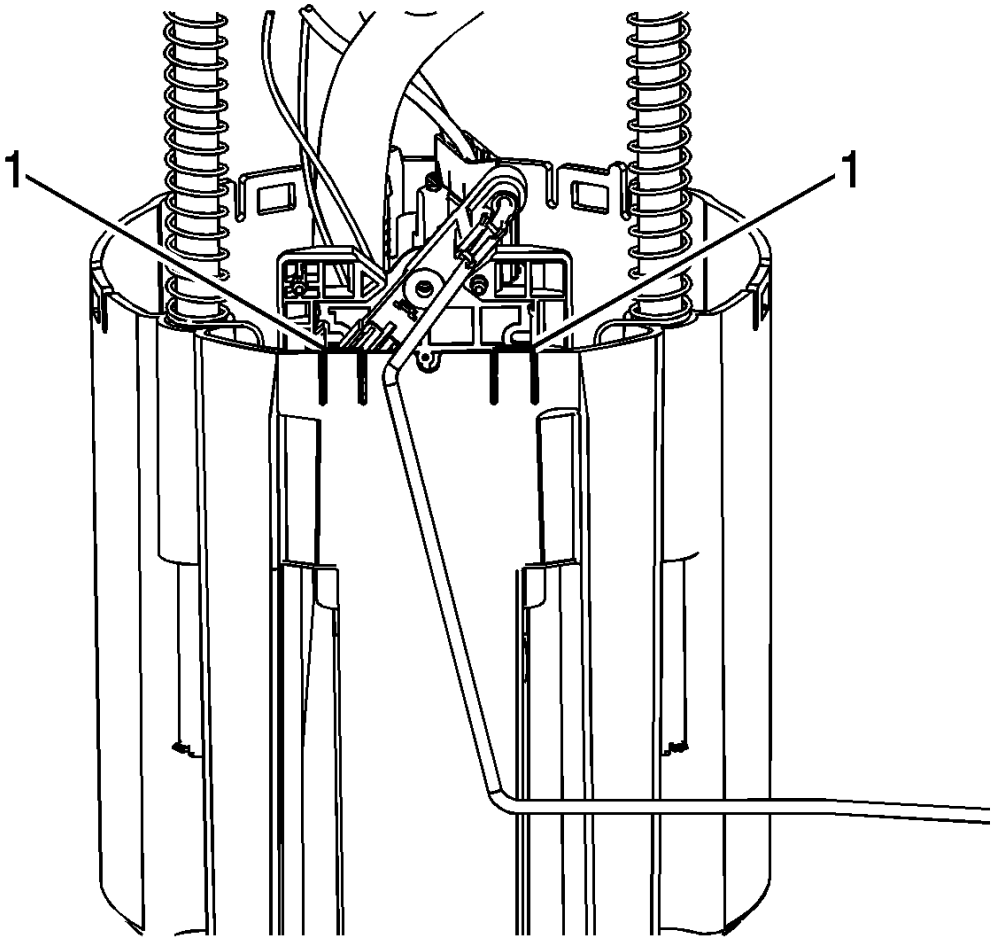

Fig. 78: Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

1. Remove the fuel pump module. Refer to **Fuel Tank Fuel Pump Module Replacement**.
2. Using two flat-bladed tools, carefully pull both locking tabs (1) outward while simultaneously lifting the level sensor.

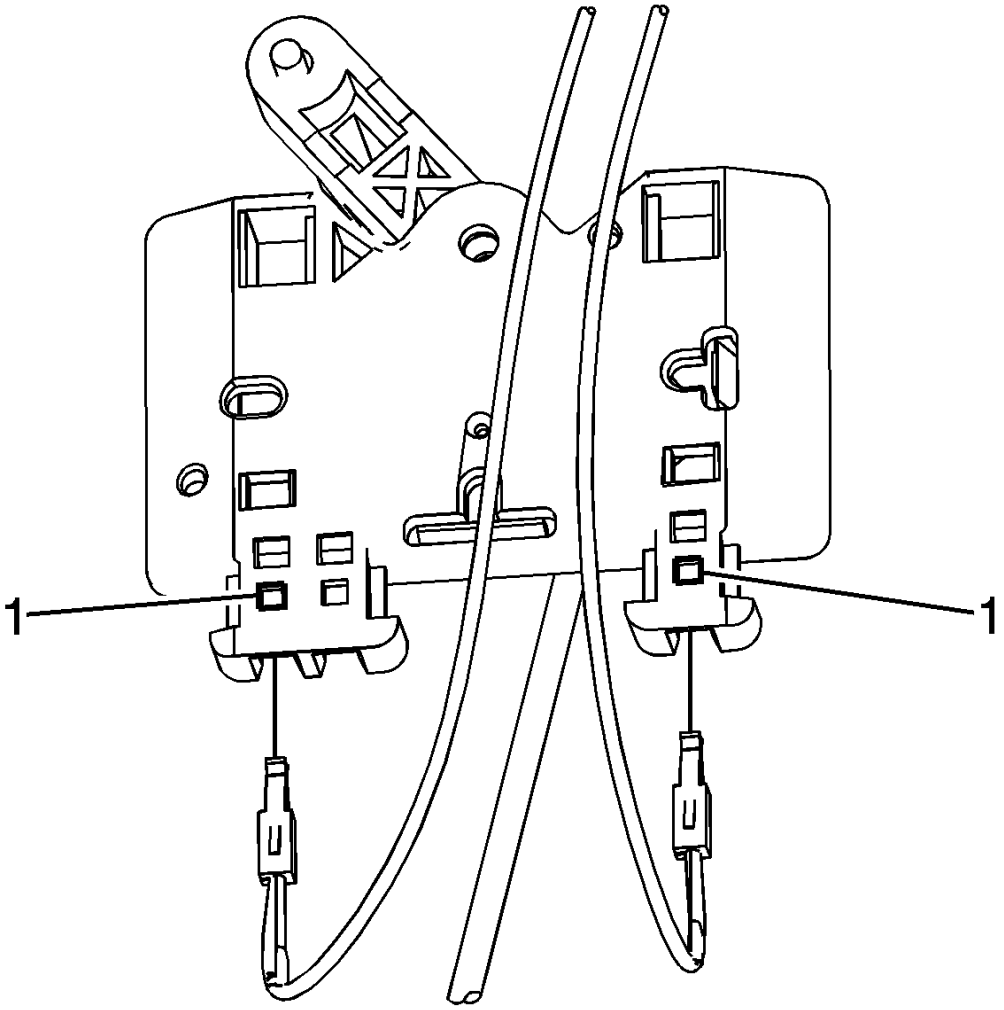

Fig. 79: Electrical Terminals
Courtesy of GENERAL MOTORS COMPANY

3. Using a small bladed tool, push in the electrical terminals (1) while simultaneously pulling out.

Installation Procedure

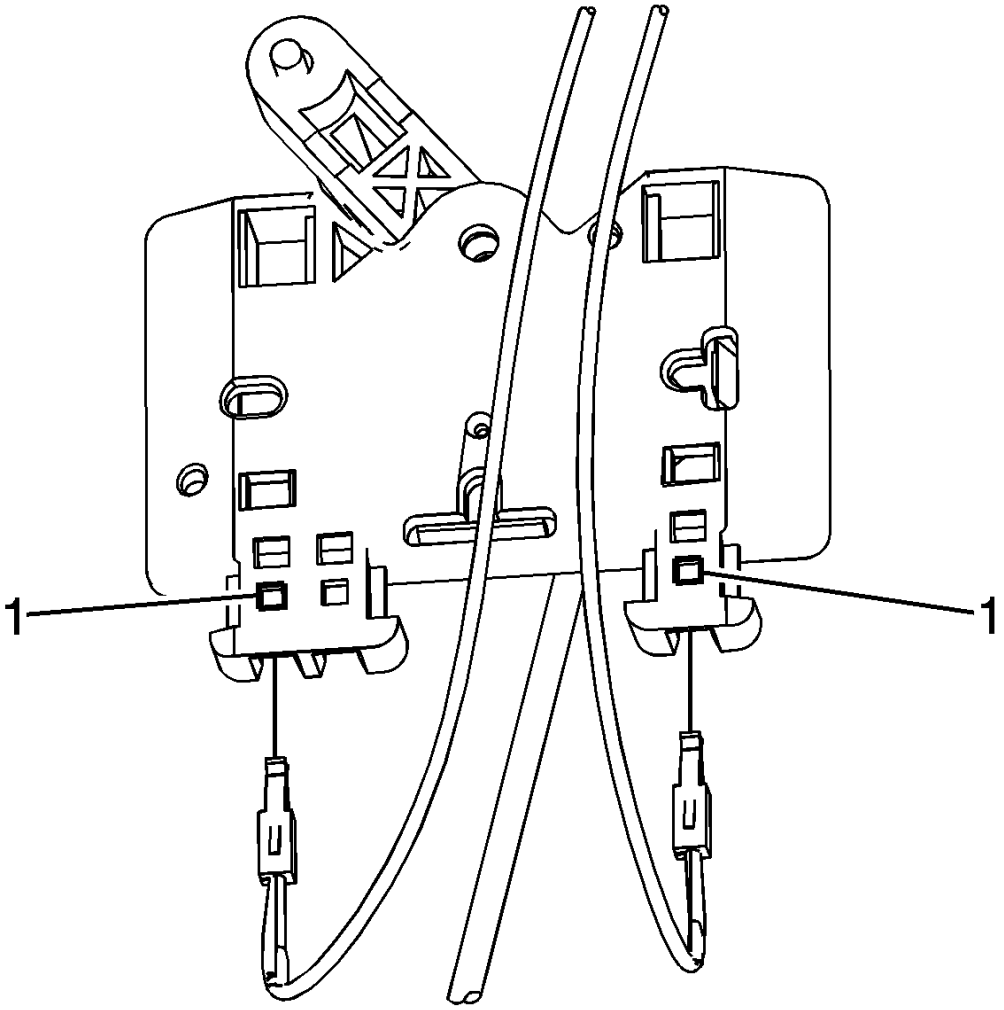

Fig. 80: Electrical Terminals
Courtesy of GENERAL MOTORS COMPANY

1. Push in the electrical terminals (1) and ensure the terminals are secure.

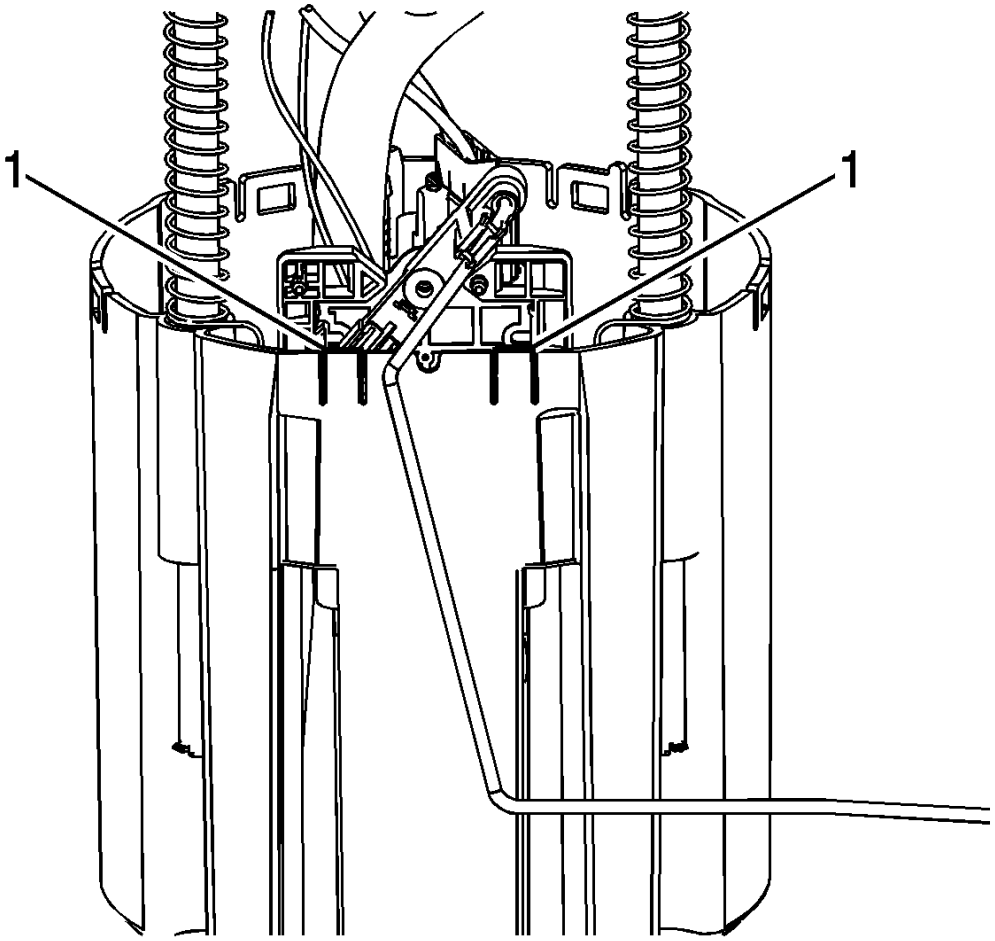

Fig. 81: Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

2. Carefully insert the level sensor until the locking tabs (1) snap into the locking position.
3. Install the fuel pump module. Refer to **Fuel Tank Fuel Pump Module Replacement**.

FUEL PUMP FUEL FEED HOSE REPLACEMENT

Removal Procedure

1. Relieve the fuel system pressure. Refer to **Fuel Pressure Relief (Without CH 48027)Fuel Pressure Relief (CH 48027)Fuel Pressure Relief (High Side)**

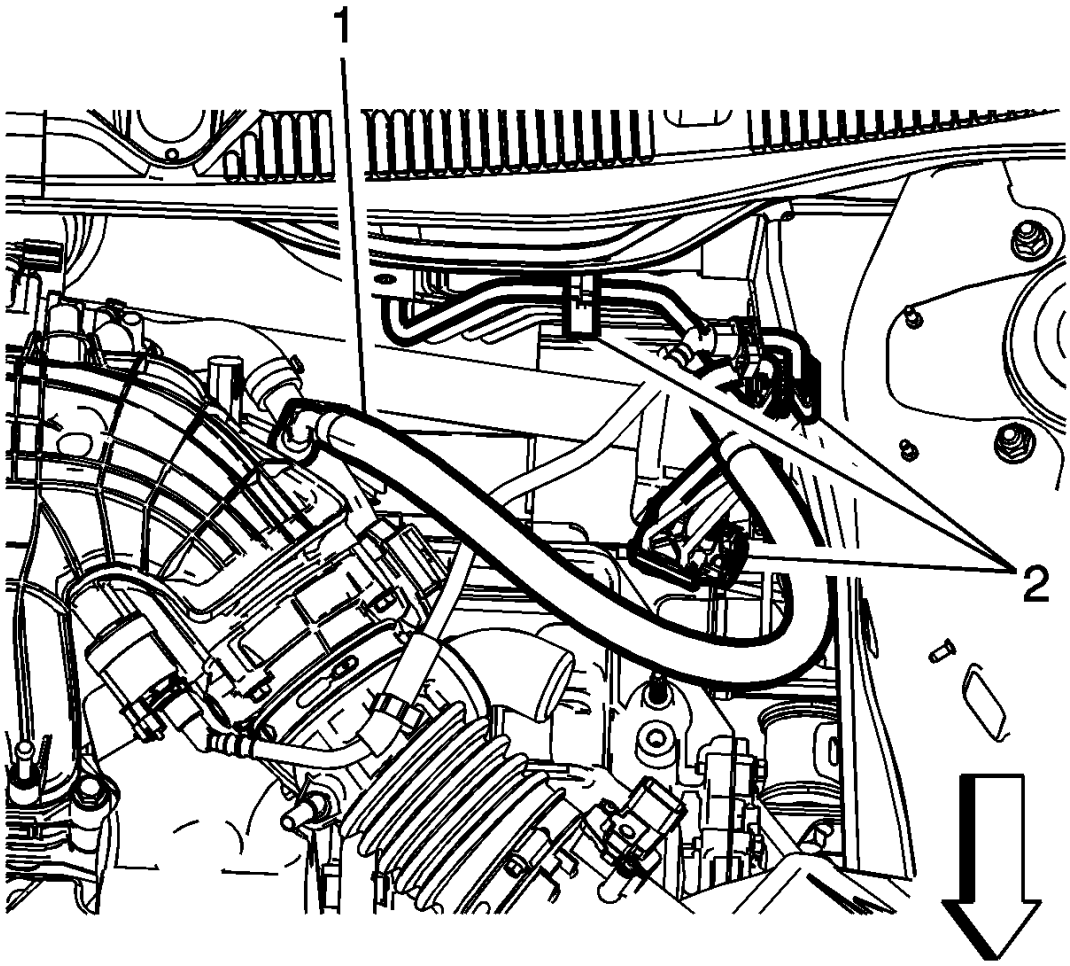

Fig. 82: Fuel Line And Retainers
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the fuel line (1) from the retainers (2). Refer to **Metal Collar Quick Connect Fitting Service**.
3. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

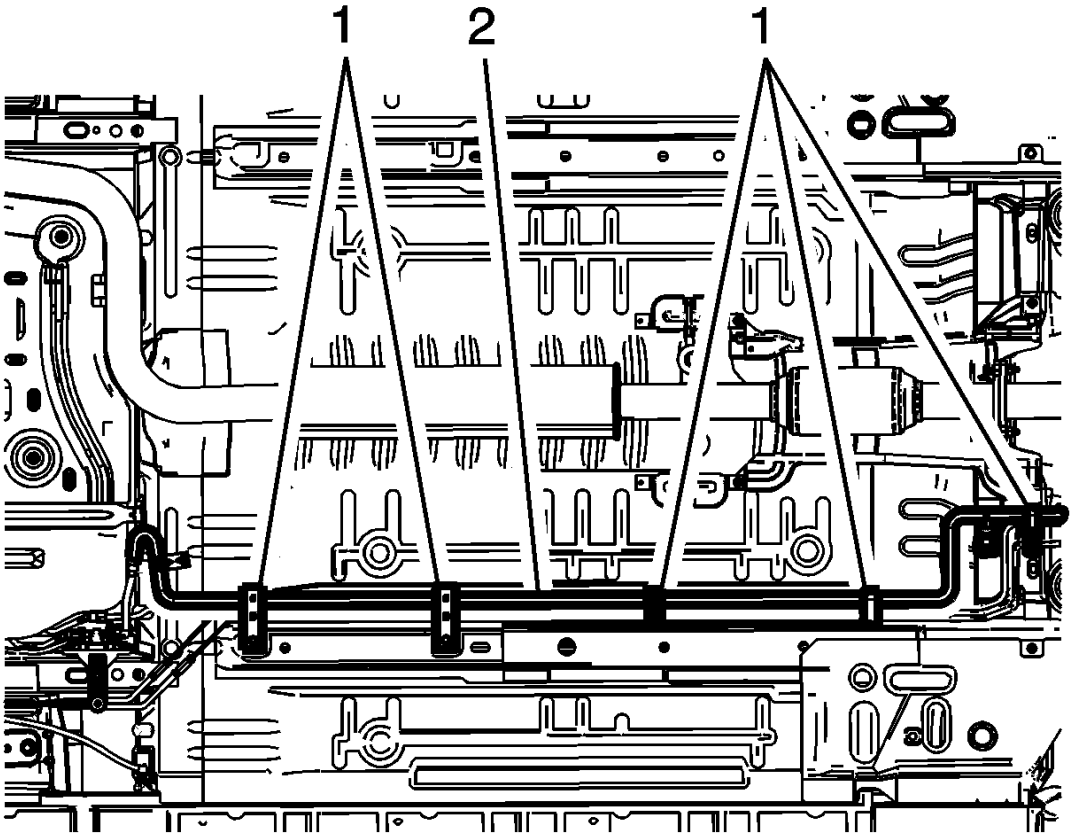

Fig. 83: Fuel Line And Retainers
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the fuel line (1) from the retainers (2). Refer to **Plastic Collar Quick Connect Fitting Service**.

Installation Procedure

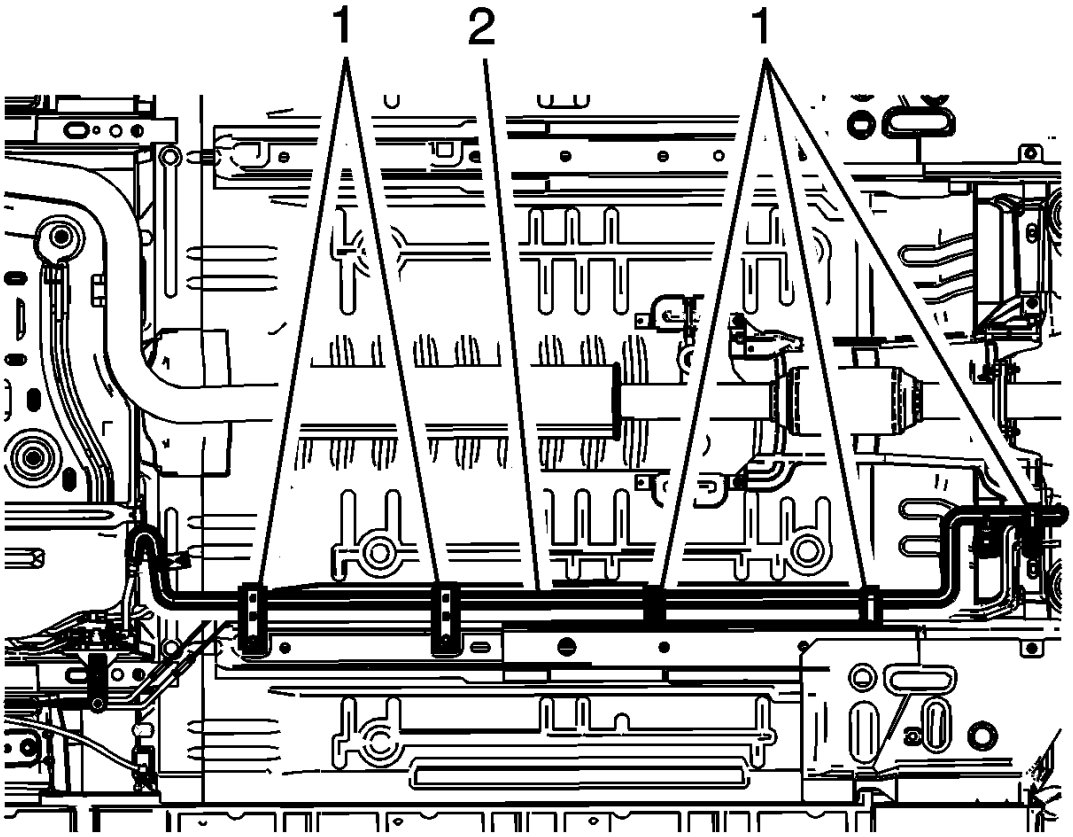

Fig. 84: Fuel Line And Retainers
Courtesy of GENERAL MOTORS COMPANY

1. Connect the fuel line (1) from the retainers (2). Refer to **Plastic Collar Quick Connect Fitting Service**.
2. Lower the vehicle.

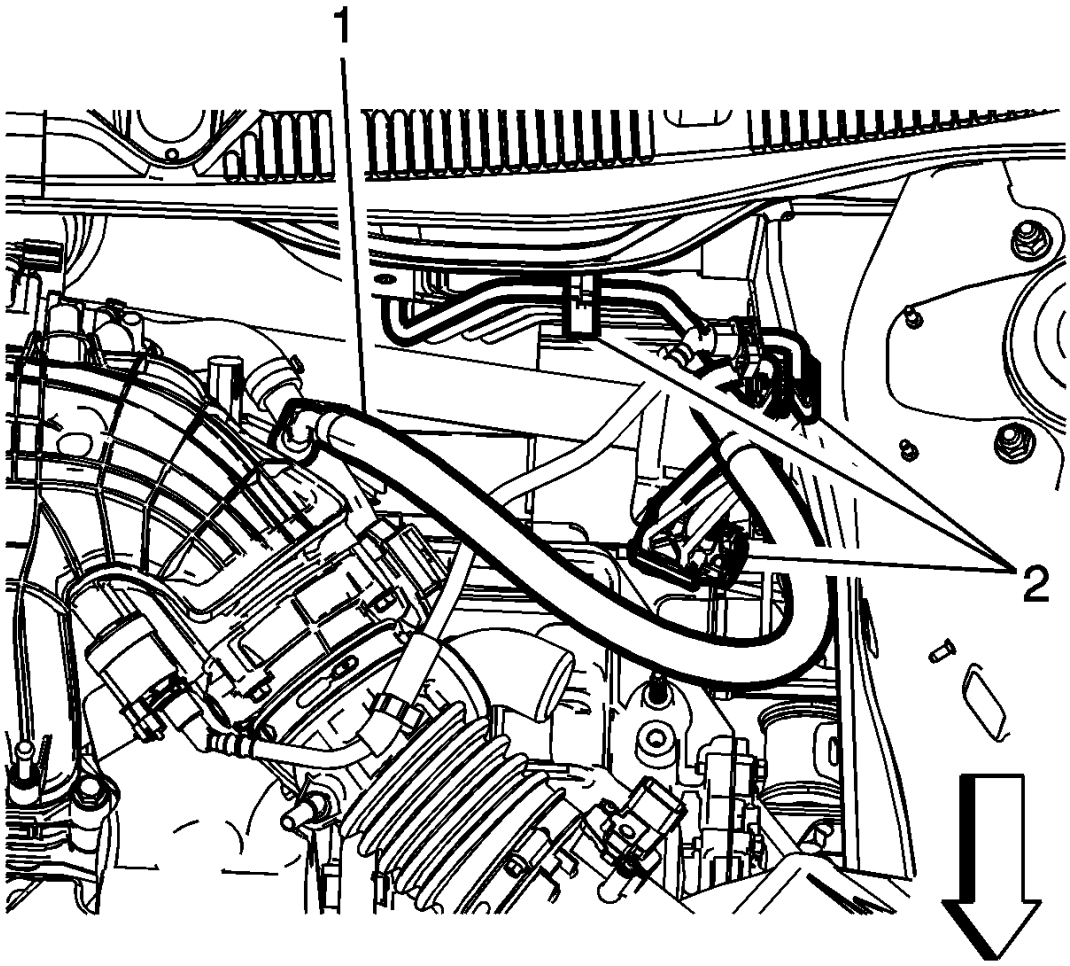

Fig. 85: Fuel Line And Retainers
Courtesy of GENERAL MOTORS COMPANY

3. Connect the fuel line (1) from the retainers (2). Refer to **Metal Collar Quick Connect Fitting Service**.

FUEL FEED REAR PIPE REPLACEMENT

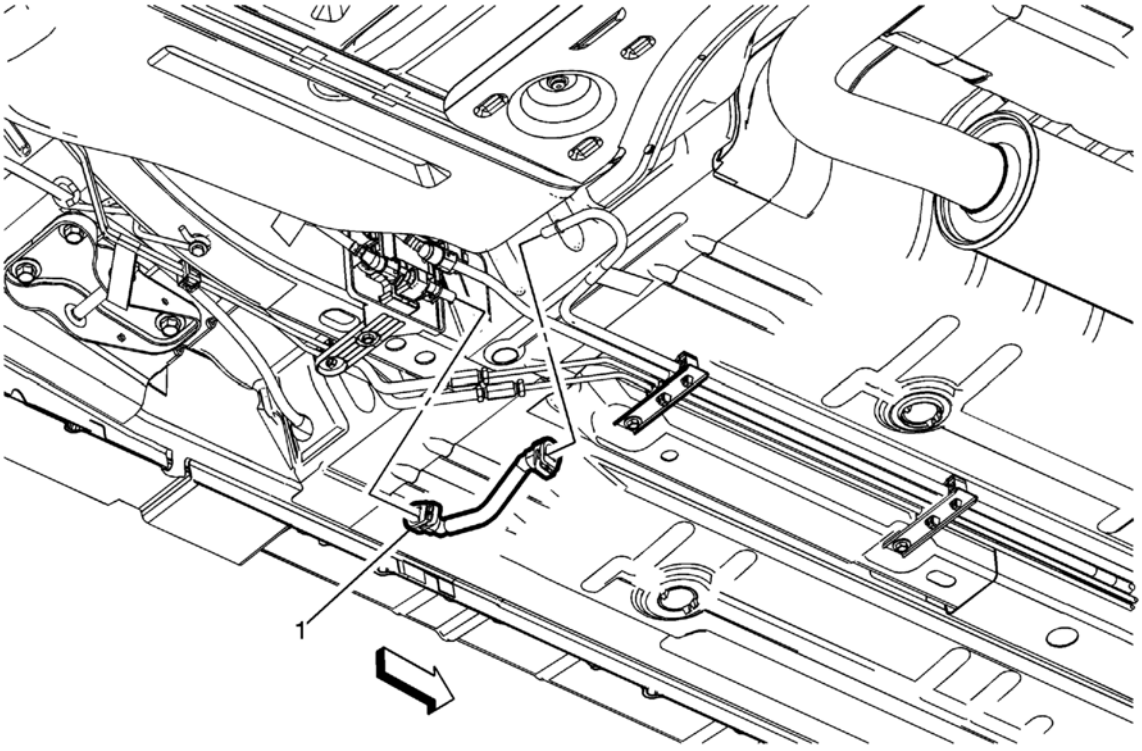

Fig. 86: Fuel Feed Rear Pipe
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Relieve the fuel system pressure. Refer to **Fuel Pressure Relief (Without CH 48027)Fuel Pressure Relief (CH 48027)Fuel Pressure Relief (High Side)**. 2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .	
1	Fuel Feed Rear Pipe. **Procedure** Disconnect the fuel feed rear pipe quick connect fittings. Refer to **Plastic Collar Quick Connect Fitting Service**

FLEXIBLE FUEL SENSOR REPLACEMENT

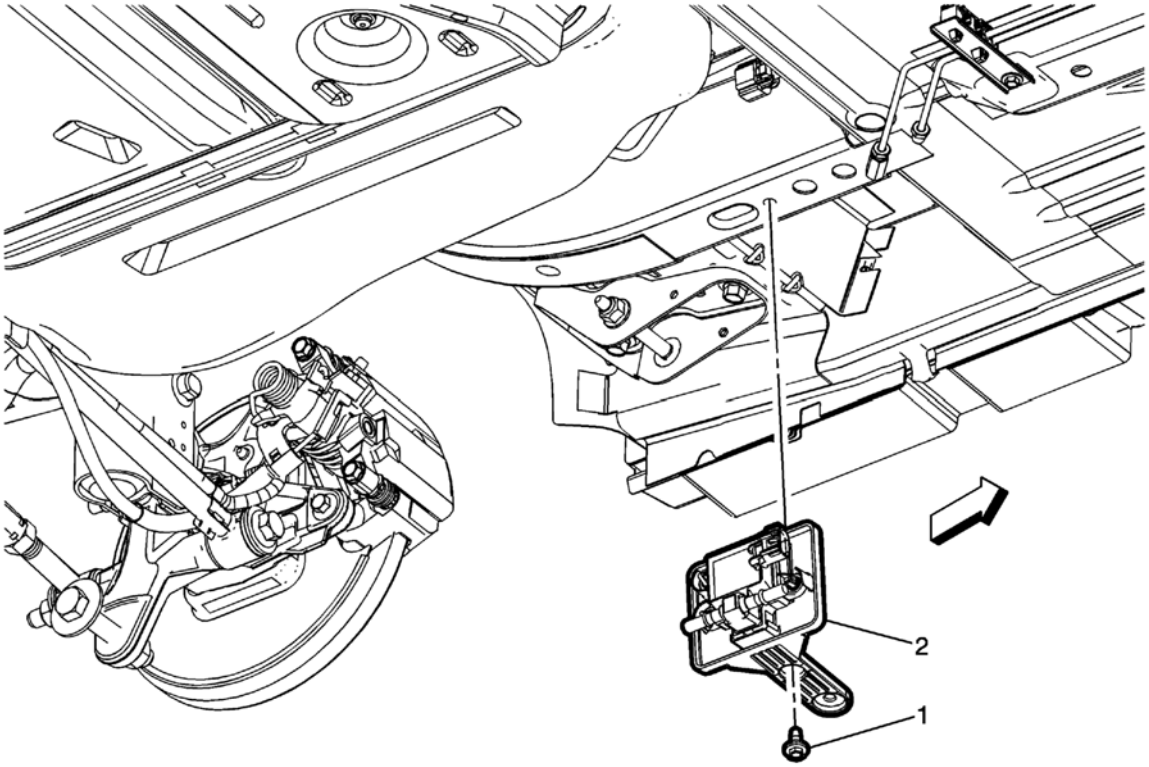

Fig. 87: Flexible Fuel Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Relieve the fuel system pressure. Refer to **Fuel Pressure Relief (Without CH 48027)Fuel Pressure Relief (CH 48027)Fuel Pressure Relief (High Side)** 2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**	
1	Flex Fuel Sensor Bolt. **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)
2	Flex Fuel Sensor. **Procedure** 1. Disconnect the fuel line connectors. Refer to **Plastic Collar Quick Connect Fitting Service**

Callout	Component Name
	2. Disconnect the electrical connector.

FUEL PRESSURE SENSOR REPLACEMENT - FUEL FEED PIPE

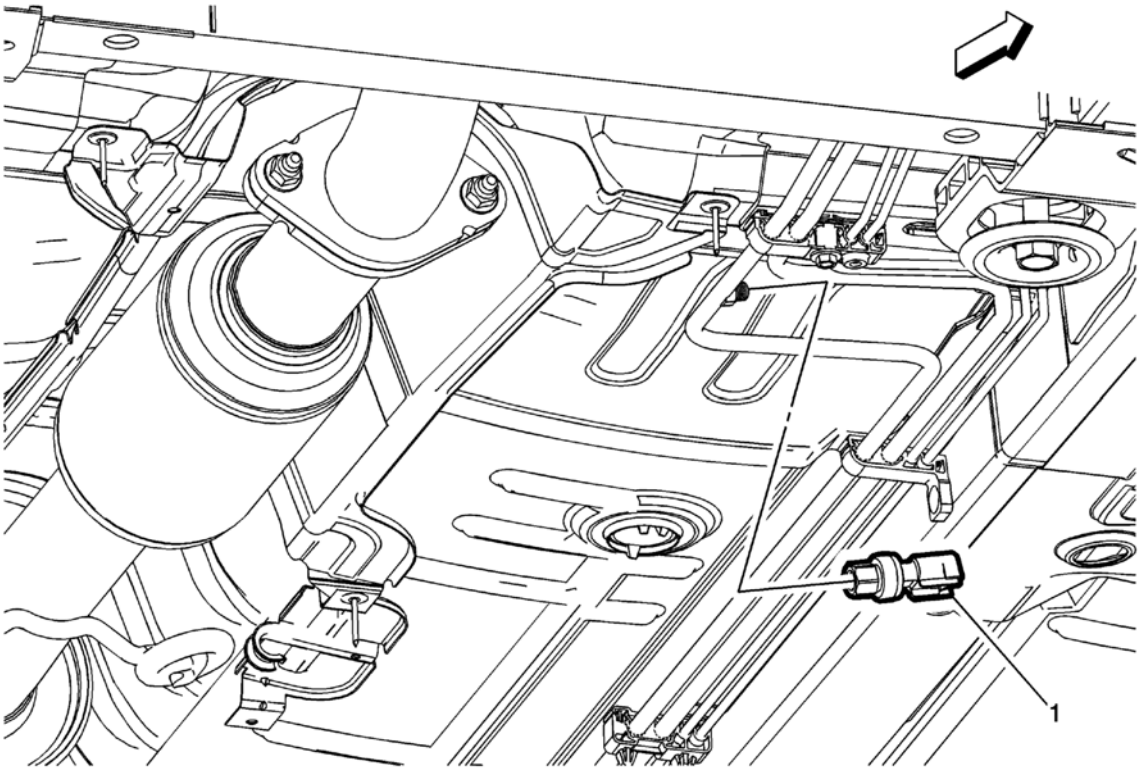

Fig. 88: Fuel Pressure Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Relieve the fuel system pressure. Refer to **Fuel Pressure Relief (Without CH 48027)Fuel Pressure Relief (CH 48027)Fuel Pressure Relief (High Side)**. 2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .	
1	Fuel Pressure Sensor **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Disconnect the electrical connector.

Callout	Component Name
	2. Use a NEW O-ring whenever the sensor is removed. **Tighten** 9Y (80 lb in)

FUEL FEED PIPE REPLACEMENT

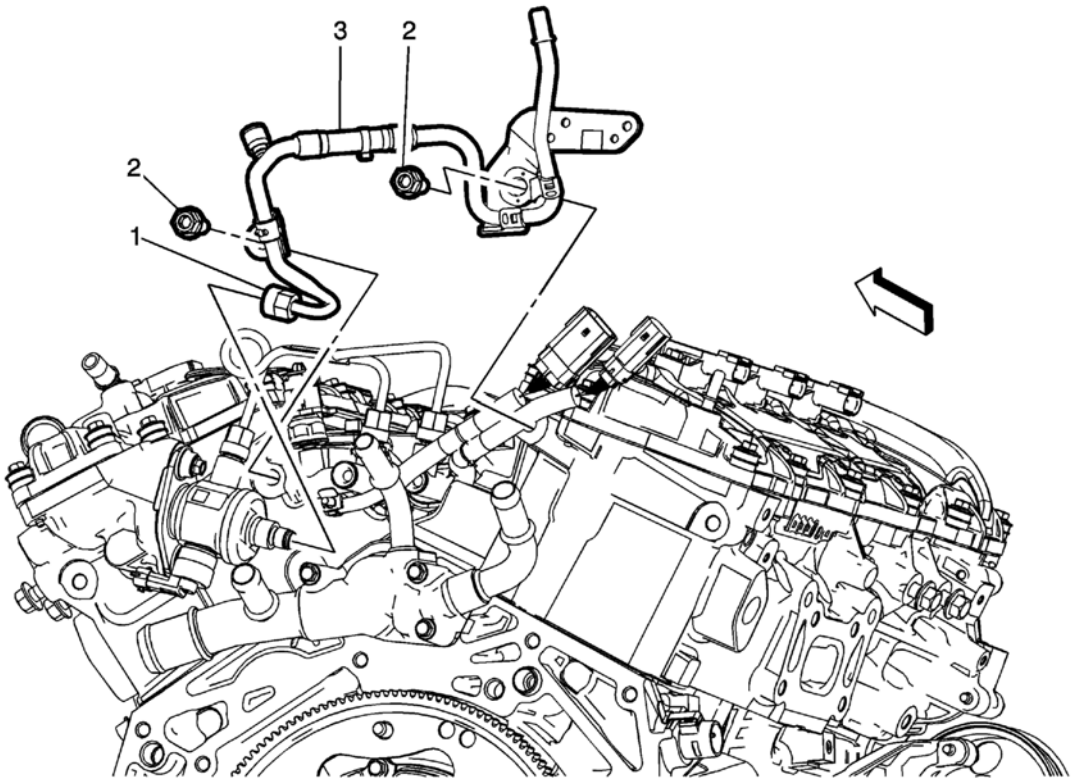

Fig. 89: Fuel Feed Pipe
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Predures 1. Relieve the fuel system pressure. Refer to **Fuel Pressure Relief (Without CH 48027)Fuel Pressure Relief (CH 48027)Fuel Pressure Relief (High Side)**. 2. Remove the intake manifold cover. Refer to **Intake Manifold Cover Replacement** . 3. Remove the fuel pipe shield. Refer to **Fuel Pipe Shield Replacement**. 4. Disconnect the fuel feed line quick connect. Refer to **Metal Collar Quick Connect Fitting Service**.	
1	Fitting (Qty: 1) **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . **Tighten** 28 N.m(20 lb ft)
2	Bolt (Qty: 2) **Tighten** 50 N.m(28 lb ft)
3	Fuel Feed Pipe **Procedure** 1. DISCARD the pipe when removed, and install a NEW pipe. 2. Ensure that the high pressure fuel pipe, and fuel pump fittings are clean and dry prior to assembly. 3. Pressure up the fuel system and check for leaks.

FUEL SYSTEM CLEANING

CAUTION: **Refer to Cover and Plug Openings Caution .**

NOTE: **When flushing the fuel tank, treat the fuel and water mixture as a hazardous material. Handle the material in accordance with all local, state and federal laws and regulations.**

NOTE: **Whenever the fuel tank is cleaned, inspect the fuel pump fuel strainer. If the fuel pump fuel strainer is contaminated, replace the fuel pump fuel strainer and inspect the fuel pump.**

NOTE: **Always maintain cleanliness when servicing fuel system components.**

1. Remove the fuel tank fuel pump module. Refer to **Fuel Tank Fuel Pump Module Replacement**.
2. Inspect the fuel pump inlet for dirt and debris. If dirt and debris are found, replace the fuel pump.
3. Flush fuel tank with hot water.
4. Pour the water out of the fuel sender assembly opening in the fuel tank. Rock the fuel tank in order to ensure that the removal of the water from the fuel tank is complete.
5. Allow tank to dry completely before reassembly.
6. Install the fuel tank fuel pump module. Refer to **Fuel Tank Fuel Pump Module Replacement**.

FUEL PRESSURE SENSOR REPLACEMENT - FUEL INJECTION FUEL RAIL

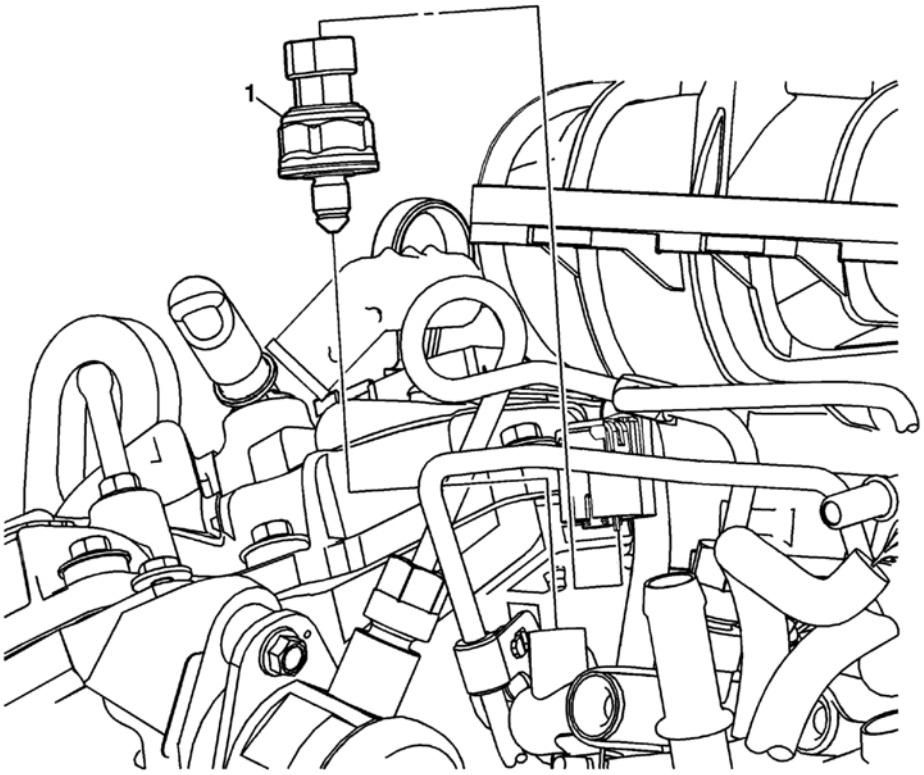

Fig. 90: Fuel Pressure Sensor - Fuel Injection Fuel Rail
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Relieve the fuel system pressure. Refer to **Fuel Pressure Relief (Without CH 48027)Fuel Pressure Relief (CH 48027)Fuel Pressure Relief (High Side)**. 2. Remove the fuel pipe shield. Refer to **Fuel Pipe Shield Replacement**.	
1	Fuel Injection Fuel Rail Fuel Pressure Sensor **CAUTION:** **Refer to Fastener Caution .** **Procedure** Disconnect the electrical connector. **Tighten** 33 N.m (25 lb ft)

FUEL INJECTION FUEL RAIL ASSEMBLY REPLACEMENT - BANK 1

Special Tools

EN-49248 Injector Rail Assembly Remover

For equivalent regional tools, refer to **Special Tools (Diagnostic Tools)** **Special Tools (Repair Tools)** .

Removal Procedure

1. Relieve the fuel system pressure. Refer to **Fuel Pressure Relief (Without CH 48027)Fuel Pressure Relief (CH 48027)Fuel Pressure Relief (High Side)**.
2. Remove the fuel pipe shield. Refer to **Fuel Pipe Shield Replacement**.
3. Remove the intake manifold. Refer to **Intake Manifold Replacement** .
4. Remove the fuel feed intermediate pipe. Refer to **Fuel Feed Intermediate Pipe Replacement**.
5. Remove the fuel injection fuel rail noise shield from the fuel rails.

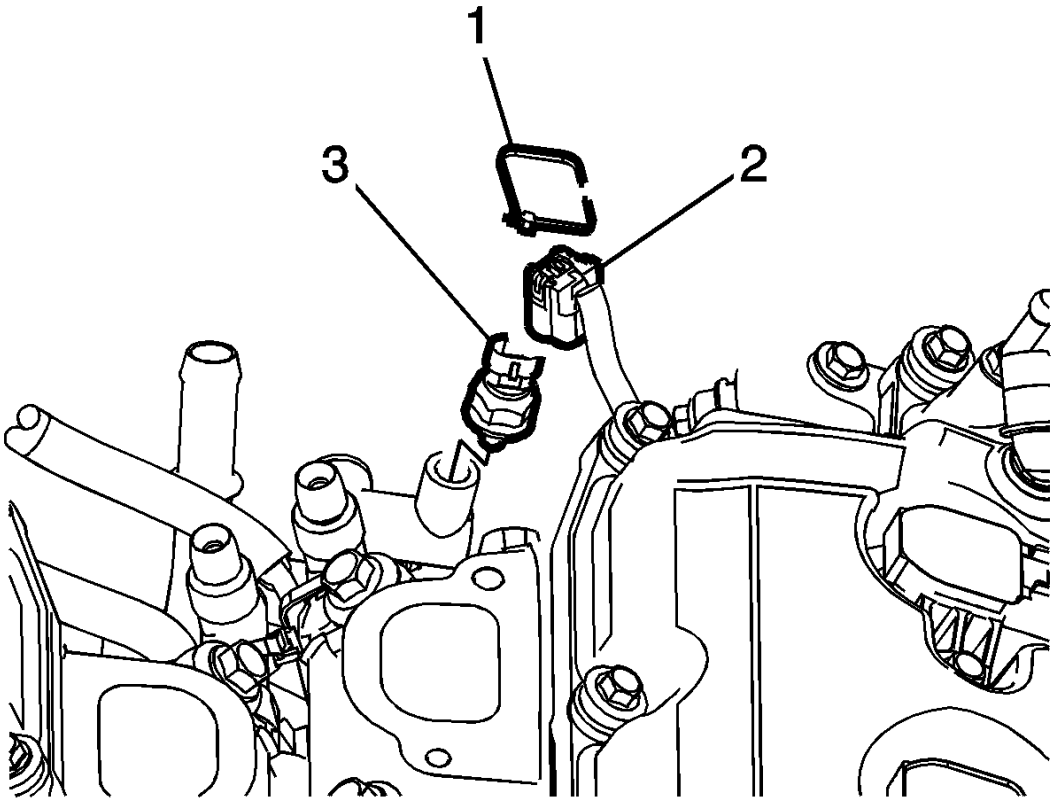

Fig. 91: Fuel Pressure Sensor And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

6. Cut the plastic tie strap (1).
7. Disconnect the fuel pressure sensor electrical connector (2).
8. Remove the fuel pressure sensor (3).

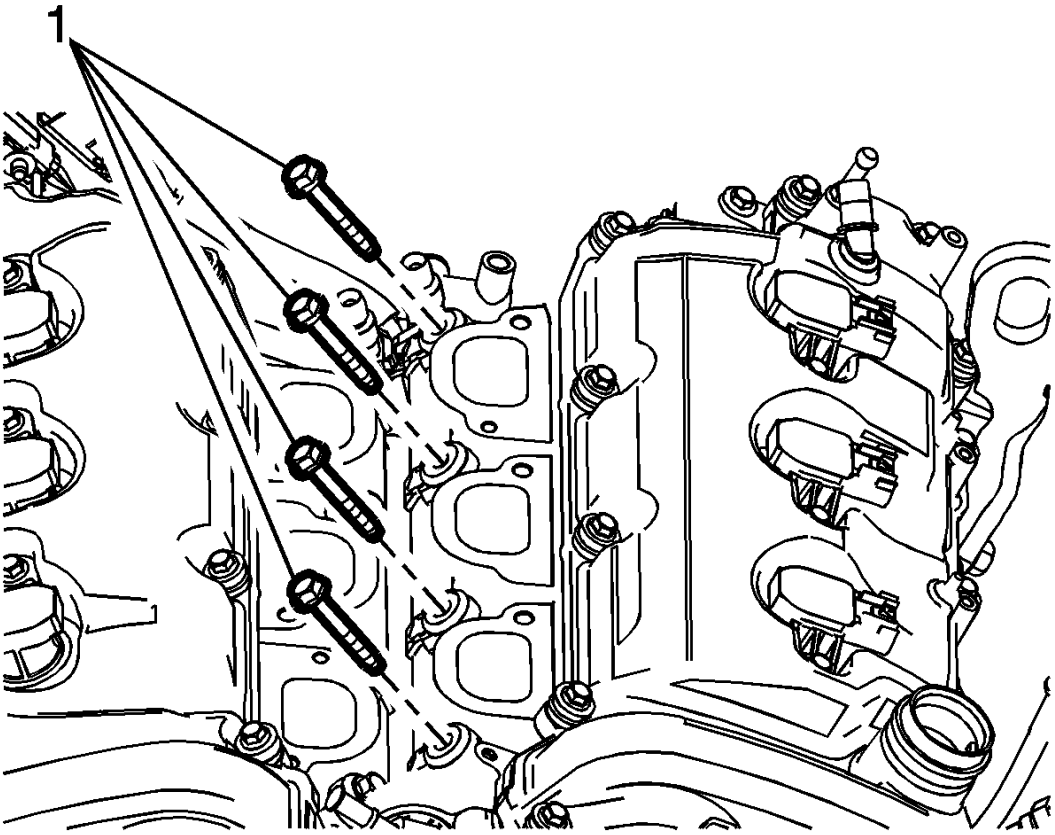

Fig. 92: Left Side Fuel Rail Fasteners
Courtesy of GENERAL MOTORS COMPANY

9. Remove the bank 2 fuel rail fasteners (1).

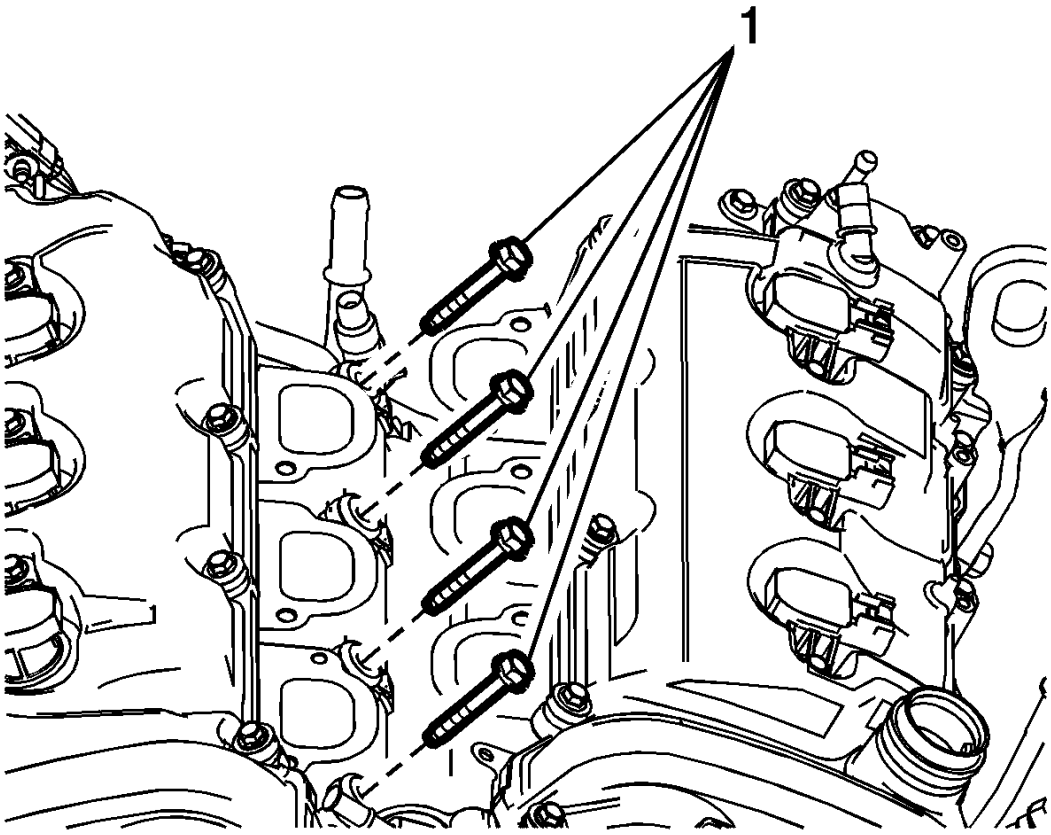

Fig. 93: Right Side Fuel Rail Fasteners
Courtesy of GENERAL MOTORS COMPANY

10. Remove the bank 1 fuel rail fasteners (1) for clearance purposes.

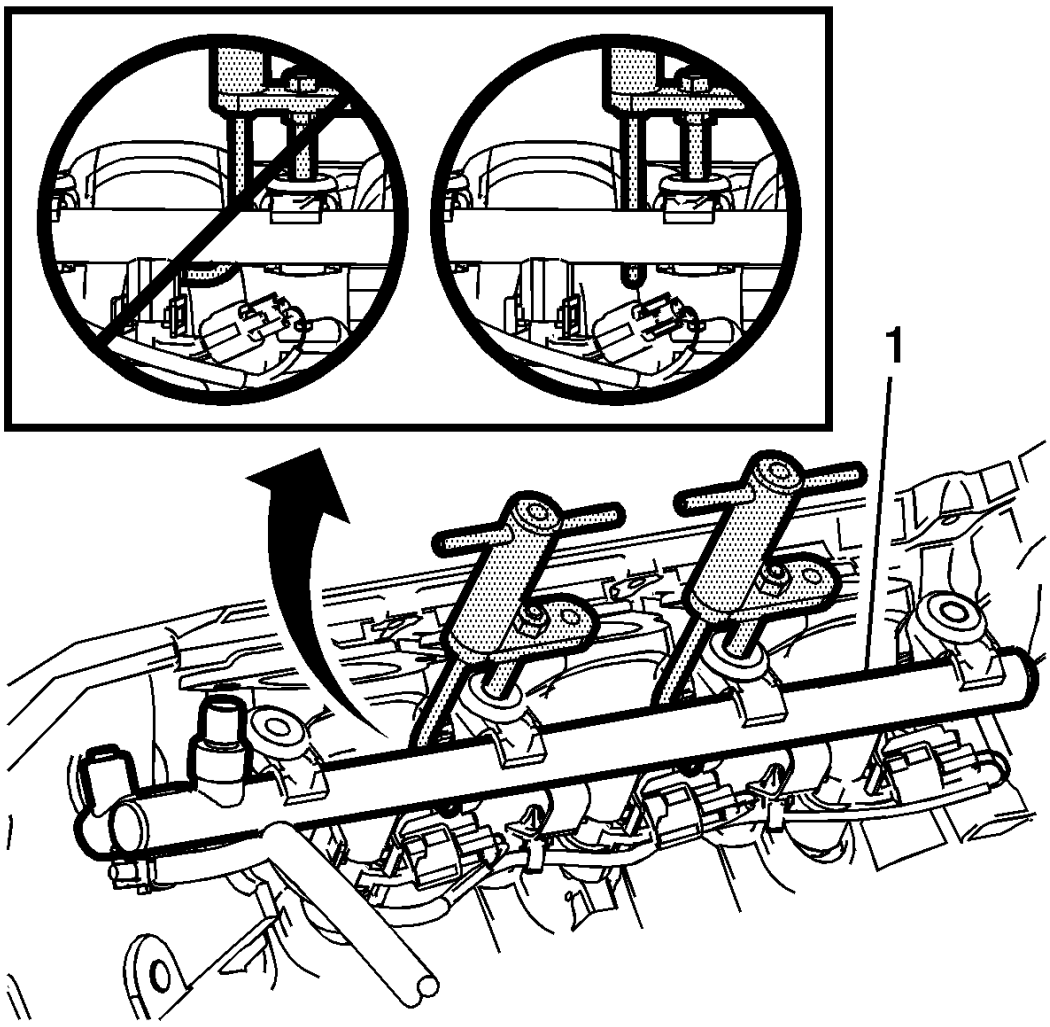

Fig. 94: Raising Fuel Rail With Special Tool
Courtesy of GENERAL MOTORS COMPANY

11. Using the **EN-49248-4** hook , raise the fuel rail (1) as an assembly.
12. Once the fuel rail is free, remove the **EN-49248** special tool.

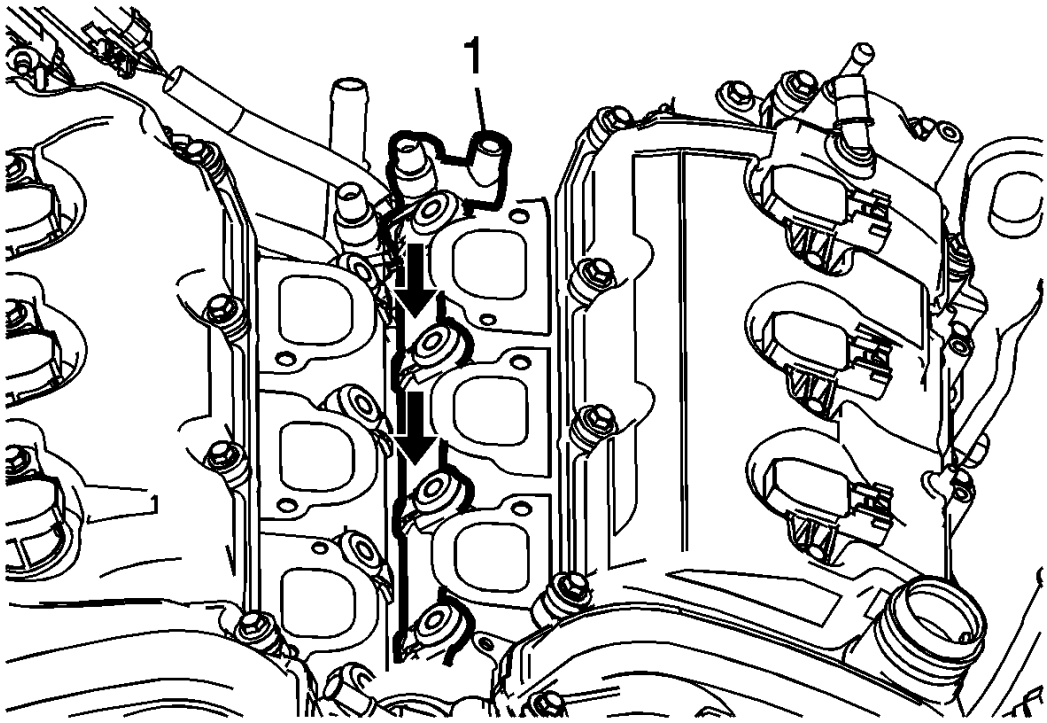

Fig. 95: Sliding Fuel Rail Toward Front Of Engine
Courtesy of GENERAL MOTORS COMPANY

13. Slide the fuel rail (1) toward the front of the engine approximately 1 inch (25.4 mm), in order to clear the center injector bore.

NOTE: **The direct fuel injectors must be rebuilt whenever the injector has been released from the fuel rail or cylinder head.**

14. Once the fuel rail is removed, remove the fuel injectors and rebuild them. Refer to **Fuel Rail and Injectors Cleaning and Inspection (LF1, LFW or LFX)** .

Installation Procedure

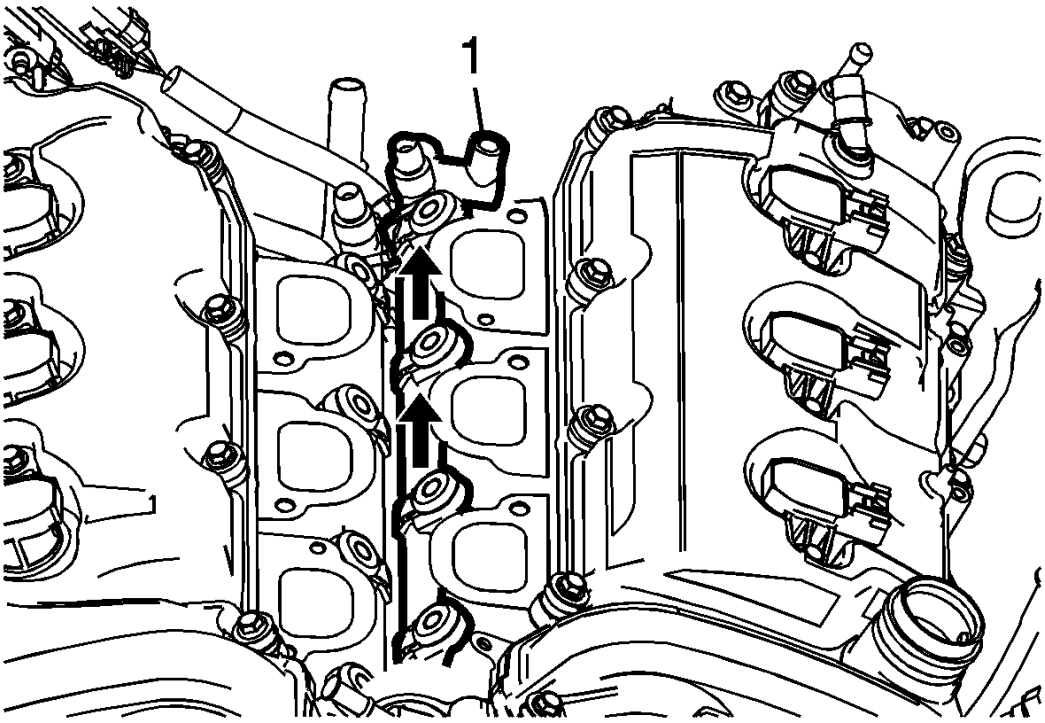

Fig. 96: Sliding Fuel Rail Toward Rear Of Engine
Courtesy of GENERAL MOTORS COMPANY

1. Slide the fuel rail (1) toward the rear of the engine approximately 1 inch (25.4 mm), in order to align the center injector bore.

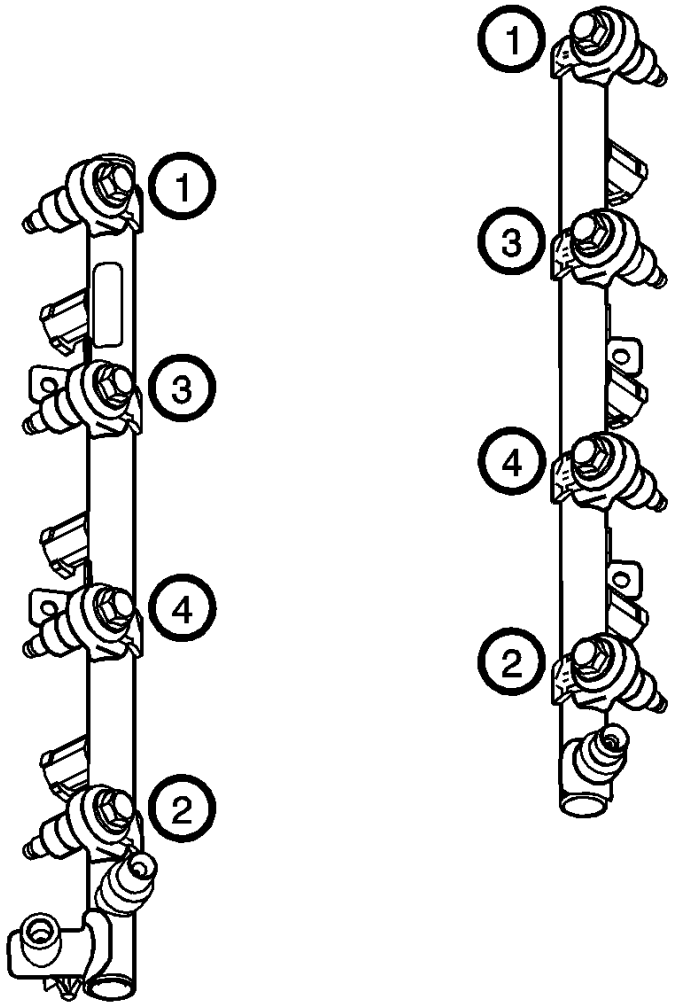

Fig. 97: Identifying Fuel Rail Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Hand tighten the two outer fuel rail fasteners to seat the injectors.
3. Start and hand tighten the remaining fuel rail fasteners.
4. Tighten the fuel rail fasteners in the sequence shown above:
    1. First pass 12 N.m (106 lb in).
    2. Final pass 23 N.m (17 lb ft).

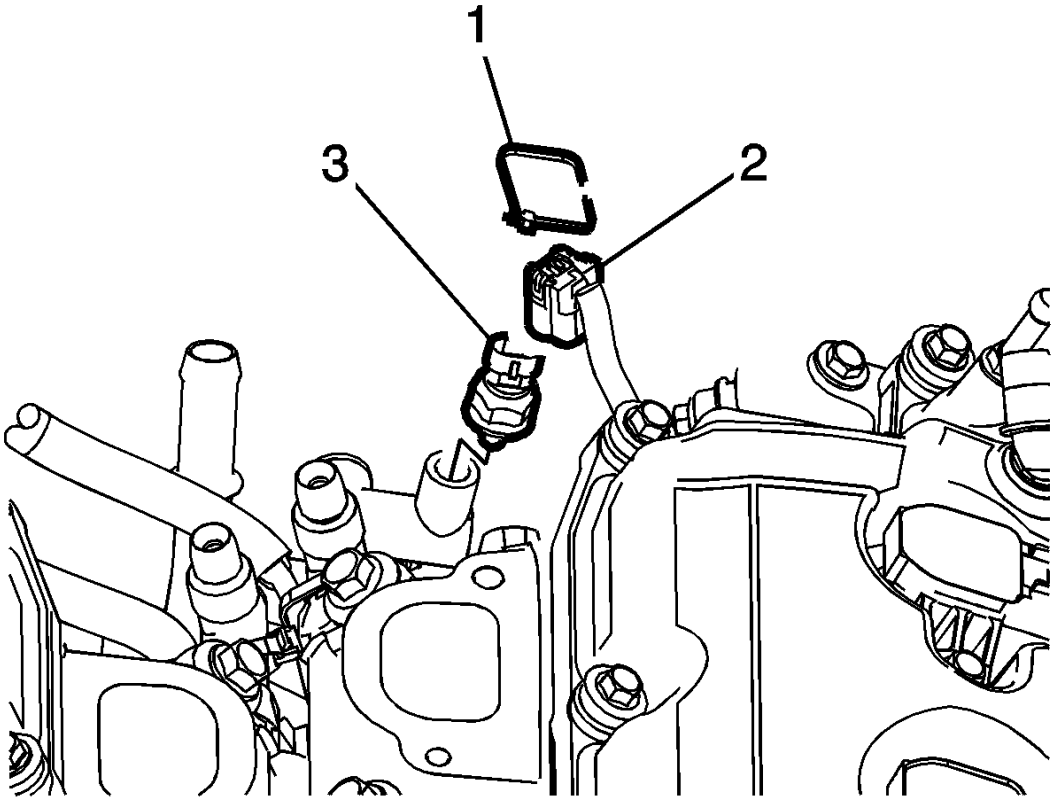

Fig. 98: Fuel Pressure Sensor And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

5. Tighten the fuel pressure sensor (3) to 33 N.m (25 lb ft).
6. Connect the fuel pressure sensor electrical connector (2) and secure it with a new plastic zip tie.
7. Install the fuel feed intermediate pipe. Refer to **Fuel Feed Intermediate Pipe Replacement**.
8. Inspect for fuel leaks using the following procedure:
    1. Turn ON the ignition, with the engine OFF for 2 seconds.
    2. Turn OFF the ignition, for 10 seconds.
    3. Turn ON the ignition, with the engine OFF.
    4. Inspect for fuel leaks.
9. Install the fuel injection fuel rail noise shield to the fuel rails.
10. Install the intake manifold. Refer to **Intake Manifold Replacement** .
11. Install the fuel pipe shield. Refer to **Fuel Pipe Shield Replacement**.
12. Install the low side fuel pressure service port cap.
13. Install the fuel tank cap.

FUEL INJECTION FUEL RAIL ASSEMBLY REPLACEMENT - BANK 2

Special Tools

EN-49248 Injector Rail Assembly Remover

For equivalent regional tools, refer to **Special Tools (Diagnostic Tools)** **Special Tools (Repair Tools)** .

Removal Procedure

1. Relieve the fuel system pressure. Refer to **Fuel Pressure Relief (Without CH 48027)Fuel Pressure Relief (CH 48027)Fuel Pressure Relief (High Side)**.
2. Remove the fuel pipe shield. Refer to **Fuel Pipe Shield Replacement**.
3. Remove the intake manifold. Refer to **Intake Manifold Replacement** .
4. Remove the fuel feed intermediate pipe. Refer to **Fuel Feed Intermediate Pipe Replacement**.
5. Remove the fuel injection fuel rail noise shield from the fuel rails.

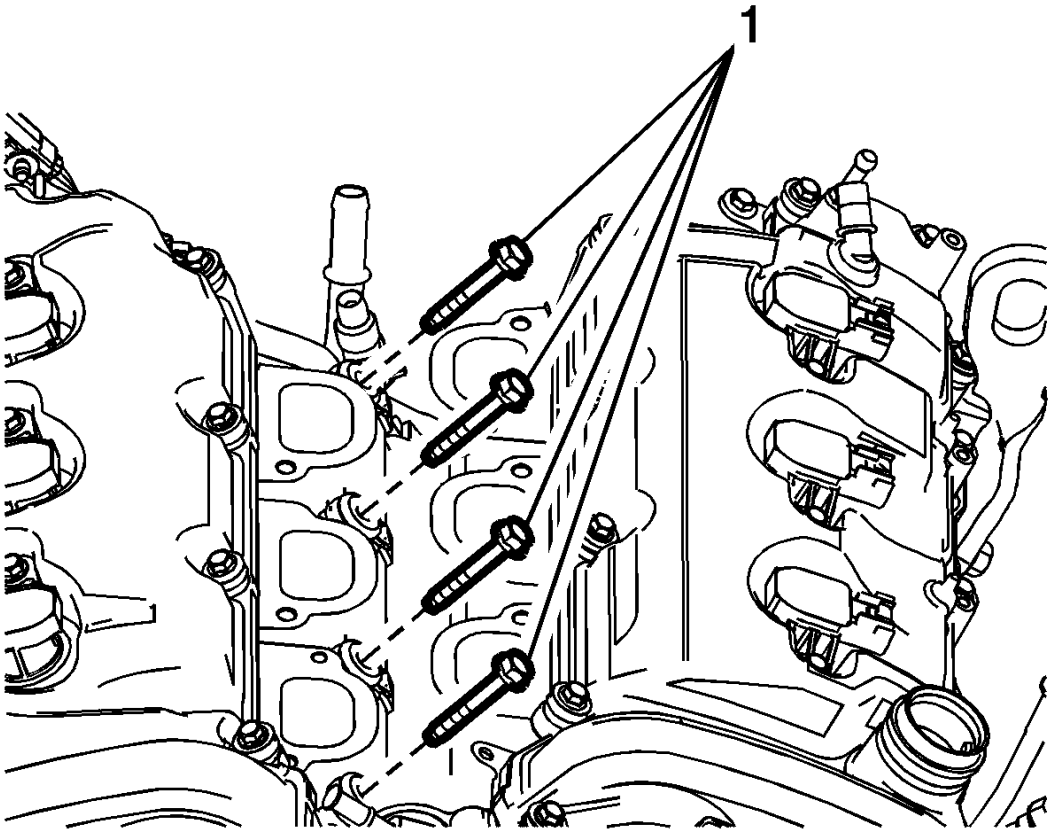

Fig. 99: Right Side Fuel Rail Fasteners
Courtesy of GENERAL MOTORS COMPANY

6. Remove the bank 1 fuel rail fasteners (1).

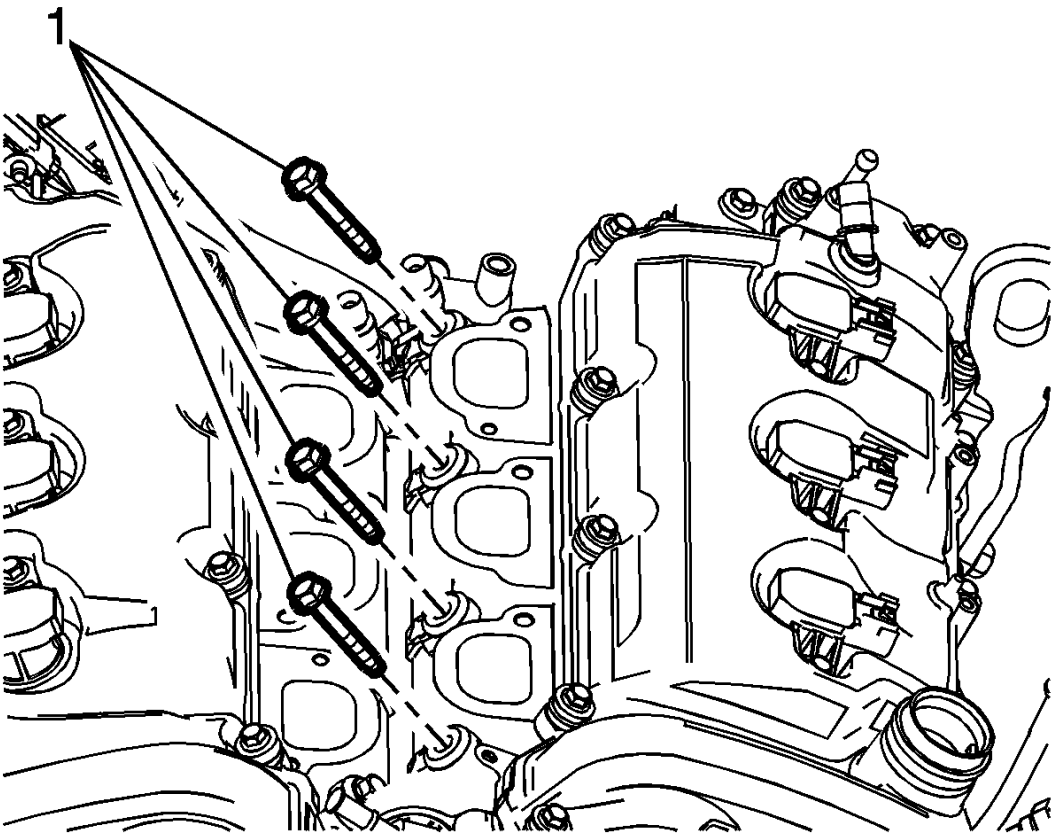

Fig. 100: Left Side Fuel Rail Fasteners
Courtesy of GENERAL MOTORS COMPANY

7. Remove the bank 2 fuel rail fasteners (1) for clearance purposes.

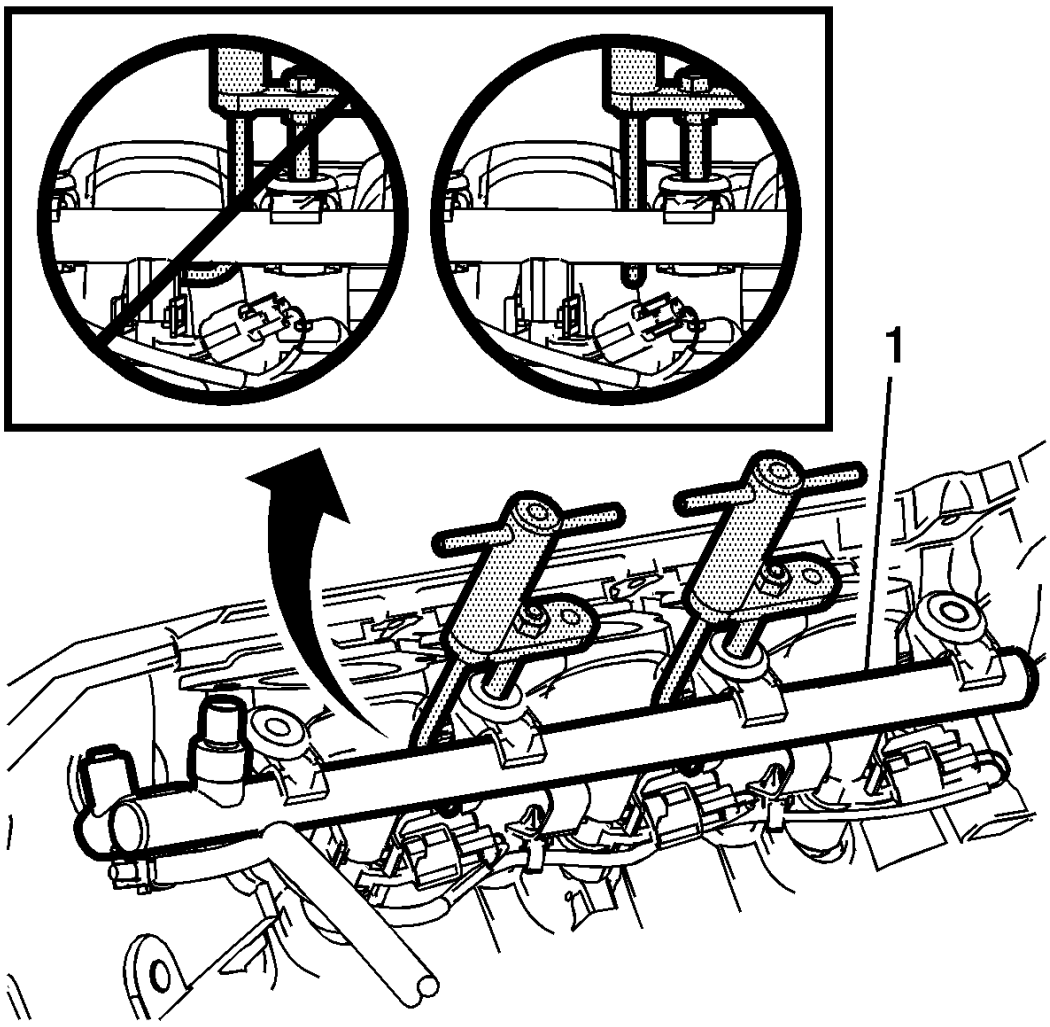

Fig. 101: Raising Fuel Rail With Special Tool
Courtesy of GENERAL MOTORS COMPANY

8. Using the **EN-49248-4** hook , raise the fuel rail (1) as an assembly.
9. Once the fuel rail is free, remove the **EN-49248** remover.

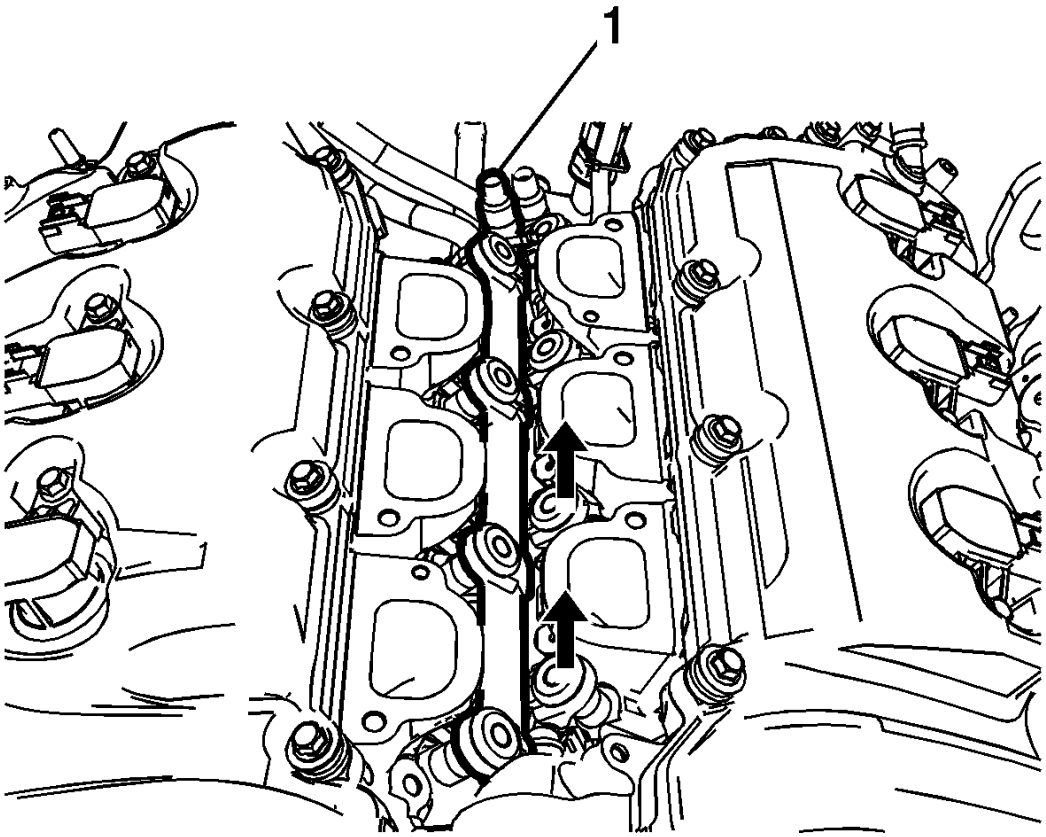

Fig. 102: Sliding Fuel Rail Toward Rear Of Engine
Courtesy of GENERAL MOTORS COMPANY

10. Slide the fuel rail (1) toward the rear of the engine approximately 1 inch (25.4mm), in order to clear the center injector bore.

NOTE: **The direct fuel injectors must be rebuilt whenever the injector has been released from the fuel rail or cylinder head.**

11. Once the fuel rail is removed, remove the fuel injectors and rebuild them. Refer to **Fuel Rail and Injectors Cleaning and Inspection (LF1, LFW or LFX)** .

Installation Procedure

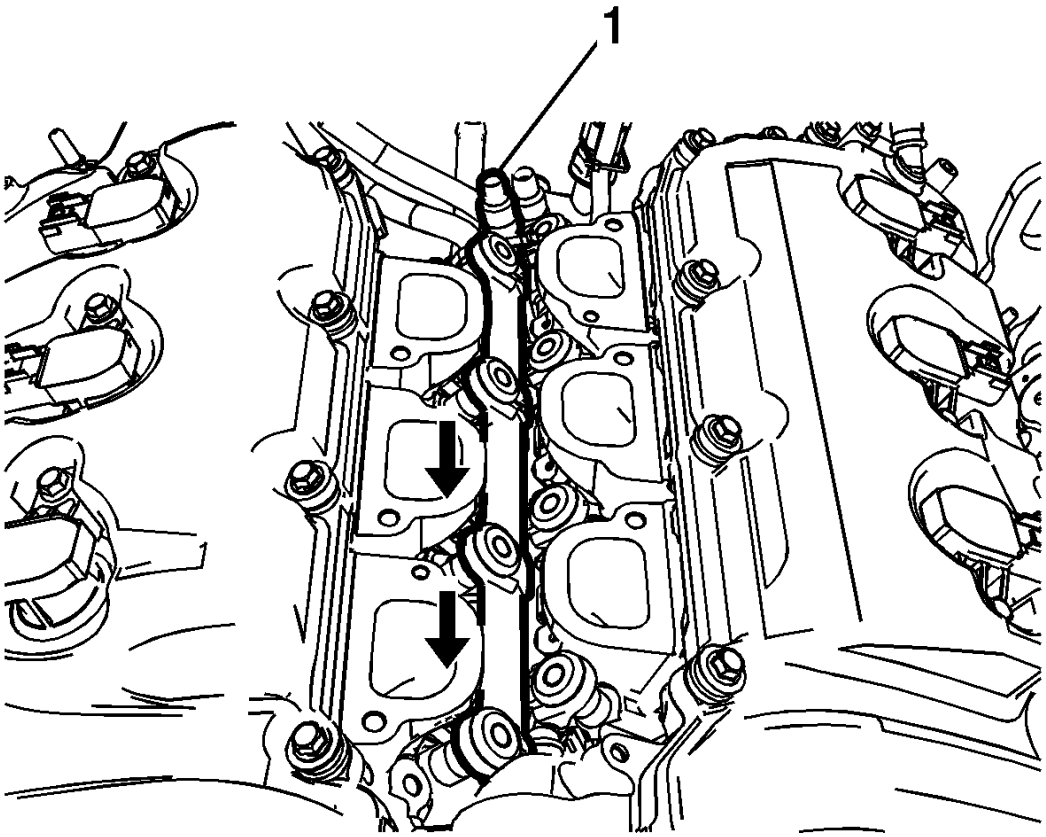

Fig. 103: Sliding Fuel Rail Toward Front Of Engine
Courtesy of GENERAL MOTORS COMPANY

1. Slide the fuel rail (1) toward the front of the engine approximately 1 inch (25.4mm), in order to align the center injector bore.

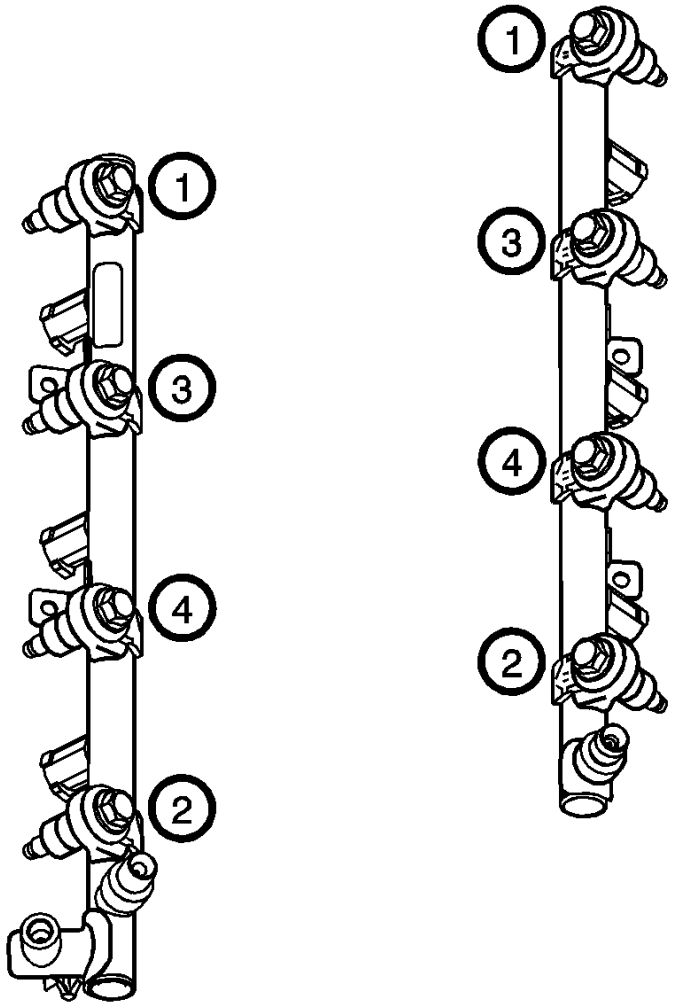

Fig. 104: Identifying Fuel Rail Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Hand tighten the two outer fuel rail fasteners to seat the injectors.
3. Start and hand tighten the remaining fuel rail fasteners.
4. Tighten the fuel rail fasteners in the sequence shown above:
    1. Tighten the Bank 1 fuel rail bolts first pass to 12 N.m (106 lb in).
    2. Tighten the Bank 1 fuel rail bolts a final pass to 23 N.m (17 lb ft).
5. Install the fuel feed intermediate pipe. Refer to **Fuel Feed Intermediate Pipe Replacement**.
6. Inspect for fuel leaks using the following procedure:
    1. Turn ON the ignition, with the engine OFF for 2 seconds.
    2. Turn OFF the ignition, for 10 seconds.
    3. Turn ON the ignition, with the engine OFF.
    4. Inspect for fuel leaks.
7. Install the fuel injection fuel rail noise shield to the fuel rails.

8. Install the intake manifold. Refer to **Intake Manifold Replacement** .
9. Install the fuel pipe shield. Refer to **Fuel Pipe Shield Replacement**.
10. Install the low side fuel pressure service port cap.
11. Install the fuel tank cap.

FUEL FEED INTERMEDIATE PIPE REPLACEMENT

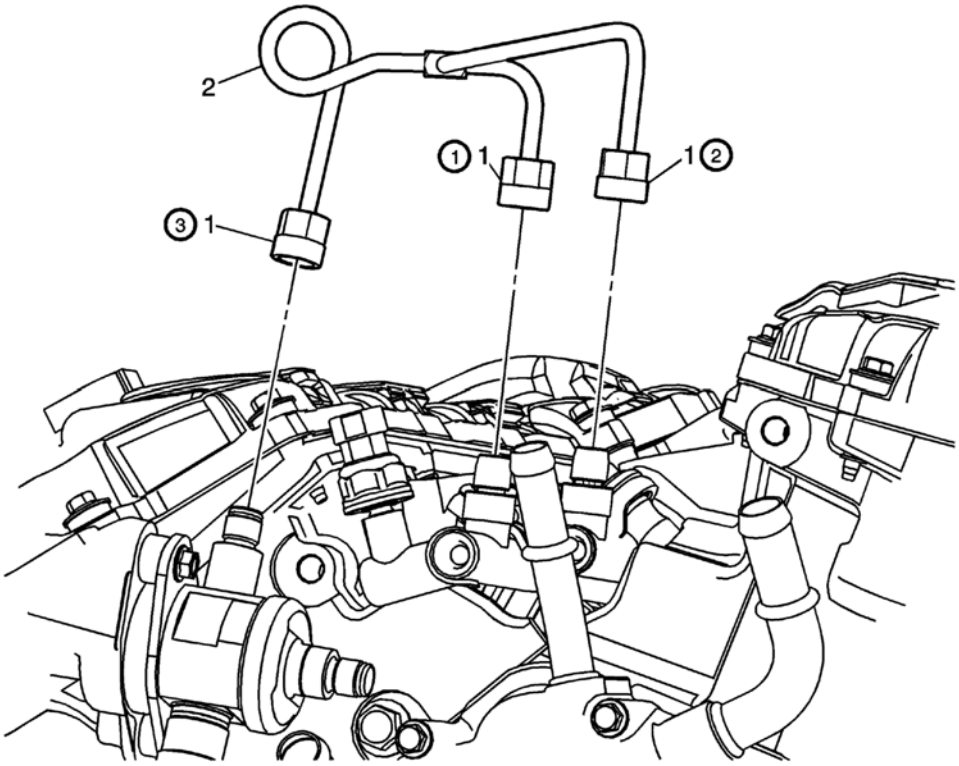

Fig. 105: View Of Fuel Feed Intermediate Pipe
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Relieve the fuel system pressure. Refer to **Fuel Pressure Relief (Without CH 48027)Fuel Pressure Relief (CH 48027)Fuel Pressure Relief (High Side)**. 2. Remove the intake manifold cover. Refer to **Intake Manifold Cover Replacement** . 3. Remove the fuel pipe shield. Refer to **Fuel Pipe Shield Replacement**.	
1	Fitting (Qty: 3) **CAUTION:** **Refer to Fastener Caution .**

Callout	Component Name
	NOTE: **Tighten the fittings in sequence as numbered:** **1, 2, 3** Tighten 20 (21 lb ft) Fuel Feed Intermediate Pipe **Procedure** 1. Discard the pipe when removed and install a NEW pipe. 2. Lubricate the pipes with silicon free engine oil. Refer to **Adhesives, Fluids, Lubricants, and Sealers** . 3. Pressure up the fuel system and check for leaks.
2	

FUEL PIPE SHIELD REPLACEMENT

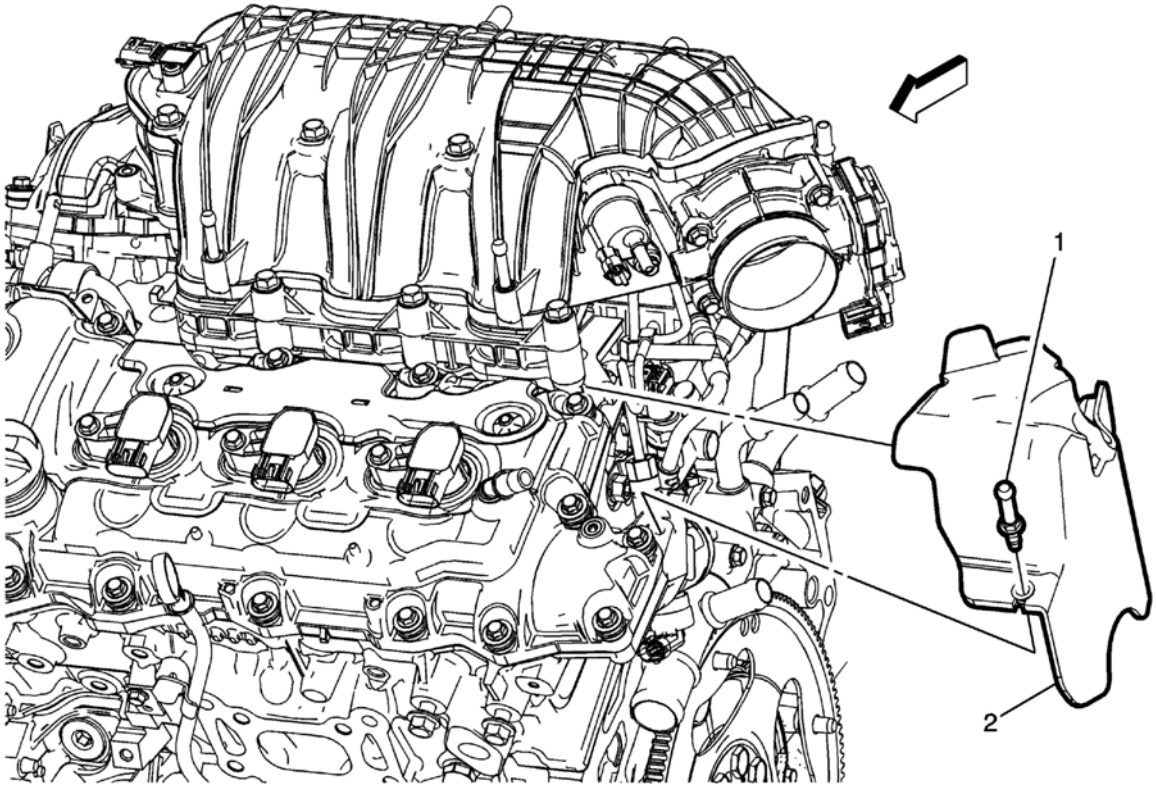

Fig. 106: Fuel Pipe Shield
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure **Remove the intake manifold cover. Refer to Intake Manifold Cover Replacement .**	
1	Bolt

Callout	Component Name
Preliminary Procedure **Remove the intake manifold cover. Refer to Intake Manifold Cover Replacement .**	
	CAUTION: **Refer to Fastener Caution .** Tighten 10 N.m (89 lb in)
2	Fuel Pipe Shield

FUEL PUMP REPLACEMENT

Special Tools

EN-48896 High Pressure Fuel Pump Installation Alignment Gauge

For equivalent regional tools, refer to **Special Tools (Diagnostic Tools)** **Special Tools (Repair Tools)** .

Removal Procedure

1. Relieve the low and high side fuel system pressure. Refer to **Fuel Pressure Relief (Without CH 48027)Fuel Pressure Relief (CH 48027)Fuel Pressure Relief (High Side)**.
2. Remove the thermostat housing. Refer to **Engine Coolant Thermostat Housing Replacement** .

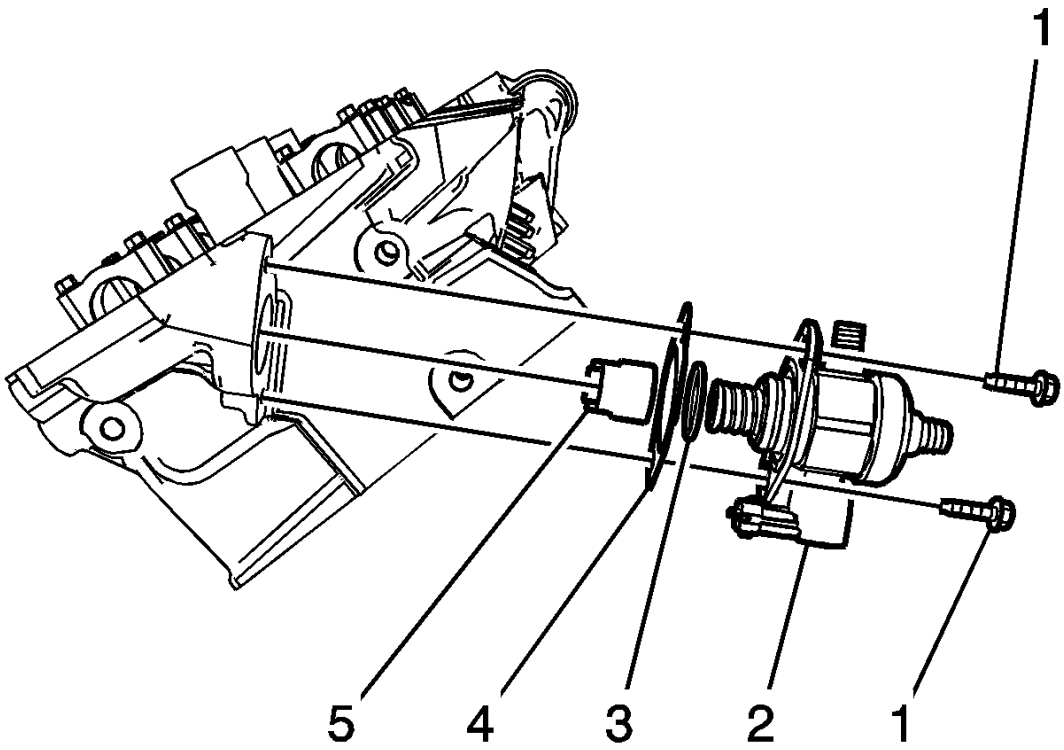

Fig. 107: Identifying High Pressure Fuel Pump Components
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the engine wiring harness electrical connector from the high pressure fuel pump.
4. Remove the low pressure feed pipe. Discard the pipe. Refer to **Fuel Feed Pipe Replacement**.
5. Remove the high pressure pipe. Discard the pipe. Refer to **Fuel Feed Intermediate Pipe Replacement**.

CAUTION: Alternately loosen the fuel pump bolts one turn at a time until the pump is fully disengaged from fuel pump lifter follower. Trying to remove the pump bolts without even side-to-side loosening may result in pump plunger damage

6. Remove and discard the high pressure fuel pump bolts (1).
7. Remove the high pressure fuel pump (2).
8. Remove and DISCARD the high pressure fuel pump O-ring (3).
9. Remove and DISCARD the high pressure fuel pump gasket (4).
10. Remove the high pressure fuel pump roller lifter (5).

Installation Procedure

NOTE: **The camshaft must be in the base circle position before the high pressure fuel pump is installed.**

1. Use the **EN-48896** alignment gauge to ensure that the camshaft lobe is in the base circle position. At base circle the tool will be flush with the head.
2. Lubricate the high pressure fuel pump cylinder head bore and roller lifter with camshaft prelube. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

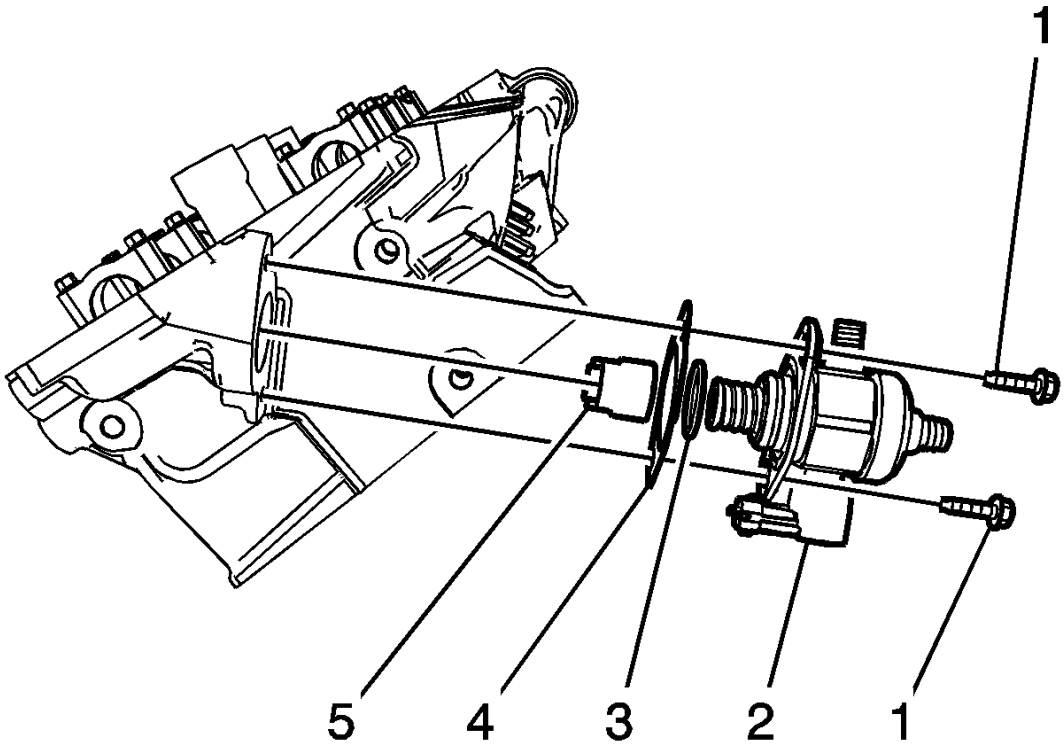

Fig. 108: Identifying High Pressure Fuel Pump Components
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The high pressure fuel pump gasket has a retaining feature to hold the pump retaining bolts in place.**

3. Install the high pressure fuel pump roller lifter (5).

NOTE: **Lubricate the NEW O-ring seals with clean engine oil.**

4. Install a NEW high pressure fuel pump O-ring (3).
5. Position the NEW high pressure fuel pump gasket (4) and bolts (1) to the fuel pump.

CAUTION: **Alternately hand-tighten the fuel pump bolts one turn at a time until the pump is fully seated. Trying to draw down the pump without even side-to-side tightening may result in pump plunger damage.**

6. Install the high pressure fuel pump (2). Force will be required while hand tightening the bolts.

CAUTION: **Refer to Fastener Caution .**

7. Tighten the high pressure fuel pump retaining bolts to 15 (11 lb ft).
8. Ensure the high pressure fuel pump and fuel rail fittings are clean prior to assembly.
9. Install a NEW high pressure fuel pipe. Refer to **Fuel Feed Intermediate Pipe Replacement**.
10. Install a NEW fuel feed pipe to the high pressure fuel pump. Refer to **Fuel Feed Pipe Replacement**.
11. Connect the high pressure fuel pump wiring harness.
12. Install the thermostat housing. Refer to **Engine Coolant Thermostat Housing Replacement** .
13. Install the fuel tank cap.

NOTE: **If a fuel leak occurs at the fuel rail, the fuel rail will need to be replaced.**

14. Inspect for leaks using the following procedure:
    1. Turn ON the ignition, with the engine OFF for 2 seconds.
    2. Turn OFF the ignition, for 10 seconds.
    3. Turn ON the ignition, with the engine OFF.
    4. Inspect for fuel leaks.
15. Install the pressure relief cap to the fuel feed pipe.

FUEL INJECTOR REPLACEMENT

Removal Procedure

1. Relieve the high side fuel system pressure. Refer to **Fuel Pressure Relief (Without CH 48027)Fuel Pressure Relief (CH 48027)Fuel Pressure Relief (High Side)**.

NOTE: **The fuel injectors have an alignment feature, note the position of the injectors alignment for installation.**

2. Remove the fuel injection fuel rail assembly. Refer to **Fuel Injection Fuel Rail Assembly Replacement - Bank 1**, or **Fuel Injection Fuel Rail Assembly Replacement - Bank 2**.
3. For removal of the fuel injectors, refer to **Fuel Rail and Injectors Cleaning and Inspection (LF1, LFW or LFX)** .

Installation Procedure

1. Prepare the fuel injectors for assembly, refer to **Fuel Rail and Injectors Cleaning and Inspection (LF1, LFW or LFX)** .

NOTE: **The fuel injectors have an alignment feature and must be reinstalled as**

noted during removal.

2. Install the fuel injection fuel rail assembly. Refer to **Fuel Injection Fuel Rail Assembly Replacement - Bank 1**, or **Fuel Injection Fuel Rail Assembly Replacement - Bank 2**.
3. Pressurize the fuel system and check for leaks.

EVAPORATIVE EMISSION CANISTER PURGE SOLENOID VALVE REPLACEMENT

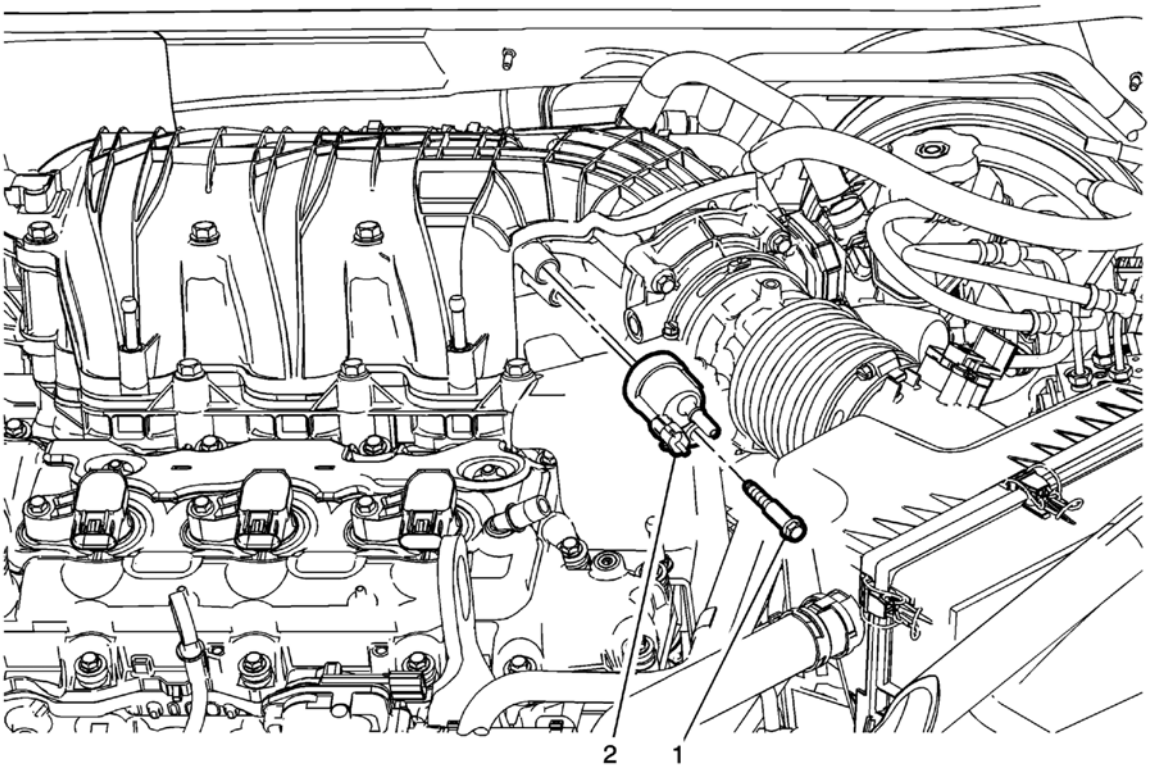

Fig. 109: Evaporative Emission Canister Purge Solenoid Valve
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the intake manifold cover. Refer to **Intake Manifold Cover Replacement** . 2. Disconnect the electrical connector. 3. Disconnect the chassis EVAP pipe from the EVAP canister purge solenoid. Refer to **Plastic Collar Quick Connect Fitting Service**	
1	Evaporative Emission Canister Purge Valve Bolt. **CAUTION:** **Refer to Fastener Caution .**

Callout	Component Name
	Tighten 16 N.m(12 lb ft)
2	Evaporative Emission Canister Purge Valve.

EVAPORATIVE EMISSION CANISTER VENT SOLENOID VALVE REPLACEMENT

Removal Procedure

NOTE: **Clean the evaporative emission (EVAP) connections and surrounding areas prior to disconnecting the line in order the avoid possible system contamination.**

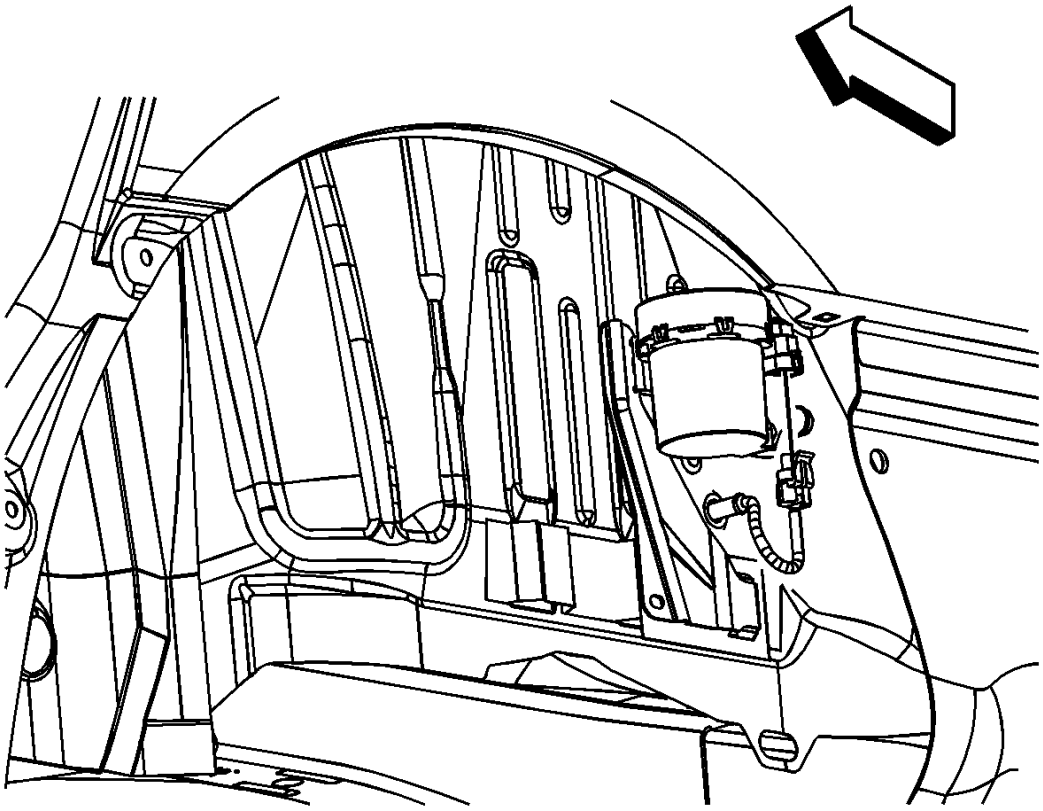

Fig. 110: EVAP Canister Vent Solenoid Valve Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Disconnect the EVAP canister vent solenoid valve electrical connector.

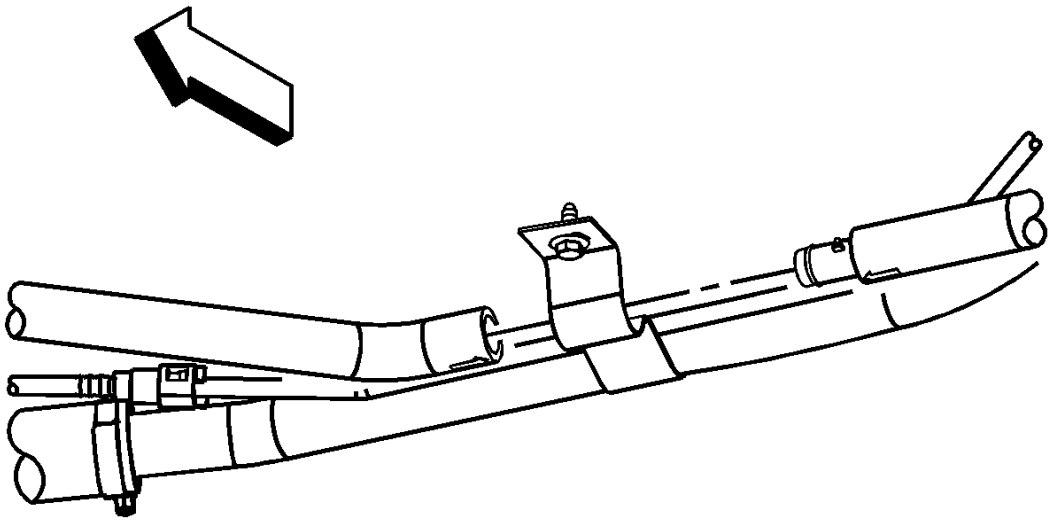

Fig. 111: EVAP Canister Vent Solenoid Valve And EVAP Emission Canister Hose
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the EVAP canister vent solenoid valve from the EVAP emission canister hose.

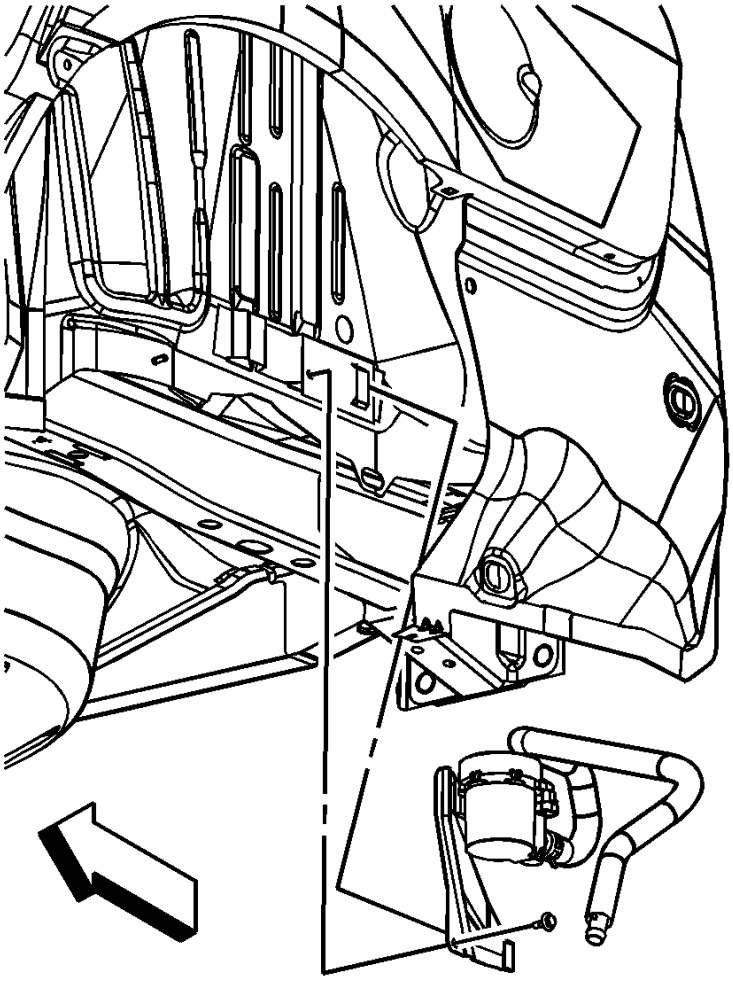

Fig. 112: Installing/Removing The EVAP Canister Vent Solenoid Valve Bracket Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Remove the EVAP canister vent solenoid valve bracket bolt.
5. Remove the EVAP canister vent solenoid valve.

Installation Procedure

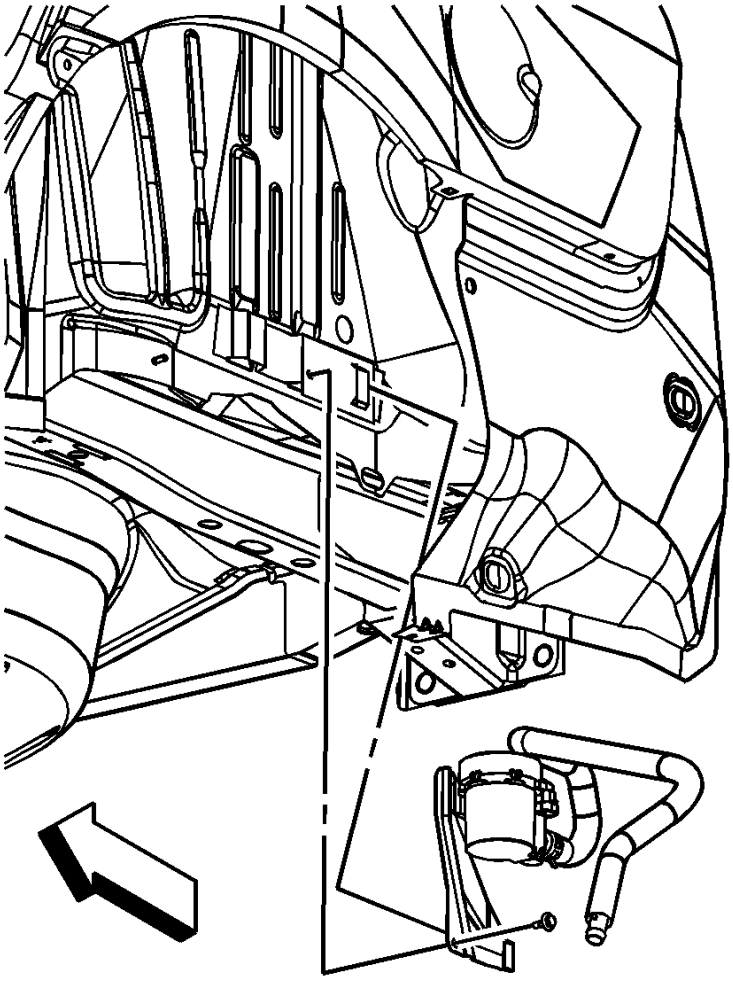

Fig. 113: Installing/Removing The EVAP Canister Vent Solenoid Valve Bracket Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Install the EVAP canister vent solenoid valve.

CAUTION: Refer to Fastener Caution .

2. Install the EVAP canister vent solenoid valve bracket bolt.

Tighten

Tighten the bolt to 10 N.m (89 lb in).

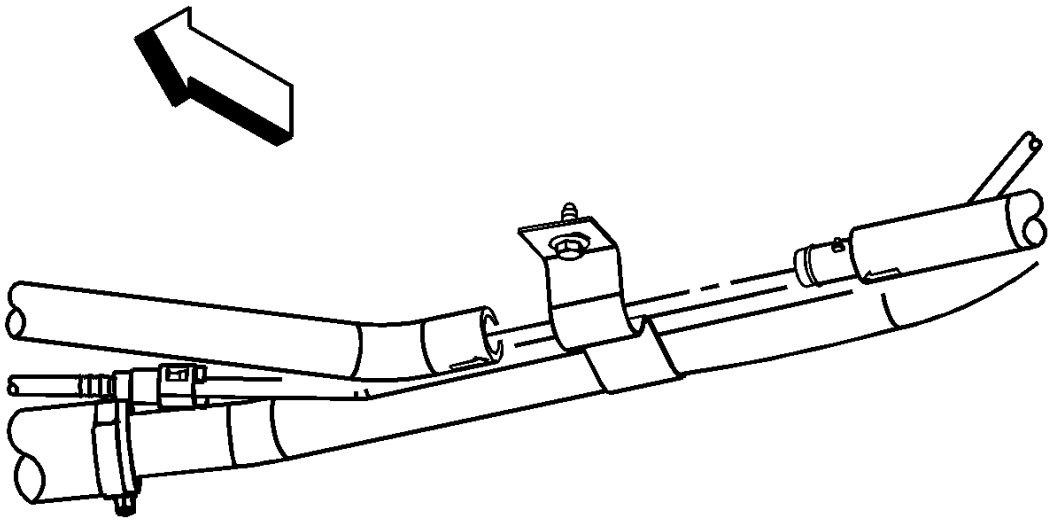

Fig. 114: EVAP Canister Vent Solenoid Valve And EVAP Emission Canister Hose
Courtesy of GENERAL MOTORS COMPANY

3. Connect the EVAP canister vent solenoid valve to the EVAP emission canister hose.

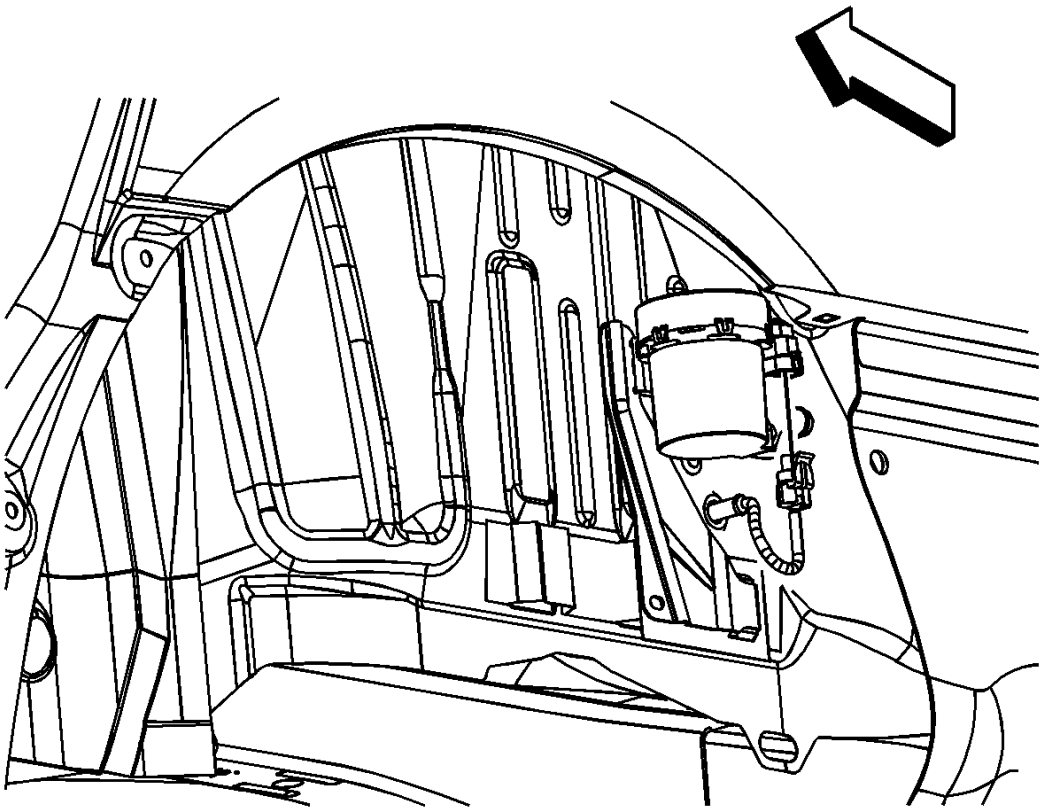

Fig. 115: EVAP Canister Vent Solenoid Valve Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

4. Connect the EVAP canister vent solenoid valve electrical connector.
5. Lower the vehicle.

EVAPORATIVE EMISSION CANISTER PURGE PIPE REPLACEMENT

Removal Procedure

1. Install the engine support fixture. Refer to **Engine Support Fixture** .
2. Relieve the fuel system pressure. Refer to **Fuel Pressure Relief (Without CH 48027)Fuel Pressure Relief (CH 48027)Fuel Pressure Relief (High Side)**

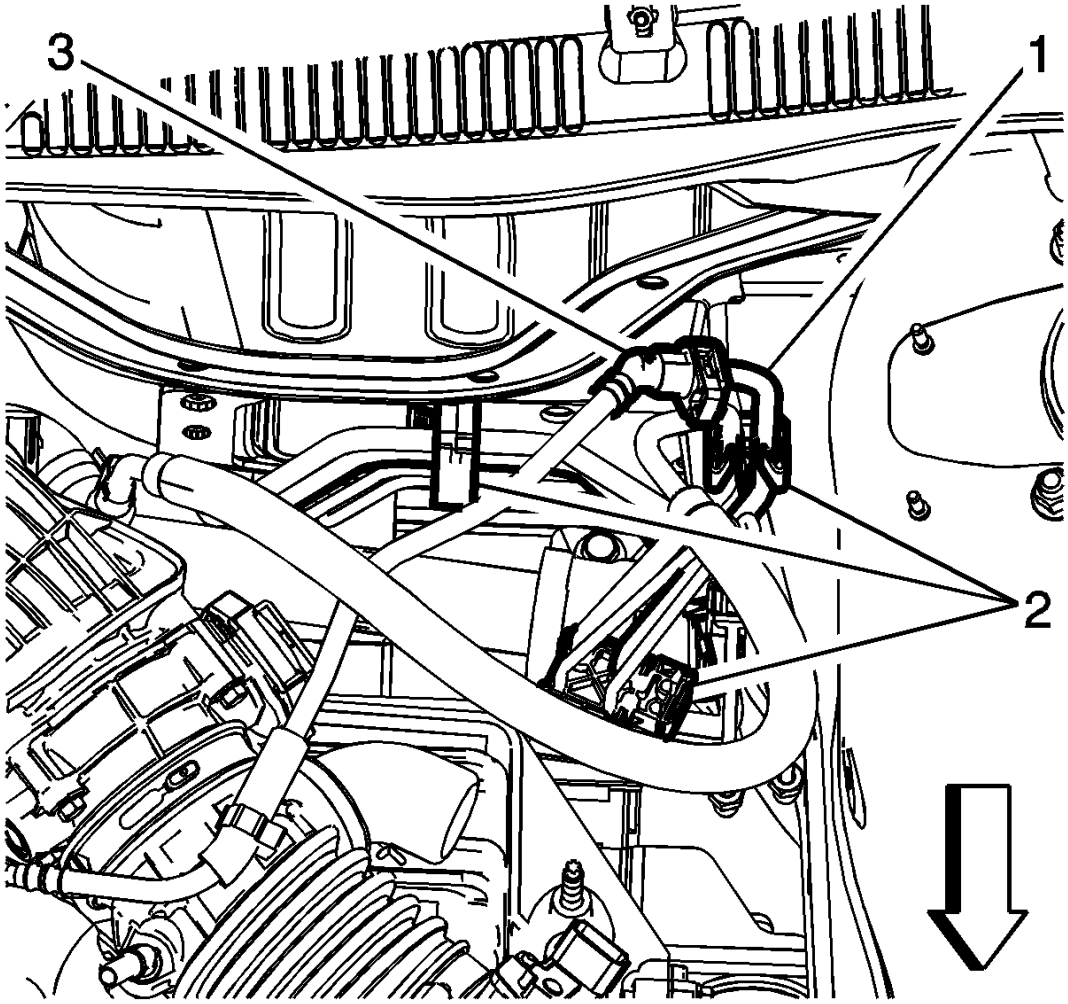

Fig. 116: Evaporative Emission Pipe And Retainers
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the evaporative emission pipe from the evaporative emission canister vent front pipe (3). Refer to **Plastic Collar Quick Connect Fitting Service**
4. Disconnect the evaporative emission pipe (1) from the retainers (2).
5. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
6. Lower the frame. Refer to **Frame Replacement**
7. Remove the fuel feed rear pipe. Refer to **Fuel Feed Rear Pipe Replacement**
8. Remove the evaporative emission pipe rear frame retaining bracket bolt.
9. Remove the evaporative emission pipe middle frame retaining bracket bolt.
10. Remove the evaporative emission pipe middle frame retaining press in pin.
11. Remove the evaporative emission pipe front retaining bracket bolt.

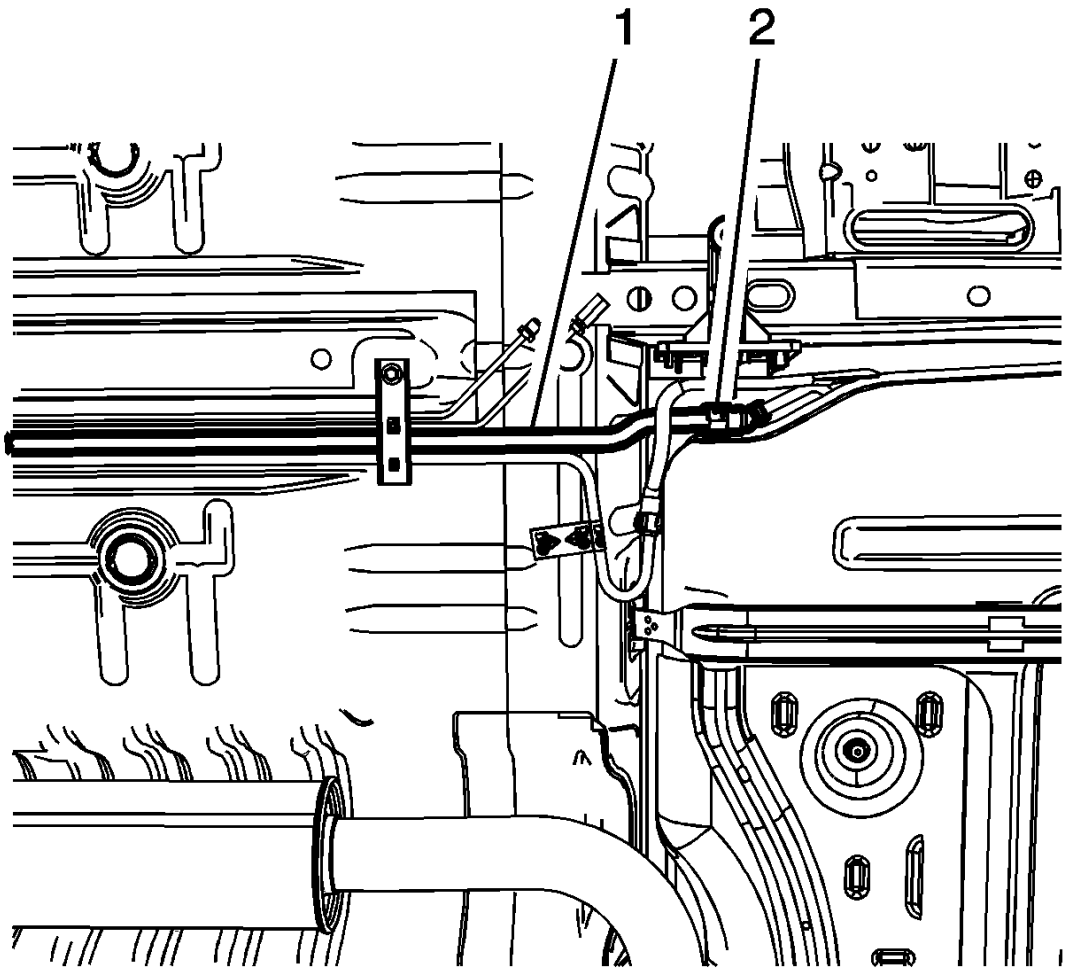

Fig. 117: Evaporative Emission Pipe And Evaporative Emission Purge Pipe
Courtesy of GENERAL MOTORS COMPANY

12. Remove the evaporative emission pipe (1) from the evaporative emission purge pipe (2) that goes to the EVAP canister.

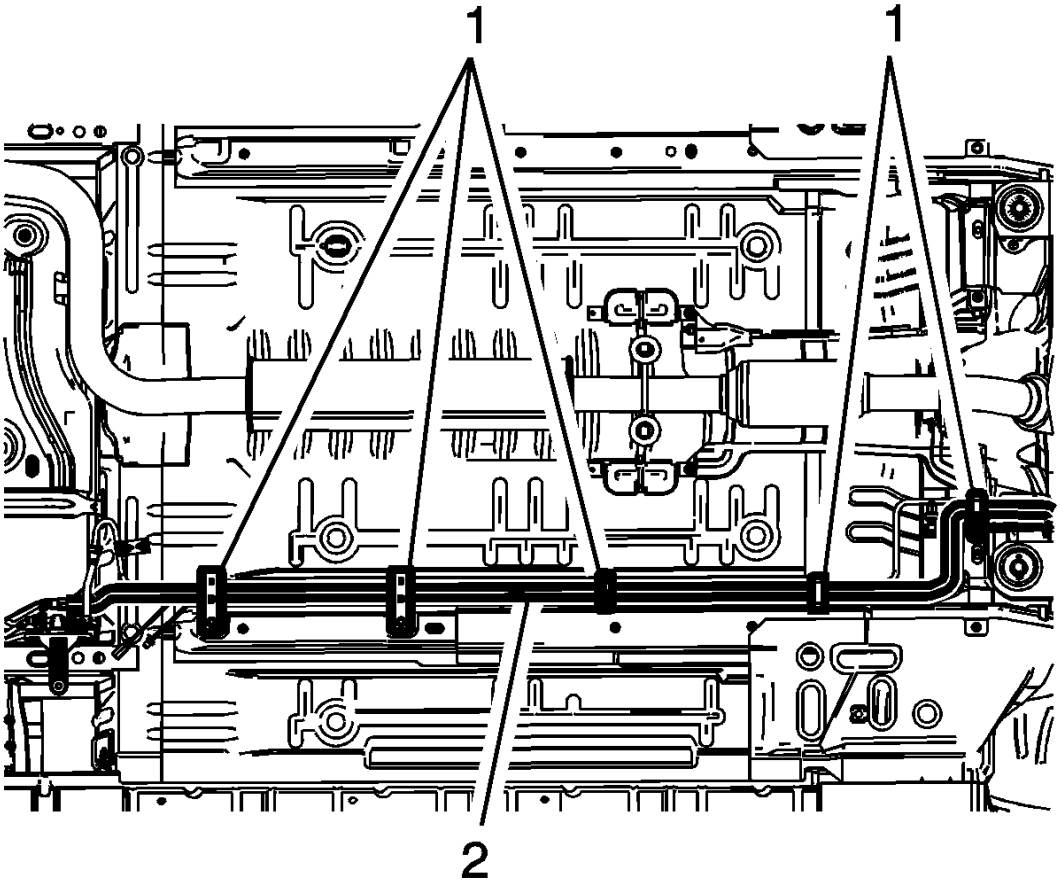

Fig. 118: Evaporative Emission Pipe And Retainers
Courtesy of GENERAL MOTORS COMPANY

13. Disconnect the evaporative emission pipe (1) from the retainers (2). Refer to **Plastic Collar Quick Connect Fitting Service**
14. Remove the evaporative emission pipe from the vehicle.

Installation Procedure

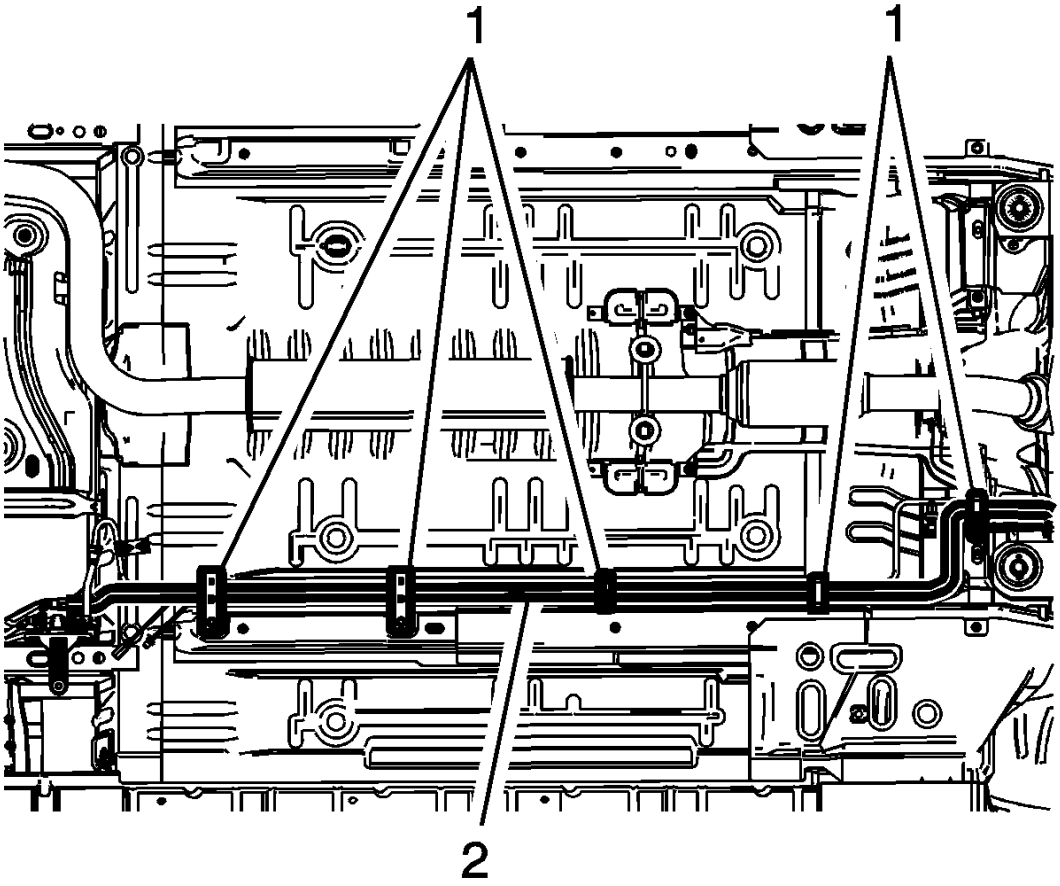

Fig. 119: Evaporative Emission Pipe And Retainers
Courtesy of GENERAL MOTORS COMPANY

1. Install the evaporative emission pipe to the vehicle
2. Connect the evaporative emission pipe (1) from the retainers (2). Refer to **Plastic Collar Quick Connect Fitting Service**.

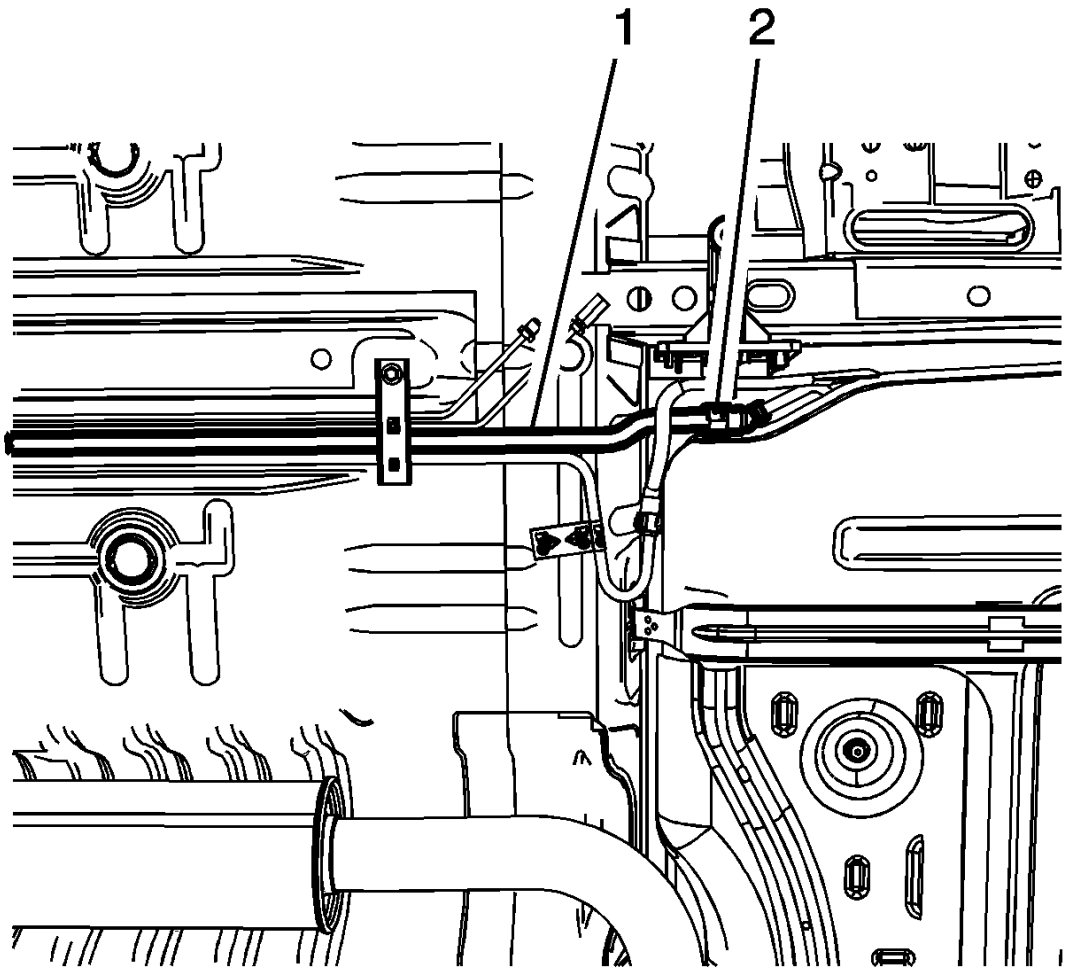

Fig. 120: Evaporative Emission Pipe And Evaporative Emission Purge Pipe
Courtesy of GENERAL MOTORS COMPANY

3. Install the evaporative emission pipe (1) to the evaporative emission purge pipe (2) that goes to the EVAP canister.
4. Install the evaporative emission pipe front retaining bracket bolt.
5. Install the evaporative emission pipe middle frame retaining press in pin.
6. Install the evaporative emission pipe middle frame retaining bracket bolt.
7. Install the evaporative emission pipe rear frame retaining bracket bolt.
8. Install the fuel feed rear pipe. Refer to **Fuel Feed Rear Pipe Replacement**
9. Raise the frame. Refer to **Frame Replacement**
10. Lower the vehicle.

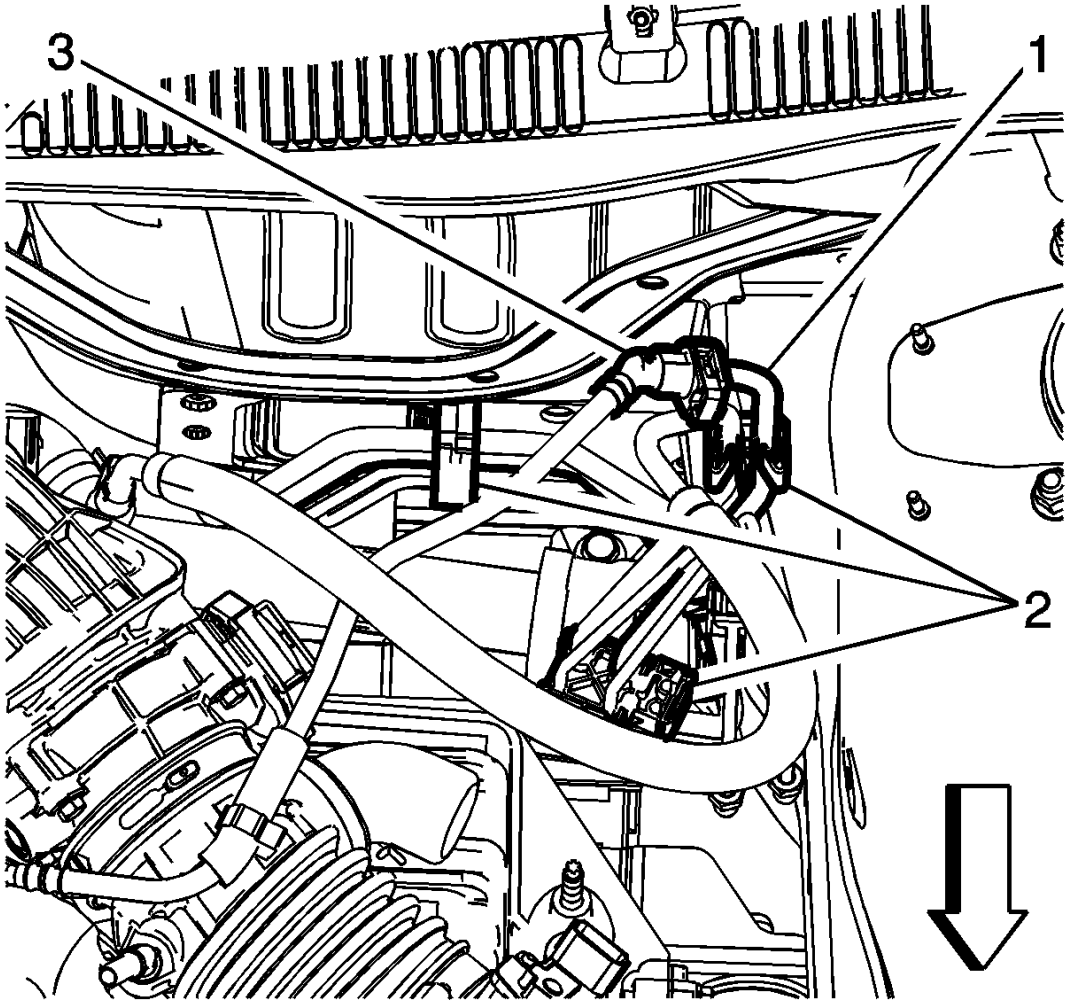

Fig. 121: Evaporative Emission Pipe And Retainers
Courtesy of GENERAL MOTORS COMPANY

11. Connect the evaporative emission pipe to the evaporative emission canister vent front pipe (3). Refer to **Plastic Collar Quick Connect Fitting Service**
12. Connect the evaporative emission pipe (1) from the retainers (2). Refer to **Plastic Collar Quick Connect Fitting Service**.

EVAPORATIVE EMISSION CANISTER VENT FRONT PIPE REPLACEMENT

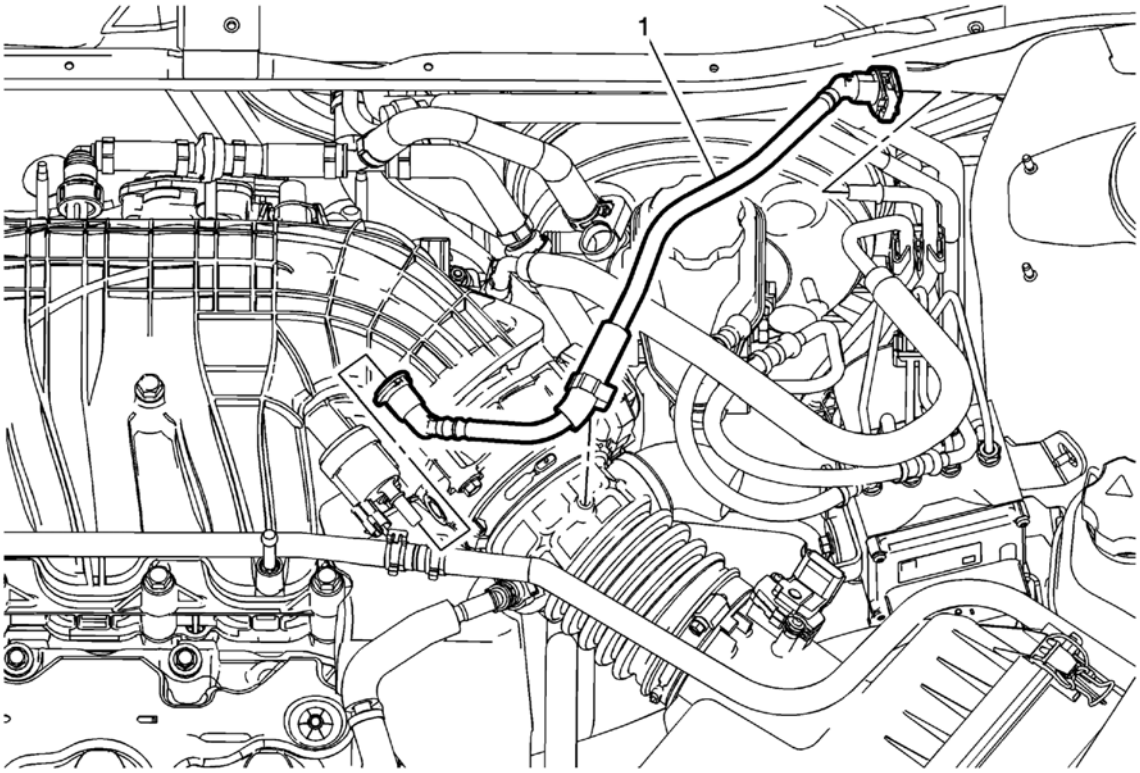

Fig. 122: Evaporative Emission Canister Vent Front Pipe
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the intake manifold cover. Refer to **Intake Manifold Cover Replacement** .	
1	Evaporative Emission Canister Vent Front Pipe. **Procedure** Disconnect the EVAP pipe from the EVAP canister purge valve and the EVAP pipe. Refer to **Plastic Collar Quick Connect Fitting Service**

EVAPORATIVE EMISSION CANISTER REPLACEMENT

Removal Procedure

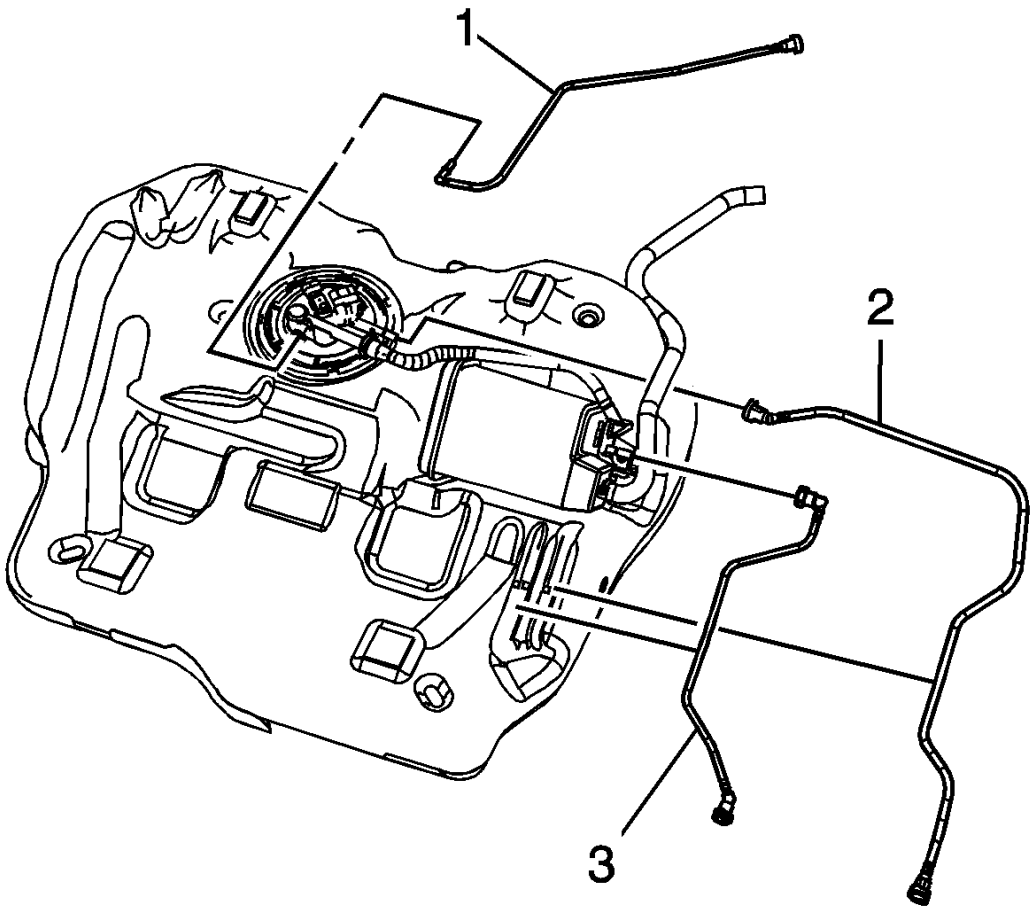

Fig. 123: View Of Fuel Tank Lines
Courtesy of GENERAL MOTORS COMPANY

1. Remove the fuel tank. Refer to **Fuel Tank Replacement**.
2. Disconnect the evaporative emission (EVAP) line (3) from the canister. Refer to **Plastic Collar Quick Connect Fitting Service**.

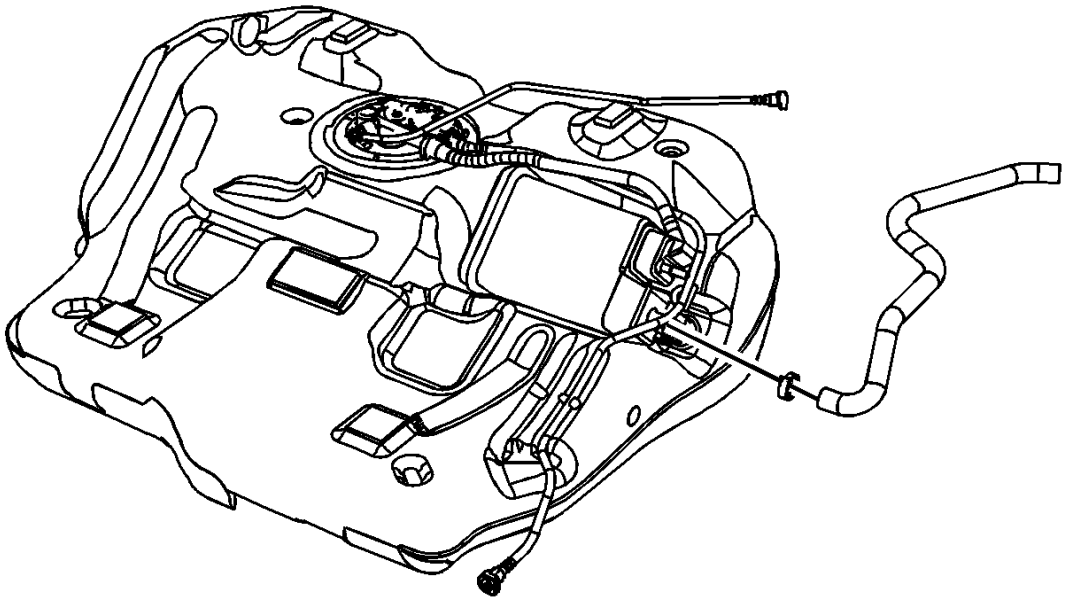

Fig. 124: EVAP Canister Hose
Courtesy of GENERAL MOTORS COMPANY

3. Reposition the EVAP canister hose clamp.
4. Remove the EVAP canister hose.

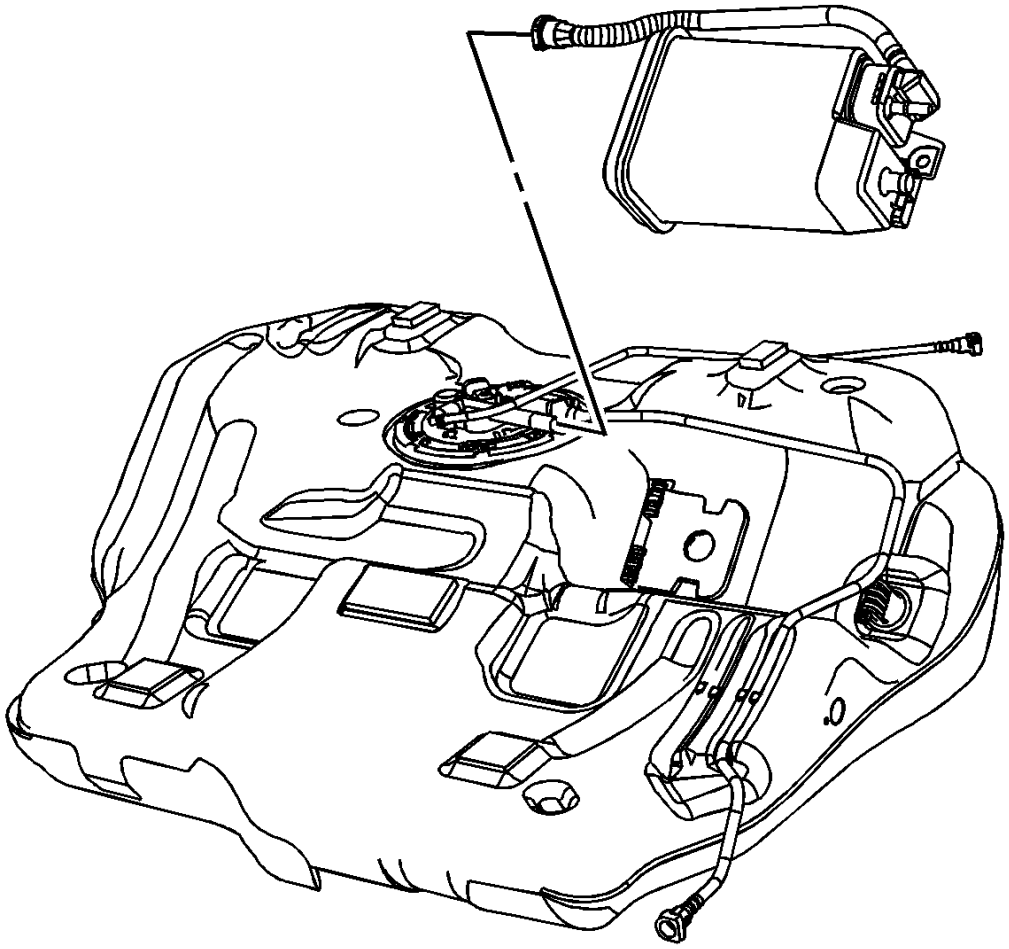

Fig. 125: EVAP Canister & Fuel Tank
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect the canister EVAP line from the fuel sender. Refer to **Plastic Collar Quick Connect Fitting Service**.
6. Squeeze the small retainer in front of the canister in order to disengage the canister.
7. Remove the EVAP canister.

Installation Procedure

CAUTION:

- **Do not attempt to straighten kinked nylon pipes. Replace any kinked nylon pipes in order to prevent damage to the vehicle.**
- **Do not attempt to repair sections of nylon pipes. Replace damaged nylon pipes.**
- **Replace the vapor pipes with original equipment or parts that meet GM specifications.**
- **Replace the vapor hoses with original equipment or parts meeting GM specifications. Use only reinforced fuel-resistant hose identified with the word Fluoroelastomer or GM 6163M on the hose.**

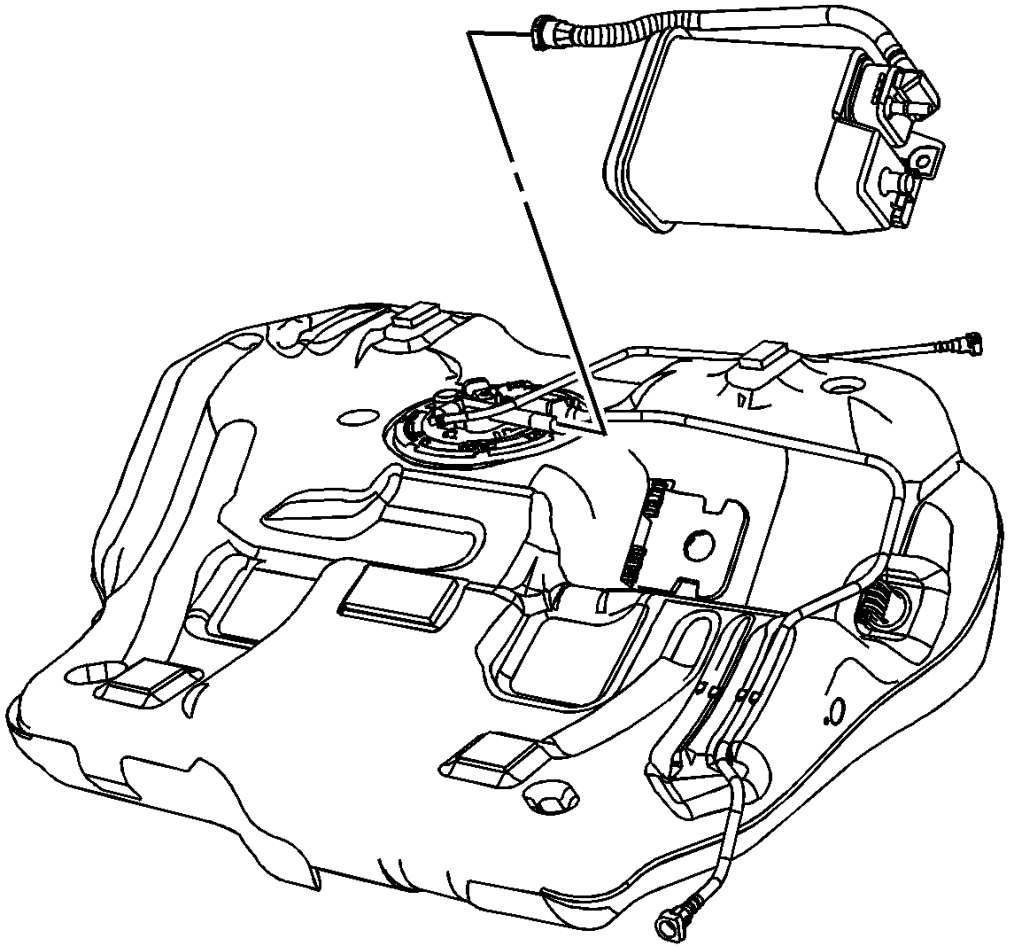

Fig. 126: EVAP Canister & Fuel Tank
Courtesy of GENERAL MOTORS COMPANY

1. Install the EVAP canister.
2. Squeeze the small retainer in front of the canister in order to engage the canister.
3. Connect the canister EVAP line to the fuel sender. Refer to **Plastic Collar Quick Connect Fitting Service**.

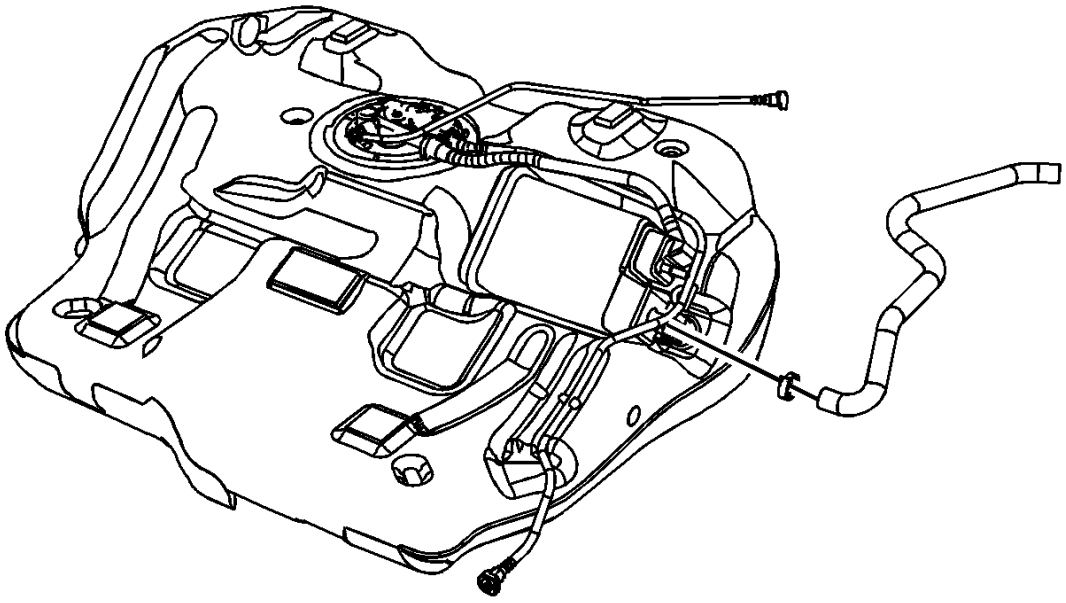

Fig. 127: EVAP Canister Hose
Courtesy of GENERAL MOTORS COMPANY

4. Install the EVAP canister hose.
5. Position the EVAP canister hose clamp.

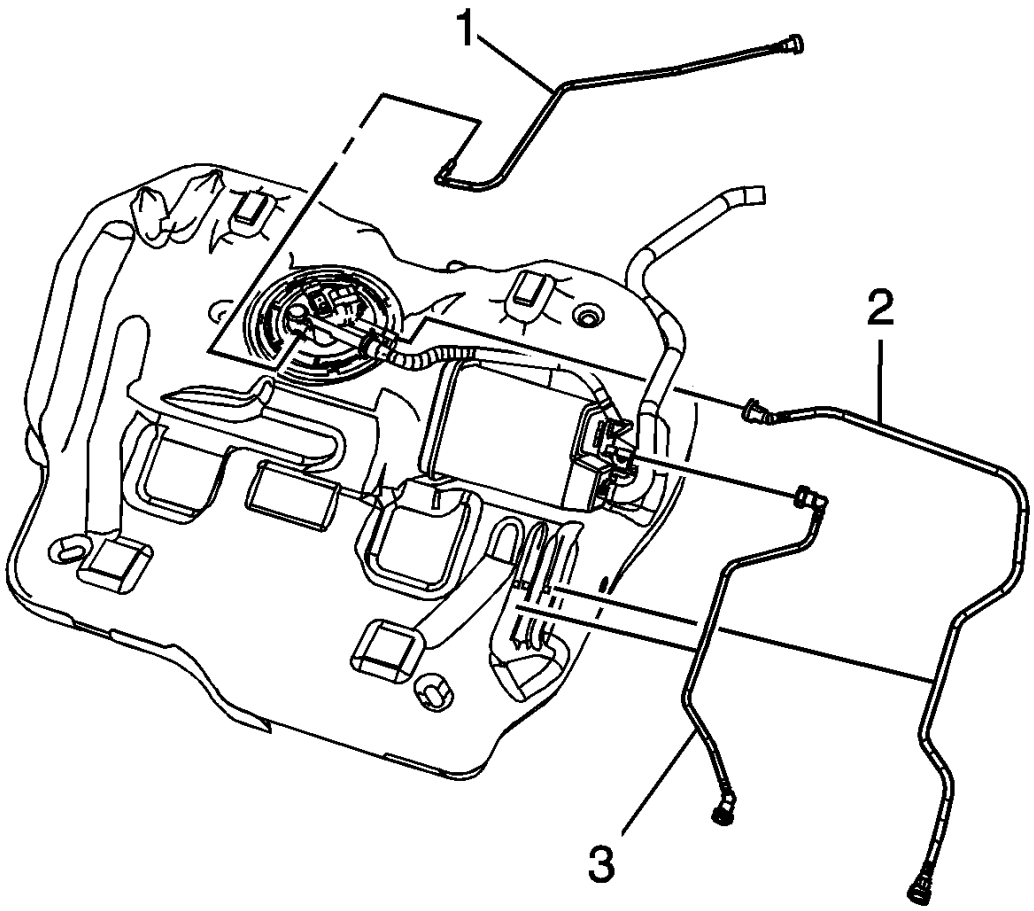

Fig. 128: View Of Fuel Tank Lines
Courtesy of GENERAL MOTORS COMPANY

6. Connect the EVAP line (3) to the canister. Refer to **Plastic Collar Quick Connect Fitting Service**.
7. Install the fuel tank. Refer to **Fuel Tank Replacement**.

EVAPORATIVE EMISSION SYSTEM CLEANING

Tools Required

J 41413-200 EVAP Pressure/Purge Diagnostic Station

Inspection Procedure

IMPORTANT: Do not perform this procedure unless instructed by an evaporative emission (EVAP) diagnostic.

1. Turn OFF the ignition.
2. Remove the EVAP canister purge solenoid. Refer to **Evaporative Emission Canister Purge Solenoid Valve Replacement**.
3. Lightly tap the EVAP canister purge valve on a clean hard surface.

4. Inspect for carbon particles exiting either of the vacuum ports.
    - If no carbon particles are found reinstall the EVAP canister purge solenoid and continue with the EVAP cleaning procedure. Refer to **Evaporative Emission Canister Purge Solenoid Valve Replacement**.
    - If carbon particles are found during the inspection procedure, replace the EVAP canister purge solenoid and continue with the EVAP cleaning procedure. Refer to **Evaporative Emission Canister Purge Solenoid Valve Replacement**.
    - If you were instructed to replace the EVAP canister purge solenoid, and no carbon particles are found, return to the EVAP diagnostic procedure. Do not perform the EVAP cleaning procedure.

EVAP Cleaning Procedure

1. Remove the EVAP canister. Refer to **Evaporative Emission Canister Replacement**.
2. Turn OFF the main valve on **J 41413-200** EVAP Pressure/Purge Diagnostic Station.
3. Disconnect the hose from the diagnostic station pressure regulator.
4. Using a section of vacuum hose, connect one end to the diagnostic station pressure regulator.
5. Connect the other end of the vacuum hose to the canister side of the purge pipe.
6. Turn ON the main nitrogen cylinder valve and continue to discharge nitrogen for 15 seconds.
7. If the nitrogen does not dislodge the carbon particles, replace the purge pipe.
8. Return the EVAP pressure/purge diagnostic station to the stations original condition.
9. Install a new EVAP canister. Refer to **Evaporative Emission Canister Replacement**.
10. Connect all previously disconnected EVAP pipe connectors.
11. Lower the vehicle.
12. Continue with the published service manual diagnostic DTC procedure.

IGNITION COIL REPLACEMENT - BANK 1

Removal Procedure

1. Remove the intake manifold. Refer to **Intake Manifold Replacement** .

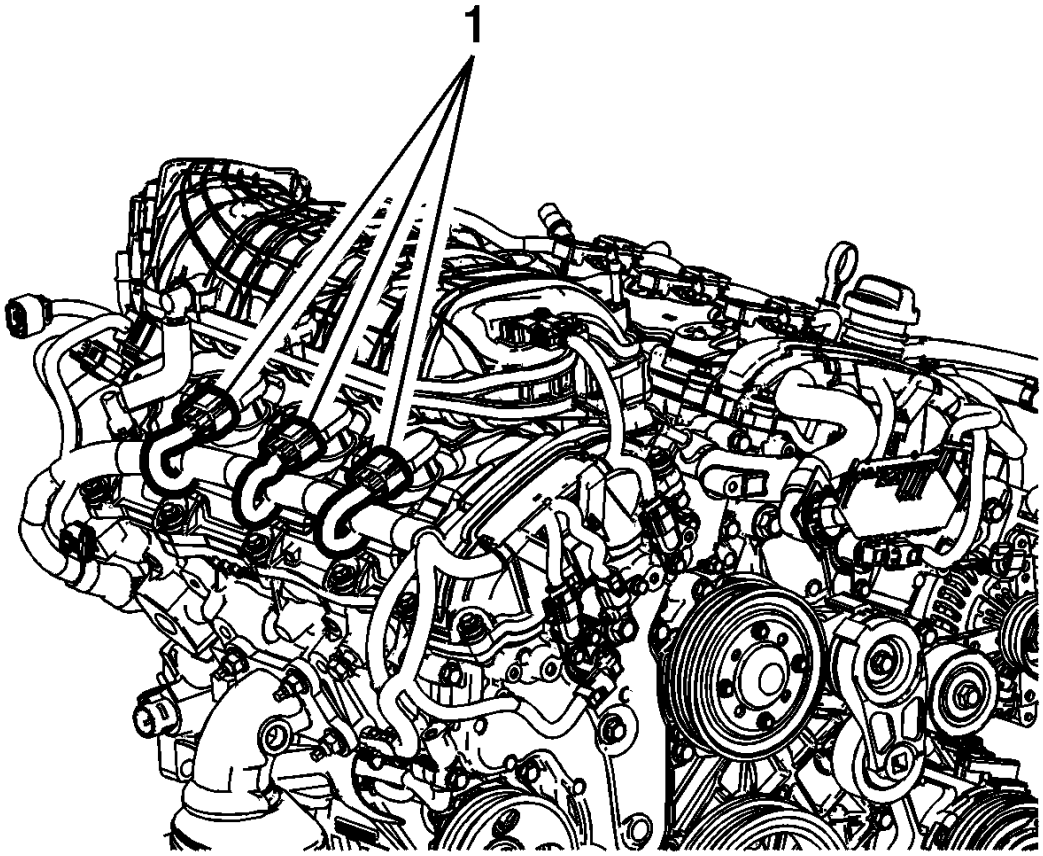

Fig. 129: Engine Wiring Harness Electrical Connectors
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the engine wiring harness electrical connector(s) (1) from the ignition coil(s).

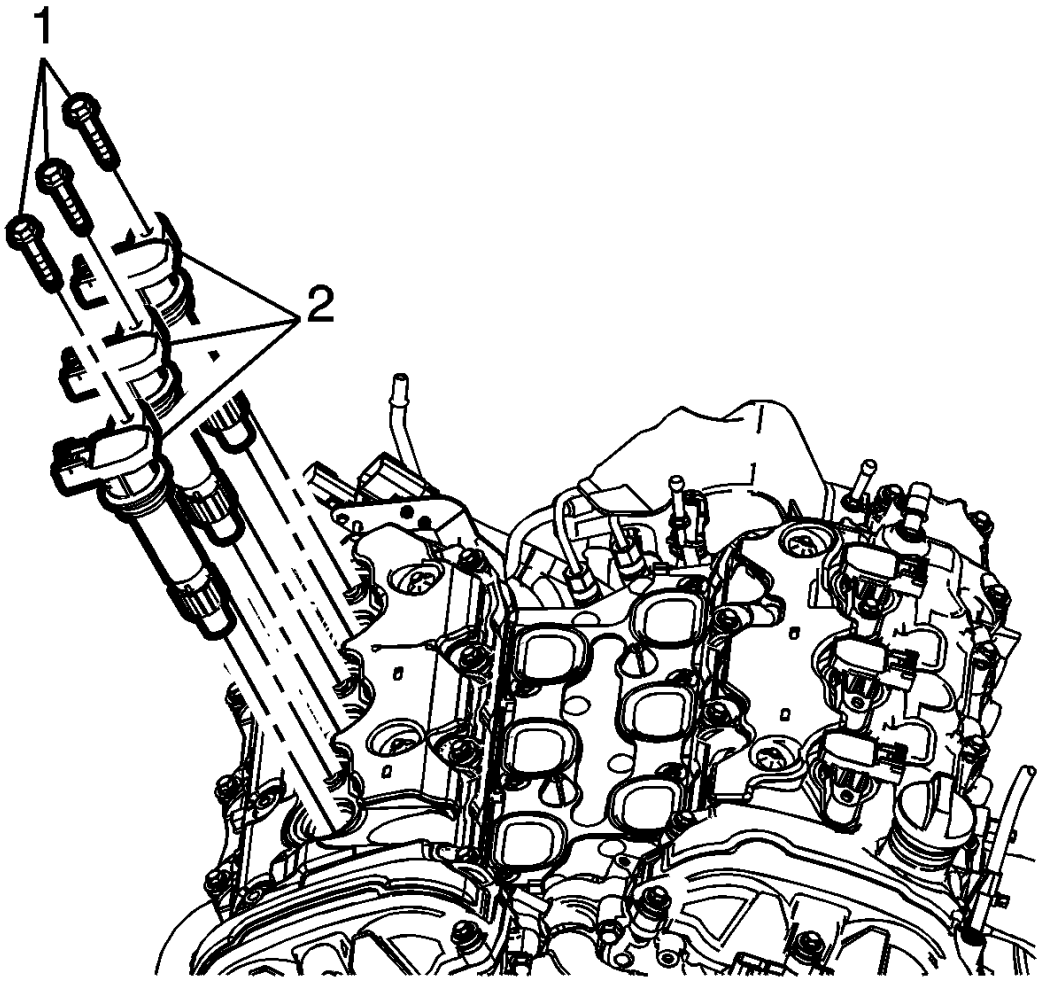

Fig. 130: Ignition Coils And Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Remove the ignition coil bolt(s) (1).
4. Remove the ignition coil(s) (2).

Installation Procedure

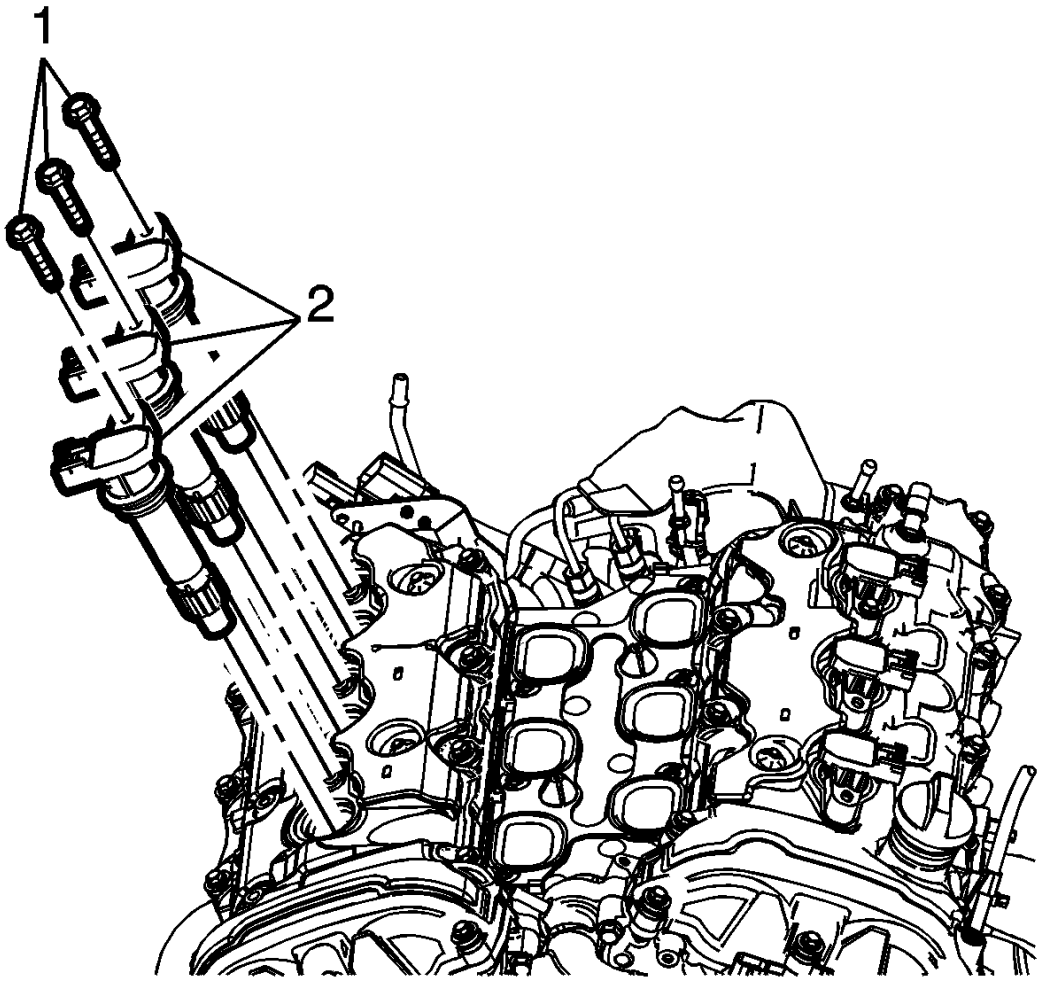

Fig. 131: Ignition Coils And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the ignition coil(s) (2).

CAUTION: Refer to Fastener Caution .

2. Install the ignition coil bolt(s) (1)and tighten to 10 N.m (89 lb in).

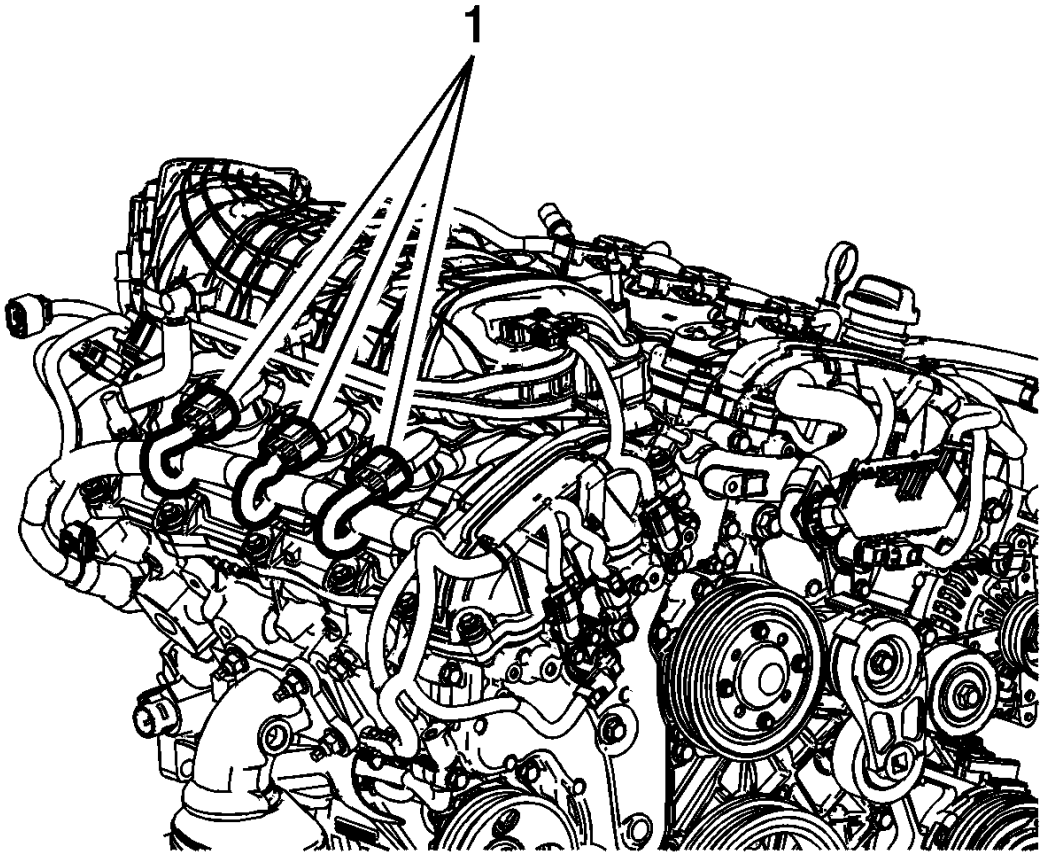

Fig. 132: Engine Wiring Harness Electrical Connectors
Courtesy of GENERAL MOTORS COMPANY

3. Connect the engine wiring harness electrical connector(s) (1) to the ignition coil(s).
4. Install the intake manifold. Refer to **Intake Manifold Replacement** .

IGNITION COIL REPLACEMENT - BANK 2

Removal Procedure

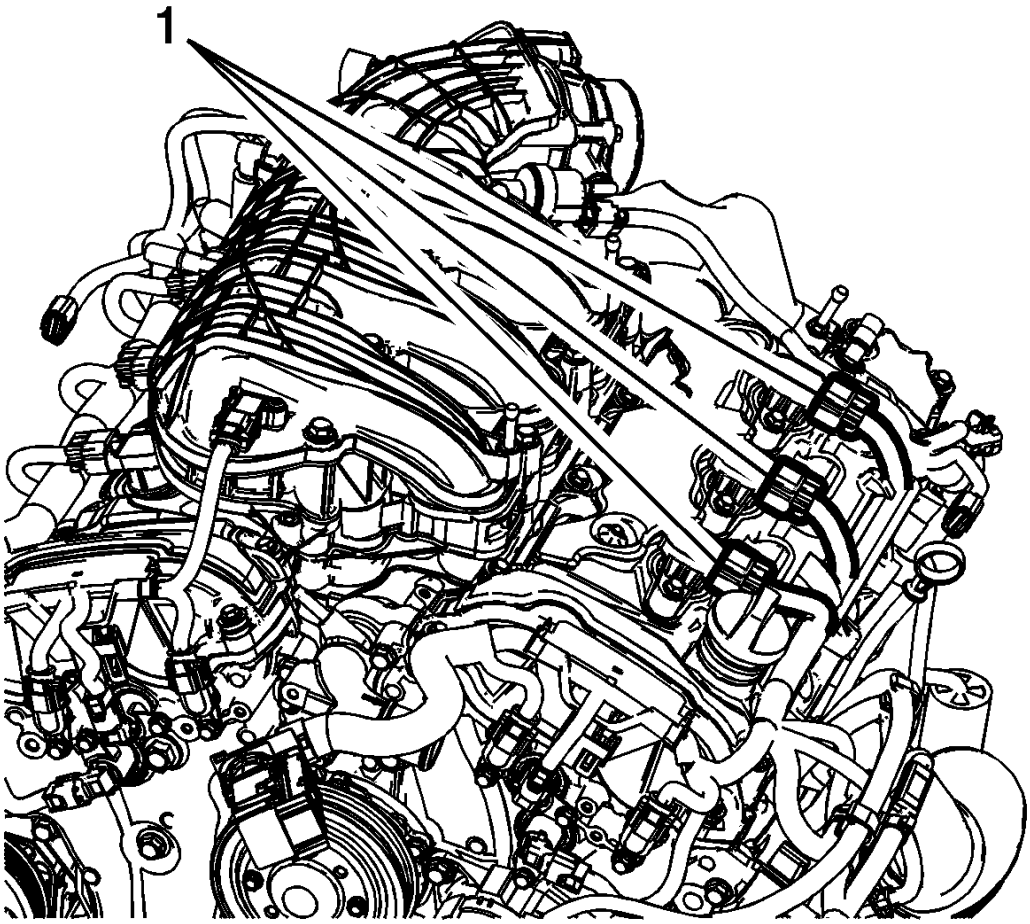

Fig. 133: Engine Wiring Harness Electrical Connectors
Courtesy of GENERAL MOTORS COMPANY

1. Remove the intake manifold cover. Refer to **Intake Manifold Cover Replacement** .
2. Disconnect the engine wiring harness electrical connector(s) (1) from the ignition coil(s).

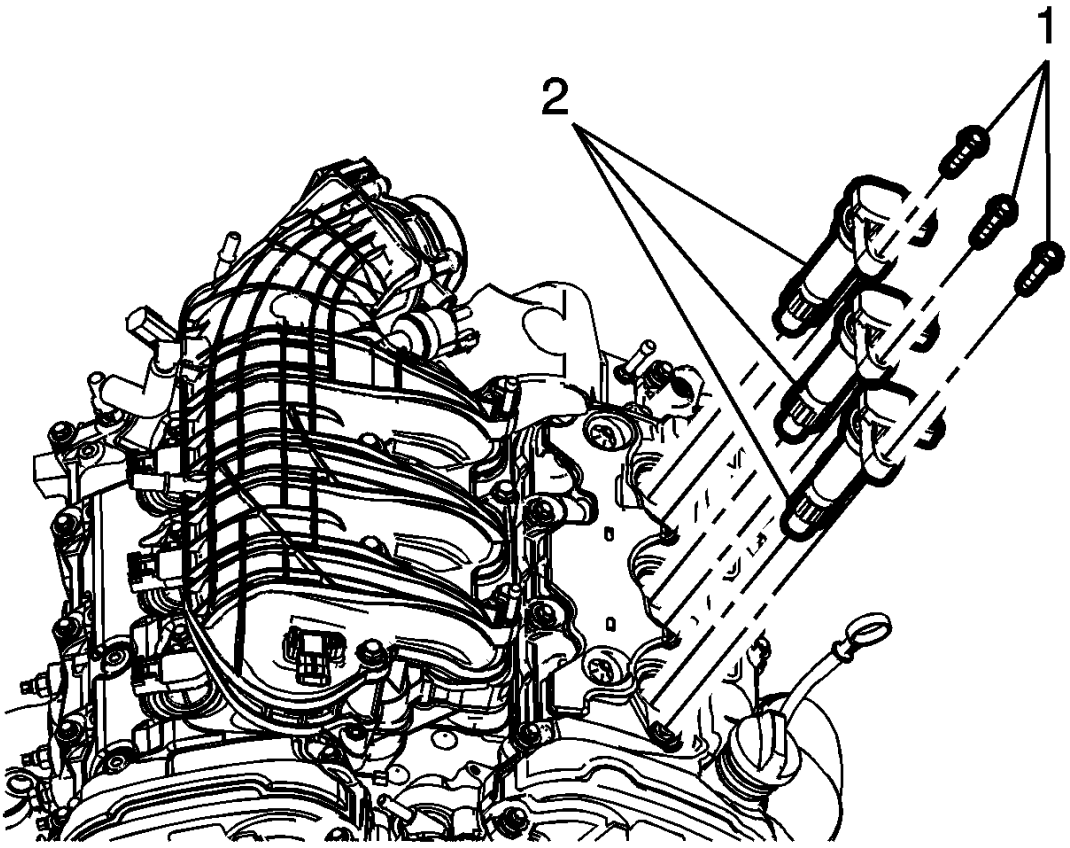

Fig. 134: Ignition Coils And Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Remove the ignition coil bolt(s) (1).
4. Remove the ignition coil(s) (2).

Installation Procedure

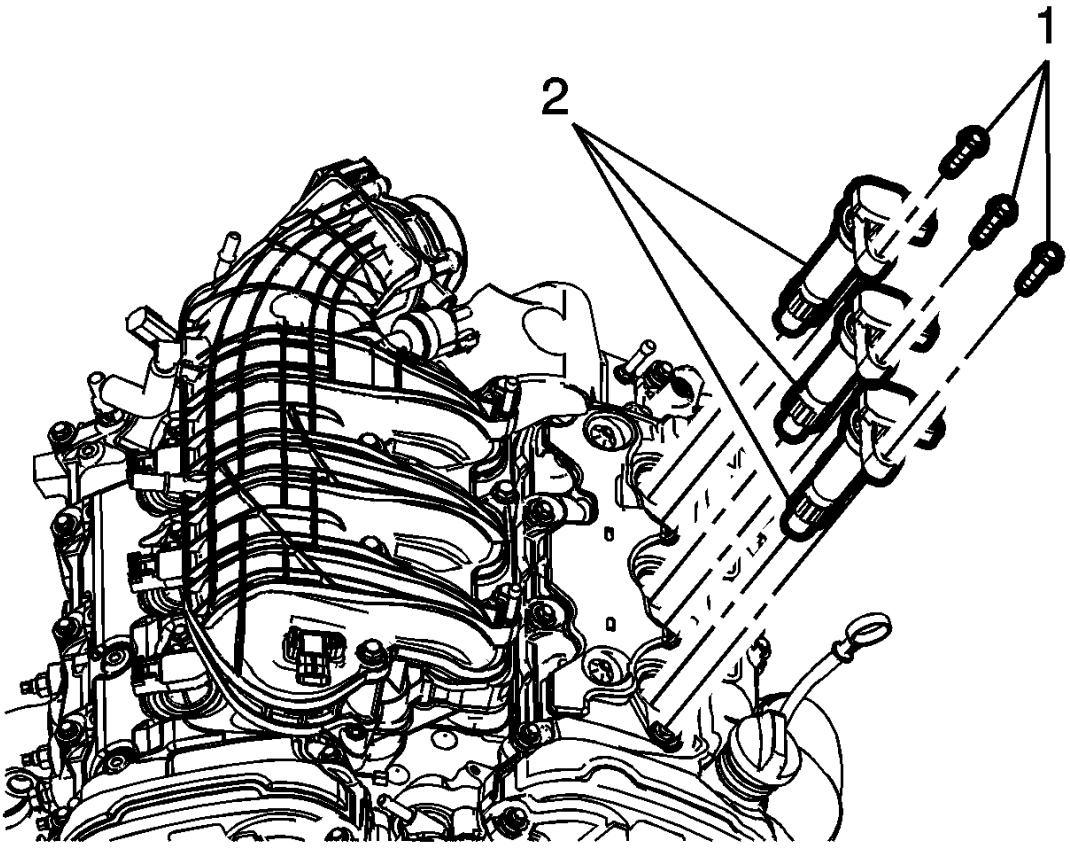

Fig. 135: Ignition Coils And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the ignition coil(s) (2).

CAUTION: Refer to Fastener Caution .

2. Install the ignition coil bolt(s) (1) and tighten to 10 N.m (89 lb in).

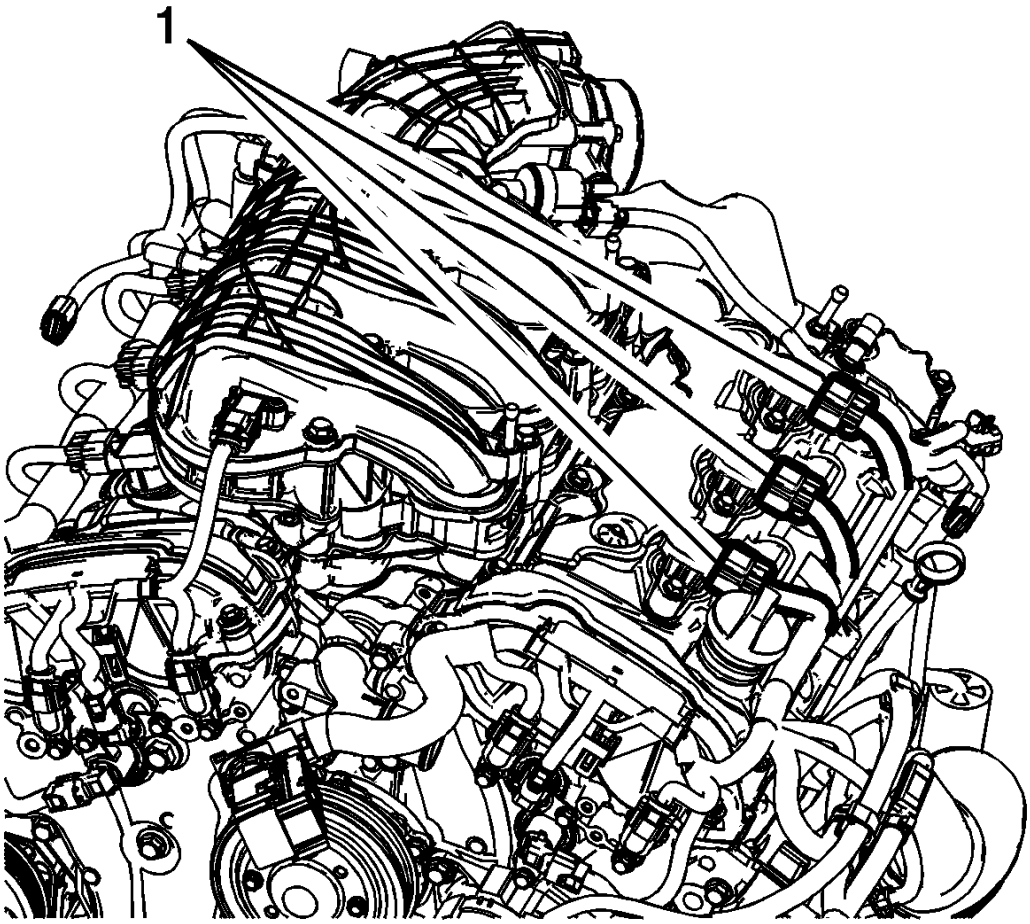

Fig. 136: Engine Wiring Harness Electrical Connectors
Courtesy of GENERAL MOTORS COMPANY

3. Connect the engine wiring harness electrical connector(s) (1) to the ignition coil(s).
4. Install theintake manifold cover. Refer to **Intake Manifold Cover Replacement** .

SPARK PLUG INSPECTION

Spark Plug Usage

Ensure that the correct spark plug is installed. An incorrect spark plug causes driveability conditions. Refer to the Electronic Parts Catalog.

Spark Plug Inspection

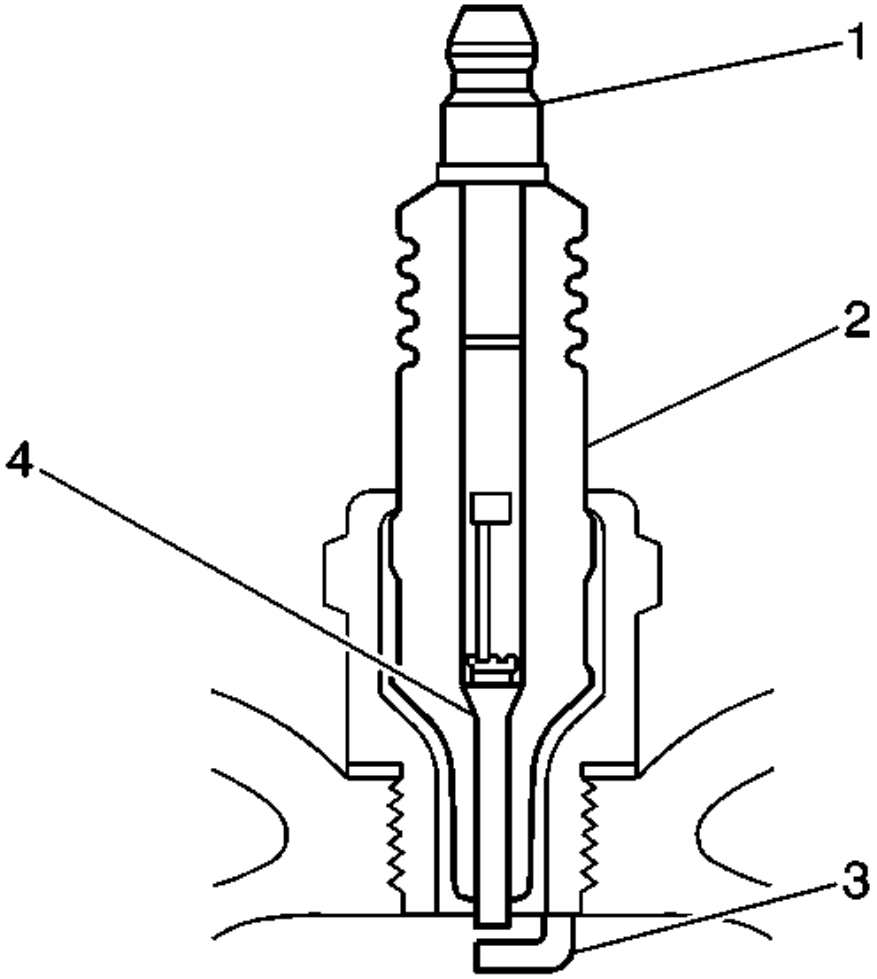

Fig. 137: Cross Sectional View Of Spark Plug
Courtesy of GENERAL MOTORS COMPANY

- Inspect the terminal post (1) for damage.
  - Inspect for a bent or broken terminal post (1).
  - Test for a loose terminal post (1) by twisting and pulling the post. The terminal post (1) should NOT move.
- Inspect the insulator (2) for flashover or carbon tracking, soot. This condition is often mistakenly identified as a cracked insulator. This is caused by the electrical charge traveling across the insulator (2) between the terminal post (1) and ground. Inspect for the following conditions:
  - Inspect the spark plug boot for damage.
  - Inspect the spark plug recess area of the cylinder head for moisture, such as oil, coolant, or water. A spark plug boot that is saturated causes arcing to ground.
- Inspect the insulator (2) for cracks. All or part of the electrical charge may arc through the crack instead of the electrodes (3, 4).
- Inspect for evidence of improper arcing.
  - Measure the gap between the center electrode (4) and the side electrode (3) terminals. This must be

done carefully in order to avoid damaging the small diameter Iridium center electrode. Refer to **Ignition System Specifications** . An excessively wide electrode gap can prevent correct spark plug operation.

- Inspect for the correct spark plug torque. Refer to **Ignition System Specifications** . Insufficient torque can prevent correct spark plug operation. An over torqued spark plug, causes the insulator (2) to crack.
- Inspect for signs of tracking that occurred near the insulator tip instead of the center electrode (4).
- Inspect for a broken or worn side electrode (3).
- Inspect for a broken, worn, or loose center electrode (4) by shaking the spark plug.
  - A rattling sound indicates internal damage.
  - A loose center electrode (4) reduces the spark intensity.
- Inspect for bridged electrodes (3, 4). Deposits on the electrodes (3, 4) reduce or eliminates the gap.
- Inspect for worn or missing platinum pads on the electrodes (3, 4) If equipped.
- Inspect for excessive fouling.

- Inspect the spark plug recess area of the cylinder head for debris. Dirty or damaged threads can cause the spark plug not to seat correctly during installation.

Spark Plug Visual Inspection

- Normal operation-Brown to grayish-tan with small amounts of white powdery deposits are normal combustion by-products from fuels with additives. Reddish orange deposits can indicate MMT fuel additive which is still used in some markets around the world (will cause misfire and cannot be burned off). MMT fuel additive use should be avoided.
- Carbon Fouled-Dry, fluffy black carbon, or soot caused by the following conditions:
  - Rich fuel mixtures
    - Leaking fuel injectors
    - Excessive fuel pressure
    - Restricted air filter element
    - Incorrect combustion
  - Reduced ignition system voltage output
    - Weak coils
    - Worn ignition wires
    - Incorrect spark plug gap
  - Excessive idling or slow speeds under light loads can keep spark plug temperatures so low that normal combustion deposits may not burn off.
- Deposit Fouling-Oil, coolant, or additives that include substances such as silicone, very white coating, reduces the spark intensity. Most powdery deposits will not effect spark intensity unless they form into a glazing over the electrode.

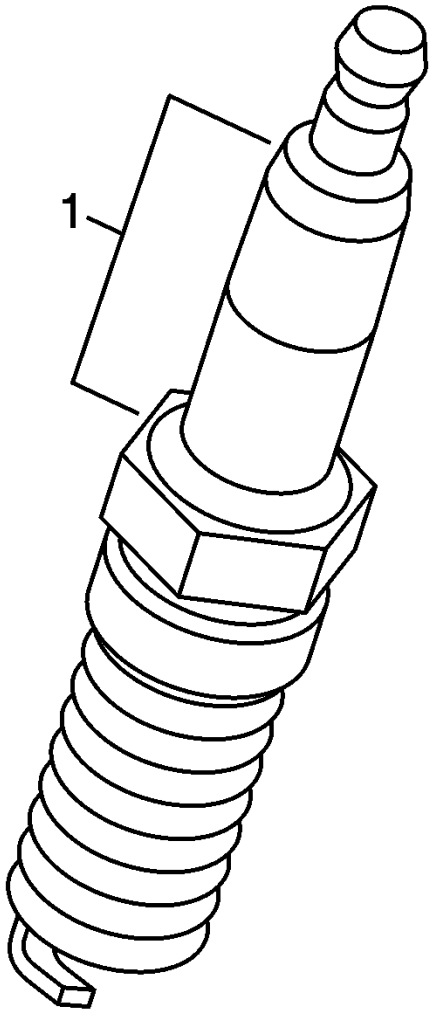

Fig. 138: Inspect For Carbon On Spark Plug Tower
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Carbon on spark plug tower means carbon will also be on inside of spark plug wire boot or coil boot and will cause both new spark plug and spark plug wire or coil boot to fail again.**

-
- If carbon tracking occurs on spark plug tower (1), replace spark plug and spark plug wire or coil boot.

SPARK PLUG REPLACEMENT

Removal Procedure

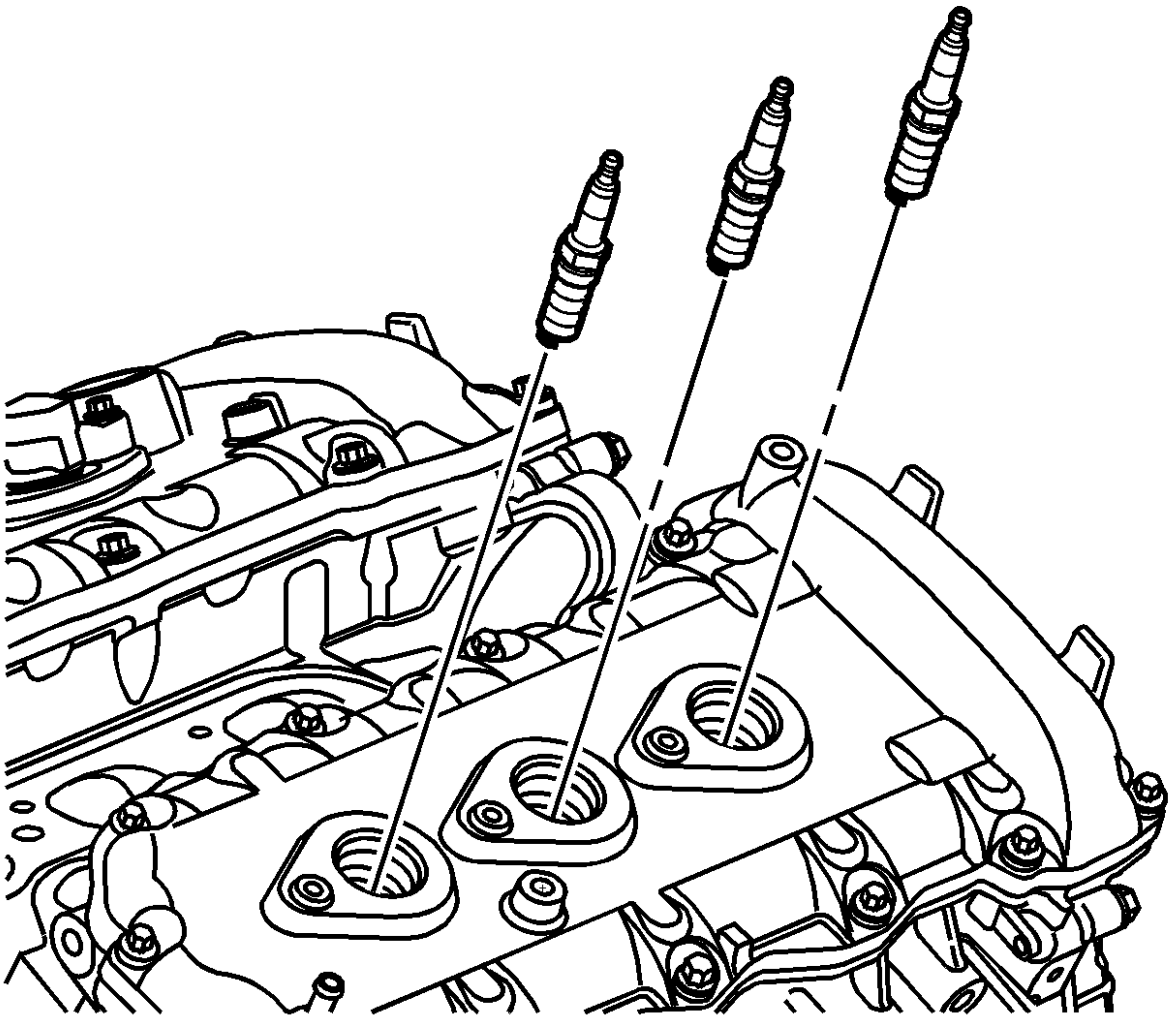

Fig. 139: View Of Spark Plugs
Courtesy of GENERAL MOTORS COMPANY

1. Remove the ignition coil(s). Refer to **Ignition Coil Replacement - Bank 1**, and/or **Ignition Coil Replacement - Bank 2**.

WARNING: **Refer to Safety Glasses and Compressed Air Warning .**

CAUTION: **Clean the spark plug recess area before removing the spark plug. Failure to do so could result in engine damage because of dirt or foreign material entering the cylinder head, or by the contamination of the cylinder head threads. The contaminated threads may prevent the proper seating of the new plug. Use a thread chaser to clean the threads of any contamination.**

2. Use compressed air in order to remove debris from the spark plug cavity.

CAUTION: **Allow the engine to cool before removing the spark plugs. Attempting to remove the spark plugs from a hot engine may cause the plug threads to**

seize, causing damage to cylinder head threads.

3. Remove the spark plug.

Installation Procedure

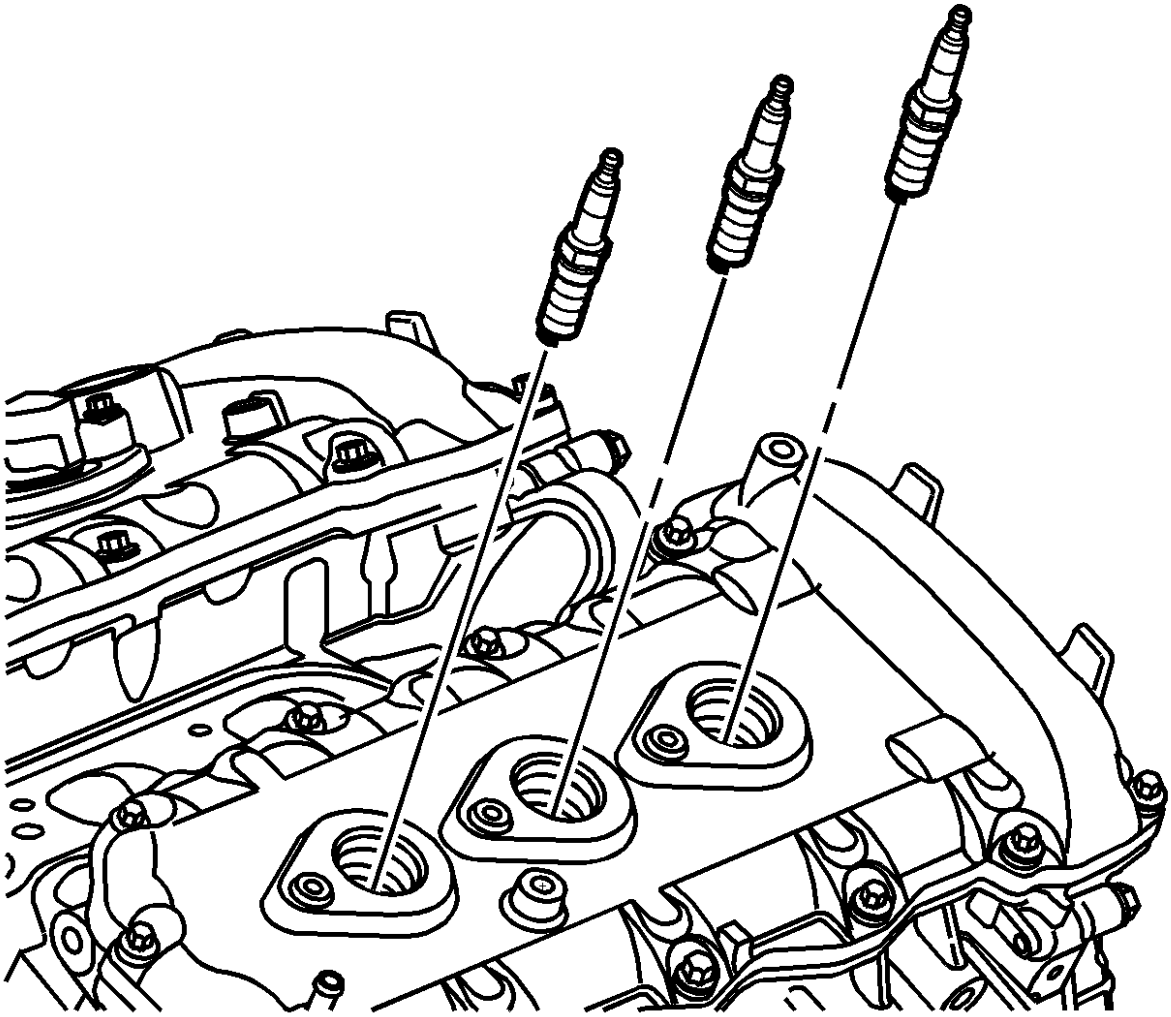

Fig. 140: View Of Spark Plugs
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Use only the spark plugs specified for use in the vehicle. Do not install spark plugs that are either hotter or colder than those specified for the vehicle. Installing spark plugs of another type can severely damage the engine.

CAUTION: Check the gap of all new and reconditioned spark plugs before installation. The pre-set gaps may have changed during handling. Use a round feeler gauge to ensure an accurate check. Installing the spark plugs with the wrong gap can cause poor engine performance and may even damage the engine.

1. Ensure that the spark plug gap is equivalent to the spark plug gap specification. Refer to **Ignition System Specifications** .

CAUTION: **Be sure that the spark plug threads smoothly into the cylinder head and the spark plug is fully seated. Use a thread chaser, if necessary, to clean threads in the cylinder head. Cross-threading or failing to fully seat the spark plug can cause overheating of the plug, exhaust blow-by, or thread damage.**

CAUTION: **Refer to Fastener Caution .**

2. Install the spark plug and tighten to 20 N.m (15 lb ft)..
3. Install the ignition coil(s). Refer to **Ignition Coil Replacement - Bank 1**, and/or **Ignition Coil Replacement - Bank 2**.

CRANKSHAFT POSITION SENSOR REPLACEMENT

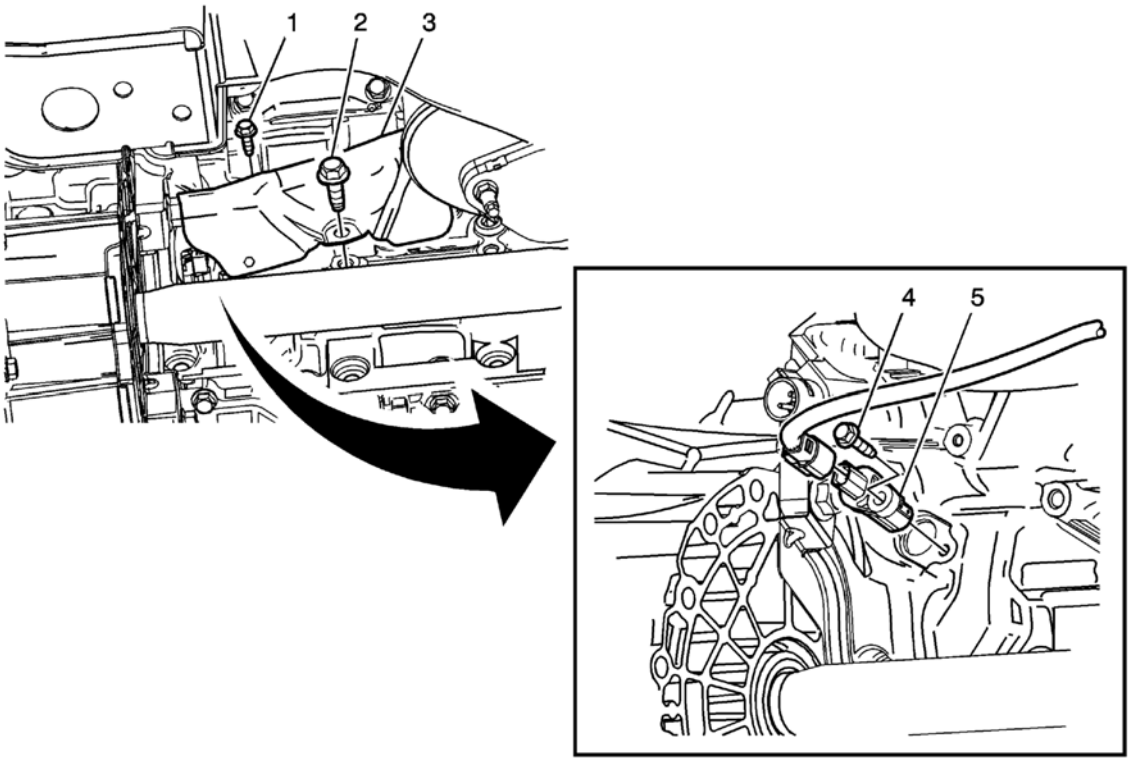

Fig. 141: Crankshaft Position Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. If equipped with AWD, remove the right side catalytic converter. Refer to **Catalytic Converter Replacement - Right Side (Rear)** . 2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .	

Callout	Component Name
1	Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)
2	Bolt **Tighten** 58 N.m (42 lb ft)
3	Exhaust Manifold Lower Heat Shield
4	Bolt **Tighten** 10 N.m (89 lb in)
5	Crankshaft Position Sensor **Procedure** Disconnect the crankshaft position sensor harness connector.

CAMSHAFT POSITION SENSOR REPLACEMENT - BANK 2 (LEFT SIDE) EXHAUST

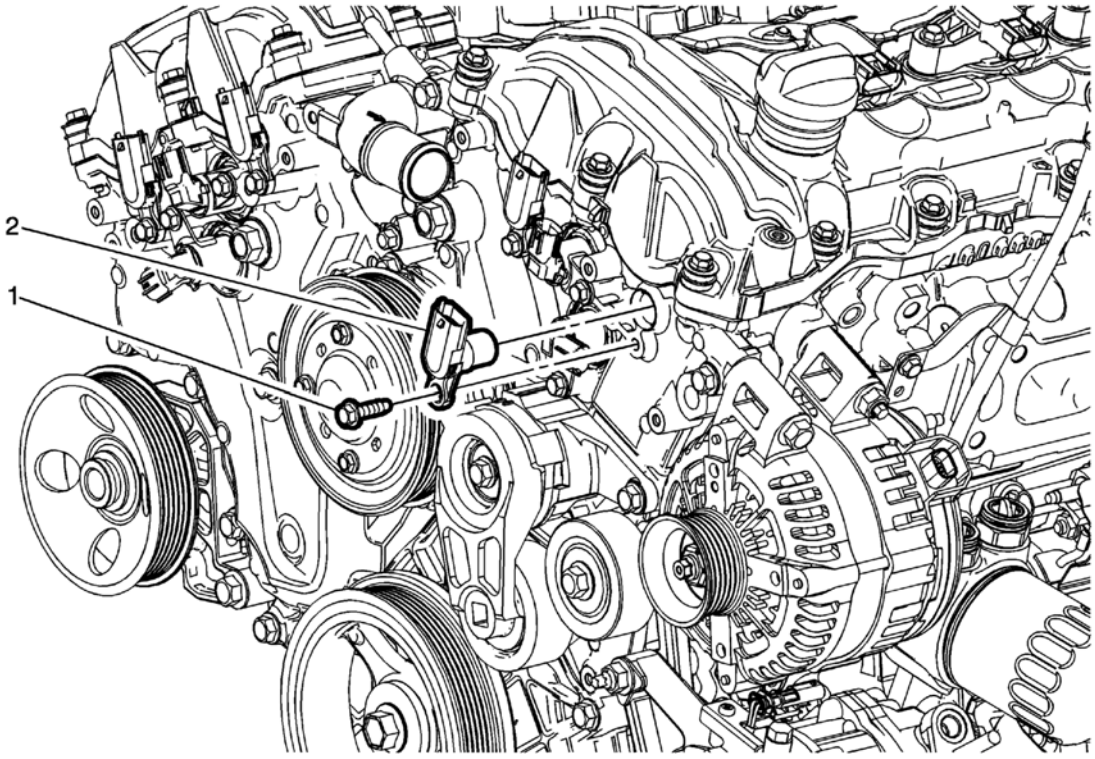

Fig. 142: Camshaft Position Sensor - Bank 2 (Left Side) Exhaust
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Camshaft Position Sensor Fastener **CAUTION:** **Refer to** Fastener Caution **.** **Tighten** 10 N.m (89 lb in)
2	Camshaft Position Sensor **Procedure** Disconnect the electrical connector.

CAMSHAFT POSITION SENSOR REPLACEMENT - BANK 2 (LEFT SIDE) INTAKE

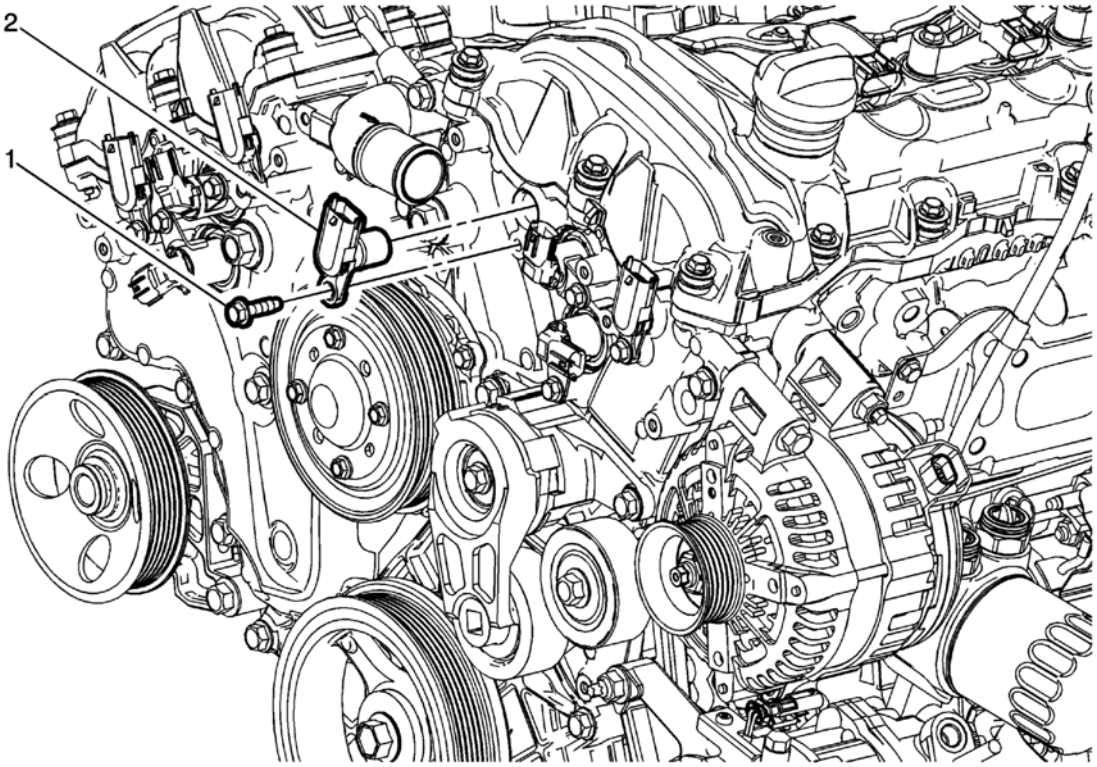

Fig. 143: Camshaft Position Sensor - Bank 2 (Left Side) Intake
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Camshaft Position Sensor Fastener **CAUTION:**

Callout	Component Name
	Refer to Fastener Caution . **Tighten** 10 N.m (89 lb in)
2	Camshaft Position Sensor **Procedure** Disconnect the electrical connector.

CAMSHAFT POSITION SENSOR REPLACEMENT - BANK 1 (RIGHT SIDE) EXHAUST

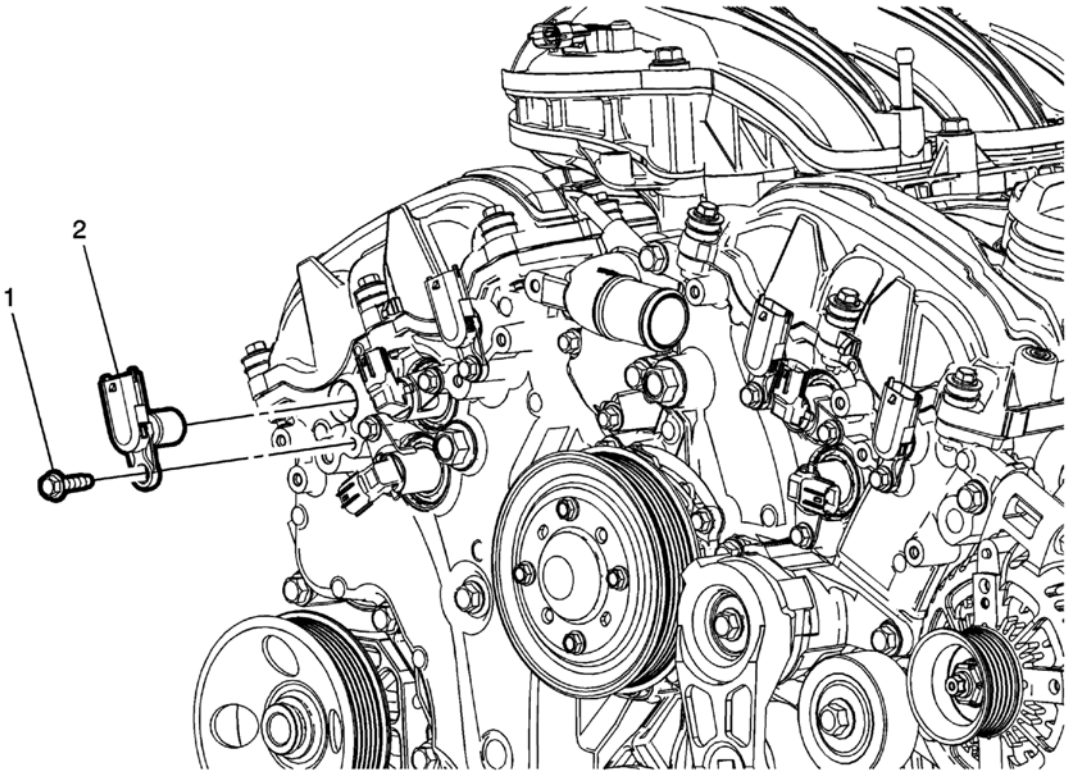

Fig. 144: Camshaft Position Sensor - Bank 1 (Right Side) Exhaust
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Camshaft Position Sensor Fastener **CAUTION:** **Refer to** Fastener Caution .

Callout	Component Name
	Tighten 10 N.m (89 lb in)
2	Camshaft Position Sensor **Procedure** Disconnect the electrical connector.

CAMSHAFT POSITION SENSOR REPLACEMENT - BANK 1 (RIGHT SIDE) INTAKE

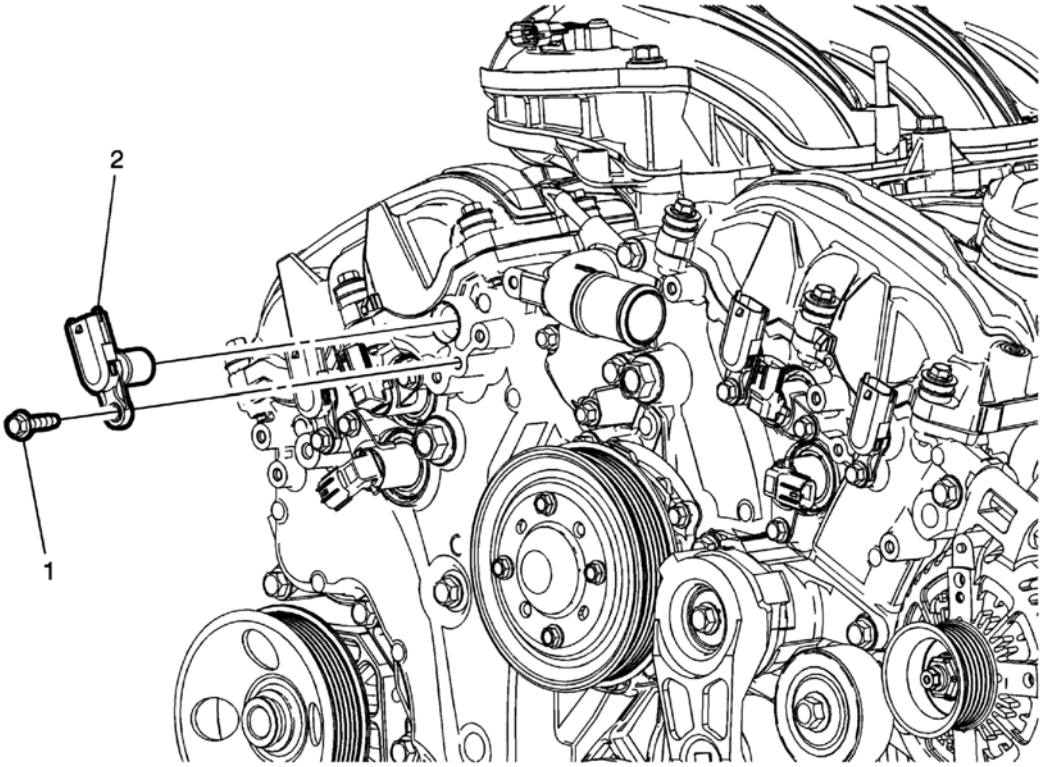

Fig. 145: Camshaft Position Sensor - Bank 1 (Right Side) Intake
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Camshaft Position Sensor Fastener **CAUTION:** **Refer to Fastener Caution .** **Tighten** 10 N.m (89 lb in)
2	Camshaft Position Sensor **Procedure** Disconnect the electrical connector.

CAMSHAFT POSITION ACTUATOR SOLENOID VALVE SOLENOID REPLACEMENT - BANK 1 (RIGHT SIDE) INTAKE

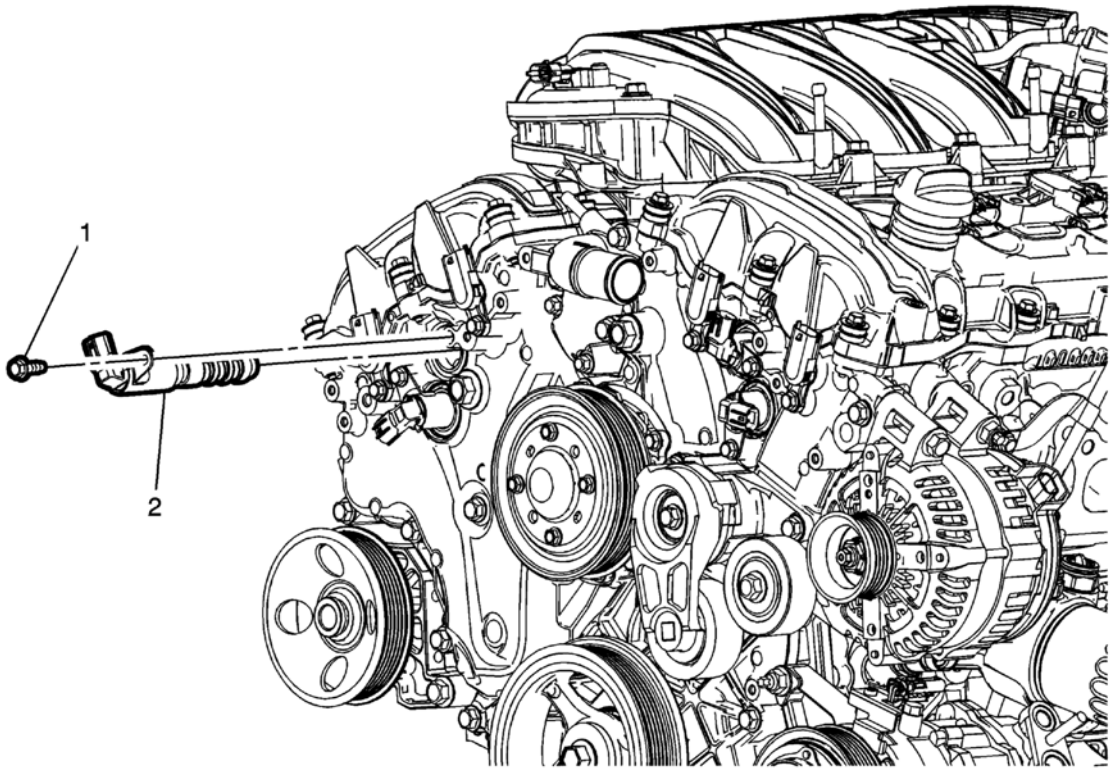

Fig. 146: Camshaft Position Actuator Solenoid Valve Solenoid - Bank 1 (Right Side) Intake
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Camshaft Position Actuator Solenoid Valve Fastener **CAUTION:** **Refer to Fastener Caution .** **Procedure** Disconnect the electrical connector. **Tighten** 10 N.m (89 lb in)
2	Camshaft Position Actuator Solenoid Valve

CAMSHAFT POSITION ACTUATOR SOLENOID VALVE SOLENOID REPLACEMENT - BANK 1 (RIGHT SIDE) EXHAUST

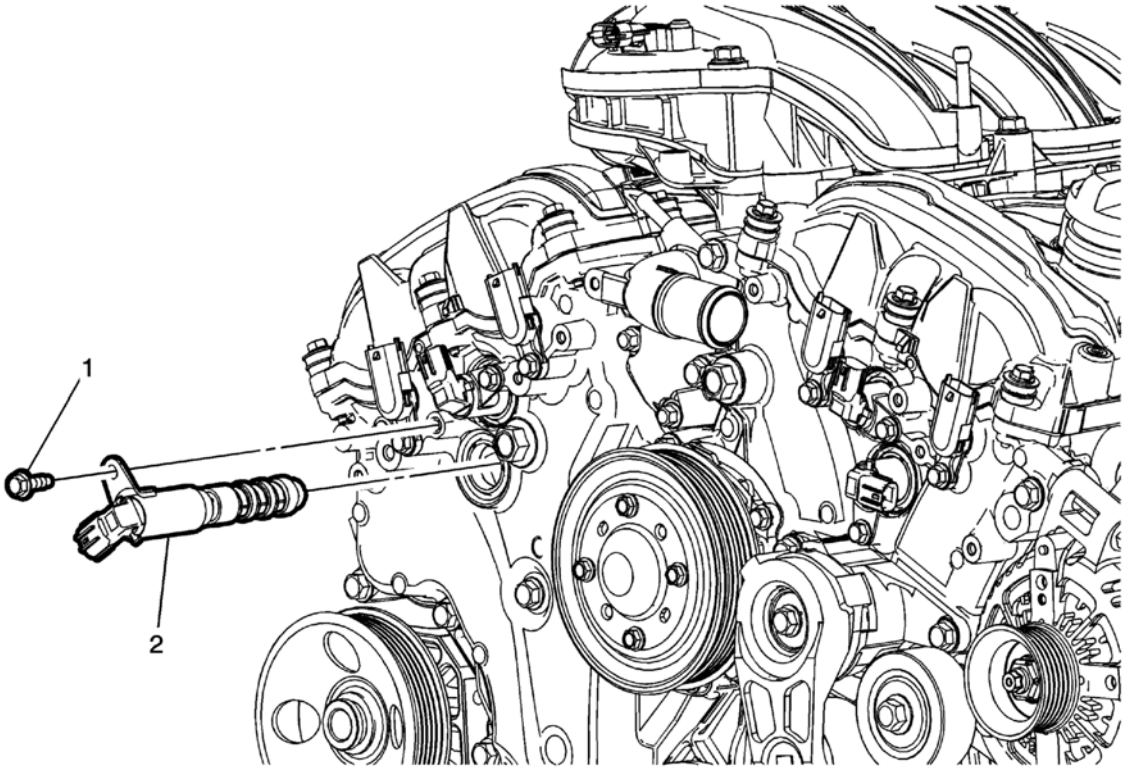

Fig. 147: Camshaft Position Actuator Solenoid Valve Solenoid - Bank 1 (Right Side) Exhaust
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Camshaft Position Actuator Solenoid Valve Fastener **CAUTION:** **Refer to Fastener Caution .** **Procedure** Disconnect the electrical connector. **Tighten** 10 N.m (89 lb in)
2	Camshaft Position Actuator Solenoid Valve

CAMSHAFT POSITION ACTUATOR SOLENOID VALVE SOLENOID REPLACEMENT - BANK 2 (LEFT SIDE) INTAKE

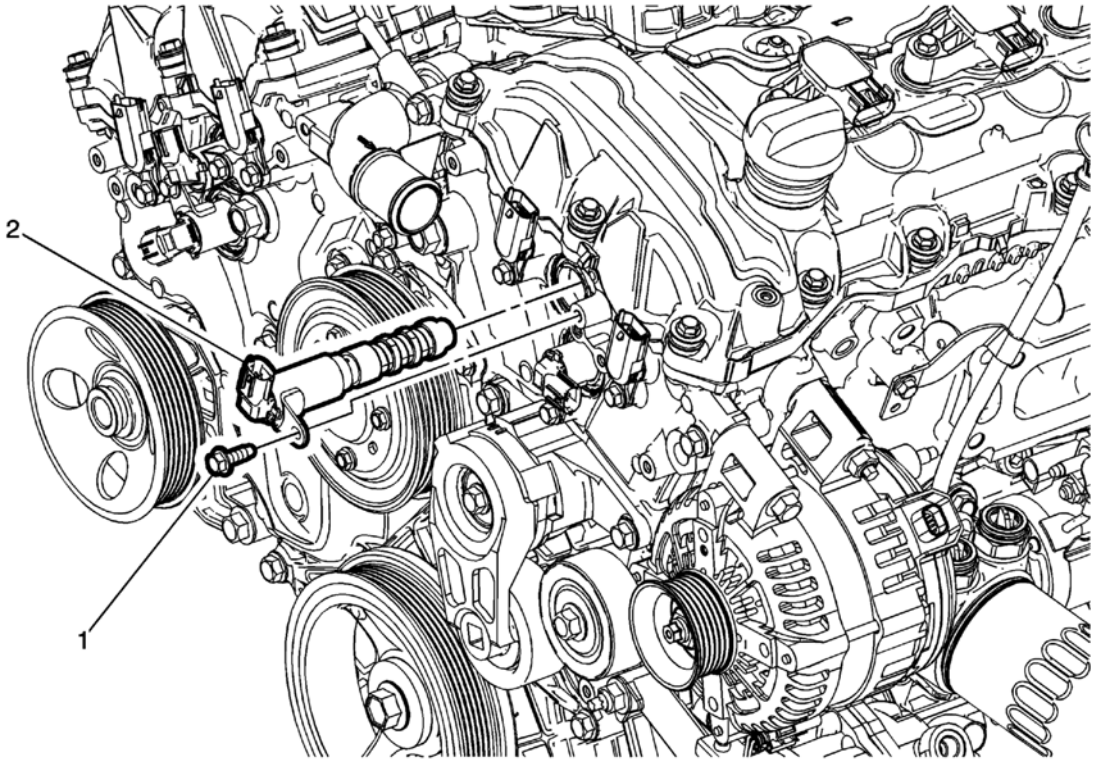

Fig. 148: Camshaft Position Actuator Solenoid Valve Solenoid - Bank 2 (Left Side) Intake
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Camshaft Position Actuator Solenoid Valve Fastener **CAUTION:** **Refer to Fastener Caution .** **Procedure** Disconnect the electrical connector. **Tighten** 10 N.m (89 lb in)
2	Camshaft Position Actuator Solenoid Valve

CAMSHAFT POSITION ACTUATOR SOLENOID VALVE SOLENOID REPLACEMENT - BANK 2 (LEFT SIDE) EXHAUST

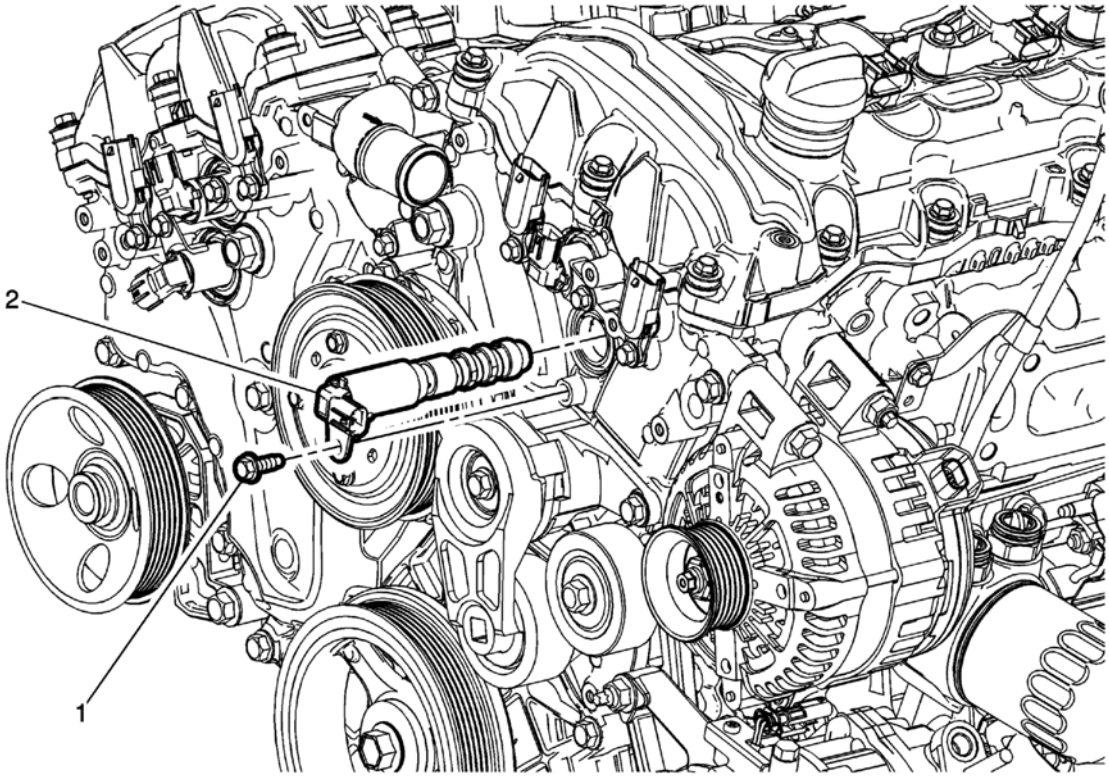

Fig. 149: Camshaft Position Actuator Solenoid Valve Solenoid - Bank 2 (Left Side) Exhaust
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Camshaft Position Actuator Solenoid Valve Fastener **CAUTION:** **Refer to** **Fastener Caution .** **Tighten** 10 N.m (89 lb in)
2	Camshaft Position Actuator Solenoid Valve **Procedure** Disconnect the electrical connector.

KNOCK SENSOR REPLACEMENT - BANK 1

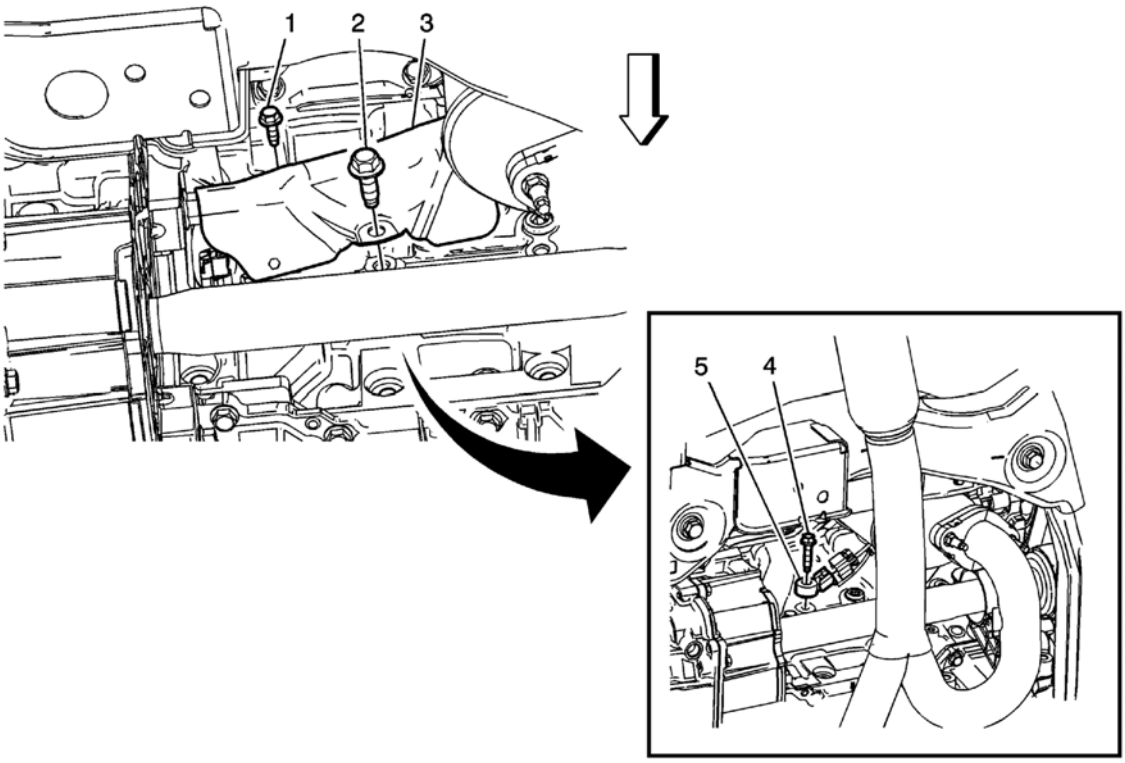

Fig. 150: Knock Sensor - Bank 1
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .	
1	Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 25 N.m (18 lb ft)
2	Bolt **Tighten** 58 N.m (42 lb ft)
3	Exhaust Manifold Lower Heat Shield
4	Bolt **Tighten** 23 N.m (17 lb ft)
5	Knock Sensor **Procedure** Disconnect the electrical connector.

KNOCK SENSOR REPLACEMENT - BANK 2

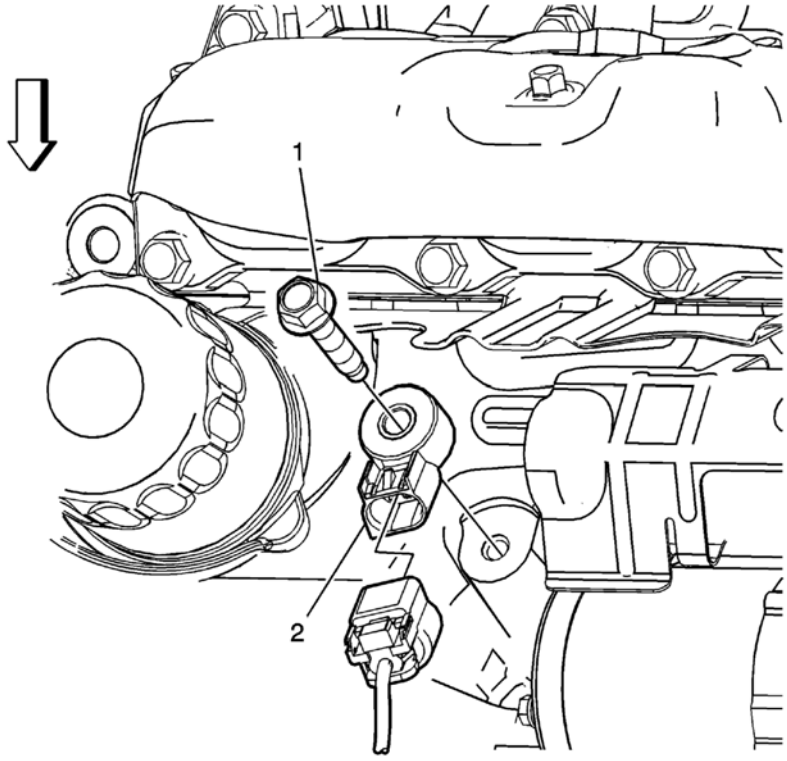

Fig. 151: Knock Sensor - Bank 2
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .	
1	Knock Sensor Fastener **CAUTION:** **Refer to** **Fastener Caution** . **Tighten** 23 N.m (17 lb ft)
2	Knock Sensor **Procedure** Disconnect the electrical connector.

SECONDARY AIR INJECTION PIPE REPLACEMENT

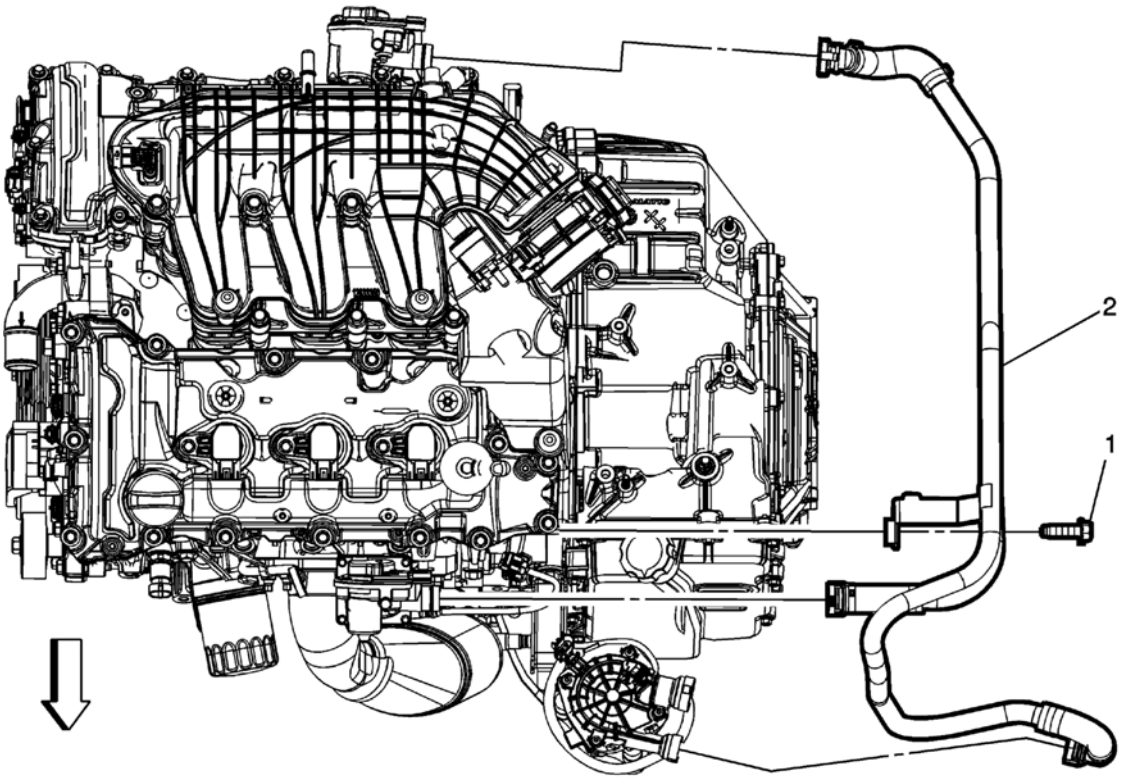

Fig. 152: Secondary Air Injection Pipe
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
	Preliminary Procedures **1. Remove the intake manifold cover. Refer to Intake Manifold Cover Replacement .** **2. Remove the air cleaner outlet duct. Refer to Air Cleaner Outlet Duct Replacement.**
1	Secondary Air Injection Pipe Bolt. **CAUTION:** **Refer to Fastener Caution .** **Tighten** 58 N.m (43 lb ft)
2	Secondary Air Injection Pipe. **Procedure** Disconnect the quick connect fittings by squeezing both sides.

SECONDARY AIR INJECTION BYPASS VALVE REPLACEMENT - BANK 2

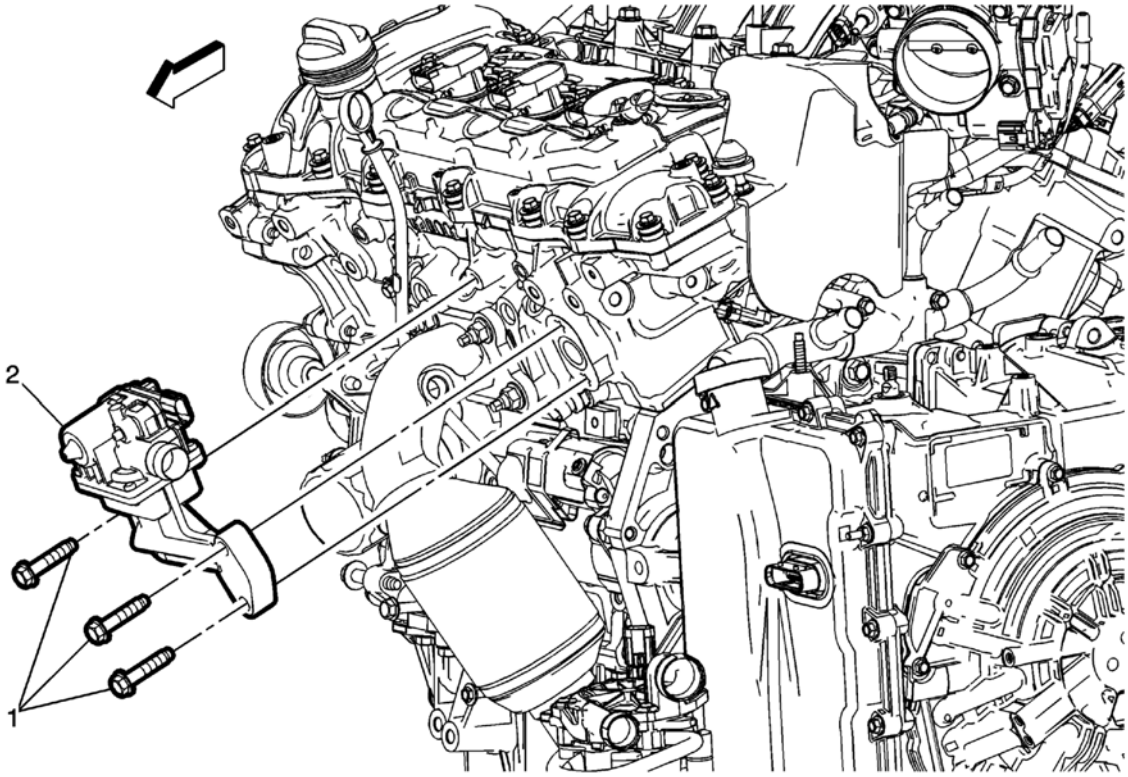

Fig. 153: Secondary Air Injection Bypass Valve - Bank 2
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
	Preliminary Procedures **1. Remove the intake manifold cover. Refer to Intake Manifold Cover Replacement .** **2. Remove the secondary air injection pipe. Refer to Secondary Air Injection Pipe Replacement.**
1	Secondary Air Injection Bypass Valve Bolts (Qty: 3). **CAUTION:** **Refer to Fastener Caution .** **Tighten** 25 N.m (18 lb ft)
2	Secondary Air Injection Bypass Valve. **Procedure** Disconnect the secondary air injection valve electrical connector.

SECONDARY AIR INJECTION BYPASS VALVE REPLACEMENT - BANK 1

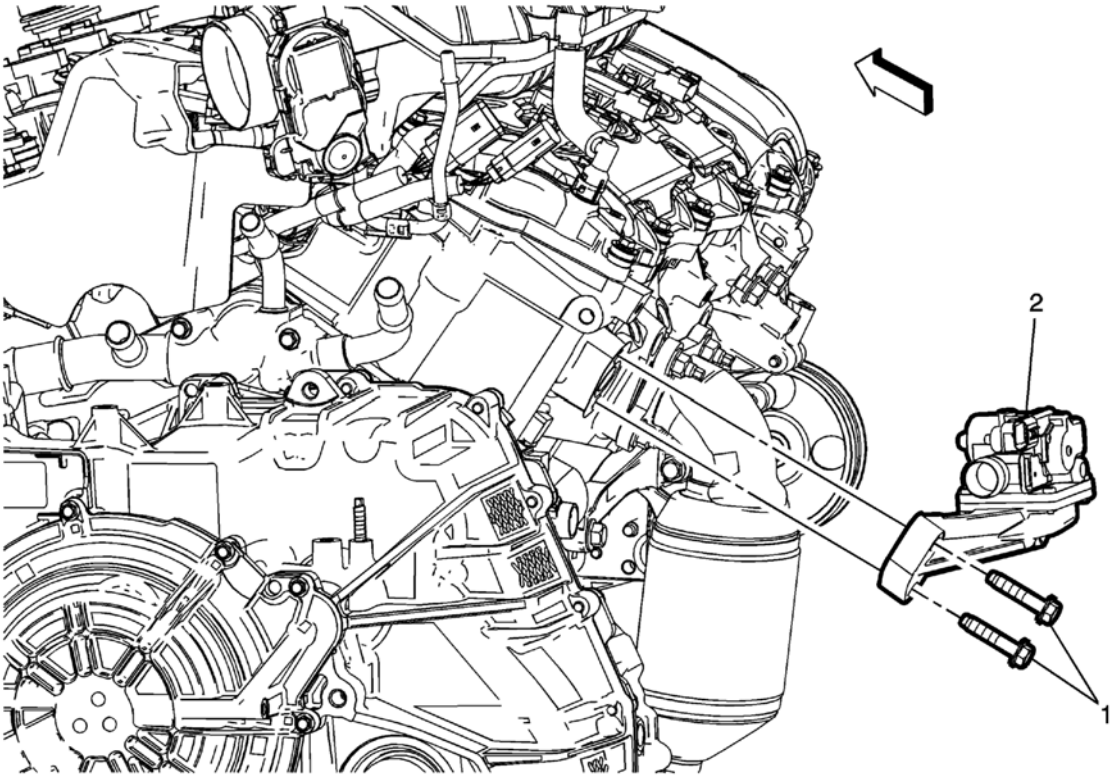

Fig. 154: Secondary Air Injection Bypass Valve - Bank 1
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
	Preliminary Procedures **1. Remove the secondary air injection pipe. Refer to Secondary Air Injection Pipe Replacement.** **2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle**
1	Secondary Air Injection Bypass Valve Bolts (Qty: 2). **CAUTION:** **Refer to Fastener Caution .** **Tighten** 25 N.m (18 lb ft)
2	Secondary Air Injection Bypass Valve. **Procedure** Disconnect the secondary air injection valve electrical connector.

SECONDARY AIR INJECTION PUMP REPLACEMENT

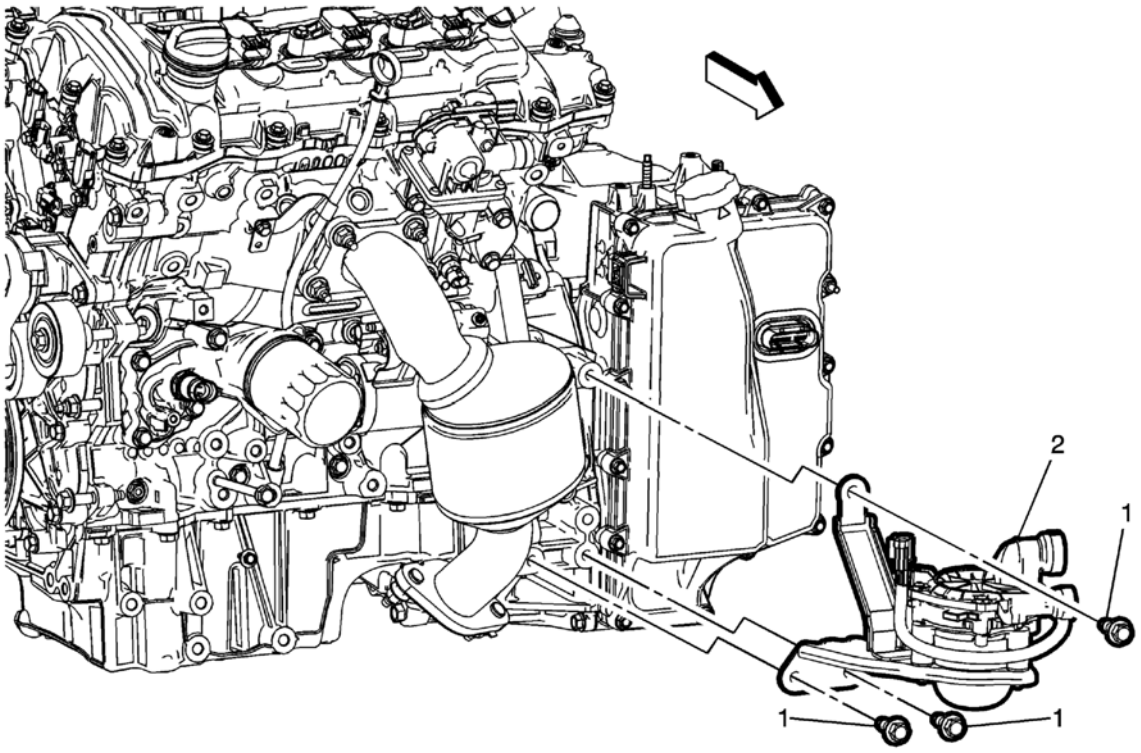

Fig. 155: Secondary Air Injection Pump
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
	Preliminary Procedures **1. Revove the radiator air lower baffel and deflector. Refer to Radiator Air Lower Baffle and Deflector Replacement** **2. Remove the secondary air injection pipe. Refer to Secondary Air Injection Pipe Replacement** **3. Remove the secondary air injection pump hose. Refer to Secondary Air Injection Pump Hose Replacement**
1	Secondary Air Injection Pump Bolts (Qty: 3). **CAUTION:** **Refer to Fastener Caution .** **Tighten** 58 N.m (43 lb ft)
2	Secondary Air Injection Pump. **Procedure** Disconnect the secondary air injection pump elactrical connector.

SECONDARY AIR INJECTION PUMP HOSE REPLACEMENT

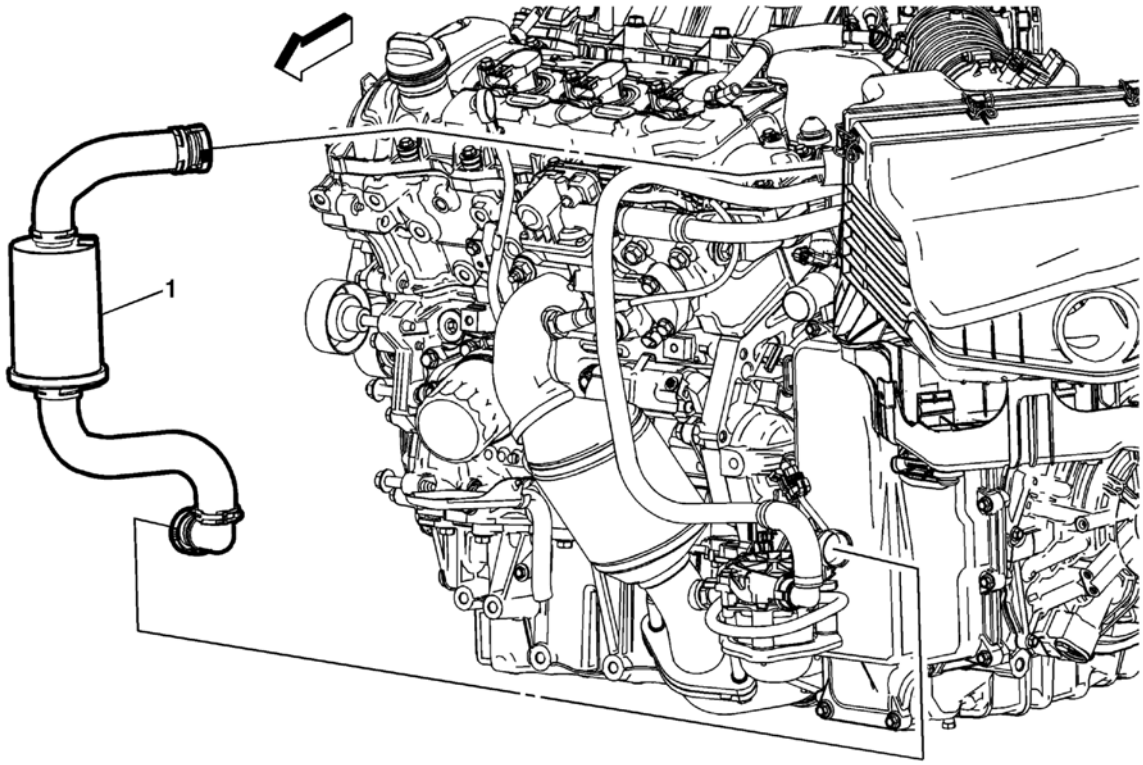

Fig. 156: Secondary Air Injection Pump Hose
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures **Revove the radiator air lower baffel and deflector. Refer to Radiator Air Lower Baffle and Deflector Replacement**	
1	Secondary Air Injection Pump Inlet Hose. **Procedure** Disconnect the quick connect fittings by squeezing both sides.

AIR CLEANER ELEMENT REPLACEMENT

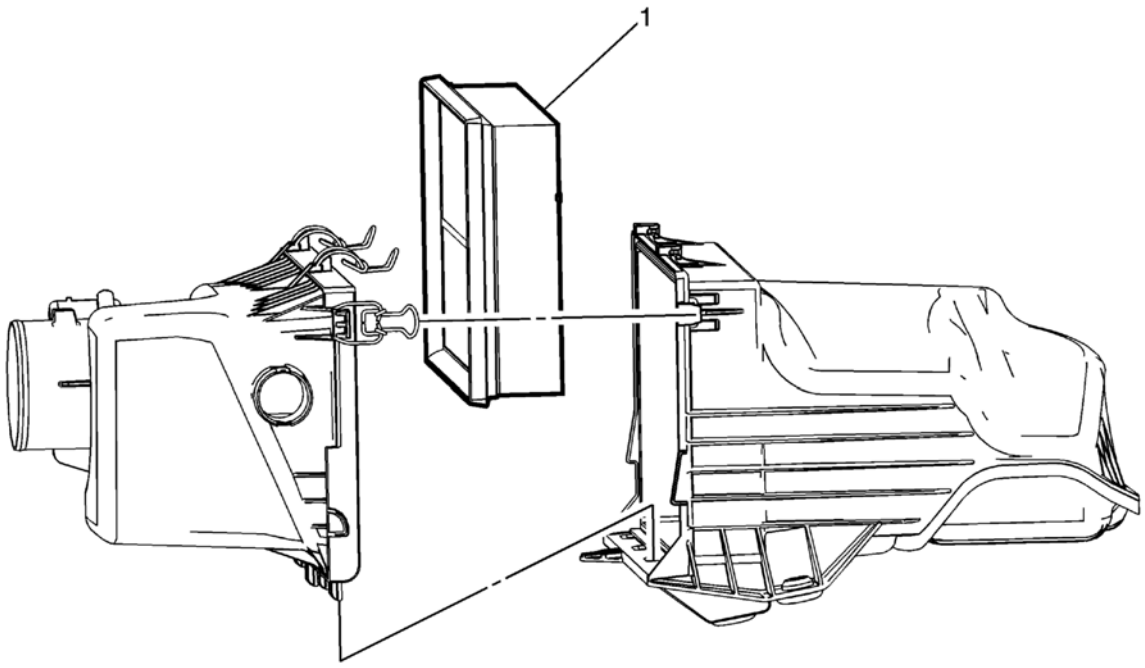

Fig. 157: Air Cleaner Element
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement** 2. Remove the secondary air injection pump hose. Refer to **Secondary Air Injection Pump Hose Replacement** 3. Disconnect the MAF sensor electrical connector.	
1	Air Cleaner Element **Procedure** Release the spring clamps on top and side of the air cleaner housing.

AIR CLEANER ASSEMBLY REPLACEMENT

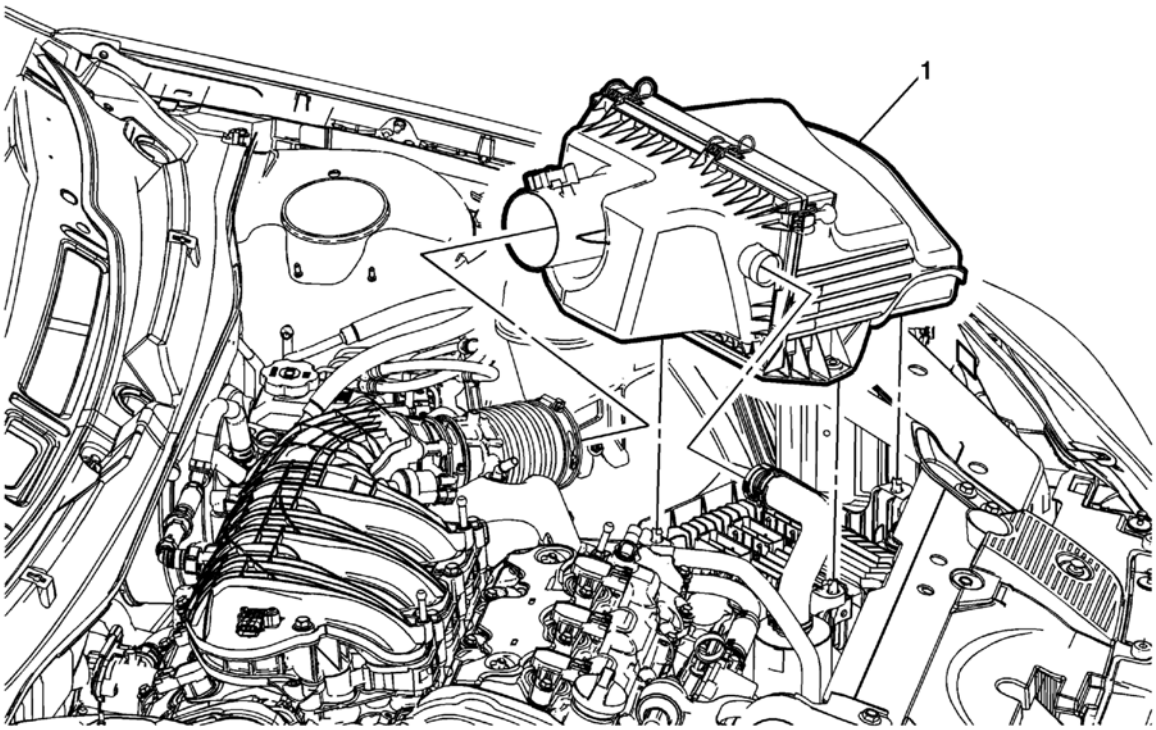

Fig. 158: Air Cleaner Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement** 2. Remove the secondary air injection pump hose. Refer to **Secondary Air Injection Pump Hose Replacement** 3. Disconnect the MAF sensor electrical connector.	
1	Air Cleaner Assembly.

AIR CLEANER OUTLET DUCT REPLACEMENT

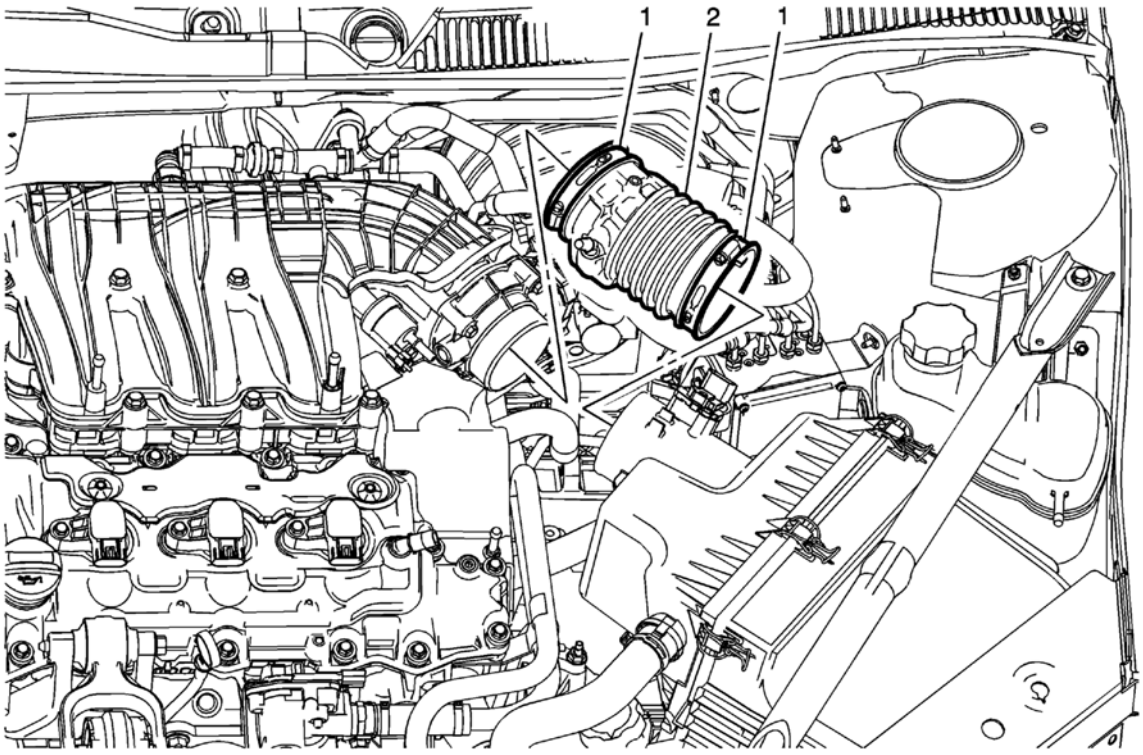

Fig. 159: Air Cleaner Outlet Duct
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the positive crankcase ventilatioin tube front. Refer to **Positive Crankcase Ventilation Tube Replacement - Front**	
1	Air Cleaner Outlet Duct Clamps. (Qty: 2). **CAUTION:** **Refer to Fastener Caution .** **NOTE:** **Ensure the outlet duct is fully seated to the mating surfaces before clamping. Verify that the cuff is not rolled**

Callout	Component Name
	under. **Tighten** 3 N.m (27 lb in)
2	Air Cleaner Outlet Duct

AIR CLEANER BRACKET REPLACEMENT

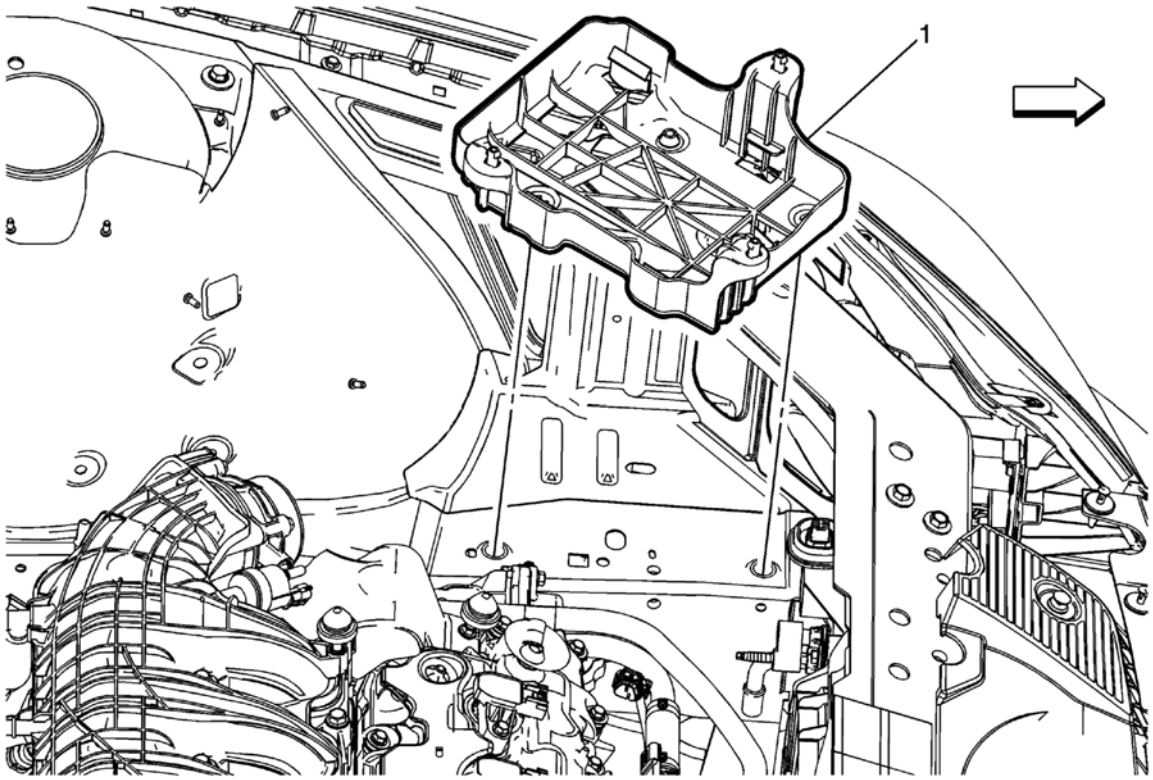

Fig. 160: Air Cleaner Bracket
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the engine control module. Refer to **Engine Control Module Replacement**	
1	Air Cleaner Bracket. **Procedure** Apply suitable upward pressure to the air cleaner bracket to release the retainers.

DESCRIPTION AND OPERATION

CAMSHAFT ACTUATOR SYSTEM DESCRIPTION

Camshaft Actuator System Overview

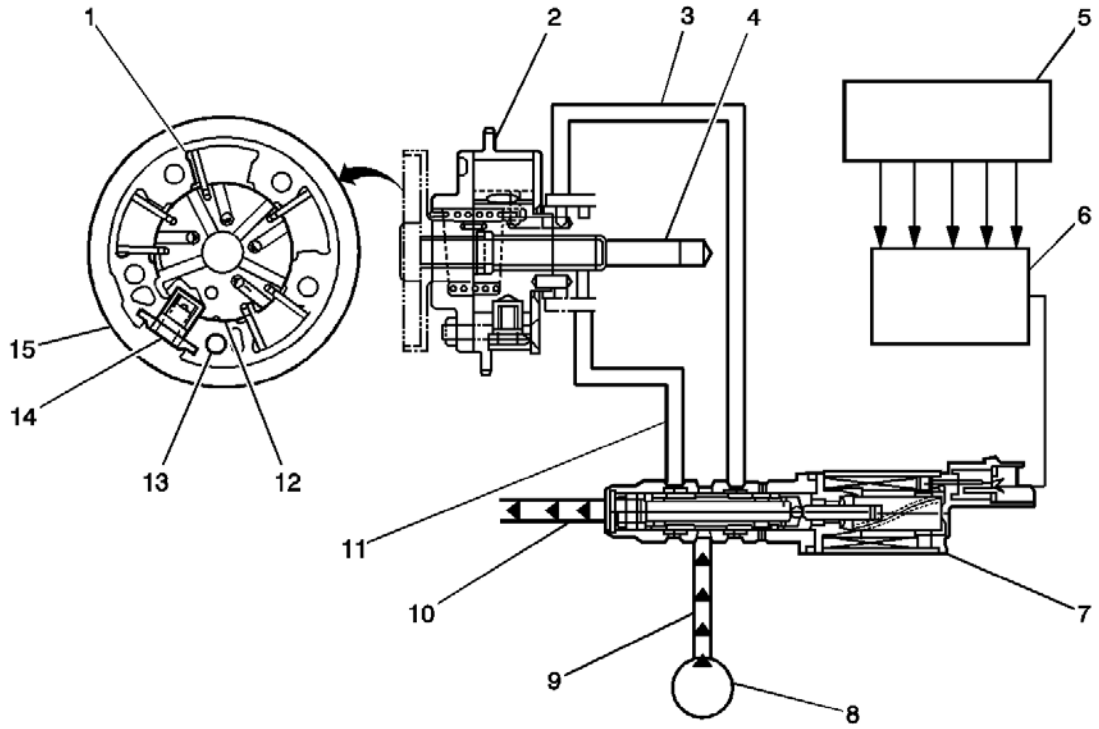

Fig. 1: Identifying Camshaft Actuator System Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Camshaft Actuator Vane
2	Timing Chain Sprocket
3	Engine Oil Pressure-For retarding the camshaft
4	Camshaft
5	Input Signals from Engine Sensors
6	Engine Control Module (ECM)
7	Camshaft Actuator Solenoid
8	Engine Oil Pump
9	Engine Oil Pressure Supply
10	Engine Oil Drain
11	Engine Oil Pressure-For advancing the camshaft
12	Camshaft Actuator Rotor

Callout	Component Name
13	Camshaft Position Sensor Reluctor
14	Camshaft Actuator Lock Pin
15	Camshaft Actuator Housing

The camshaft actuator system enables the engine control module (ECM) to change camshaft timing of all 4 camshafts while the engine is operating. The camshaft position (CMP) actuator assembly (15) varies the camshaft position in response to directional changes in oil pressure. The CMP actuator solenoid valve controls the oil pressure that is applied to advance or retard a camshaft. Modifying camshaft timing under changing engine demand provides better balance between the following performance concerns:

- Engine power output
- Fuel economy
- Tailpipe emissions

The CMP actuator solenoid valve (7) is controlled by the ECM. The crankshaft position (CKP) sensor and the CMP sensors are used to monitor changes in camshaft positions. The ECM uses the following information in order to calculate the desired camshaft positions:

- Engine coolant temperature
- Calculated engine oil temperature (EOT)
- Mass air flow (MAF)
- Throttle position (TP)
- Vehicle speed
- Volumetric efficiency

Operation

The CMP actuator assembly has an outer housing that is driven by an engine timing chain. Inside the assembly is a rotor with fixed vanes that is attached to the camshaft. Oil pressure that is applied to the fixed vanes will rotate a specific camshaft in relationship to the crankshaft. The movement of the intake camshafts will advance the intake valve timing. The movement of the exhaust camshafts will retard the exhaust valve timing. When oil pressure is applied to the return side of the vanes, the camshafts will return to 0 crankshaft degrees, or top dead center (TDC). The CMP actuator solenoid valve directs the oil flow that controls the camshaft movement. The ECM commands the CMP solenoid to move the solenoid plunger and spool valve until oil flows from the advance passage (11). Oil flowing thru the CMP actuator assembly from the CMP solenoid advance passage applies pressure to the advance side of the vanes in the CMP actuator assembly. When the camshaft position is retarded, the CMP actuator solenoid valve directs oil to flow into the CMP actuator assembly from the retard passage (3). The ECM can also command the CMP actuator solenoid valve to stop oil flow from both passages in order to hold the current camshaft position.

The ECM operates the CMP actuator solenoid valve by pulse width modulation (PWM) of the solenoid coil. The higher the PWM duty cycle, the larger the change in camshaft timing. The CMP actuator assembly also contains a lock pin (14) that prevents movement between the outer housing and the rotor vane assembly. The lock pin is released by oil pressure before any movement in the CMP actuator assembly takes place. The ECM is continuously comparing CMP sensor inputs with CKP sensor input in order to monitor camshaft position and detect any system malfunctions. If a condition exists in either the intake or exhaust camshaft actuator system,

the opposite bank, intake or exhaust, camshaft actuator will default to 0 crankshaft degrees.

CMP Actuator System Operation

Driving Condition	Change in Camshaft Position	Objective	Result
Idle	No Change	Minimize Valve Overlap	Stabilized Idle Speed
Light Engine Load	Retarded Valve Timing	Decrease Valve Overlap	Stabled Engine Output
Medium Engine Load	Advanced Valve Timing	Increase Valve Overlap	Better Fuel Economy with Lower Emissions
Low to Medium RPM with Heavy Load	Advanced Valve Timing	Advance Intake Valve Closing	Improved Low to Mid-range Torque
High RPM with Heavy Load	Retarded Valve Timing	Retard Intake Valve Closing	Improved Engine Output

ELECTRONIC IGNITION SYSTEM DESCRIPTION

The electronic ignition system produces and controls a high-energy secondary spark. This spark is used to ignite the compressed air/fuel mixture at precisely the correct time. This provides optimal performance, fuel economy, and control of exhaust emissions. This ignition system uses an individual coil for each cylinder. The ignition coils are mounted in the center of each camshaft cover with short integrated boots connecting the coils to the spark plugs. The driver modules within each ignition coil are commanded ON/OFF by the Engine Control Module (ECM). The ECM primarily uses engine speed, the mass air flow (MAF) sensor signal, and position information from the crankshaft position and the camshaft position sensors. This controls the sequence, dwell, and timing of the spark. The electronic ignition system consists of the following components:

Crankshaft Position Sensor

The crankshaft position sensor works in conjunction with a reluctor wheel on the crankshaft (front mounted crankshaft position sensor) or a reluctor wheel that is part of the flywheel (rear mounted crankshaft position sensor). The ECM monitors the voltage frequency on the crankshaft position sensor signal circuit. As each reluctor wheel tooth rotates past the sensor, the sensor creates a digital ON/OFF pulse. This digital signal is processed by the ECM. This creates a signature pattern that enables the ECM to determine the crankshaft position. The ECM uses the signal to determine which pair of cylinders is approaching top dead center based on the crankshaft position signal alone. The camshaft position sensor signals are used in order to determine which of these 2 cylinders is on a firing stroke, and which is on the exhaust stroke. The ECM uses this to properly synchronize the ignition system, the fuel injectors, and the knock control. This sensor is also used in order to detect misfire.

The ECM also has a dedicated replicated crankshaft position sensor signal output circuit that may be used as an input signal to other modules for monitoring engine RPM.

Camshaft Position Sensor

This engine uses a camshaft position sensor for each camshaft. The camshaft position sensor signals are a digital ON/OFF pulse and output 4 times per revolution of the camshaft. The camshaft position sensor does not directly affect the operation of the ignition system. The camshaft position sensor information is used by the ECM to determine the position of the camshaft relative to the crankshaft position. By monitoring the camshaft position and crankshaft position signals the ECM can accurately time the operation of the fuel injectors. The ECM supplies the camshaft position sensor with a 5 V reference circuit and a low reference circuit. The

camshaft position sensor signals are an input to the ECM. These signals are also used to detect camshaft alignment with the crankshaft.

The ECM also has a dedicated replicated camshaft position sensor signal output circuit that may be used as an input signal to other modules for monitoring engine RPM.

Knock Sensor

The knock sensor system enables the ECM to control the ignition timing for the best possible performance while protecting the engine from potentially damaging levels of detonation, also known as spark knock. The knock sensor system uses 1 or 2 flat response 2-wire sensors. The sensor uses piezo-electric crystal technology that produces an AC voltage signal of varying amplitude and frequency based on the engine vibration or noise level. The amplitude and frequency depend upon the level of knock that the knock sensor detects. The ECM receives the knock sensor signal through the high and low signal circuits.

The ECM learns a minimum noise level, or background noise, at idle from the knock sensor and uses calibrated values for the rest of the RPM range. The ECM uses the minimum noise level to calculate a noise channel. A normal knock sensor signal will ride within the noise channel. As engine speed and load change, the noise channel upper and lower parameters will change to accommodate the normal knock sensor signal, keeping the signal within the channel. In order to determine which cylinders are knocking, the ECM only uses knock sensor signal information when each cylinder is near top dead center (TDC) of the firing stroke. If knock is present, the signal will range outside of the noise channel.

If the ECM has determined that knock is present, it will retard the ignition timing to attempt to eliminate the knock. The ECM will always try to work back to a zero compensation level, or no spark retard. An abnormal knock sensor signal will stay outside of the noise channel or will not be present. Knock sensor diagnostics are calibrated to detect faults with the knock sensor circuitry inside the ECM, the knock sensor wiring, or the knock sensor voltage output. Some diagnostics are also calibrated to detect constant noise from an outside influence such as a loose/damaged component or excessive engine mechanical noise.

Ignition Coils

Each ignition coil contains a solid state driver module as its primary element. The engine ECM (ECM) signals the coil driver to initiate a firing event by applying ignition control circuit voltage for the appropriate amount of time otherwise known as dwell. When the voltage is removed the coil fires the spark plug.

Engine Control Module (ECM)

The ECM controls all ignition system functions and constantly corrects the spark timing. The ECM monitors information from various sensor inputs that may include the following components, if applicable:

- Throttle position sensor
- Engine coolant temperature (ECT) sensor
- Mass air flow (MAF) sensors
- Intake air temperature (IAT) sensors
- Vehicle speed sensor (VSS)
- Transmission gear position or range information sensors
- Engine knock sensors

- Ambient pressure sensors (BARO)

ENGINE CONTROL MODULE DESCRIPTION

The Engine Control Module (ECM) interacts with many emission related components and systems, and monitors emission related components and systems for deterioration. OBD II diagnostics monitor the system performance and a diagnostic trouble code (DTC) sets if the system performance degrades. The ECM is part of a network and communicates with various other vehicle control modules.

Malfunction indicator lamp (MIL) operation and DTC storage are dictated by the DTC type. A DTC is ranked as a Type A or Type B if the DTC is emissions related. Type C is a non-emissions related DTC.

The ECM is the control center of the engine controls system. Review the components and wiring diagrams in order to determine which systems are controlled by the ECM.

The ECM constantly monitors the information from various sensors and other inputs, and controls the systems that affect engine performance and emissions. The ECM also performs diagnostic tests on various parts of the system and can turn on the MIL when it recognizes an operational problem that affects emissions. When the ECM detects a malfunction, the ECM stores a DTC. The condition area is identified by the particular DTC that is set. This aids the technician in making repairs.

ECM Function

The ECM can supply 5 V or 12 V to various sensors or switches. This is done through pull-up resistors to regulated power supplies within the ECM. In some cases, even an ordinary shop voltmeter will not give an accurate reading due to low input resistance. Therefore, a digital multimeter (DMM) with at least 10 megaohms input impedance is required in order to ensure accurate voltage readings.

The ECM controls the output circuits by controlling the ground or the power feed circuit through transistors or a device called an output driver module.

EEPROM

The electronically erasable programmable read only memory (EEPROM) is an integral part of the ECM. The EEPROM contains program and calibration information that the ECM needs in order to control engine operation.

Special equipment, as well as the correct program and calibration for the vehicle, are required in order to reprogram the ECM.

Data Link Connector (DLC)

The data link connector (DLC) provides serial data communication for ECM diagnosis. This connector allows the technician to use a scan tool in order to monitor various serial data parameters, and display DTC information. The DLC is located inside the driver's compartment, underneath the instrument panel.

Malfunction Indicator Lamp (MIL)

The malfunction indicator lamp (MIL) is inside the instrument panel cluster (IPC). The MIL is controlled by the ECM and illuminates when the ECM detects a condition that affects vehicle emissions.

ECM Service Precautions

The ECM, by design, can withstand normal current draws that are associated with vehicle operations. However, care must be used in order to avoid overloading any of these circuits. When testing for opens or shorts, do not ground or apply voltage to any of the ECM circuits unless the diagnostic procedure instructs you to do so. These circuits should only be tested with a DMM unless the diagnostic procedure instructs otherwise.

Emissions Diagnosis For State I/M Programs

This OBD II equipped vehicle is designed to diagnose any conditions that could lead to excessive levels of the following emissions:

- Hydrocarbons (HC)
- Carbon monoxide (CO)
- Oxides of nitrogen (NOx)
- Evaporative emission (EVAP) system losses

Should this vehicle's on-board diagnostic system (ECM) detect a condition that could result in excessive emissions, the ECM turns ON the MIL and stores a DTC that is associated with the condition.

Aftermarket (Add-On) Electrical And Vacuum Equipment

CAUTION: Do not attach add-on vacuum operated equipment to this vehicle. The use of add-on vacuum equipment may result in damage to vehicle components or systems.

CAUTION: Connect any add-on electrically operated equipment to the vehicle's electrical system at the 12 V battery (power and ground) in order to prevent damage to the vehicle.

Aftermarket, add-on, electrical and vacuum equipment is defined as any equipment installed on a vehicle after leaving the factory that connects to the vehicle's electrical or vacuum systems. No allowances have been made in the vehicle design for this type of equipment.

Add-on electrical equipment, even when installed to these strict guidelines, may still cause the powertrain system to malfunction. This may also include equipment not connected to the vehicle electrical system, such as portable telephones and radios. Therefore, the first step in diagnosing any powertrain condition is to eliminate all of the aftermarket electrical equipment from the vehicle. After this is done, if the problem still exists, the problem may be diagnosed in the normal manner.

Electrostatic Discharge (ESD) Damage

NOTE: In order to prevent possible electrostatic discharge damage to the ECM, DO NOT touch the connector pins on the ECM.

The electronic components that are used in the control systems are often designed to carry very low voltage. These electronic components are susceptible to damage caused by electrostatic discharge. Less than 100 V of static electricity can cause damage to some electronic components. By comparison, it takes as much as 4,000 V for a person to even feel a static discharge.

There are several ways for a person to become statically charged. The most common methods of charging are

by friction and by induction. An example of charging by friction is a person sliding across a car seat.

Charging by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with the opposite polarity. Static charges can cause damage, therefore, it is important to use care when handling and testing electronic components.

Emissions Control Information Label

The underhood Vehicle Emissions Control Information Label contains important emission specifications. This identifies the year, the displacement of the engine in liters, and the class of the vehicle.

This label is located in the engine compartment of every General Motors vehicle. If the label has been removed, it can be ordered from GM service parts operations (GMSPO).

EVAPORATIVE EMISSION CONTROL SYSTEM DESCRIPTION

Typical Evaporative Emission (EVAP) System Hose Routing Diagram
